BATTALION, *angle of a*; ſee ANGLE.

BATTALION, *fraiſing a*; ſee FRAISING.

BATTARDEAUX, in *Bridge-building*; ſee COFFER-*dams.*

BATTEN, a name which the workmen give to a ſcantling of wooden ſtuff, from two to four inches broad, and about an inch thick; the length being pretty conſiderable, but undetermined.

The term is chiefly uſed in ſpeaking of doors, &c. which are not framed of whole deal, &c. with ſtiles, rails, and pannels, like wainſcot, but are made to appear as if they were, by means of theſe pieces, or *battens*, bradded on the plain board round the edges, and ſometimes croſs them, and up and down.

Hence *batten* doors, or windows, are ſuch as ſeem to be wainſcot ones, but are not. Theſe are ſaid to be either *ſingle* or *double*, as the *battens* are fitted on to one ſide, or to both.

BATTENS *of the hatches*, in *Sea-language*, are nailed along the tarpaulings, and ſerve to keep their edges cloſe down to the hatches, in order to prevent the water which waſhes over the deck from penetrating into the lower apartments of the ſhip.

BATTERING-RAM; ſee ARIES.

BATTERING-*rams*, in *Heraldry*, a bearing or coat of arms, reſembling the military engine of the ſame name.

BATTERING, the attacking a place, work, or the like, with heavy artillery. See BATTERY.

To **BATTER** *in breach, battre en breche*, is to play furiouſly on a work, as the angle of a half-moon, in order to demoliſh and make a gap or BREACH in it.

In this, they obſerve never to fire a ſingle piece againſt the top of the wall; but all towards the bottom: three, four, five, or ſix feet from the ground: they alſo fire *par camarade*, all together, till they perceive the earth fall from behind the lining of the rampart.

BATTERING-*pieces*, or pieces of *battery*; ſee CANNON.

BATTERY, in the *Military Art*, denotes an eminence caſt up, whereon to plant artillery, that it may play to better advantage. It conſiſts of an epaulement or breaſt-work, of about eight feet high, and eighteen or twenty thick.—See *Tab. Fortif. fig.* 21. *n.* 33. and *fig.* 23.

The word is French, formed of *battre, to beat, ſtrike.*

In all *batteries*, the open ſpace left to put the muzzles of the great guns out at, are called *embraſures*; and the diſtances between the embraſures, *merlons.*—The guns are generally about fifteen or ſixteen feet diſtant from one another, that the parapet may be ſtrong, and the gunners may have room to work.

There are alſo *batteries of mortars*, the ſame with thoſe of cannon, except that they have no *embraſures*: and the ſlope of the breaſt-work is made inwards, contrary to that of other parapets, having their platforms about ſix feet ſquare, and eight feet aſunder.

The *battery* of a camp is uſually ſurrounded with a trench and palliſades at the bottom, as alſo with a parapet on the top, having as many holes as there are pieces of artillery, and two redoubts on the wings, or certain places of arms, capable of covering the troops, which are appointed for their defence. See EMBRASURES, MAGAZINES, MERLONS, PARAPET, PLATFORMS, TRENCHES, &c.

BATTERY, *open*, is nothing more than a number of cannon, generally field-pieces, ranged in a row a-breaſt of one another, on ſome ſmall natural elevation of the ground, or on an artificial bank of about a yard or two high.

BATTERY, *covered*, is when the cannon and gunners are covered by a bank made of bruſh-wood, faggots, and earth; of about eighteen or twenty feet thick, and ſeven or eight feet high.

The cannon uſed in ſuch *batteries* are generally from nine to eighteen pounders; ſometimes twenty-four pounders are uſed in them.

BATTERY, *ſunk* or *buried*, is that whoſe platform is ſunk or let down into the ground, with trenches cut in the earth againſt the muzzles of the guns, to ſerve for embraſures.

This ſort, which the French call *batterie en terre*, and *ruimante*, is generally uſed upon the firſt making approaches, to beat down the parapet of the place.

Batteries, *croſs*, are two batteries at a conſiderable diſtance from each other, which play athwart one another at the ſame time, and upon the ſame point, forming right angles; where, what one bullet ſhakes, the other beats down.

Battery *d'enfilade*, is one which ſweeps the whole length of a ſtrait line, a ſtreet, &c.

Battery *en echarpe*, is that which plays obliquely.

Battery *de revers*, or *murdering battery*, is one that plays on the back of any place; and being placed on an eminence, ſees into it.

Battery *joint*, or *par camerade*, or *cameretta*, is when ſeveral guns play at the ſame time upon one place.

Battery *enrouage*, is that uſed to diſmount the enemy's cannon.

Battery *à ricochet*, is adapted to the method of *ricochet* firing, firſt invented and practiſed by Vauban, at the ſiege of Aeth, in 1697: the guns are loaded with ſmall charges, and are elevated, ſo as to fire over the parapet; and the ſhot is hereby made to roll along the oppoſite rampart. This method of firing with guns has ſince been applied to mortars and howitzes with great ſucceſs.

Battery *coffer*, is that where the ſides of the wall and merlons only are formed of faſcines, and all the cavities or included ſpaces filled with earth.

Battery, *gabion*; ſee Gabions.

Battery, in *Law*, denotes an act that tends to the breach of the peace of the realm, by unlawfully ſtriking, beating, or offering other violence to another perſon.

Battery is frequently confounded with *aſſault*, though in law they are different offences; for that, in the treſpaſs for *aſſault* and *battery*, one may be found guilty of the *aſſault*, yet convicted of the *battery*: there may therefore be *aſſault* without *battery*; but *battery* always implies an *aſſault*.

A perſon guilty of *battery* againſt a clergyman, is liable to three kinds of proſecution for the ſame offence: an indictment for breach of peace, a civil action for damages, and a ſuit in the eccleſiaſtical court.

Battery is ſometimes uſed in ſpeaking of the fabric of metalline utenſils.

In this ſenſe, *battery*-works include pots, ſaucepans, kettles, and the like veſſels, which, though caſt at firſt, are to be afterwards hammered or beaten into form.

Some make *battery* for the kitchen, *batterie de cuiſine*, comprehend all utenſils for the ſervice of the kitchen, whether of iron, braſs, copper, or other matters. Others take the term in a narrower ſenſe, and reſtrain it to utenſils of braſs or copper.

A ſociety for the mineral and *battery*-work of England was incorporated by queen Elizabeth.

Battery, in *Electricity*, is a combination of coated ſurfaces of glaſs, ſo connected together, that they may be charged at once, and diſcharged by a common conductor. Mr. Gralath, a German electrician, was the firſt who contrived to increaſe the ſhock, by charging ſeveral phials at the ſame time. Dr. Franklin, after he had analyſed the Leyden phial, and found that it loſt at one ſurface the electric fire which it received at the other, conſtructed a *battery* conſiſting of eleven panes of large ſaſh-glaſs, coated on each ſide, and connected in ſuch a manner, that the whole might be charged together, and with the ſame labour as one ſingle pane; and by bringing all the giving ſides into contact with one wire, and all the receiving ſides with another, he contrived to unite the force of all the plates, and to diſcharge them at once. The moſt complete *battery* that has yet been conſtructed, is deſcribed by Dr. Prieſtley, of which he ſays, that after long uſe he ſees no reaſon for wiſhing the leaſt alteration in any part of it. This *battery* (ſee *Plate of Electricity, fig.* 1.) conſiſts of 64 jars, each 10 inches long, and 2½ inches in diameter, coated within 1½ inch of the top; and contains in the whole 32 ſquare feet. The wire of each jar has a piece of very ſmall wire twiſted about the lower end of it, to touch the inſide coating in ſeveral places; and it is put through a pretty large piece of cork, within the jar, to prevent any part of it from touching the ſide, which would tend to promote a ſpontaneous diſcharge. Each wire is turned round, ſo as to make a hole at the upper end; and through theſe holes a pretty thick braſs rod with knobs paſſes, one rod ſerving for one row of the jars. The communication between theſe rods is made by laying over them all a thick chain. When part only of the *battery* is uſed, the chain is laid over as many rods as will furniſh the required number of rows of jars. The bottom of the box, in which the jars ſtand, is covered with a plate of tin, and a bent wire touching the plate paſſes through the box, and appears on the outſide. To this wire any conductor deſigned to communicate with the outſide of the *battery* is faſtened, as the ſmall wire in the figure, and the diſcharge is made by bringing the braſs knob to any of the knobs of the *battery*. When a very great force is required, the quantity of coated ſurface may be increaſed, or two or more *batteries* may be uſed. Franklin's Exp. and Obſ. ed. 1769. p. 28. Prieſtley's Hiſt. &c. of Electricity, ed. 1775. vol. ii. p. 99.

BATTEURS *d'eſtrade*, ſcouts, or horſemen ſent out before, and on the wings of an army, two or three miles, to make diſcoveries; of which they are to give an account to the general.

BATTIFOLIUM, or Battifollum, a kind of tower or defence, frequently mentioned by Latin hiſtorians of the middle age. It ſeems to have been of wood, and to have been erected on ſudden and haſty occaſions.

BATTLE, an action which paſſes between two armies ranged in order of *battle*, and who engage in a country ſufficiently open for them to encounter in front, and at the ſame time; or, at leaſt, for the greater part of the line to engage, while the remainder remains in ſight, by reaſon of ſome difficulty, which hinders it from entering ſo readily into action, with a front equal to that which may be oppoſed to it by the enemy.

Other great actions, though generally of a longer duration, and even frequently attended with greater ſlaughter, are only called *fights*, by the French *combats*. Feuq. Mem. c. 80.

A *battle* loſt, almoſt always draws with it the loſs of the artillery of the army, and frequently alſo that of the baggage: conſequently, as the army beaten cannot again look the enemy in the face till it have repaired thoſe loſſes, it is forced to leave the enemy a long time maſter of the country, and at liberty to execute all its ſchemes.—Whereas a great fight loſt is rarely attended with a loſs of all the artillery, and ſcarce ever of the baggage, becauſe the two armies not meeting in front, they can only have ſuffered in the part that has been engaged. Feuq. loc. cit.

An ingenious modern author remarks, that it is not, uſually, the real loſs ſuſtained in a *battle* (that is, of ſome thouſands of men) that proves ſo fatal to a ſtate; but it is the imaginary loſs, and diſcouragement, which deprives it of the uſe of thoſe very powers which fortune had left it. Conſid. ſur les Cauſ. de la Grand. des Rom. c. iv. p. 39.

Drawing up an army for Battle, is called *embattelling*; the rules and method for which are furniſhed by the ſcience called by the ancients *tactics*.

Battle, *order of*, the diſpoſition of the ſquadrons and battalions of an army in one or more lines, according to the conditions of the ground, either in order to engage the enemy, or to be reviewed by the general.

Battle, *field of*, the ground on which the two armies engage.

The Greeks notified the places of their *battles* and victories by adding the word Νικη; whence Nicodemia, Nicopolis, Theſſalonica, &c. The ancient Britons did the like, by adding the word *Mais*; whence Maiſſeveth, Malmaiſbury, &c. The Engliſh by the word *field*.

The Romans had their particular days, called *præliares dies*, wherein alone it was lawful to join *battle*; and others wherein it was unlawful, called *dies atri*.

The Athenians, by the ancient laws of their country, were not to draw out their forces for *battle* till after the ſeventh day of the month. And Lucian relates of the Lacedæmonians, that, by the laws of Lycurgus, they were not to fight before full moon. Among the Germans, it was reputed an impiety to fight in the wane of the moon; and Cæſar tells us, that Arioviſtus was beaten by him, becauſe, contrary to the laws of his country, he had fought when the moon was in her wane. The German ſoldiers were intimidated with the apprehenſion, and afforded Cæſar an eaſy victory; *acie commiſſa impeditos religione hoſte vicit.* De Bell. Gall. lib. ii.

It is well known that Jeruſalem was taken by Pompey in an attack on the ſabbath-day, when, by the Jewiſh ſuperſtitious notions, they were not allowed to fight, or even defend themſelves. Dion. lib. vii.

The Romans did not carry their ſuperſtition ſo far; their *atri dies* were only obſerved in reſpect of attacking: no day was too holy for them to defend themſelves in. Macrob. Saturn. lib. i. c. 16.

Among the ancients, we find frequent inſtances of *battles* in the night: it was by the moon-light that Pompey beat Mithridates, and Scipio, Aſdrubal and Syphax. Flor. lib. iii.

Battle *array*, denotes the order in which an army is drawn up at a review, or for engagement; more frequently called *line of battle*.

Battle, *pitched or ſet*, that wherein both armies have room and time to range themſelves in good order.

The firſt *pitched battle*, of which we have any diſtinct account, is that between Crœſus and Cyrus, deſcribed by Xenophon, concerning which we have a diſſertation by M. Freret, wherein ſeveral points of the ancient tactics are well explained. Cyropæd. lib. vi. and vii. Mem. Acad. Inſcr. tom. ix. p. 209.

In modern war, we find few *pitched* or *ſet battles*: the chief view of the great commanders of late days is rather to harraſs or ſtarve the enemy by frequent alarms, cutting off his proviſions, carrying off his baggage, ſeizing his poſts, &c. than to join iſſue with him, and put the whole on the event of one day; a *battle* generally deciding the fate of a campaign, ſometimes of a whole war. Hence it is a rule, never to venture a general *battle*, unleſs either you fight to advantage, or be forced to it.

Joining or giving *battle* ſhould always be by deſign: a general ſhould never ſuffer himſelf to be forced to fight.

Reaſons for giving *battle* are, ſuperiority in the number or quality of forces; neceſſity of putting a ſpeedy end to the war; different views or intereſts of the commanders of the enemy's army; their negligence in encamping or marching; neceſſity of relieving a place beſieged; the diſpoſition of an army, which muſt be ruined, unleſs prevented by the ſucceſs of a *battle*; the certainty of ſuccours coming to the enemy, which will render him ſuperior; ſome preceding advantage, which, though not deciſive, has given the enemy a conſiderable check. For avoiding it the reaſons are, having leſs to hope for from a victory, than to fear from a defeat; expecting further ſuccours, or the junction of a ſeparate corps; finding the enemy advantageouſly poſted, or a proſpect of diſſipating his army by temporizing and avoiding *battle*. Means for execution are, to form the order of *battle* ſuitable to the quantity and quality of the forces whereof the army is compoſed, and the ground wherein it is expected to find the enemy; diſtributing the poſts to the general officers; giving copies of the order of *battle* to all thoſe who have command in it; diſtributing a ſufficient number of charges to the men, and having freſh munition and arms ready behind thoſe who have a long fire to ſuſtain; letting the army have time to reſt and refreſh themſelves before the *battle*; being ſufficiently provided with medicines and ſurgeons; being abſolutely free from the incumbrance of the heavy baggage; inſpiring the army with the deſire of fighting, hopes of victory, and promiſes of plunder; and not neglecting the advantages of wind and ſun. The ſtratagem of the Arabs deſerves mention. They uſed to turn looſe a number of camels loaden with ſand and duſt-bags full of holes to the windward of the enemy, who by this means were covered and ſuffocated with a cloud of duſt. Vid. Phil. Tranſ. N° 219. p. 137.

On the day of *battle*, the means of execution are, taking the advantages of the ground, obſerving the order of *battle* before concerted, changing it where found neceſſary, and giving notice thereof to thoſe concerned; diſtributing the artillery in the line according to the ground; watching for all advantages to be taken, by opening and ſtrengthening the wings; giving the word before marching to the enemy; taking care to obſerve the right and left, and the diſtance between the lines: if the army march in front, to make frequent halts, to give time for the line to recover its order, and to the artillery to fire and load again; above all, forbidding the ſoldiers from firing, to receive the enemies fire, and not to charge till after drawing their fire from them, is a capital point; it being certain, that when troops, who have parted with their fire, ſee others advance, and going to pour in their fire upon them, they will immediately give way. But when both ſides purſue the ſame maxim, the beſt expedient ſeems to be, to march up cloſe to the enemy, before they give their fire, and having fired, to prevent the enemy from giving theirs, by falling upon them with the bayonets on the muzzle of the muſkets the inſtant you have fired, which may be done under cover of the ſmoke, before they can perceive it. Bland's Milit. Diſcip. c. ix. art. 2.

If the army, by its march, cannot come at the enemy in front, it muſt approach in a ſufficient number of columns to be in order of *battle*, out of diſtance of being charged in columns. The artillery is ſtill to accompany the firſt line in the order wherein it was firſt diſtributed, if the ground will allow, and the reſt of the army to follow this motion, ſtill obſerving the diſtance between the two lines as at firſt appointed, to prevent confuſion. If the victory continue to declare in his favour, and he has the good fortune to overthrow the ſecond line, more care ſtill is to be taken to prevent the troops from ſeparating, leſt they be charged and put into diſorder by the firſt line of the enemy, who may have rallied behind their ſecond line. The routed troops muſt ſtill be purſued in a body, and in lines. No battalion ought ever to advance before the line in purſuit, for fear of being flanked, till the diſorder be general: afterwards, the number of thoſe detached for the purſuit is to be increaſed, without ever ſuffering a man to quit his flag without being commanded. On this occaſion, the general is to make uſe of the reſerved body, and of freſh troops, who have not engaged, to purſue the enemy, to prevent their rallying, and to take priſoners, which the troops muſt never be ſuffered to meddle with during the *battle*, not ſo much as to look on the plunder of the field, till the victory be abſolutely aſſured, and the enemy ſo broken, and at ſuch a diſtance, that there is no danger of his turning back on the bodies detached to purſue them: after which, during the reſt of the day, the victorious troops may be ſuffered to reap the plunder of the field of *battle*. If the firſt line give way, or be put into diſorder by the enemy, the battalions are to retire through the intervals left between thoſe of the ſecond line, behind which they are to ſtop and rally. Great care is to be here taken by the officers, that, inſtead of retiring through the intervals, they do not run directly into the battalions, and either carry them off with them, or put them into ſuch confuſion, that the enemy be upon them before they have proper time to repair the diſorder.

On the firſt line's giving way, the ſecond ſhould march up briſkly to their relief, and attack the enemy, before they have time to repair the diſorder, which the action and the purſuit muſt of courſe have thrown them into; by doing which, they may eaſily retrieve what is loſt, and defeat and render uſeleſs the enemy's firſt line, which had been conſiderably weakened and diſordered by the former attack. This is the more eaſy to be effected, as the enemy's firſt fire is ſpent, which is that which does moſt execution; the other, from the great hurry of loading, being of little conſequence, in compariſon with the firſt. The great miſchief is, that the ſecond line ſeeing the firſt give way, are uſually ſtruck with a panic, which magnifies the enemy; ſo that by the time they approach near, they either betake themſelves to flight, or make but a faint reſiſtance.

In caſe fortune declare on the enemy's ſide, the great buſineſs of the general is to prevent a total rout. His capacity and experience are to ſhew him the moment which precedes the loſs of a *battle*, that he may take the neceſſary precautions to diminiſh the diſorder of a flight, either by the vigorous effort of a body of troops unſhattered, in order to give time for the reſt to rally, and thus ſecure a retreat; or by ſeizing ſome poſt behind, whither he may retire with ſafety; or a defile, behind which he may rally and re-aſſemble his ſcattered troops. As the loſs of the field of *battle* frequently carries with it that of the baggage and artillery, he is to remain no longer in this firſt place than while he can re-aſſemble his army; after which he is to lead it into ſome ſecure camp, where he may recover his loſſes, ſend for freſh cannon, troops, &c. If the loſs be conſiderable enough to hazard ſome conſiderable town, he is to throw into it the beſt of his infantry left, and endeavour ſtill to keep the field with the cavalry, to harraſs the enemy, in caſe he attempts a ſiege; or to oblige him to keep the army together, and prevent his dividing into ſeveral bodies, if his deſign be only to penetrate farther, and ravage the country. Bland.

The ancients never joined *battle* without much ceremony and preparation; as taking auguries, offering ſacrifices, haranguing the ſoldiers, giving the word, or a *teſſera*, &c. The ſignals of *battle* were ſounding the *claſſicum*, or general charge, and diſplaying a peculiar flag, called by Plutarch a purple robe. To which may be added, ſinging pæans, raiſing military ſhouts, and the like.

Battle was alſo formerly uſed for a body of forces drawn up in order of *battle*.

This amounts to the ſame with what is otherwiſe called BATTALION.

In this ſenſe, we meet with the length or depth of the *battle*; the front, rear, and flanks of the *battle*.

Battle, *length of the*, is the number of men in a rank, or the ſpace from the left flank to the right flank.

Battle, *depth of the*, is the extent of a file, or the number of men from the front to the rear.

A Roman legion, ranged in order of *battle*, conſiſted of *haſtati*, placed in the front; of *principes*, who were all old experienced ſoldiers, placed behind the former; and of *triarii*, heavy-armed with large bucklers, behind the *principes*. The *haſtati* were ranked cloſe; the ranks of the *principes* were much opener, ſo that they could receive the *haſtati*; and thoſe of the *triarii* opener ſtill, inſomuch that they could receive both the *principes* and the *haſtati* within them, without any diſorder, and ſtill facing the enemy. When therefore the *haſtati* found themſelves unable to ſtand the enemy's charge, they retired gently within the *principes*, where joining with them, they renewed the combat. If theſe found themſelves too weak to ſuſtain the enemy, both retired among the *triarii*, where rallying, they formed a new corps, and charged with more vigour than ever. If theſe failed, the *battle* was loſt; the Romans had no further reſource. Macchiav. Art. de Guer. lib. iii. c. 1.

The moderns are unacquainted with this method of inſerting or embatteling one company into another; without which, the former cannot be well ſuccoured or defended, and their places taken by others; which was a thing the Romans practiſed with great exactneſs.

As to the *velites*, and, in later times, the archers and ſlingers, they were not drawn up in this regular manner, but diſpoſed of either before the front of the *haſtati*, or ſcattered up and down among the void ſpaces of the *haſtati*, or ſometimes placed in two bodies in the wings. Theſe always began the combat, ſkirmiſhing in flying parties with the foremoſt troops of the enemy. If they were repulſed, which was uſually the caſe, they fell back to the flanks of the army, or retired again in the rear. When they retired, the *haſtati* advanced to the charge.

As to the cavalry, it was poſted at the two corners of the army, like the wings on a body, and fought ſometimes on foot, ſometimes on horſeback. The auxiliary forces compoſed the two points of the *battle*, and covered the whole body of the Romans.

Other leſs uſual forms of *battle* among the Romans were, the *cuneus*, or wedge; *globus*, or round form; *forfex*, or pair of ſheers; *turris*, or an oblong ſquare figure; *ſerra*, or ſaw. Kennet. Rom. Ant. Not. p. ii. lib. iv. c. 10.

The Greeks were inferior to the Romans in marſhalling their armies for *battle*, as they drew up their whole army in a front, and truſted the ſucceſs of the day to a ſingle force. Pott. Archæol. tom. ii. lib. iii. c. 9.

They had three forms of *battle* for the horſe, viz. the ſquare, the wedge, and the rhombus, or diamond form. The firſt held beſt for the defenſive; the two latter for the offenſive: the wedge being preferred as bringing moſt hands to fight. Ælian. Tact. c. 18.

BATTLE, in a *Naval Senſe*, denotes an engagement between two fleets, ſquadrons, or even ſingle ſhips.

This is more frequently diſtinguiſhed by the name of ſea-fight.

Of late times, fleets are ranged in line of *battle*, like land armies, and fight much after the ſame order; to the expediency of which, ſome objections may be made.

The ancients had divers forms of ſea-*battles*; as the half-moon, circle, and forceps. In all theſe, not only the ſhips engaged each other, and by their beaks and prows, and ſometimes their ſterns, endeavoured to daſh in pieces, or overſet and ſink each other, but the ſoldiers alſo annoyed the enemy with darts and ſlings, and, on their nearer approach, with ſwords and ſpears, boarding each other by laying bridges between the ſhips.

By way of preparation, they took down their ſails, and lowered their maſts, and ſecured whatever might expoſe them to the wind, chooſing rather to be governed by their oars.

It is obſervable, that the ancient and uſual way of fighting in our fleets was board and board, yard-arm and yard-arm, through and through; and not at a diſtance in a line or half-moon, as is now done: which practice our old ſailors ſay they were ſtrangers to.—For this reaſon our guns are ſhorter, and of larger bore, than thoſe of the French, which are adapted to the method of fighting in line of battle; as being longer, and carrying farther. So that we engage with them in this way at a diſadvantage. It has been often found that their balls will fly over our ſhips, before ours can reach them by a mile. Dennis Eſſ. on Navy, ſect. 2.—See SIGNAL.

BATTLE, *line of*; ſee LINE.

BATTLE, *ſquare*; ſee *Square* BATTALION.

BATTLE, *attainder by*; ſee ATTAINDER.

BATTLE, in *Middle Age Writers*, properly denotes a combat or duel decreed by order of a court of juſtice, for the deciſion of a cauſe, where otherwiſe ſufficient proof could not be had. See JUDICIUM *Dei*, ORDEAL, and PURGATION.

It was anciently allowed of in our law, and may ſtill be demanded at the election of the appellee (particular caſes only excepted), where the defendant in appeal of murder or felony, may fight with the appellant, and make proof thereby whether he be culpable or innocent of the crime. Glanv. lib. xiv. c. 1. If the appellee be ſo far vanquiſhed, that he cannot or will not fight any longer, he may be adjudged to be hanged immediately: but if he can maintain the fight until the ſtars appear, he ſhall have judgment to be quit of the appeal. 2 Hawk. P. C. 426. The trial by wager of *battle* may ſtill be demanded by the tenant, or defendant in a writ of right. Blackſtone's Comm. vol. iii. p. 337. vol. iv. p. 340, &c. See DUEL.

BATTLE *royal*, in *Cock-fighting*, denotes a fight between three, five, or ſeven cocks all together; ſo as that the cock which ſtands longeſt gets the day.

BATTLE *ax*. The *battle ax* was originally called *ſecuris Danica*, becauſe firſt introduced into England by the Danes; but being adopted in theſe countries, we find it called in later writers, *ſecuris Angla*, and *ſecuris Scotica*, the Engliſh and Scottiſh axes. The grandees wore them enriched with gold, and beſet with pearls. They were of that kind called *bipennes*, and have ſince generally degenerated into halbards or partiſans, though we find them ſtill retained, under their old denomination, by the band of gentlemen penſioners. Du-Cange.

BATTLEMENTS, in the *Military Art*, indentures; or notches on the top of a wall, parapet, or other building, in form of embraſures, for the ſake of looking through them, &c. much affected in the old fortification.

BATTOLOGY, from βαττος, *battus*, *babbler*, and λεγω, *I ſpeak*; in *Grammar*, a multiplying of words without occaſion, or a needleſs and ſuperfluous repetition of the ſame words, or things.

BATTOON, or BATOON; ſee BASTON.

BATTORY, a name given by the *Hans Towns* to their magazines or factories abroad.

The chief of theſe *battories* are thoſe at Archangel, Novogrod, Berghem, Liſbon, Venice, and Antwerp.

BATTUS, an order of penitents at Avignon, and in Provence, whoſe piety carries them to exerciſe ſevere diſcipline upon themſelves, both in public and private.

BATTUTA, in the *Italian Muſic*, the motion of the hand or foot in keeping or beating time.

Among Italian muſicians, we frequently find the words, *a battuta*, which import, *in meaſure*, or beating each time equally. This uſually occurs after what they call *recitativo*, which is rather declaiming than ſinging, and in which little or no meaſure is obſerved. *A battuta*, then, denotes, that they are to begin again to mark or beat the time equally.

BATUDA, a method of fiſhing mentioned in ſome *Middle Age Writers*, wherein the fiſh are driven by beating the water with poles, till flocking into one place, they are the ſooner caught.

BATZ, or BATZEN, a copper coin mixed with ſome ſilver, and current at different rates, according to the quantity of alloy, in many parts of Germany and Switzerland.

B. AV. See CHARACTER.

BAUDEKIN, BALDICUM, and BALDAKINUM, in our *Old Writers*, is uſed for cloth of *baudekin*, or gold; or tiſſue, upon which figures in ſilk, &c. were embroidered. But ſome writers account it only cloth of ſilk.

BAUGE, a drugget manufactured in Burgundy, with thread, ſpun thick, and coarſe wool.

BAUHINIA, in *Botany*, the name of a genus of plants of the *decandria monogynia* claſs, ſo called from the two *Bauhines*, famous for their botanical writings: *mountain ebony*. The characters are theſe: the flower is compoſed of five petals; and hath ten *ſtamina*. The oblong *germen* ſits upon the foot-ſtalk, which afterward becomes a long taper pod, incloſing a row of roundiſh compreſſed ſeeds. There are ten ſpecies.

All theſe plants are natives of the warm countries, and will not thrive in England, unleſs kept in a warm ſtove. They are propagated by ſeeds, which muſt be procured from the countries where they grow naturally, for they do not naturally perfect their ſeeds in England.

BAVINS, in *War*, bruſh faggots, made with the bruſh at length. See FASCINES.

BAUM, *meliſſa*, in *Botany*, a genus of the *didynamia gymnoſpermia* claſs of plants. The characters are theſe: the flower is of the lip kind, having a cylindrical tube, the chaps gaping, the upper lips erect, forked, and indented at the end. The under lip is trifid; it hath four awl-ſhaped *ſtamina*, two of which are as long as the petal, the others but half ſo long. It hath a quadrifid *germen*, which afterward turns to four naked ſeeds, ſitting in the empalement. There are eight ſpecies.

The common *baum* grows naturally on the mountains near Geneva, and in ſome parts of Italy; but is cultivated here in gardens as a medicinal and culinary herb. It has a perennial root, the ſtalks are ſquare, branching, and it riſes from two to three feet high, garniſhed with leaves ſet by pairs, indented about the edges, the lower ones ſtanding upon ſomewhat longiſh foot-ſtalks. The flowers grow in looſe bunches at the wings of the ſtalk in whorls, ſtanding upon ſingle foot-ſtalks: they are of the lip kind; the upper lip ſtands erect, and is forked; the under lip is divided into three parts: the middle one is roundiſh, and indented at the top. The flowers are white, and the whole plant has a pleaſant ſcent ſomewhat like lemons.

This plant is eaſily propagated by parting the root; for which the beſt time is in October, that the off-ſets may have time to get root before the froſts come on. They ſhould be planted two feet aſunder in beds of common garden earth, in which they will ſoon ſpread and meet together. The only culture required is to keep the plants clean from weeds, and to cut off the decayed ſtalks in autumn, ſtirring the ground between them.

Baum is greatly eſteemed among the common people, as good in diſorders of the head and ſtomach; but is leſs regarded in the ſhops. It is however reputed good in hypochondriac and hyſteric diſorders, and by outward application to eaſe the ſtinging of bees and waſps. It is moſt conveniently taken by way of infuſion, like tea; and the green herb, contrary to the general rule in regard to other plants, is much better than the dry. The only officinal preparation of *baum* is the ſimple water.

Hoffman has contrived a proceſs for the obtaining the virtues of this plant, which affords its principles better than any other, and gives two medicines to the phyſician, unknown before, but of great value.

This method might be purſued with the ſame ſucceſs in other caſes, and many plants, not ſufficiently eſteemed at preſent, might thus afford uſeful preparations.

He took a large quantity of the leaves of *baum*, freſh picked from the ſtalks, and filling a glaſs veſſel more than half full with them, fixing the ſtopper carefully in, he put the veſſel into a dung-hill, where he let it remain three months. At the end of this time he took it out, and found the whole reduced to a kind of pultice. This being diſtilled in a retort, yielded firſt an empyreumatic liquor, but afterwards, when the fire was increaſed, a black and ſtinking oil came over, in form of thin *laminæ*, ſpreading itſelf over the ſurface of the liquor. There remained at the bottom of the retort a black and burnt maſs, reſembling a coal, which, being thrown on burning charcoal, had very much the ſmell of the common tobacco.

In this firſt diſtillation no volatile ſalt appeared, but the empyreumatic liquor being examined, was found very ſharp and acrid on the tongue, and of a ſharp and pungent ſmell. Spirit of vitriol being mixed with it, it afforded no efferveſcence; but on the mixing it with ſpirit of hartſhorn, ſpirit of urine, or the like, a ſmall ebullition always was produced, though it laſted but a few moments.

This liquor, rectified by a ſecond diſtillation, affords the volatile ſalt of *baum*, which is a fine white and pellucid ſubſtance, adhering to the neck of the glaſs, in form of fine white and ſtriated cryſtal; and a yellow ætherial oil, of a very penetrating ſmell, and ſharp taſte, becomes ſeparated by the ſame rectification. Theſe are both found to be very great medicines, the ſalt as a ſudorific, and the oil as a high cordial, a carminative, and a deobſtruent.

Of the ENS PRIMUM of *baum*, we meet with high commendations in Mr. Boyle.

Baſtard BAUM; ſee MELITTIS.

Shrubby BAUM; ſee MOLUCCA.

Turky BAUM; ſee DRAGON'*s head*.

BAVOSA, in *Ichthyology*, a name given by the Italians to a ſpecies of the ray fiſh, called by the modern authors *leviraia*, and *raia oxyrynchus*, and by the earlier authors, *raja bos*, *bos marinus*, and *leioraia*. It is diſtinguiſhed by Artedi by the name of the variegated ray, with ten prickly tubercules on the middle of the back. See PHOLIS.

BAURAC, an ancient name for nitre, but in ſome places uſed in a reſtrained ſenſe, as not ſignifying every thing that was called by that name, but only one of two different ſalts that were confuſedly called nitre.

The Arabians give the name *baurach* to *tincar* or *tincal*, which when refined is called BORAX, but when it is rough, in little cryſtalline maſſes like the ſmall cryſtals of *ſal gem*, mixed with earth and other impurities, it is always diſtinguiſhed by the name of TINCAL. Neumann, p. 227.

BAWD, a perſon who keeps a place of proſtitution, or makes a trade of debauching women, and procuring or conducting criminal intrigues.

Some think the word is derived from the old French *baude*, *bold* or *impudent*; though Verſtegan has a conjecture which would carry it higher, viz. from *bathe*, anciently written *bade*.

In which ſenſe, *bawd* originally imported no more than bath-holder, as if bagnios had anciently been the chief ſcenes of ſuch proſtitution.

The Romans had their male as well as female *bawds*; the former denominated *lenones* and *proagogi*, among us *panders*; the latter, *lenæ*.

By a law of Conſtantine, *bawds* were to be puniſhed by pouring melted lead down their throats.

By the common law of England, a perſon may be indicted for keeping a bawdy-houſe, and puniſhed by fine and impriſonment: and haunters of bawdy-houſes bound to their good behaviour.

But it does not appear that the offence of being a *bawd* is indictable; though that of keeping a bawdy-houſe is. See STEWS.

BAWLING, among *Hunters*, is ſpoke of the dogs, when they are too buſy before they find the ſcent good.

BAY, *laurus*, in *Botany*, a genus of the *enneandria monogynia* claſs. Its characters are theſe: it is male and female in different plants; but the male flowers have no empalement. They have nine *ſtamina*, which are ſhorter than the petal, ſtanding by threes, terminated by ſlender ſummits. The female flowers have no empalements; they have one petal, which is cut into ſix ſegments at the top. In the bottom is ſituated an oval *germen*; and there are two globular glands, ſtanding upon very ſhort foot-ſtalks, fixed to the baſe of the petal. The *germen* becomes an oval berry with one cell, incloſing one ſeed of the ſame form. They are all propagated by ſowing the berries, or by laying down the tender branches, which will take root in one year's time, and may then be tranſplanted into beds for a year or two, or even placed at once where they are to remain. They muſt be trained up ſtraight, by tying them to ſtakes, and their under-ſhoots pruned off, to make them advance in height. Theſe trees are proper to plant on the warm ſides of hills, where they may be ſheltered from the north and north-eaſt winds. In open ſituations, the *bay*-tree will ſometimes indeed loſe all its verdure in ſevere winters, and appear dead, and many trees have on this occaſion been dug up and burnt; but this is a raſh and very wrong practice; for uſually, if they are ſuffered to remain, they ſhoot freely again, and after another ſeaſon are found as lively as ever.

Alexandria BAY; ſee BUTCHER'*s broom*.—*Cherry* BAY; ſee LAUREL.—*Dwarf* BAY; ſee SPURGE *laurel*.—*Indian* BAY; ſee MYRTLE.—*Loblolly* BAY; ſee GORDONIA.—*Plum* BAY; ſee GUAIAVA.—*Roſe* BAY; ſee OLEANDER.—*Sweet flowering* BAY; ſee *Laurel-leaved* TULIP-*tree*.

BAY, in *Geography*, denotes a little gulph; or an arm of the ſea, ſtretching up into the land; being larger in the middle within, than at its entrance, which is called the *mouth of the bay*.

BAY likewiſe ſignifies a pen, or pond-head, made up a great height, to keep in ſtore of water for driving the wheels of a forge or furnace of an iron-mill, by the ſtream that comes thence through a paſſage, or flood-gate, called the *pen-ſtock*.

BAY, among *Huntſmen*. Deer, &c. are ſaid to *bay*, or *be at bay*, when, after being hard run, they turn head againſt the hounds.

BAY, among *Farmers*, is that part of the barn where the mow is placed.

BAY *colour*, denotes a kind of red inclining to cheſnut, chiefly uſed in ſpeaking of horſes.

In this ſenſe, the word *bay* is formed from the Latin *baius*, or *badius*, and that from the Greek βαιος, *a palm-branch*: ſo that *badius* or *bay* properly denotes *color phœniceus*. Hence alſo, among the ancients, thoſe now called *bay* horſes, were denominated *equi palmati*.

We have divers ſorts and degrees of *bays*; as a light *bay*, a dappled *bay*, &c.

All *bay* horſes are ſaid to have black manes, which diſtinguiſh them from ſorrels, which have red or white manes.

Bay is one of the beſt colours, and *bay* horſes are commonly good.

BAY, in *Building*, denotes any kind of opening in walls; as a door, window, or even chimney.

BAY *à mirroir*, in the *Manege*, the ſame as DAPPLE *bay*.

BAY *ſalt*; ſee SALT.

BAY *windows*, are the ſame with what we otherwiſe call *bow windows*.

BAY *yarn*, is a denomination ſometimes uſed promiſcuouſly with *woollen yarn*. 10 and 11 W. III. c. 10. 5 G. II. c. 21. See YARN, &c.

BAYARD, or BAIARD, in ſome *Old Writers*, is an appellative for a horſe.

Hence the phraſes, *blind bayard*, *bayard's watering*, *bayard's green*, &c.

BAYONET, a ſhort broad dagger, made lancet-faſhion, and having, inſtead of an hilt, an iron handle and ring, to fix it to the end of a muſquet, ſo as not to hinder its firing or charging.

Bayonets are of great ſervice to the dragoons and fuſileers, after they have ſpent all their powder and ball.

This inſtrument is alſo uſed in hunting the boar or bear; for which purpoſe it is made larger than for the military uſe.

The origin of the word is unknown; probably it came from the city Bayonne, where this weapon is ſaid to have been firſt employed; or perhaps from its being invented by ſome engineer of that place.

BAYS, in *Commerce*, a kind of coarſe, open, woollen ſtuff, having a long knap; ſometimes frized on one ſide, and ſometimes not frized, according to the uſes it is intended for.

This ſtuff is without wale, being wrought on a loom with two treddles, like flannel.—The manufacture of *bays* is very conſiderable in England, particularly about Colcheſter; and in Flanders, about Liſle and Tournay, &c. Formerly the French, as well as Italians, were furniſhed with *bays* from England; but of late the French workmen have undertaken to counterfeit them, and ſet up manufactures of their own; and that with ſucceſs; eſpecially at Niſmes, Montpellier, &c.

The export of *bays* is very conſiderable to Spain, Portugal, and Italy. Their chief uſe is for the religious, and for linings in the army: the looking-glaſs makers alſo uſe them behind their glaſſes, to preſerve the tin or quickſilver; and the caſe-makers to line their caſes.

The breadth of *bays* is commonly a yard and half, yard and three quarters, or two yards; by forty-two to forty-eight in length: thoſe of a yard and three quarters are moſt proper for the Spaniſh trade.

BAZA, or **Bazat**, in *Commerce*, fine ſpun cotton, which comes from Jeruſalem, whence it is alſo called Jeruſalem COTTON.

BAZAR, or **Basar**, a denomination among the Turks and Perſians, given to a kind of exchanges, or places where their fineſt ſtuffs and other wares were ſold.

Theſe are alſo called *bezeſtins.*

The word *bazar* ſeems of Arabic origin, where it denotes *ſale*, or exchange of goods.

Some of the eaſtern *bazars* are open, like the market-places in Europe, and ſerve for the ſame uſes, more particularly for the ſale of the more bulky and leſs valuable commodities. Others are covered with lofty cielings, or even domes pierced to give light; and it is in theſe the jewellers, goldſmiths, and other dealers in the richer wares, have their ſhops.

The *bazar* or *maidan* of Iſpahan is one of the fineſt places in all Perſia, and even ſurpaſſes all the exchanges in Europe; yet, notwithſtanding its magnificence, it is excelled by the *bazar* of Tauris, which is the largeſt that is known, having ſeveral times held thirty thouſand men ranged in order of battle.

At Conſtantinople, there is the old and the new *bazar*, which are large, ſquare buildings, covered with domes, and ſuſtained by arches and pilaſters; the former chiefly for arms, harneſſes, and the like; the latter for goldſmiths, jewellers, furriers, and all ſort of manufacturers.

BAZGENDGES, in *Natural Hiſtory*, the name of a ſubſtance uſed by the Turks, and other eaſtern nations, in their ſcarlet-dying: they mix it for this purpoſe with cochineal and tartar, the proportions being two ounces of the *bazgendges* to one ounce of cochineal.

The *bazgendges* ſeem to be no other than the horns of the turpentine tree in the eaſtern parts of the world; and it is not only in Syria that they are found, but China alſo affords them. Many things of this kind were ſent over to Mr. Geoffroy at Paris from China, as the ſubſtances uſed in the ſcarlet-dying of that country, and they all proved wholly the ſame with the Syrian and Turkiſh *bazgendges*, and with the common turpentine horns. The lentiſk or maſtic tree is alſo frequently found producing many horns of a like kind with theſe, and of the ſame origin, all being owing to the *pucerons*, which make their way into the leaves, to breed their young there. Reaumur's Hiſt. of Inſects, vol. vi. p. 37.

BAZOCHE, or **Basoche**, a royal kind of juriſdiction exerciſed among the clerks of the palais, or courts of juſtice at Paris.

It is adminiſtered in the name and by the authority of the king of *Bazoche*, *roy de la Bazoche*, by virtue of an ancient grant of the kings of France. The elder among the clerks are the officers; and he who preſides is the chancellor.

This court only takes cognizance of cauſes among the clerks, or between clerks and artificers for goods bought, or work done. The freedoms they took with private characters in their inquiſitions and remonſtrances, has occaſioned ſeveral *arrets* to reſtrain their power, and prohibit their holding pleas without leave.

A collection of ſtatutes, ordonnances, regulations, monuments, and prerogatives of the kingdom of *Bazoche*, were publiſhed at Paris in 1654, 8vo.

BDELLIUM, βδέλλιον, an aromatic gum, brought from the Levant, of ſome uſe, both as a medicine, and a perfume.

The word is ſuppoſed to have been formed of the Hebrew בדלח, *bedollach*, which the Engliſh tranſlators render by the appellation *bdellium*. It is alſo written *bedellium*, *bedello*, *ptellium*, *petalium*, *megalium*, and *telinum*.

There is much uncertainty concerning both the plant and the place of its production, which is ſuppoſed to be in Africa. We find mention of the name both among the ancient naturaliſts, and in Scripture; but it is doubtful whether any of theſe be the ſame with the modern kind. As for the Scripture *bdellium*, we know very little of it. Moſes deſcribes *manna* as of the colour of *bdellium*; and Joſephus explains the paſſage, by ſaying it is the gum of a tree reſembling the olive tree; and that the manna wherewith the Jews were fed in the deſart reſembled this drug.—But Scaliger and others ſet aſide this explication, and own, they do not know what the *bdellium* mentioned in Scripture is.

The gum of this name among the moderns is ſomewhat bitteriſh to the taſte, looks tranſparent when broken, and if rubbed, ſeems a fattiſh ſubſtance.

It is thought to facilitate digeſtion, to diſcuſs and promote perſpiration, and to be good in coughs, and many diſorders of the breaſt; but its chief uſe now in compoſition is in diſcutient plaſters, cerates, and unguents; in which it is much commended for reducing of ruptures, and ſoftening any indurations of the nervous parts. Juncker. Lemery.

The *pilulæ de bdellio majores*, deſcribed by Meſſue, are uſed by ſome againſt the piles and exceſſes of the *menſes*. Hermannus alſo praiſes the oil of *bdellium* againſt obſtructions of the womb. Fumigations of the ſame gum, *ſuffitus ex bdellio*, received by the *anus*, are alſo ordered by ſome to ſtop immoderate fluxes of the hæmorrhoids. It is one of the weakeſt deobſtruent gums, and is now rarely uſed. From one ounce of this gum reſin, may be extracted by water ſix drams and two ſcruples; or by ſpirit, two drams.

BEACON, a SIGNAL for the better ſecuring the kingdom from foreign invaſions.

On certain eminent places of the country are placed long poles erect, whereon are faſtened pitch-barrels to be fired by night, and ſmoke made by day, to give notice, in a few hours, to the whole kingdom, of an approaching invaſion.—Theſe are commonly called *beacons*; whence alſo comes *beaconage*.

Beacons are alſo marks and ſigns for the ſea; erected on the coaſts by the maſters, &c. of Trinity-houſe, who are impowered to do this by act of parliament, 8 El. c. 13. If any perſon ſhall deſtroy or remove any ſea-mark, he ſhall forfeit 100*l.* and in caſe of inability to pay it, be *ipſo facto* outlawed.

BEACONAGE, money paid towards the maintenance of a *beacon*.

The word is derived from the Saxon *beacnian, to nod*, or *ſhew by a ſign*: hence alſo the word *beckon*.

BEAD, in *Architecture*, denotes a round moulding, carved in ſhort emboſſments, like beads in necklaces.

Sometimes alſo an aſtragal is carved *bead-faſhion*.

There are alſo a ſort of *beads plain*, frequently ſet on the edge of each *faſcia* of an architrave; ſometimes alſo on the lining-board of a door-caſe; and on the upper end of ſkirting-boards.

Bead, in *Aſſaying*, the ſmall lump or maſs of pure metal ſeparated from the *ſcoriæ*, and ſeen diſtinct and pure in the middle of the coppel while in the fire.

Thus, in ſeparating ſilver from its ore by means of lead, the ſilver remains in form of a *bead*, when the lead, that had before aſſiſted in the operation, is all reduced to *ſcoriæ*. In this proceſs, the *bead* of ſilver muſt be taken out of the coppel as ſoon as it is ſeen pure and fine, leſt growing cold, it ſhould be conglutinated to the coppel or litharge. This *bead*, when rightly made, is always porous underneath. Cramer.

Beads are more particularly uſed among us for a ſort of glaſs necklace, made in imitation of the colour and figure of pearl.

Beads are alſo uſed in ſpeaking of thoſe glaſs globules vended to the ſavages on the coaſts of Africa; thus denominated, becauſe they are ſtrung together for the convenience of traffic.

The common black glaſs of which *beads* are made for necklaces, &c. is coloured with mangaueſe only; one part of manganeſe is ſufficient to give a black colour to near twenty of glaſs. Lewis's Comm. Phil. p. 422.

Beads, in a religious ſenſe; ſee CHAPLET.

Bead *roll*, among the Romiſh prieſts, a liſt or catalogue of ſuch perſons, for the reſt of whoſe ſouls they are obliged to rehearſe a certain number of prayers, &c. which are told by means of their *beads*.

Bead *makers*, called by the French *paternoſtriers*, are thoſe employed in the making, ſtringing, and ſelling of *beads*.

At Paris there are three companies of *paternoſtriers*, or *bead makers*; one who make them of glaſs or cryſtal; another in wood and horn; and the third in amber, coral, jet, &c.

Bead *proof*, or *bubble proof*, terms uſed by our diſtillers, to expreſs that ſort of PROOF of the ſtandard ſtrength of ſpirituous liquors, which conſiſts in their having, when ſhaken in a phial, or poured from on high into a glaſs, a crown of bubbles, which ſtand on the ſurface ſome time after. This is eſteemed a proof that the ſpirit conſiſts of equal parts of rectified ſpirits and phlegm.

This is a fallacious rule as to the degree of ſtrength in the liquor; becauſe any thing that will increaſe the tenacity of the ſpirit, will give it this proof, though it be under the due ſtrength. Our malt diſtillers ſpoil the greater part of their goods, by leaving too much of the ſtinking oil of the malt in their ſpirit, in order to give it this proof, when ſomewhat under the ſtandard ſtrength.

But this is a great deceit on the purchaſers of malt ſpirits, as they have them by this means not only weaker than they ought to be, but ſtinking with an oil, which they are not eaſily cleared of afterwards.

On the other hand, the dealers in brandy, who uſually have the art of ſophiſticating it to a great nicety, are in the right when they buy it by the ſtrongeſt *bead proof*, as the grand mark of the beſt; for being a proof of the brandy containing a large quantity of its oil, it is, at the ſame time, a token of its high flavour, and of its being capable of bearing a very large addition of the common ſpirits of our own produce, without betraying their flavour, or loſing its own.

We value the French brandy for the quantity of this eſſential oil of the grape which it contains, and that with good reaſon; as it is with us principally uſed for drinking as an agreeably flavoured cordial; but the French themſelves, when they want it for any curious purpoſes, are as careful in the rectifications of it, and take as much pains to clear it from this oil, as we do to free our malt ſpirit from that nauſeous and fœtid oil, which it originally contains.

No judgment can be formed of brandies by the *bead proof* as to their mixed or adulterated, or their pure ſtate, further than that they are likely to be moſt pure, when they have the greateſt proportion of this oil, in regard to mixtures of other ſpirits. There are many occaſions where we want ſpirit, merely as ſpirit, and where any oil, whether ſweet or ſtinking, muſt be equally improper. Shaw's Eſſ. on Diſtillery.

BEAD *tree*, *azederach*, or *melia*, in *Botany*, a genus of the *decandria monogynia* claſs. Its characters are theſe: the flower has five ſpear-ſhaped petals which ſpread open, and a cylindrical *nectarium* of one leaf, indented at the brim in ten parts. It has ten ſmall *ſtamina* inſerted in the top of the *nectarium*; with a conical *germen*, which turns to a ſoft globular fruit, including a roundiſh nut, having five rough furrows, and five cells, each containing one oblong ſeed. There are two ſpecies.

BEADLE, or BEDEL, BEDELLUS, ſignifies a meſſenger or apparitor of a court, who cites men to appear and anſwer in the court to what is alleged againſt them.

BEADLE is alſo uſed for an officer in univerſities, whoſe place it is to walk before the maſters at all public proceſſions, &c. with a mace.

Spelman, Voſſius, and Somner derive *beadle* from the Saxon *bidel*, *a public crier*; in which ſenſe biſhops, in ſome ancient Saxon manuſcripts, are called *beadles of God*, *Dei bedelli*.—The tranſlator of the Saxon New Teſtament renders *exactor* by *bydele*; and the word is uſed in the ſame ſenſe in the laws of Scotland.

BEAGLES, a ſmall ſort of hounds or hunting dogs.

Beagles are of divers kinds; as the *ſouthern beagle*, ſomething leſs and ſhorter, but thicker than the deep-mouthed hound; the *fleet northern*, or *cat beagle*, ſmall, and of a finer ſhape than the ſouthern, and a harder runner. From the two, by croſſing the ſtrains, is bred a third ſort, held preferable to either.

To theſe may be added a ſtill ſmaller ſort of *beagles*, ſcarce bigger than lap-dogs, which make pretty diverſion in hunting the coney, or even ſmall hare in dry weather; but otherwiſe unſerviceable, by reaſon of their ſize.

BEAK, *roſtrum*, in *Ornithology*, the bill of a bird; from the form and ſtructure of which, Linnæus divides this whole family or general claſs of animals, into ſix orders. See BIRD, and ORNITHOLOGY.

BEAK, in *Architecture*, a little fillet left on the edge of a larmier, which forms a canal, and makes a kind of pendant chin; anſwering to what Vitruvius calls the *mentum*.

BEAK, or BEAK-*head of a ſhip*, is that part without the ſhip, before the forecaſtle, which is faſtened to the ſtem, and is ſupported by the main knee: this is uſually carved and painted, and, beſides its uſe, makes the becoming part, or grace of a ſhip.

The *beak* was anciently made of wood; but fortified with braſs, and faſtened to the prow, ſerving to annoy the enemy's veſſels. Its invention is attributed to Piſæus, an Italian. The firſt *beaks* were made long and high; but afterwards a Corinthian, named Ariſto, contrived to make them ſhort and ſtrong, and placed ſo low, as to pierce the enemy's veſſels under water. By the help of theſe, great havock was made by the Syracuſians in the Athenian fleet. Pott. Archæol. lib. iii. c. 17.

BEAK was alſo uſed for one of the ancient battalias, or forms of ranging an army for battle, particularly uſed by the Macedonians.

BEAK is alſo applied to the ſlender crooked prominences of divers bodies, bearing ſome analogy or reſemblance to the *beaks* of birds.

In this ſenſe we meet with *beaks* of ſhoes, *roſtra calceorum*, for long peaked toes, in uſe of old. Du-Cange.

Among *Farriers*, *beak* denotes a little horſe-ſhoe, turned up, and faſtened in upon the fore-part of the hoof. Its uſe is to keep the ſhoes faſt, and not liable to be ſtruck off by the horſe, when by reaſon of any itch, or being much diſturbed with the flies in hot weather, he ſtamps his feet violently on the ground.

BEAKED, *becqué*, in *Heraldry*, is uſed when the beak or bill of a fowl is of a different tincture from the body. In this caſe, they ſay *beaked* and membered of ſuch a tincture.

BEAKING, in *Cock-fighting*, expreſſes the fighting of theſe birds with their bills, or holding with the bill, and ſtriking with the heels.

BEAM, in *Architecture*, the largeſt piece of wood in a building; being laid acroſs the walls, and ſerving to ſupport the principal rafters of the roof.

No houſe has leſs than two of theſe *beams*, viz. one at each head: into theſe the girders of the garret floor are alſo framed; and, if the building be of timber, the teazle-tenons of the poſts.

The proportions of *beams* near London are fixed by ſtatute, as follows: a *beam* fifteen feet long muſt be ſeven inches on one ſide its ſquare, and five on the other: if it be ſixteen feet long, one ſide muſt be eight inches, the other ſix: if ſeventeen feet long, one ſide muſt be ten inches, the other ſix: in the country they uſually make them ſtronger. Sir H. Wotton adviſes theſe to be of the ſtrongeſt and moſt durable timber.

Some of the beſt authors have conſidered the force or ſtrength of *beams*, and brought their reſiſtance to a preciſe calculation; particularly M. Varignon, and M. Parent; the ſyſtem of the latter is as follows.

When, in a *beam* breaking parallel to its baſe, which is ſuppoſed to be a parallelogram, two plans of fibres, which were before contiguous, are ſeparated, there is nothing to be conſidered in thoſe fibres, but their number, bigneſs, tenſion before they broke, and the lever by which they act; all theſe together make the ſtrength or reſiſtance of the *beam* to be broke.

Suppoſe then another *beam* of the ſame wood, where the baſe is likewiſe a parallelogram, and of any bigneſs, with regard to the other, at pleaſure; the height or thickneſs of each of theſe when laid horizontal, being divided into an indefinite number of equal parts, and their breadth into the ſame number, in each of their baſes will be found an equal number of little quadrangular cells, proportional to the baſes whereof they are parts.—Theſe then will repreſent little baſes, or, which is the ſame thing, the thickneſſes of the fibres to be ſeparated for the fracture of each *beam*: and, ſince the number of cells is equal in each, the ratio of the baſes of both *beams* will be that of the reſiſtance of their fibres, both with regard to number and thickneſs.

Now, the two *beams* being ſuppoſed of the ſame wood, the fibres moſt remote from the points of ſupport, which are thoſe which break the firſt, muſt be equally ſtretched when they break. Thus the fibres, v. gr. of the tenth diviſion, are equally ſtretched in each caſe, when the firſt breaks; and in whatever proportion the tenſion be ſuppoſed, it will ſtill be the ſame in both caſes; ſo that the doctrine is entirely free, and unembarraſſed with any phyſical ſyſtem.

Laſtly, it is evident, the levers whereby the fibres of the two *beams* act, are repreſented by the height or depth of their baſes; and, of conſequence, the whole reſiſtance of each *beam*, is the product of its baſe by its height; or, which is the ſame thing, it is the ſquare of the height multiplied by the breadth: which holds, not only in caſe of parallelogrammatic, but alſo of elliptic baſes.

Hence, if the baſes of two *beams* be equal, though both their heights and breadths be unequal, their reſiſtance will be as their heights alone; and, by conſequence, one and the ſame *beam* laid on the ſmalleſt ſide of its baſe, will reſiſt more than when laid flat, in proportion as the firſt ſituation gives it a greater height than the ſecond: and thus an elliptic baſe will reſiſt more, when laid on its greateſt axis, than when on its ſmalleſt.

Since, in *beams* equally long, it is the baſes that determine the proportion of their weights or ſolidities; and ſince, their baſes being equal, their heights may be different; two *beams* of the ſame weight may have reſiſtances differing to infinity: thus, if in the one the height of the baſe be conceived infinitely great, and the breadth infinitely ſmall, while in the other the dimenſions of the baſe are infinite; the reſiſtance of the firſt will be infinitely greater than that of the ſecond, though their ſolidity and weight be the ſame. If therefore all required in architecture were to have *beams* capable of ſupporting vaſt loads, and at the ſame time to be of the leaſt weights poſſible, it is plain they muſt be cut thin as laths, and laid edgewiſe.

If the baſes of two *beams* be ſuppoſed unequal, but the ſum of the ſides of the two baſes equal, v. gr. if they be either 12 and 12, or 11 and 13, or 10 and 14, &c. ſo that they always make 24; and further, if they be ſuppoſed to be laid edgewiſe; purſuing the ſeries, it will appear, that in the *beam* of 12 and 12, the reſiſtance will be 1728, and the ſolidity or weight 144; and that in the laſt, or 1 and 23, the reſiſtance will be 529, and the weight 23: the firſt therefore, which is ſquare, will have leſs than half the ſtrength of the laſt, with regard to its weight.

Hence M. Parent remarks, that the common practice of cutting the *beams* out of trees as ſquare as poſſible, is ill huſbandry: he hence takes occaſion to determine geometrically, what dimenſions the baſe of a *beam* to be cut out of any tree propoſed, ſhall have, in order to its being of the greateſt poſſible ſtrength; or, which is the ſame thing, a circular baſe being given, he determines the rectangle of the greateſt reſiſtance that can be inſcribed; and finds, that the ſides muſt be nearly as 7 to 5, which agrees with obſervation.

Hitherto the length of the *beams* has been ſuppoſed equal; if it be unequal, the baſes will reſiſt ſo much the leſs, as the *beams* are longer.

To this it may be added, that a *beam* ſuſtained at each end, breaking by a weight ſuſpended from its middle, does not only break at the middle, but alſo at each extreme; or, if it does not actually break there, at leaſt immediately before the moment of the fracture, which is that of the equilibrium between the reſiſtance and the weight, its fibres are as much ſtretched at the extremes, as in the middle.—So that, of the weight ſuſtained by the middle, there is but one third part which acts at the middle, to make the fracture; the other two only acting to induce a fracture in the two extremes.

A *beam* may either be ſuppoſed loaden only with its own weight, or with other foreign weights applied at any diſtance, or elſe only with thoſe foreign weights. Since, according to M. Parent, the weight of a *beam* is not ordinarily above $\frac{1}{70}$ part of the load given it to ſuſtain, it is evident, that in conſidering ſeveral weights, they muſt all be reduced by the common rules to one common centre of gravity.

M. Parent has calculated tables of the weights that will be ſuſtained by the middle, in *beams* of various baſes and lengths, fitted at each end into walls, on a ſuppoſition that a piece of oak of an inch ſquare, and a foot long, retained horizontally by the two extremes, will ſuſtain 315lb. in its middle before it breaks, which it is found by experience it will. Mem. Acad. R. Scien. an. 1708.

BEAM *of a* PLOUGH, a name given by our farmers to the great timber of the plough, into which all the other parts of the plough-tail are infixed.

This is uſually made of aſh, and is ſtraight, and eight feet long in the common plough: but, in the four-coultered PLOUGH, it is ten feet long, and its upper part arched. The head of this *beam* lies on the pillow of the PLOUGH, and is raiſed higher, or ſunk lower, as that pillow is elevated or depreſſed by being ſhipped along the crow-ſtaves. Near the middle, it has an iron collar, which receives the tow-chain from the box, and the bridle-chain from the ſtake or gallows of the plough is fixed into it a little below the collar. Some inches below this, there is a hole, which lets through the coulter; and below that, there are two other ſmall ones, through which the heads of the retches paſs. Theſe are the irons which ſupport the ſheat, and with it the ſhare. Farther backward ſtill is a large perforation, through which the body of the ſheat paſſes; and behind that, very near the extremity, is another hole, through which the piece called the hinder-ſheat paſſes.

BEAMS *of a ſhip*, are the large, - main, croſs timbers, ſtretching from ſide to ſide, which hold the ſides of a ſhip from falling together, and which alſo ſupport the decks and orlops of the SHIP.

The *main beam* is that next the main maſt; and from it they are reckoned by *firſt*, *ſecond*, and *third beam*. The great *beam* of all is called the *midſhip beam*. See *Tab. Ship. fig.* 2. *n.* 36. 45. 61. 28. 91. 87.

There are uſually twenty-four *beams* on the lower deck of a ſhip of 74 guns, and to the other decks additional ones in proportion, as the ſhip lengthens above.

On the BEAM, in *Sea-language*, denotes any diſtance from the ſhip on a line with the *beams*, or at right angles with the keel. Any object that lies eaſt or weſt, when the ſhip ſteers northward, is ſaid to be on the ſtarboard or larboard *beam*.

Before the BEAM, ſignifies an arch of the horizon comprehended between the line of the *beam*, and that point of the compaſs which ſhe ſtems.

On the Weather BEAM, ſignifies on the weather ſide of the ſhip.

Camber BEAM; ſee CAMBER-*beam*.

BEAM *of an anchor*; ſee ANCHOR.

BEAM *of a balance*, is that piece of iron or wood, ſomewhat bigger toward the middle than at the ends, where there are holes through which run the ropes or ſtrings which hold the ſcales: the *beam* is divided into two equal parts, by a needle placed over it perpendicularly: and the centre of motion muſt be placed a little above the centre of gravity, that the *beam* may reſt exactly in an horizontal poſition. See BALANCE.

BEAM, or *roller*, among *Weavers*, is a long and thick wooden cylinder placed lengthways on the back-part of the loom of thoſe who work with the ſhuttle. The threads of the warp, of linen or woollen cloth, ſerges, or other woollen ſtuffs, are rolled upon the *beam*, and enrolled as the work goes on. That cylinder on which the ſtuff is rolled as it is weaved, is alſo called the *beam* or *roller*, and is placed on the fore-part of the loom.

BEAM, in *Heraldry*, is uſed to expreſs the main horn of a hart or buck.

BEAM, among *Hunters*, denotes the main ſtem of a deer's head, or that part which bears the antlers, royals, and tops; the little ſtreaks wherein are called circles.

BEAM is alſo uſed for a fiery meteor in the ſhape of a pillar; and for a ray of the ſun.

BEAM *compaſſes*; ſee COMPASSES.

BEAM *feathers*, in *Falconry*, the longeſt feathers of a hawk's wing.

BEAM-*filling*, in *Building*, the filling up the vacant ſpace between the raiſing plate and roof, with ſtones, or bricks, laid between the rafters on the raiſing plate, and plaſtered on with loam; this is frequent where the garrets are not pargeted, or plaſtered.

BEAM *fiſh*, in *Ichthyology*, a ſea monſter like a pike; a dreadful enemy to mankind, ſeiſing like a blood-hound, and never letting go if he gets faſt hold. The teeth of this fiſh are ſaid to be ſo venomous, that unleſs an antidote be immediately applied, the leaſt touch of them is mortal.

BEAM *tree*; ſee SERVICE *tree*.

BEAN, *faba*, in *Botany*. Linnæus comprehends this genus of plants under *vicia*. The characters are theſe: the flower is of the butterfly kind; the ſtandard is large, oval, and indented at the end; it hath two oblong erect wings, which incloſe the keel being much longer. The keel is ſhort, ſwelling, and cloſely covers the parts of generation: the nine *ſtamina* are in three parts, and one ſtands ſeparate. At the bottom is ſituated an oblong compreſſed *germen*, which afterward becomes a long compreſſed leathery pod, having one cell, filled with compreſſed kidney-ſhaped ſeeds.

We have four ſorts of *beans* commonly ſowed in our gardens. 1. The ſmall Liſbon or Maragan.. 2. The Spaniſh. 3. The Sandwich. And, 4. The Windſor *beans*. The firſt and ſecond ſorts are to be planted in October and November, under warm walls and hedges, where if they ſtand through the winter, they produce *beans* early in the ſpring. They may alſo be raiſed very cloſe in beds, and covered with hoops and mats in the winter, and in ſpring planted out; but there is ſome hazard in the tranſplanting, and they will be a fortnight or more later than thoſe which have ſtood the winter abroad.

The Liſbon *bean* is preferred to the Spaniſh; and the curious ought to have freſh ſeed every two years from abroad, for they are apt to degenerate, though not in goodneſs, yet in their earlineſs.

The Spaniſh and Windſor *beans* are not to be planted till after Chriſtmas; but eſpecially the Windſor, which are ſubject, more than any other kind, to be hurt by the cold. Theſe *beans* ſhould have an open ground, and be planted at the diſtance of three feet and an half row from row, and five or ſix inches from one another in the rows.

The Sandwich *beans* are hardier than the Windſor, and may be planted to come in between the early crops and them; and though not much regarded at preſent, they are a very good *bean*.

The firſt plantation of Windſor *beans* ſhould be made in the middle of January; and after that, a new plantation ſhould be made every three weeks till the middle of May, that there may be a ſucceſſion of crops.

The Toker *bean* comes about the ſame time with the Sandwich, and is a great bearer; therefore it is now much planted. The white and black bloſſom *beans* are alſo much eſteemed; but, unleſs their ſeeds are preſerved with care, are apt to degenerate. Miller.

There is ſcarce any plant, whoſe ſeed ſo well ſerves the purpoſe of the inquirer into the nature and ſtructure of ſeeds in general, as the *bean*.

Trials have not long ſince been made in France to raiſe garden *beans* in open fields, on the principles of the new huſbandry; and the reſult ſufficiently indicated, that with proper care large crops might be raiſed in this way.

The medicinal and dietetic qualities of *beans* are ſaid to be nutritive, but flatulent: the pods yield a water held good againſt the gripes in children. Some have uſed the horſe-*bean* as a ſuccedaneum to coffee, which in principles it much reſembles; only that it contains but half the quantity of oil. Mr. Boyle has ſeveral experiments

ments of *beans* treated pneumatically, to ſhew the great plenty of air they afford, on which their flatulency depends. The expanſion of *beans* in growing, the ſame author found ſo conſiderable, that it would raiſe a plug clogged with above an hundred pounds weight. Boyle's Works abr. tom. i. p. 285. tom. ii. p. 615, &c.

Beans, with proper management, make one of the fineſt of all baits for fiſh. The method of preparing them for this purpoſe is this: take a new earthen pot, glazed on the inſide; boil ſome *beans* in it, ſuppoſe a quarter of a peck: they muſt be boiled in river water, and ſhould be previouſly ſteeped in ſome warm water for ſix or ſeven hours. When they are about half boiled, put in three or four ounces of honey, and two or three grains of muſk: let them boil a little on, then take them off the fire, and uſe them in this manner: ſeek out a clean place, where there are no weeds, that the fiſh may ſee and take the *beans* at the bottom of the water. Throw in ſome *beans* at five or ſix in the morning, and in the evening, for ſome days. This will draw them together, and they may be taken in a caſting-net in great numbers together.

BEAN *flour*, called by the Romans *lomentum*, was of ſome repute among the ancient ladies as a coſmetic, wherewith to ſmooth the ſkin, and take away wrinkles.

The ancients made uſe of *beans* in gathering the votes of the people, and for the election of magiſtrates. A *white bean* ſignified abſolution, and a *black* one condemnation.

Beans had a myſterious uſe in the *lemuralia* and *parentalia*; where the maſter of the family, after waſhing, was to throw a ſort of *black beans* over his head, ſtill repeating the words, *I redeem myſelf and family by theſe beans.* Ovid gives a lively deſcription of the whole ceremony in his Faſti, lib. v. ver. 435.

Abſtinence from *beans* is ſaid to have been enjoined by Pythagoras, for which prohibition various reaſons have been aſſigned.

The Egyptian prieſts held it a crime to look at *beans*, judging the very ſight unclean. The *flamen dialis* was not permitted even to mention the name. Lucian introduces the ſame philoſopher in hell, ſaying, that to eat *beans*, and to eat our father's head, were equal crimes.

After all, both the genuineneſs of the precept, and the reality of any ſuch abſtinence among the ancient Pythagoreans, have been diſputed. Some attribute the precept to Empedocles, a diſciple of Pythagoras. Ariſtoxenus, an ancient writer cited by A. Gellius, introduces Pythagoras ſaying, that he eat more frequently of *beans* than of any other pulſe, on account of their gently looſening the belly.

BEAN *ſtalks*. The aſhes of *beanſtalks* make good and clear glaſs.

BEAN, *Horſe*. The *horſe bean* is the only kind propagated by the plough; it delights chiefly in a ſtiff and moiſt clay; three buſhels will ſow an acre, and this is to be done in February. The common produce is about twenty buſhels from an acre. They muſt lie ſome time upon the ground after they are cut, before they are carried in. Some farmers ſow tares and *horſe beans* together, which is a very good way, for the ſeeds are eaſily ſeparated by a riddle.

By the new huſbandry, leſs than one buſhel of ſeed will plant an acre of land: and the produce has exceeded that of the old, by more than ten buſhels an acre.

BEAN, *Bog*, *menyanthes*, in *Botany*, a plant common in boggy places, but as it is never cultivated, not worthy of further notice. It is a genus of the *pentandria monogynia* claſs, with a hairy corolla, a bifid ſtigma, and a ſingle-celled capſule.

BEAN, *Kidney*, *phaſeolus*, in *Botany*, a genus of the *diadelphia decandria* claſs. The characters are theſe: the empalement of the flower is of one leaf: the flower is of the butterfly kind; and hath a heart-ſhaped, obtuſe, inclined ſtandard, reflexed on the ſides: the wings are oval, the length of the ſtandard, with a narrow ſpiral keel twiſted contrary to the ſun. It hath ten *ſtamina*, nine joined in one body, and the other ſtanding ſeparate; and an oblong compreſſed hairy *germen*, ſupporting a ſlender inflexed ſpiral ſtyle, crowned by an obtuſe hairy *ſtigma*. The *germen* afterward becomes a long pod with a thick ſhell, ending in an obtuſe point, incloſing oblong compreſſed kidney-ſhaped ſeeds.

It would be to little purpoſe to enumerate all the varieties of this plant which have come to our knowlege; ſince America does annually furniſh us with ſo many new ſorts, that there is no knowing what varieties may be produced in England: beſide, as they are not likely to be much cultivated here, ſince ſome of the old ſorts are preferable to any of the new ones, for the uſe of the kitchen-garden, we need therefore only mention thoſe which are moſt eſteemed for the table.

There are at preſent three ſorts of *kidney beans* chiefly propagated for the table in England. Theſe are, 1. The common white or Dutch *kidney bean*. 2. The ſmaller *kidney bean*, commonly called the Batterſea *kidney bean*. And, 3. The upright ſort, called the tree *kidney bean*.

The firſt was ſome time ago greatly propagated in England, and is ſtill in Holland: it grows very tall, and requires long ſtakes and poles to climb on, and its beans are conſiderably broad; this makes them leſs ſaleable in the markets, people ſuppoſing them to be old becauſe they are broad; and they are hence grown into diſuſe, though a much more valuable kind for eating than any other.

The ſecond ſort or Batterſea *bean*, is what is more univerſally cultivated; it never grows very tall, nor rambles far, and the air can eaſily paſs between the rows, becauſe of its moderate growth; and this makes it bear plentifully, and ripen well for the table. It is the beſt taſted *bean*, except the laſt.

The third, or tree *kidney bean*, is alſo a plentiful bearer, and never rambles, but grows up in form of a ſhrub; but its beans are broader than the Batterſea kind, and are not ſo well taſted.

Miller recommends the ſcarlet bloſſom *bean*, which has been uſually cultivated for the beauty of its flowers, as the beſt ſort for the table.

They are all propagated from ſeeds, which are to be put into the ground the latter end of March or beginning of April for an early crop, but theſe ſhould have a warm ſituation and a dry ſoil; they muſt alſo be planted in a dry ſeaſon. The manner of planting them is, to draw lines with a hough over the bed, at two feet and a half diſtance, into which the ſeeds are to be dropped at about two inches aſunder, and the earth is to be drawn over them with the head of a rake, to cover them about an inch deep. In a week after ſowing, the plants will appear, and the earth ſhould be drawn up about their ſtalks as they riſe up; for a few days after this they will require no farther care, except to be kept clear from weeds, and, when the beans appear, to have them gathered twice a week; for if the beans are ſuffered to hang on too long, they not only become of no value, but they weaken the plant.

The firſt crop of *kidney beans* will continue a month in good order; and to ſupply the table afterwards, there ſhould be freſh ſowings in March, April, May, and June, the laſt of which will continue till the froſts come to deſtroy them. Some raiſe their early crops on hotbeds; and this is to be done exactly in the ſame manner as the raiſing the early CUCUMBER.

BEAN, *Kidney, tree*, in *Botany*; ſee GLYCINE.

BEAN *tree, binding, mimoſa*; ſee SENSITIVE *plant*.

BEAN, *Molucco*, a name given by Sir Robert Sibbald, in his *Prodromus*, and by Mr. Wallace, in his deſcription of the Orkney iſlands, to a ſort of fruit frequently caſt on ſhore in the North-weſt iſlands of Scotland; eſpecially on the coaſts moſt expoſed to the waves of the great ocean.

They are called by ſome Orkney *beans*, and are not the produce of that iſland, or indeed of any other part of Europe, but of America.

Sir Hans Sloane procured four ſpecies of them little injured by the ſea, and found on examination that three of them were the common produce of the iſland of Jamaica; where he had himſelf gathered them, and deſcribed them in his catalogue and hiſtory.

The firſt ſort was a kind of kidney bean, and the plant which produces it is deſcribed by Sir Hans under the name of the great perennial kidney bean with a great crooked lobe. It is alſo figured in the Hortus Malabaricus, by the name of *perim kakuvalli*, and Sir Robert Sibbald alſo calls it *nux Indica ex qua pyxides pro pulvere ſternutatorio parant*. This is a native of the Eaſt and Weſt Indies, and is ſometimes found thrown on ſhore in the county of Kerry in Ireland; and in ſome other places.

A ſecond kind of fruit thrown on ſhore in the Orkneys, is a very common fruit in Jamaica, known there by the name of the horſe-eye bean; it has this name from its reſembling the eye of ſome large animal, by reaſon of a *hilus* or welt which ſurrounds it. This is deſcribed by many authors, and among the reſt by Sir Hans Sloane, in his catalogue of Jamaica plants; and is found in many other of the hotter parts, both of the Eaſt and Weſt Indies.

A third kind of fruit found on theſe ſhores, is that called by the people of Jamaica the aſh-coloured nickar-nut; it has this name from its colour, and from its being perfectly round, of the ſhape of a nickar or marble, ſuch as boys play with. This is alſo common in the Eaſt and Weſt Indies.

A fourth kind is alſo a Jamaica fruit, with the hiſtory of which we are not yet well acquainted; no body has ſeen it growing, but the fruit itſelf is preſerved in many of the collections of the curious, and has been figured and deſcribed by Cluſius, and others, under the name of a round exotic fruit rigid with four riſing nerves.

Theſe are the principal kinds of fruit thus toſſed on ſhore with us; but how the products of Jamaica, or other parts of America, ſhould be brought to the ſhores of Scotland and Ireland, ſeems difficult to determine on any certain foundation. It is eaſy to conceive, that when they grow by the ſides of rivers, they may fall off from the trees into them, and be thence conveyed into the ſea. It is likewiſe eaſy to ſee, that when they are thus floating on the ſurface of the ſea, they may be carried about by the winds and currents to a conſiderable diſtance; but their motion this way muſt naturally be ſtopped by the main continent of America, and they muſt be forced through the gulf of Florida, or the canal of Bahama, going thence conſtantly eaſt, and into the North American ſea. This is eaſily conceived by a ſimilar fact which happens every day: which is, that a kind of ſea lentil, called *ſargaſſo*, which grows very plentifully on the rocks about Jamaica, is waſhed off from thence, and carried by the winds and currents, which for the moſt part go impetuouſly the ſame way, toward the coaſt of Florida, and thence into the North American ocean; and is there found floating on the ſurface. Thus far it is eaſy to trace our fruits from their native ſoil; but how after this they ſhould be forwarded to us is unaccountable, unleſs we ſuppoſe, that as ſhips when they go ſouth expect a trade eaſterly wind, and when they come north expect and generally find a weſterly wind, for at leaſt two parts in three of the year; ſo theſe fruits, being brought north by the current from the gulf of Florida, are put into the way of theſe weſterly winds, and by them conveyed to the coaſts of Scotland and Ireland. Philoſoph. Tranſ. N° 222. p. 300.

By the ſame means that theſe *beans* came to Scotland, it is reaſonable to believe that the ſame winds and currents brought from America thoſe ſeveral things towards the Azores and Porto Santo, which are recorded by Ferdinand Columbus, in the life of his father; which gave this bold adventurer the firſt notion that there was ſuch a place as America. Among the things he mentions as waſhed aſhore in this manner, was a piece of wood very ingeniouſly wrought, but evidently without the help of iron tools. This was taken up by a Portugueſe pilot, four hundred and fifty leagues from ſhore, off Cape St. Vincent, after a weſt wind, which had blown violently for many days: after this ſuch another piece of wood was taken up on the ſhores of Porto Santo, after ſuch another long and violent weſt wind. Large canes, vaſtly ſuperior to any of the growth of the then known parts of the world, were alſo found thrown on the ſame ſhores, and the fruits of pines which did not grow in any known part of the world: and finally, the bodies of two men appearing to be of a different nation from any of the known people, and two of their canoes, were driven on ſhore on the iſland Flores, one of the Azores. All theſe things having been found only after ſtrong and continued weſt winds, it appeared very evident, that there muſt be land ſomewhere to the weſt, where fruits and men were to be found; and that theſe men had no knowlege of our arts, by their want of iron. From theſe conjectural concluſions ſprung the greateſt diſcovery of modern times.

BEAN *caper*, *zygophyllum*, or *fabago*, in *Botany*, a genus of the *decandria monogynia* claſs. Its characters are theſe: the empalement of the flower is compoſed of five oval obtuſe leaves; the flower has five obtuſe petals, which are longer than the empalement, and are indented at their points: it has a cloſed *nectarium*, which includes the *germen*, compoſed of ſeveral ſcales or little leaves, to which the baſes of the *ſtamina* are faſtened. It has ten awl-ſhaped *ſtamina*, terminated by oblong ſummits and an oblong *germen*, ſupporting an awl-ſhaped ſtyle, crowned by a ſingle *ſtigma*. The *germen* becomes an oval five-cornered capſule with five cells, containing ſeveral roundiſh ſeeds. There are four ſpecies.

The Syrians uſe this plant to kill worms, on account of its bitterneſs.

BEAN *cod*, a ſmall fiſhing-veſſel or pilot-boat, very common on the ſea coaſts and in the rivers of Portugal.

BEAN *trefoil*; ſee *Shrub* TREFOIL.

BEAN *tree*, *erythrina*; ſee CORALLODENDRON.

BEAN *fly*, in *Natural Hiſtory*, the name given by authors to a very beautiful fly, of a pale purple colour, frequently found on *bean* flowers. It is produced from the worm or maggot called by authors *mida*.

BEAN is alſo uſed by ſome *Anatomiſts* to denote the *glans of the penis*, on account of its figure and reſemblance to that pulſe.

BEAN is alſo improperly uſed for a weight, containing the third part of a ſcruple.

BEAR, *urſus*, in *Phyſiology*, denotes a well-known quadruped of the cat kind, of ſome uſe in medicine; but more in commerce and ſport. See *Tab. of Quadrupeds*, &c. *fig.* 3.

Bear, in the Linnæan ſyſtem of *Zoology*, makes a diſtinct genus of animals of the *feræ* kind, the characters of which are, that the fore-teeth, above and below, are ſix in number, the upper ones alternately hollow within; the cutting teeth are ſingle and conical; the grinders five or ſix; the tongue ſmooth, the noſe prominent, and the *penis* large. The common *bear* has a ſhort tail. Under this genus, the author takes in the creature called the *coati mundi*, under the name of *lotor*, or *urſus cauda annulata*. See RACKOON.

The *bear* differs, in many reſpects, from all the other beaſts of prey. Its head is much larger than theirs: its ſkin on the back is extremely hard, tough, and ſtrong; under the belly it is more tender: its hairs are longer, ſofter, and leſs rigid than in any other wild beaſt of prey, and reſemble wool in ſome degree: its ſkull is much thinner than that of the lion; but its brain more than twice as much in quantity: its eyes are very ſmall, and, what is very remarkable, have a nictitating membrane to cover them on occaſion. Its feet have all five toes, as well the hinder as the fore ones; and what is remarkable is, that the large toe, which anſwers to the thumb with us, is in the place of the little finger. It is a very common creature in Germany, Poland, Lithuania, and many other places. Ray.

The *bear* was formerly an inhabitant of the Britiſh iſland; and was tranſported from Britain to Rome. *Bear*-baiting was a favourite paſtime with our anceſtors; an inſtance of which occurs ſo lately as the time of queen Elizabeth.

The *bear* is obſerved to bear ſome analogy to man; as having hair on both eye-lids, which no other brute has. His ſtructure and anatomy are deſcribed by the French academiſts. Du Hamel Hiſt. Reg. Acad. Sc. lib. i. § 11.

Some diſtinguiſh two kinds of *bears*, *terreſtrial* and *marine*; the former of which keep to the mountains, whereas the latter come out on the ice as far as the middle of the North ſea. Some of this kind are found in Nova Zembla, of an incredible ſize.

Each male among the ſea *bears* has a ſeraglio to himſelf, containing from fifteen to fifty females, which he poſſeſſes as his own property.

BEAR's *fleſh* was much eſteemed by the ancients: even at this day, the paw of a *bear* ſalted and ſmoaked, is ſerved up at the tables of princes.

Bear's fleſh is reckoned one of the greateſt rarities among the Chineſe; inſomuch that, as Du Halde informs us, the emperor will ſend fifty or a hundred leagues into Tartary, to procure them for a great entertainment.

BEAR's *greaſe* is eſteemed by ſome a ſovereign remedy againſt cold diſorders, eſpecially rheumatiſms. Some have alſo employed it with ſucceſs in the gout, and againſt tumours and ulcers.

To be good, it muſt be newly melted, greyiſh, glutinous, of a ſtrong diſagreeable ſmell, and a moderate conſiſtence. That which is too white, is adulterated with common tallow.

BEAR's *ſkin* makes a fur in great eſteem, and on which depends a conſiderable article of commerce, being uſed in houſings, on coach-boxes, &c. In ſome countries, cloaths are made of it, more eſpecially bags wherein to keep the feet warm in ſevere colds. Of the ſkins of *bears* cubs are made gloves, muffs, and the like.

BEAR *garden*, a place where *bears* and other beaſts are expoſed as a public ſpectacle to be baited.

BEAR *leading*, to ſhew tricks, is an ancient practice, which we find prohibited in the canons of the church. Du-Cange.

BEAR *wards*, *urſarii*, were a kind of ſervants in great families among the Romans, who had the care of breeding and feeding thoſe animals. Pitiſc. Lex. Ant. tom. ii. p. 1110.

Our nobility had formerly officers of this kind. The annual ſalary of one of them belonging to the fifth earl of Northumberland, was twenty ſhillings. Northumb. Houſehold Book.

Order of the **BEAR**, was a military order in Switzerland, erected by the emperor Frederic II. in 1213, by way of acknowledgment for the ſervice the Swiſs had done him, and in favour of the abbey of St. Gal. To the collar of the order hung a medal, on which was repreſented a *bear* raiſed on an eminence of earth.

BEAR, or **BERE**, is a ſpecies of barley cultivated in Scotland and Ireland, and the northern parts of England. It yields a large return, but is not eſteemed ſo good for malting as the common barley.

Ant **BEAR**, in *Zoology*; ſee ANT *eater*.

Bear'*s ears*, in *Botany*; ſee Auricula.

Bear'*s ear ſanicle*; ſee Sanicle.

Bear-*bind*; ſee Convolvulus.

Bear'*s breech*, Acanthus, in *Botany*, and Branc *urſine*; a genus of the *didynamia angioſpermia* claſs. Its characters are theſe: the empalement of the flower is two-leaved and bifid; the petal has but one lip, which is turned backward, and is divided into three at the end. The capſule has two cells, each containing one ſeed; it is of the ringent claſs of flowers, whoſe ſeeds are in a capſule. It is in the ſecond diviſion of Linnæus's fourteenth claſs. There are four ſpecies. See *Tab. I. of Botany, Claſs* 1.

The common *acanthus*, whoſe leaves compoſe the ornaments of the Corinthian capital, and is uſed in medicine, grows naturally in Italy, Sicily, and the Levant.

The *farina* of *bear's breech*, microſcopically examined, has the appearance repreſented in *Tab. of Microſcopical Objects, Claſs* 2.

Bear'*s foot*; ſee Hellebore.

Bear, in *Aſtronomy*, a name given to two conſtellations called the *greater* and the *leſſer bear*; or ursa *major* and *minor*.

The pole ſtar is ſaid to be in the tail of the *leſſer bear*; this ſtar is never above two degrees diſtant from the north pole of the world.

BEARD, the hair growing on the chin, and adjacent parts of the face; chiefly of adults and males.

Various are the ceremonies and cuſtoms the *beard* has been liable to: Kingſon aſſures us, that a conſiderable branch of the religion of the Tartars conſiſts in the management of their *beards*; and that they waged a long and bloody war with the Perſians, and declared them infidels, though, in other reſpects, of the ſame faith with themſelves, merely becauſe they would not cut their whiſkers after the mode or rite of the Tartars.

Athenæus, from Chryſippus, obſerves that the Greeks always wore their *beards* till the time of Alexander; and that the firſt who cut it at Athens ever after bore the addition of κορσης, *ſhaven*, on medals. Plutarch adds, that Alexander commanded the Macedonians to be ſhaven, leſt the length of their *beards* ſhould give a handle to their enemies: however this be, we find Philip, his father, as well as Amyntas and Archelaus, his predeceſſors, repreſented on medals without *beards*.

Pliny obſerves, that the Romans did not begin to ſhave till the year of Rome 454, when P. Ticinius brought over a ſtock of barbers from Sicily: he adds, that Scipio Africanus was the firſt who introduced the mode of ſhaving every day.

Among that people, it became the cuſtom to have viſits made in form at the cutting of the *beard* for the firſt time: the firſt fourteen Roman emperors ſhaved, till the time of the emperor Adrian, who retained the mode of wearing the *beard*. Plutarch tells us he did it to hide the ſcars in his face.

Formerly there was a great deal of ceremony uſed in bleſſing the *beard*; and there are ſtill extant the prayers uſed in the ſolemnity of conſecrating it to God, when an eccleſiaſtic was ſhaven.

Perſons of quality had their children ſhaved the firſt time by others of the ſame, or greater quality, who, by this means, became god-father, or adoptive father of the children.

Anciently, indeed, a perſon became god-father of the child by barely touching his *beard*: thus hiſtorians relate, that one of the articles of the treaty between Alaric and Clovis was, that Alaric ſhould touch the *beard* of Clovis to become his God-*father*.

As to eccleſiaſtics, the diſcipline has been very different on the article of *beards*: ſometimes they have been enjoined to wear them, from a notion of too much effeminacy in ſhaving, and that a long *beard* was more ſuitable to the eccleſiaſtical gravity; and ſometimes again they were forbid it, as imagining pride to lurk beneath a venerable *beard*.

The Greek and Romiſh churches have long diſputed together about their *beards*: ſince the time of their ſeparation, the Romaniſts ſeem to have given more into the practice of ſhaving, by way of oppoſition to the Greeks; and have even made ſome expreſs conſtitutions *de radendis barbis*.

The Greeks, on the contrary, eſpouſe very zealouſly the cauſe of long *beards*, and are extremely ſcandalized at the beardleſs images of ſaints in the Roman churches.

By the ſtatutes of ſome monaſteries, it appears, that the lay-monks were to let their *beards* grow, and the prieſts among them to ſhave; and that the *beards* of all that were received into the monaſteries were bleſſed with a great deal of ceremony.

To let the *beard* grow is a token of mourning in ſome countries, and to ſhave it is ſo in others. Le Comte obſerves, that the Chineſe affect long *beards* extravagantly; but nature has balked them, and only given them very little ones, which, however, they cultivate with great care: the Europeans are ſtrangely envied by them on this account.

The Ruſſians wore their *beards* till within theſe few years, when the czar Peter enjoined them all to ſhave; but notwithſtanding his injunction, he was obliged to keep on foot a number of officers to cut off by violence the *beards* of ſuch as would not otherwiſe part with them.

Chryſoſtom obſerves, that the kings of Perſia had their *beards* woven or matted together with gold thread; and ſome of the firſt kings of France had, in the ſame manner, their *beards* knotted and buttoned with gold.

Among the Turks, it is more infamous for any one to have his *beard* cut off, than among us to be publicly whipt, or branded with a hot iron. They who ſerve in the ſeraglio have their *beards* ſhaved as a token of ſervitude; and when they are ſet at liberty, they permit it to grow. With them and the Perſians, the *beard* is a mark of authority and liberty. There are abundance in that country who would prefer death to this kind of puniſhment. The Arabs make the preſervation of the *beard* a capital article of religion, becauſe Mahomet never cut his.

The Turkiſh wives kiſs their huſbands *beards*, and children their fathers, as often as they come to ſalute them. The men kiſs one anothers *beards* reciprocally on both ſides, when they ſalute one another in the ſtreets, or come off from any journey.

The Jews wear a *beard* on their chin, but not on the upper lip or cheeks.

Beard, *touching the*, was an action anciently made uſe of by ſupplicants, and thoſe who made vows.

Beard, *anointing the*, with unguents, is an ancient practice both among the Jews and Romans, and ſtill continues in uſe among the Turks; where one of the principal ceremonies obſerved in ſerious viſits, is to throw ſweet-ſcented water on the *beard* of the viſitant, and to perfume it afterwards with aloes wood, which ſticks to this moiſture, and gives it an agreeable ſmell, &c.

In *Middle Age Writers* we meet with *adlentare barbam*, uſed for ſtroking and combining it to render it ſoft and flexible.

The Turks, when they comb their *beards*, hold a handkerchief on their knees, and gather very carefully the hairs that fall; and when they have got together a certain quantity, they fold them up in paper, and carry them to the place where they bury the dead.

Beard, *plucking the*, was practiſed to Cynics by way of contempt.

Some authors alſo ſpeak of *mortgaging the beard*, *barbam hypothecare*. Du-Cange.

Beard, *barba falſa*, was an artificial one. In a general court of Catalonia, held in 1351, it is expreſly enjoined, *Ne quis barbam falſam ſeu fictam audeat deferre vel fabricare*. Du-Cange.

Hottoman has given an elegant dialogue *de barba*, firſt printed by Plantin in 1586.

Beard *of a muſcle*, oyſters, or the like, denotes an aſſemblage of threads or hairs, by which thoſe animals faſten themſelves to ſtones, &c.

The hairs of this *beard* terminate in a flat ſpungy ſubſtance, which being applied to the ſurface of a ſtone, ſticks thereto, like the wet leather ſuckers uſed by boys.

Beards, in the *Hiſtory of Inſects*, are two ſmall, oblong, fleſhy bodies, placed juſt above the trunk, as in the gnats, and in the moths and butterflies.

Beard, or *under-beard*, called alſo *chuck*, of a horſe, is that part under the lower mandible on the outſide, and above the chin, which bears the curb of the bridle.

Beard, *old man's*, in *Botany*; ſee Clematis.

Beard *of a comet*, denotes the rays which the comet emits towards that part of the heavens to which its proper motion ſeems to direct it.

In which the *beard* of the comet is diſtinguiſhed from the *tail*, which is underſtood of the rays emitted towards that part from which its motion ſeems to carry it. See Tail.

It is called *beard*, from ſome fancied reſemblance it bears to the *beard* of a man.

BEARDED, *barbatus*, denotes a perſon or thing with a beard, or ſome reſemblance thereof.

In *Middle Age Writers*, this is ſometimes expreſſed by *malibarbis*, q. d. *barba in malis ſeu genis*.

The faces on ancient Greek and Roman medals are generally *bearded*. Some are denominated *pogonati*, as having long beards, e. gr. the Parthian kings. Others have only a *lanugo* about the chin, as the Seleucid family. Adrian was the firſt of the Roman emperors who nouriſhed his beard: hence all imperial medals before him are *beardleſs*; after him, *bearded.*

The medals of gods, and heroes in vigorous youth, repreſent them *beardleſs*, except Jupiter, and a few others.

The Romans paid their worſhip to a *bearded* Venus, *Veneri barbatæ*, ſuppoſed to have been of both ſexes; a ſtatue of whom was alſo found in the iſle of Cyprus.

The reaſon of repreſenting the goddeſs of beauty with a *beard*, is variouſly gueſſed at by the learned.

Bearded *women* have been all obſerved to want the menſtrual diſcharge; and ſeveral inſtances are given by Hippocrates, and other phyſicians, of grown women, eſpecially widows, in whom the *menſes* coming to ſtop, *beards* appeared. Euſebius Nieerembergius mentions a woman, who had a *beard* reaching to her navel. Bartholin ſpeaks of a *bearded* woman at Copenhagen, who, partly in virtue thereof, paſſed for an hermaphrodite.

Bearded *brothers*, *fratres barbati*, are more particularly uſed in *Eccleſiaſtical Writers* for thoſe otherwiſe called *fratres converſi* in the order of Grammont and the Ciſtercians.

They took this denomination, becauſe allowed to wear their *beards*, contrary to the rule of the profeſſed monks.

Bearded *huſk*, among *Floriſts*, a huſk which is hairy on the edges, as is that of the roſe, &c.

BEARDING *of wool*; ſee Wool.

BEARER, in *Architecture*, a poſt, or brick wall, trimmed up between the two ends of a piece of timber, to ſhorten its bearing, or to prevent its bearing with the whole weight at the ends only.

Bearers, *geſtantes*, in *Middle Age Writers*, are ſometimes uſed for a child's goſſips, becauſe they hold the infant in their arms, and preſent him to the prieſt in the ceremony of baptiſm. Du-Cange.

Bearers *of a* Bill *of* Exchange, denote the perſons in whoſe hands it is, and in favour of whom the laſt order or indorſement was made.

When a bill is ſaid to be *payable to bearer*, it is underſtood to be payable to him, who firſt offers himſelf after it becomes due. To be paid a bill of this kind, there needs neither order or transfer; yet it is good to know to whom it is paid.

Bearers are more peculiarly uſed among us for thoſe who carry the dead to their graves.

In a ſenſe ſomewhat different from this, we aſay *pall-bearers*, &c.

The ancients had peculiar orders or officers of *bearers*, called by the Greeks κοπιαται; by the Romans, *lecticarii.* The *veſpillones*, or *bajuli*, were a lower ſort of *bearers*, appointed for perſons of inferior rank.

Bearers, in *Agriculture*, denote the fruit branches, or ſuch as bear fruit.

The *bearers*, or bearing branches of an apple-tree, and the like, are found to be rougher, and fuller of aſperities in their bark, than the other branches.

Bearers, in *Heraldry*; ſee Supporters.

Bearer, *Croſs*; ſee Cross.

BEARING, in *Geography* and *Navigation*, the ſituation of one place from another, with regard to the points of the compaſs; or the angle, which a line drawn through the two places makes with the meridians of each.

The *bearings* of places on the ground are uſually determined from the magnetic needle: in the managing of theſe lies the principal part of ſurveying; ſince the *bearing* and diſtance of a ſecond point from a firſt being found, the place of that ſecond is determined; or the *bearings* of a third point from two others, whoſe diſtance from each other is known, being found, the place of the third is determined: inſtrumentally we mean; for to calculate trigonometrically, there muſt be more *data.* Mr. Collins gives the ſolution of a problem in the Philoſophical Tranſactions, where the diſtances of three objects on the ſame plain being given, and the *bearings* from a fourth place in the ſame plain obſerved, the diſtances from the place of obſervation to the reſpective objects are required.

Bearing, in the *Sea-language.*—When a ſhip ſails towards the ſhore, ſhe is ſaid to *bear in with the land.*—When a ſhip that was to windward comes under another ſhip's ſtern, and ſo gives her the wind, ſhe is ſaid to *bear under her lee.*—If a ſhip ſails into an harbour with the wind large, or before the wind, ſhe is ſaid to *bear in with the harbour*, &c.

In conding they ſay, *bear up the helm*, that is, let the ſhip go more large before the wind—*bear up round*, that is, let the ſhip go between her two ſheets, directly before the wind—*bear a hand*, i. e. make haſte.

They alſo ſay, a ſhip *bears*, when, having too ſlender a quarter, ſhe will ſink too deep into the water with an over-light freight, and therefore can carry but a ſmall quantity of goods.

To **Bear** *ſail well* is ſaid of a ſhip, when ſhe is a ſtiff-guided ſhip, and will not couch down on a ſide with a great deal of ſail.

When a ſhip is ſaid to *bear out her ordnance*, it is meant, that her ordnance lie ſo high, and ſhe will go ſo upright, that in reaſonable fighting weather, ſhe will be able to keep out her lower tire, and not be forced to ſhut in her ports.

A ſhip is ſaid to *overbear another*, when it is able, in a great gale of wind, to carry out more ſails, viz. a topſail more, or the like.

Bearing *off* is alſo uſed by *Seamen*, generally in buſineſs belonging to ſhipping, for *thruſt off.*

Thus, in hoiſting any thing into the ſhip, if it hath hold by any part of the ſhip or ordnance, or the like, they ſay, *bear it off from the ſhip's ſide.*—So, if they would have the breech or mouth of a piece of ordnance, or the like, put from one, they ſay, *bear off*, or *bear about* the breech.

Bearing *up*, or *bearing away*, is improperly uſed to denote the act of changing the courſe of a ſhip, in order to make her ſail before the wind, after ſhe had ſailed ſome time with a ſide-wind, or cloſe-hauled.

Bearing alſo expreſſes the ſituation of any diſtant object, eſtimated from ſome part of the ſhip, according to her poſition. In this ſenſe, the object muſt be either a-head, a-ſtern, a-breaſt, on the bow, or on the quarter.

Bearing *of a piece of timber*, in *Carpentry*, denotes the ſpace either between the two fixt extremes thereof, when it has no other ſupport; which is called *bearing at length:* or between one extreme, and a poſt, brick wall, or the like, trimmed up between the ends to ſhorten its *bearing.*

Joiſts are not to *bear* above ten feet length; nor ſingle rafters more than nine feet. 19 Car. II. c. 3.

Bearing *of an arch*, or *vault*, denotes the effort which the ſtones make to burſt open the piers, or *piedroits.*

This amounts to the ſame with what the French call *pouſsée.*

Bearings, in *Heraldry*, a term uſed to expreſs a coat of arms, or the figures of armories, by which the nobility and gentry are diſtinguiſhed from the vulgar, and from one another. Theſe ſigns of nobility with us, are evidently a copy of the ſtatues and images among the ancient Romans, which they uſed to expoſe before their houſes on public days, and carried before the body at a funeral of a great perſon. Theſe ſtatues among them were the reſemblances of their noble anceſtors. And as our coats of arms evidently were brought up in the place of them, it ſeems very natural to date the riſe and origin of heraldry in England, as now practiſed, from the time of the ſubverſion of the Roman empire by the Goths and Vandals; who, as they deſtroyed many liberal arts, ſo they ſeem in return, to have given birth to this of heraldry.

Theſe warlike nations, having ſubdued the mighty Roman empire, and raiſed their glory by military ſervice, became very fond of the atchievements of their anceſtors and great men, and derived their enſigns and titles of honour from what concerned a ſoldier. They firſt, therefore, diſtinguiſhed the whole community into three ranks, which they named, according to the different orders of military men, *miles*, *eques*, and *ſcutifer*; and their poſterity, willing to commemorate their honours, reſerved to themſelves their ſeveral military enſigns; and theſe became what we call *bearings*, or arms, the marks of gentility, or of houſes, ſome one of which had once deſerved an elevation above the common rank of men. While the direct deſcendant of this honourable perſon carried his enſigns of honour for his diſtinction, the collateral branches alſo were ambitious of preſerving the memory of their having belonged to ſuch an honourable houſe; and therefore aſſumed the ſame figure, but with ſome difference, to diſtinguiſh the diſtance from the original claim. In proceſs of time, other families, who had deſerved as well of their prince and country, whether in civil or military affairs, became deſirous of the ſame ſort of diſtinction, by way of perpetual memorial of their ſervices; and upon this occaſion many other devices were formed into arms, and continued down to poſterity in the ſeveral families.

Armorial bearings, in the tenth and eleventh centuries, were ſingle and plain, conſiſting only of few figures. Charges, differences, quarterings, &c. are the inventions of later times.

Bearing *of an organ pipe*, denotes an error or variation from the juſt ſound it ought to yield. See Temperature.

Bearing *down of the matrix*, a diſorder in pregnant women, being a ſenſation of a weight at the bottom of the *abdomen*, or preſſure on the neck of the womb, ſo as to hinder the perſon from walking without pain; and ſometimes alſo occaſioning difficulty of urine, numbneſs of the hips, uneaſineſs in going to ſtool, and in the end abortion.

BEARING *claws*, among *Cock-fighters*, denote the foremoſt toes, on which the bird goes; and if they be hurt or gravelled, he cannot fight.

BEARING *of a ſtag*, is uſed in reſpect of the ſtate of his head, or the croches which he bears on his horns.

If you be aſked what a ſtag *bears*, you are only to reckon the croches, and never to expreſs an odd number: as, if he have four croches on his near horn, and five on his far, you muſt ſay he bears ten; a falſe right on his near horn: if but four on the near horn, and ſix on the far horn, you muſt ſay he bears twelve; a double falſe right on the near horn.

BEARN *ſtone*; ſee PHOSPHORUS.

BEAST; ſee BRUTE. Authors make this difference between *beaſts of the foreſts* and *of chaſe*, that the firſt are *ſilveſtres tantum*, the latter *campeſtres tantum*. *Beaſts of the foreſt* make their abode all the day time in the great coverts and ſecret places of the woods; and in the night ſeaſon, they repair into the lawns, meadows, paſtures, and pleaſant feeding-places: whence their denomination *ſilveſtres*, q. d. *beaſts of the wood*.

Beaſts of the chaſe reſide all the day time in the fields, and on the mountains afar off, to prevent ſurprize; but on night's approach, they feed as the reſt in meadows, &c. whence their appellation *campeſtres*, q. d. *beaſts of the field*.

BEASTS *of* CHASE, in our *Statute-books*, are five; the buck, doe, fox, martin, and roe.

BEASTS *of the foreſt* are, the hart, hind, hare, boar, and wolf.

BEASTS and *fowls of the warren* are, the hare, coney, pheaſant, and partridge. See GAME.

No other, according to Manwood, are accounted *beaſts* or fowls of warren, than hares, coneys, pheaſants, and partridges. Lord Coke is of another opinion, diſtinguiſhing *beaſts* on the warren from fowls of the warren. Under the former, he includes hares, coneys, and roes: the latter he divides into *ſilveſtres*, *campeſtres*, and *aquatiles*. To the firſt belong the pheaſant, woodcock, &c. to the ſecond the partridge, quail, rail, &c. to the third the mallard, hern, &c. Coke on Littleton, p. 233.

BEAST *of burden* is underſtood of all quadrupeds employed in carrying goods on their backs.

BEAST *at ombre* is, where the player, or perſon that undertakes the game, loſes it to the other two; the penalty of which is a forfeiture equal to the ſtake played for.

BEAST, *la bête*, is alſo the name of a French game at cards.

BEASTS, *rother*. See ROTHER.

BEAT, or UNDULATION, in *Muſic*. See UNDULATION.

BEAT, in *Fencing*, denotes a blow or ſtroke given with the ſword. See BEATING.

There are two kinds of *beats*; the firſt performed with the foible of a man's ſword on the foible of his adverſary's, which in the ſchools is commonly called *baterie*, from the French *batre*, and is chiefly uſed in a purſuit, to make an open upon the adverſary. The ſecond and beſt kind of *beat* is performed with the fort of a man's ſword upon the foible of his adverſary's, not with a ſpring, as in binding, but with a jerk, or dry *beat*; and is therefore moſt proper for the parades without or within the ſword, becauſe of the rebound a man's ſword has thereby from his adverſary's, whereby he procures to himſelf the better and ſurer opportunity of riſpoſting.

BEAT, in the *Manege*. A horſe is ſaid *to beat the duſt*, when, at each ſtroke or motion, he does not take in ground or way enough with his fore-legs.

He is more particularly ſaid to *beat* the duſt at *terra à terra*, when he does not take in ground enough with his ſhoulders, making his ſtrokes or motions too ſhort, as if he made them all in one place.

He *beats the duſt* at curvets, when he does them too precipitantly, and too low.

He *beats upon a walk*, when he walks too ſhort, and thus rids but little ground, whether it be in ſtraight lines, rounds, or paſſings.

BEAT *upon the hand*, in the *Manege*. See CHACK.

BEAT *of the drum*, in the *Military Art*, is differently performed, according to the purpoſes deſigned by it. Notice is hereby given of any ſudden change; ſoldiers are ſummoned to repair to their arms and quarters; and the various movements before and after, and during the engagement, are denoted by *different beats* of the drum.

The chief *beats* or beatings on the drum are, the *general*, the *aſſembly*, the *march*, the *reveille*, the *retreat*, &c.

BEATA. See MASS *of the Beata*.

BEATER is applied, in *Matters of Commerce*, to divers ſorts of workmen, whoſe buſineſs is to hammer or flatten certain matters, metals, or the like.

In this ſenſe we meet with *plaſter-beater*, *cement-beater*, *mortar-beater*, &c.

BEATERS, *gold*, are artiſans, who, by beating gold and ſilver with a hammer on a marble, in moulds of vellum and bullocks guts, reduce them to thin leaves fit for gilding, or ſilvering of copper, iron, ſteel, wood, &c.

Gold-beaters differ from *flatters* of gold or ſilver, as the former bring their metal into leaves by the hammer; whereas the latter only flatten it by preſſing it through a mill, preparatory to beating.

There are alſo *Tin*-BEATERS employed in the looking-glaſs trade, whoſe buſineſs is to beat tin on large blocks of marble, till it be reduced to thin leaves, fit to be applied with quickſilver behind LOOKING-GLASSES. See FOLIATING, GOLD-*beating*.

BEATER is alſo uſed for an inſtrument wherewith to gravel walks and alleys in gardens even.

It is a piece of wood half a yard long, ſix inches thick, and eight or nine broad, having a handle fixed obliquely in the middle.

BEATIFIC *viſion*. See VISION.

BEATIFICATION, in *Electricity*, a term uſed by profeſſor Boze to denote an electrical experiment, by which he incircled the head of a perſon ſtrongly electrified, and ſtanding on a large cake of pitch, with a luminous glory, reſembling that with which painters ornament the heads of ſaints. The ſecret of this experiment, which occaſioned many fruitleſs and expenſive trials to the firſt electricians in Europe, conſiſted in the uſe of a ſuit of armour, decked with ſteel, in various figures; and the glory was produced by rays iſſuing from the edges of the helmet.

BEATIFICATION, in the Romiſh *Church*, the act whereby the pope declares a perſon happy, after death.

Beatification differs from *canonization*; in the former, the pope does not act as a judge in determining the ſtate of the *beatified*, but only grants a privilege to certain perſons to honour him by a particular religious worſhip, without incurring the penalty of ſuperſtitious worſhippers: but, in *canonization*, the pope ſpeaks as a judge, and determines *ex cathedra*, upon the ſtate of the *canonized*.

Beatification was introduced, when it was thought proper to delay the canonization of ſaints, for the greater aſſurance of the truth, and manifeſtation of the rigorous ſteps taken in the procedure.

It is remarkable, that particular orders of monks aſſume to themſelves the power of *beatification*.

Thus Octavia Melchiorica was *beatified* with extraordinary ceremonies by the Dominicans, for a legacy of 7000 dollars to the order.

BEATING, among *Sportſmen*, denotes the noiſe which hares make in RUTTING-*time*.

The hare is ſaid to *beat*, the hart to *bell*, &c.

BEATING, PULSATION, in *Medicine*, is applied to the reciprocal agitation or palpitation of the heart and pulſe.

Some phyſicians diſtinguiſh 81 different kinds of ſimple *beatings*, and fifteen compound ones. They compute 60 beats in the ſpace of a minute, in a temperate man. But, in fact, we generally find a greater number.

BEATING *of the heart*. Divers ſyſtems have been framed to account for the *beating* of the heart. Some have doubted whether it be mechanical, that is, deducible from any known laws or powers of nature. See Ray's Wiſdom of God, part i. p. 48.

BEATING *flax*, or *hemp*, is an operation in the dreſſing of theſe matters, contrived to render them more ſoft and pliant.

When hemp has been ſwingled a ſecond time, and the hurds laid by, they take the ſtrikes, and dividing them into dozens, and half dozens, make them up into large thick rolls, which being broached on long ſtrikes, are ſet in the chimney-corner to dry; after which they lay them in a round trough made for the purpoſe, and there with beetles beat them well, till they handle, both without and within, as pliant as poſſible, without any hardneſs or roughneſs to be felt: that done, they take them from the trough, open and divide the ſtrikes as before, and if any be found not ſufficiently beaten, they roll them up, and beat them over as before.

Beating hemp is a puniſhment inflicted on looſe or diſorderly perſons.

BEATING, in *Book-Binding*, denotes the knocking a book in quires on a marble block, with a heavy broad-faced hammer, after folding, and before binding or ſtitching it. On the *beating* it properly, the elegance and excellence of the binding, and the eaſy opening of the book, principally depends.

BEATING, in the *Paper Works*, ſignifies the *beating* of paper on a ſtone with a heavy hammer, with a large, ſmooth head, and ſhort handle, in order to render it more ſmooth and uniform, and fit for writing.

BEATING *the wind*, was a practice in uſe in the ancient method of trial by combat. If either of the combatants did not appear in the field at the time appointed, the other was to *beat the wind*, or make ſo many flouriſhes with his weapon; by which he was intitled to all the advantages of a conqueror. Du-Cange.

BEATING *the hands or feet*, by way of praiſe or approbation. See APPLAUSE.

BEATING *time*, in *Muſic*, a method of meaſuring and marking the time for performers in concert, by a motion of the hand or foot up and down ſucceſſively, and in equal times.

The general rule is, to contrive the diviſion of the meaſure ſo, that every down and up of the *beating* ſhall end with a particular note, on which very much depends the diſtinctneſs, and, as it were, the ſenſe of the melody. Hence the beginning of every time, or *beating* in the meaſure, is reckoned the accented part thereof. Malcolm.

Beating time is denoted, in the Italian muſic, by the term *a battuta*, which is uſually put after what they call *recitativo*, where little or no time is obſerved, to denote, that here they are to begin again to mark or beat the time exactly.

The Romans aimed at ſomewhat of harmony in the ſtrokes of their oars, and had an officer called *portiſculus* in each galley, whoſe buſineſs was to *beat* time to the rowers; ſometimes by a pole or mallet, and ſometimes by his voice alone.

The ancients marked the rhythm in their muſical compoſitions; but, to make it more obſervable in the practice, they beat the meaſure or time, and this in different ways. The moſt uſual conſiſted in a motion of the foot, which was raiſed from, and ſtruck alternately againſt the ground, according to the modern method.

To make the beats or ſtrokes more audible, their feet were generally ſhod with a ſort of ſandals, either of wood or iron, called by the Latins *pedicula*, *ſcabella*, or *ſcabilla*, becauſe like to little ſtools, or foot-ſtools. Sometimes they beat upon ſonorous foot-ſtools, with the foot ſhod with a wooden or iron ſole.

They beat the meaſure not only with the foot, but alſo with the right hand, all the fingers whereof they joined together, to ſtrike into the hollow of the left. He who thus marked the rhythm, was called *manuductor*. The ancients alſo beat time or meaſure with ſhells, and bones of animals, which they ſtruck one againſt another, much as the moderns now uſe caſtanets, and the like inſtruments. Burette, Mem. Acad. Inſcr. tom. vii. p. 243. 247.

BEATING, in *Navigation*, the operation of making a progreſs at ſea againſt the wind, in a zigzag line, or traverſe. See TACKING.

BEATING, *drubbing*, or *ſtripes*, make one of the moſt ancient, as well as univerſal ſpecies of puniſhment. Among the Romans it obtained, under the denomination of *verberare*, *fuſtigare*, *flagellare*, *pulſare*, &c. In the Eaſt it ſtill prevails under the name of BASTONADO.

Some diſtinguiſh between *pulſation* and *verberation*, as if the latter imported a *beating* with pain, the former without; but this diſtinction is not always kept to.

BEATING, in the Engliſh *Law*. See BATTERY.

BEATING *in the flanks*, a diſtemper to which black cattle are ſubject, and is an indication of a great inflammation in the bowels.

BEATING, in *Huſbandry*. See BURNING *of Land*.

BEATITUDE imports the ſupreme good, or the higheſt degree of happineſs human nature is ſuſceptible of.

In which ſenſe, it amounts to the ſame with what we otherwiſe call *bleſſedneſs* and *ſovereign felicity*; by the Greeks ευδαιμονια; and by the Latins *ſummum bonum*, *beatitudo*, and *beatitas*.

BEATITUDE, among *Divines*, denotes the beatific viſion, or the fruition of God in a future life to all eternity.

BEATITUDE is alſo uſed in ſpeaking of the *theſes* contained in Chriſt's ſermon on the mount, whereby he pronounces *bleſſed the poor in ſpirit*, *thoſe that mourn*, *the meek*, &c.

BEATITUDE was alſo a title anciently given to all biſhops; but of later days reſtrained to the pope.

It appears to have been ſometimes alſo given to laymen.

BEATS, in a watch or clock, are the ſtrokes made by the fangs or pallets of the ſpindle of the balance; or of the pads in a royal *pendulum*.

To find the *beats* of the balance in any watch, or in one turn of any wheel.—Having found the number of turns, which the crown-wheel makes in one turn of the wheel you ſeek for (by the direction given under the word TURN), thoſe turns of the crown-wheel, multiplied by its notches, give half the number of *beats* in that one turn of the wheel: for the balance or ſwing has two ſtrokes to every tooth of the crown-wheel: inaſmuch as each of the two pallets has its blow againſt each tooth of the crown-wheel: whence it is, that a pendulum which beats ſeconds, has in its crown-wheel only 30 teeth. To explain this, ſuppoſe the numbers of a ſixteen hour watch wherein the pinion of report is 4, the dial-wheel 32, the great wheel 55, the pinion of the ſecond wheel 5, &c. The number of the notches in the crown-wheel 17, being multiplied into 6336 (the product ariſing from the continual multiplication of the quotients 8, 11, 9, 8) gives 107712, for half the number of *beats* in one turn of the dial-wheel; for 8 times 17 is 136, which is half the number of beats in one turn of the contrate-wheel 40, and 9 times 136 is 1224, the half-beats in one turn of the ſecond wheel; and 11 times 1224 is 13464, the half-beats in one turn of the great wheel 55; and 8 times 13464 makes 107712. If you multiply this by the two pallets, i. e. double it, it gives 215424, which is the number of *beats* in one turn of the dial wheel, or 12 hours.

```

```

To know how many *beats* this watch has an hour, divide the *beats* in 12 hours into 12 parts, and it gives 17952, which is called the *train* of the watch, or the *beats* in an hour.—If this be divided into 60 parts, it gives 299, and a little more, for the *beats* in a minute; and ſo you may proceed to ſeconds or thirds.

By the *beats* and turns of the fuſee, the hours that any watch will go, may be found thus.—As the *beats* of the balance in one hour, are to the *beats* in one turn of the fuſee; ſo is the number of the turns of the fuſee 1, to the continuance of the watch's going.—Thus, 20196 : 26928 : : 12 : 16.

To find the *beats* of the balance in one turn of the fuſee, ſay, As the number of turns of the fuſee, to the continuance of the watch's going in hours: ſo are the beats in one hour, to the *beats* of one turn of the fuſee; i. e. 12 : 16 : : 20196 : 26928.

To find the *beats* of the balance in an hour, ſay, As the hours of the watch's going, to the number of turns of the fuſee; ſo are the *beats* in one turn of the fuſee, to the *beats* of an hour.—Thus, 16 : 12 : : 26928 : 20196. Derham's Artificial Clock Maker, p. 14, &c. and 22.

BEAVER, CASTOR, in the Linnæan *Syſtem of Zoology*, makes a diſtinct genus of animals, of the order of *glires*, and claſs of *marimalia*, the characters of which are, that the upper fore-teeth are trunctated, and hollowed obliquely, and that the lower are oblique at the apex, with a flat tail, and with feet which have five toes on each, and palms adapted for ſwimming. Under this genus are comprehended, 1. The *beaver*, properly ſo called, or *fiber*, with a black, flat, and oval tail, with palmated feet: this ſpecies produces the CASTOREUM. 2. The *caſtor*, with a flat lanceolated, or oblong tail, called by Cluſius, the exotic water-rat. 3. The *caſtor*, with a long, flat, lanceolated tail, with cloven feet, called *zibethicus*.

The *beaver*, diſtinctively ſo called, has two very different ſorts of hair, the one very ſoft and fine, the other long and thick; the firſt ſerves to defend the creature from the cold, the other to receive the mire in which it often wallows, and to prevent its getting to the ſkin. The teeth of this creature are formed in a very particular manner, and are extremely fit to cut trees, with which they build themſelves lodging to defend them from the weather, and to breed their young in. The fore-feet are formed like the human hand, and by this means they are able to carry their materials, and work at their habitations: the hinder feet, which are deſtined to be of uſe to them in ſwimming, are on the contrary webbed like thoſe of a gooſe. Their addreſs and contrivance in conſtructing their habitations, would ſcarcely obtain credit, were they not well atteſted.

Beavers were formerly found in Great Britain; but the breed has been long extirpated. Giraldus Cambrenſis's account of them is the lateſt in 1188. Itin. 178, 179.

The bladders in this animal deſtined for receiving the medicinal ſubſtance called *caſtor*, are diſtinct from the teſticles, and are four large ones, placed about the lower part of the *os pubis*; two of theſe ſtand above the other two, but cloſely joined to one another, the two upper being to prepare that matter, and the two other to bring it to the greater perfection and unctuouſneſs, and render it of a ſtronger ſcent and deeper colour, as it is always found with this difference in theſe bags from what it is in the upper ones. The lower bags, for this reaſon, are of a glandular ſtructure; and under theſe lower bags there is another long one full of a matter, more yellow and liquid, and ſeeming more elaborated than any of the others. This is of a different ſmell from the former, and more than any thing elſe reſembles the yolk of an egg. It is ſaid that the creature uſes this liquor to get itſelf an appetite, and that it gets it out by ſqueezing the bag that contains it with its paws. The people of Canada ſet gins for theſe creatures, and catch many of them that way; and, knowing how fond they are of this liquor, they always anoint the gins with ſome of it.

It has been generally ſaid that the teſticles of this creature were faſtened to the back-bone, but they are, in reality, not ſo, but placed on the ſides of the *os pubis* about the groin, and are altogether hid, not appearing at all any more than the *penis*, till the ſkin is removed; and the *penis*, contrary to that of a dog, which goes from the *os pubis* to the navel, deſcends in this animal downwards to the vent of the excrements, at which hole it terminates.

Beaver *ſkin*, the fur or ſkin of an amphibious animal called the *caſtor*, or *beaver*, ſometimes found in France, Germany, and Poland, but moſt abundantly in the province of Canada in North America.

Its chief uſe is in the compoſition of hats, furs, &c. Beſides this, in 1669, an attempt was made to employ it in other merchandizes; accordingly a manufactory was ſettled in the Fauxbourg S. Antoine near Paris, where they made cloths, flannels, ſtockings, &c. of *caſtor*, with a mixture of wool. The manufacture flouriſhed for a while, but ſoon decayed, it being found by experience that the ſtuffs loſt their dye when wet, and that when dry again they were harſh, and ſtiff as felts.

The merchants diſtinguiſh three kinds of *caſtor*, though all equally the ſkins of the ſame animal; theſe are *new caſtor*, *dry caſtor*, and *fat caſtor*: *new caſtor*, called alſo *winter caſtor*, and *Muſcovite caſtor*, becauſe ordinarily reſerved to ſend into Muſcovy; this is that taken in the winter huntings. This is the beſt, and moſt eſteemed for rich furs, as having loſt none of its hair by moulting. *Dry caſtor*, or *lean caſtor*, is the reſult of the ſummer huntings; when the beaſt is moulted, and has loſt part of its hair: this being much inferior to the former, is little uſed in furrs, but moſtly in hats. *Fat caſtor*, uſually called *old-coat*, or coat-*beaver*, is that which has contracted a certain fat, unctuous humour, by ſweat exhaled from the bodies of the ſavages, who have wore it for ſome time: this, though better than the dry, is yet only uſed for hats.

After the hair is cut off the ſkin to be uſed in hats, the pelt or ſkin itſelf is uſed in various works, viz. for the covering of mails and trunks, in ſlippers, &c.

Beaver is chiefly imported by the Hudſon's-bay company, from the northern parts of America; where the animal abounds.

Beaver is alſo uſed to denote a hat made of *beaver's* hair.

BEAUFET, Buffet, or Bufet, was anciently a little apartment ſeparated from the reſt of a room by ſlender wooden columns, for the diſpoſing china and glaſs ware, &c. called alſo a *cabinet*.

It is now, properly, a large table in a dining-room, called alſo a *ſide-board*, for the plate, glaſſes, bottles, baſons, &c. to be placed, as well for the ſervice of the table as for magnificence.

The *buffet*, among the Italians called *credenza*, is incloſed within a balluſtrade, elbow-high.

BEAU-MASS. See Mass.

BEAU-PLEADER, or Bew-Pleader, a writ on the ſtatute of Marlbridge, whereby it is provided, that no fine ſhall be taken of any man in any court for *fair-pleading*, i. e. for not pleading aptly, and to the purpoſe.

BEAUTY is a term whereby we expreſs a certain relation of ſome object, either to an agreeable ſenſation, or to an idea of approbation.

When, therefore, I ſay, a thing is *beautiful*, I either mean that I perceive ſomething that I approve, or that ſomething gives me pleaſure: whence it appears, that the idea annexed to the word *beauty* is double; which renders the word equivocal, and this is the ſource of moſt of the diſputes on the ſubject of *beauty*.

We muſt therefore diſtinguiſh between *ideas* and *ſenſations*. Ideas occupy the mind, ſenſations intereſt the heart. Though we ſee nothing in an object to intereſt us, we may yet diſcover ſomething in its idea to merit our approbation. Such an object therefore pleaſes, and does not pleaſe, i. e. it pleaſes the underſtanding, and not the ſenſe. On the contrary, there are ſome objects, whoſe ideas do not offer any thing laudable, which yet excite agreeable ſenſations. There is therefore *beauty* of two ſorts. It is exceeding hard to fix any general characteriſtic of *beauty*: for, as the ideas and ſenſations of different perſons differ according to the habitudes of the body, and the turn of the mind; ſo do the relations of objects to thoſe ideas and ſenſations vary, whence what we call *beauty*, reſults. Hence ariſe thoſe different opinions of a *beautiful* thought, a *beautiful* woman, a *beautiful* painting, &c. The principles of *beauty*, according to Mr. Hogarth, are fitneſs, variety, uniformity, ſimplicity, intricacy, and quantity. Analyſis of Beauty.

Dr. Hutcheſon makes uniformity amidſt variety the ſource of *beauty*; and he refers our ideas of it merely to an implanted ſenſe. Inquiry into the Original of our Ideas of Beauty and Virtue. See Sense.

M. Perrault diſtinguiſhes two kinds of *beauty* in architecture, which correſpond with the two ſpecies of *beauty* above; the one, he calls *poſitive* and *convincing*, ſuch as the richneſs of the materials, grandeur of the ſtructure, neatneſs of the workmanſhip, ſymmetry, &c. The others he calls *arbitrary*, which depend on the will, and which would admit of having their proportions changed without deformity. Theſe only pleaſe by the connexion, or aſſociation of their ideas with others of a different kind which pleaſe of themſelves; they owe their *beauty* to that prepoſſeſſion of the mind, whereby a thing, whoſe value we do know, inſinuates an eſteem for others which we do not.

Thus, he obſerves, there are many things in architecture, which reaſon and good ſenſe would judge deformed, and which, however, cuſtom has not only made tolerable, but even *beautiful*, by their being always joined with other *beauties* that are poſitive. Thus, being at firſt pleaſed with viewing them in company, and merely on account of their company, at length we become pleaſed with them alone; and thus we frequently grow fond of faults, and fall in love with deformity.

BECAH, or Bekah, a Jewiſh coin, being half a shekel.

In Dr. Arbuthnot's table of reductions, the *bekah* amounts to $13\frac{11}{16}$*d.* in Dr. Prideaux's computation to 1*s.* 6*d.*

Every Iſraelite paid an hundred *bekahs* a head every year for the ſupport of the temple. Calmet.

BECALMING, in the *Sea Language*, is when any thing keeps the wind off or away from a veſſel.

Thus one ſhip is ſaid to *becalm* another, when ſhe comes up with her on the weather-ſide: the like is ſaid of the ſhore, when it keeps the wind away. A ſhip is likewiſe ſaid to be *becalmed*, when there is no wind ſtirring.

BECASSE, in *Natural Hiſtory*. See Woodcock.

BECASSINE, in *Zoology*, a name given by many to the *tringa minor*, or, as we commonly call it, the *ſandpiper*.

BECCA, in the *Materia Medica of the Ancients*, a name given to a fine kind of reſin, collected from the turpentine and maſtic-trees of Greece and Syria, and mixed together for uſe. It was much eſteemed formerly, and not only uſed in the country where it was produced, but carried in great quantities to Mecca, and other parts of the Turkiſh dominions, where it was valued at a very great rate.

Becca *Bunga*. See Brooklime.

BECCIFAGO, in *Zoology*, the name of a ſmall bird, ſcarce ſo large as the common linnet, and with a very remarkable ſhort body. Its head, neck, back, wings, and tail, are of a greeniſh grey, and in ſome of the birds of a greeniſh brown. It feeds on vegetables, berries, &c. and is common in the north of England, where it is called the *pettychaps*. Ray.

BECHICS, Bechica, medicines proper for relieving coughs.

The word is formed of the Greek βηξ, βηχος, *a cough*.

Bechics amount to much the ſame with what we otherwiſe call *pneumonics*, *thoracics*, expectorants, and pectorals.

Bechic *pills*. See Pill.

BECK, a little river or brook, called alſo rivulet, or rill.

According to Verſtegan, the original word is *beke*, which properly imports a ſmall ſtream of water iſſuing from ſome bourn or ſpring.

Hence *hell-becks*, little brooks ſo called, on account of their ghaſtlineſs and depth, or rather from their being covered, or much concealed. See Hell.

Beck is chiefly uſed among us in the compoſition of names of places originally ſituate on rivulets; hence Welbeck, Bournbeck, &c.

The Germans uſe *beck* in the ſame manner.

BECKETS, in the *Marine*, ſignify large hooks, or circular wreaths of rope, or wooden brackets, uſed to confine ropes, tackles, oars, or ſpars, in a convenient place, till they are wanted. And, *to put the tacks and ſheets in the beckets*, is to hang up the weather-main and fore-ſheet, and the lee-main and fore-tack, to a little knot and eye-*becket* on the fore-moſt main, and fore-ſhrouds, when the ſhip is cloſe-hauled, to prevent them from hanging in the water.

BECTASSE, a ſect among the Turks, denominated from their founder Bectaſh, preacher to ſultan Amurath.

All the Janizaries belonging to the Porte are of the religion of *Bectaſſe*, and are ſaid to have derived their origin from the founder of this ſect.

BED, a place prepared to ſtretch and compoſe the body on, for reſt and ſleep; made chiefly of feathers incloſed in a ticken caſe.

We ſay a feather *bed*, a down *bed*; a ſtanding *bed*, a ſettee *bed*, a tent *bed*, a truckle *bed*, &c.

No *beds* are to be ſold, except filled with one ſort of ſtuffing only; e. gr. feather *beds* with only dry pulled feathers; and down *beds* with clean down alone. No ſcalded feathers are to be mixed with the former; nor fen-down with the latter, on pain of forfeiture; the mixture of ſuch things being conceived as contagious for man's body to lie on. Stat. 11 Hen. VII. cap. 19.

Alſo *bed* quilts, matraſſes, and cuſhions ſtuffed with horſe-hair, fen-down, goats-hair, and neats-hair, which are dreſſed in lime; and which the heat of man's body will cauſe to exhale and yield a noxious ſmell, whereby many of the king's ſubjects have been deſtroyed, are prohibited by the ſame ſtatute.

The ancient Romans had various kinds of *beds* for repoſe; as their *lectus cubicularis*, or *chamber-bed*, whereon they ſlept; their *table-bed*, or *lectus diſcubitorius*, whereon they eat (for they always eat lying), there being uſually three perſons to one *bed*, whereof the middle place was accounted the moſt honourable, as well as the *middle bed*.—Theſe *beds* were unknown before the ſecond Punic war: the Romans, till then, ſat down to eat on plain wooden benches. As for the ladies, it did not ſeem at firſt conſiſtent with their modeſty to adopt the mode of lying; accordingly they kept to the old cuſtom all the time of the commonwealth; but, from the firſt Cæſars, they eat on their *beds*. As to the youth, who had not yet put on the *toga virilis*, they were long kept to the ancient diſcipline. When they were admitted to table, they only ſat on the edge of the *beds* of their neareſt relations. Never, ſays Suetonius, did the young Cæſars, Caius and Lucius, eat at the table of Auguſtus; but they were ſet *in imo loco*, or, as Tacitus expreſſes it, *ad lecti fulcra*. From the greateſt ſimplicity, the Romans, by degrees, carried their dining *beds* to the moſt ſurpriſing magnificence. Pliny aſſures us, it was no new thing to ſee them covered over with plates of ſilver, adorned with the ſofteſt mats, and the richeſt counterpanes. Hiſt. Nat. lib. xxxiii. cap. 11.—They had alſo their *lectus lucubratorius*, whereon they ſtudied; and a *lectus funebris*, or *emortualis*, whereon the dead were carried to the pile. See FUNERAL.

BED *of ſtate*. See PARADE.

BED *of juſtice, lit de juſtice*, in the French *Laws*, denotes a throne whereon the king is ſeated in parliament.

In this ſenſe, the king is ſaid to hold his *lit de juſtice*, when he goes to the parliament of Paris, and holds a ſolemn ſeſſion, under a high canopy erected for the purpoſe.

The *bed of juſtice* is only held on affairs relating to the ſtate; on which occaſion, all the officers of the parliament appear in red robes; at other times they wear black ones. Several authors have treated expreſly on the ceremonies of the *bed of juſtice*.

BED *of a great gun*, is a piece ef plank laid within the cheeks of the carriage, on the middle tranſum, for the breech of the gun to reſt on.

BED or *ſtool of a mortar*, is a ſolid piece of oak, in form of a parallelopiped, bigger or leſs, according to the dimenſions of the mortar, hollowed a little in the middle to receive the breech, and half the trunions.

On the ſides of the *bed* are fixed the cheeks or brackets by four bolts of iron.

In ſhips, when the decks lie too low from the ports, ſo that the carriages of the pieces, with the trucks, cannot mount the ordnance ſufficiently, but that they lie too near the gun-wale; the method is to make a falſe deck for ſo much as the piece will require for her traverſing to raiſe it higher; and this they call a *bed*.

BED, in *Gardening*, a piece of made-ground, raiſed above the level of the adjoining ground, uſually ſquare or oblong, and enriched with dung, or other amendments; intended for the raiſing of herbs, flowers, ſeeds, roots, or the like.

BEDS for raiſing melons, muſhrooms, and the like, are commonly denominated *ridges*.

Muſhrooms raiſed on *beds* are not ſo good as thoſe which grow at large in the natural ſoil. See HOT-*Bed*.

BEDS, in ſpeaking of hops, denote the floor whereon they are ſpread to dry.

BED *of corn* is a heap, flat at top, three or four feet high, otherwiſe called a *couch*.

Corn, in granaries, keeps beſt in *beds* or couches.

BED-*algenſe*, a name given by the Arab aſtronomers to a fixed ſtar of the firſt magnitude in the right ſhoulder of ORION.

Bed-algenſe is of a ruddy colour, by which it is eaſily diſtinguiſhed.

BED, in *Maſonry*, denotes a COURSE or range of ſtones.

BED, *joint of the*, is the mortar between two ſtones placed over each other.

BED, in *Sea Language*, a flat, thick piece of timber, laid under the quarters of caſks, containing any liquid, and ſtowed in the ſhip's hold.

BED *of a river*, the bottom of the channel in which the ſtream flows.

BEDS, in ſpeaking of minerals and foſſils, ſignify certain STRATA, or layers of matter diſpoſed over each other.

BEDS, in the *New Huſbandry*, denotes the ſpaces occupied by the rows of corn, in contradiſtinction from the open ſpaces between them, which are called ALLEYS.

BED-CHAMBER.—*Lords or Gentlemen of the* BED-CHAMBER, are perſons of the firſt rank, ten in number; whoſe office is, each in his turn, to attend a week in the king's *bed-chamber*, lying by the king on a pallet-bed all night, and to wait on the king when he eats in private.

The firſt of theſe is called *groom of the* STOLE.

BED-MOULDING, or BEDDING-*moulding*, in *Architecture*, is a term uſed by the workmen of thoſe members in a corniche, which are placed below the coronet.

A *bed-moulding* uſually conſiſts of theſe four members, an ogee, a liſt, a large boultine, and another liſt under the coronet.

BEDALACH, in the *Materia Medica*, a name given by ſome writers to the gum bdellium; but particularly to that kind of it which was brought from Arabia, and was of a yellowiſh colour, like wax.

BEDAUDE, in *Natural Hiſtory*, a name given by French authors to a ſort of prickly CATERPILLAR found on the elm.

BEDDING, *lectoria*, in reſpect of horſes and other cattle, denotes ſtraw or litter ſpread under them to lie on.

Bedding, in ſpeaking of a roe, is uſed by ſportſmen, for the lodging of that beaſt.

A roe is ſaid to *bed*; a hart to *harbour*; a fox to *kennel*.

BEDENGIAN, in *Botany*, a name given by Avicenna and Serapion to the *poma amoris*, or *love-apples*, a ſort of fruit uſed in food by the Italians, and ſome other nations, and ſeeming to be the third kind of the *ſtrychnos*, or *ſolanum*, mentioned by Theophraſtus. That author firſt deſcribes two kinds of this plant, the one of which occaſioned ſleepy diſorders, and the other threw people who eat of it into madneſs. After theſe, which he properly accounts poiſonous kinds, he mentions a third, which was cultivated in gardens, for the ſake of the fruit, which, he ſays, is large and eſculent. This is certainly the ſame with *bedengian*, or *poma amoris*.

BEDOARA, in *Botany*, a name uſed by the Arabians, and ſome other authors, for the white thorn.

BEDRIP, or BEDREPE, or BEDERAPE, the cuſtomary ſervice which inferior tenants anciently paid their lord, by cutting down his corn, or doing other work in the field. The word is formed from the Saxon *biddon*, *to pray*, and *repe*, *to reap*, or *cut corn*.

BEDSTRAW, ſee LADY's *Bedſtraw*.

BEE, in *Phyſiology* and *Huſbandry*, a winged, favificous inſect, bred from maggots or worms, that are *apoda*, or without feet; remarkable for its ſkill and induſtry in collecting honey and wax from flowers, &c. and on that account frequently preſerved in gardens. In the Linnæan ſyſtem, it is a genus of inſects belonging to the claſs of *hymenoptera*, and comprehending fifty-five different ſpecies. Beſide the common *honey-bee*, Mr. Ray reckons nine other ſpecies, which are found wild about the fields. To this ſpecies of *hive-bees* belong the common *working-bee*, the *drones*, and the *queen-bee*.

BEES, *age of*. The large drones live but a little while, being deſtroyed without mercy by the working *bees*, probably to ſave honey. But there is another ſort of drones, lately diſcovered, no larger than the working *bees*, and not eaſily to be diſtinguiſhed from them, the age of which has not yet been aſcertained. See DRONE.

Writers are not agreed as to the age of the honey-*bees*. Some maintain that they are annual, and others ſuppoſe that they live many years. Many of them, it is well known, die annually of hard labour; and though they may be preſerved by ſucceſſion in hives, or colonies, for ſeveral years, the moſt accurate obſervers are of opinion, that their age is but a year, or, at the longeſt, no more than two ſummers.

BEE, *anatomy and ſtructure of*. This inſect is divided by two ligaments into three principal parts; viz. the head, the breaſt, and the belly. The head is furniſhed with two eyes of an oblong figure, and black colour, which are guarded by a horny tunicle, not eaſily penetrated. Between the eyes, near the middle of the head, are placed the *antennæ*, or pair of horns, which are the principal inſtruments of feeling, eſpecially in a dark hive. The jaws open to the right and left, and ſerve to carry out of the hives any thing that incommodes or offend them. Theſe are armed with teeth, which they make uſe of in their wars with each other, and the wounds of which are always mortal. The trunk, or tongue, is long and taper, and extremely pliant and flexible, adapted to the purpoſe of penetrating to the bottom of the flowers, and exhauſting them of their mellifluous juice. This part is porous, and compoſed of circular fibres, ſo that it may be contracted and folded up, when it is not uſed; and it is likewiſe fortified againſt injury by four ſtrong ſcales, two of which ſheath it, and the other two, which are larger, encompaſs the whole. Lewenhoeck calls this part the *wiper*, and Dr. Garden deſcribes it under the name of the *ſucker*, or *proboſcis*. Phil. Tranſ. Nº 94, and Nº 175.

The breaſt of the *bee* is of a cylindrical, or rather a ſpheroidical form; on each ſide of the breaſt there are two wings, and underneath ſix legs of unequal length, three on the right, and three on the left, the paws of which are furniſhed with ſmall hooks, that may be ſeen with the microſcope, whereby they faſten themſelves together in hiving and ſwarming, and alſo with a ſpongy ſubſtance, which preſerves their claws from injury. The belly of the *bee* is formed by ſix rings, which are capable of extenſion or contraction, as occaſion requires, and within theſe plaits they fix and carry their wax. The belly, beſide the inteſtines, contains a bag or bladder, in which are lodged the juices collected from flowers, and out of which it is afterwards diſcharged, by the two canals through which it was at firſt conveyed, into the cells of the magazine for winter ſupply. The ſting of the *bee* is a very curious weapon, and, when examined by the microſcope, appears of a very ſurpriſing ſtructure. It has a horny ſheath, or ſcabbard, which includes two bearded darts. This ſheath ends in a ſharp point, near the extremity of which a ſlit opens, through which, at the time of ſtinging, the two bearded darts are protruded beyond the end of the ſheath; one of theſe is a little longer than the other, and fixes its beard firſt, and the other inſtantly following, they penetrate alternately deeper and deeper, taking hold of the fleſh with their beards or hooks, till the whole ſting is buried in the fleſh; and then a venomous juice is injected through the ſame ſheath, from a little bag at the root of the ſting, which occaſions an acute pain, and a ſwelling of the part, that ſometimes continues ſeveral days. But this is beſt prevented by enlarging the wound directly, to give it a diſcharge. Mr. Derham counted on the ſting of a waſp eight beards on the ſide of each dart, ſomewhat like the beards of fiſh-hooks; and the ſame number are to be counted on the darts of the *bee's* ſting. Derham's Phyſ. Theol. p. 241. Baker's Microſc. &c. p. 210.

When theſe beards are ſtruck deep in the fleſh, if the wounded perſon ſtarts, or diſcompoſes the *bee* before it can diſengage them, the ſting is left behind ſticking in the wound; but if he hath patience to ſtand quiet, the *bee* will bring the hooks cloſe to the ſides of the darts, and withdraw the weapon; in which caſe, the wound is always much leſs painful. A waſp is not ſo liable to leave its ſting in the wound as a *bee*; the beards of it being ſhorter, and the inſect more vigorous and nimble in its operations. The *bee* is covered with a fine hair, ſmooth, and ſhining like velvet.

Bees, *architecture of*. See Honey-*combs*.

Bees, *colonies of*. See Hive.

Bees, *generation of*. Theſe inſects begin to breed in the upper part of the hive, in the empty cells adjoining to thoſe that are filled with honey; and they deſcend gradually into the lower parts, as the flowers which furniſh them with the means of ſubſiſtence increaſe; and the brood is carried to the outermoſt part of the combs. The queen-*bee* lays an egg, of an oblong figure, and larger at one end than the other, at the bottom of each cell; fixing it to one of the angles by its ſmaller end, whilſt the other end points exactly to the oppoſite angle. Sometimes more than one egg has been depoſited in the ſame cell; when this is the caſe, the working *bees* remove the ſupernumerary eggs, and leave only one in each cell. On the firſt or ſecond day after the egg is lodged in the cell, the drone *bee* injects a ſmall quantity of whitiſh liquid, which in about a day is abſorbed by the egg. On the third or fourth day is produced a worm or maggot, which, when it is grown ſo as to touch the oppoſite angle, coils itſelf up in the ſhape of a ſemicircle, and floats in a proper liquid, whereby it is nouriſhed and enlarged in its dimenſions: this liquor is of a whitiſh colour, of the thickneſs of cream, and of an inſipid taſte like flour and water. Naturaliſts are not agreed as to the origin and qualities of this liquid; ſome have ſuppoſed, that it conſiſts of ſome generative matter, injected by the honey *bees* into each cell, in order to give fecundity to the egg; but the moſt probable opinion is, that it is the ſame with what ſome writers have called the *bee-bread*; and that it is a mixture of water with the juices of plants and flowers collected merely for the nutrition of the young, whilſt they are in their weak and helpleſs ſtate. Whatever be the nature of this aliment, it is certain that the common working *bees* are very induſtrious in ſupplying the worms with a ſufficient quantity of it. The worm is fed by the working *bees* for about eight days, till one end touches the other in the form of a ring; and when it begins to feel itſelf uneaſy in its firſt poſture, it ceaſes to eat, and begins to unrol itſelf, thruſting that end forward towards the mouth of the cell, which is to be the head. The attendant *bees*, obſerving theſe ſymptoms of approaching transformation, deſiſt from their labours in carrying proper food, and employ themſelves in faſtening up the top of the cell with a lid of wax, formed in concentric circles, and by their natural heat in cheriſhing the brood, and haſtening the birth. In this concealed ſtate the worm extends itſelf at full length, and prepares a web of a ſort of ſilk, in the manner of the ſilk-worm; this web forms a complete lining for the cell, and affords a convenient receptacle for the transformation of the worm into a nymph, or chryſalis. Some naturaliſts ſuppoſe, that, as each cell is deſtined to the ſucceſſive breeding of ſeveral worms, the whole web, which is compoſed of many cruſts or doubles, is, in reality, a collection of as many webs as there have been worms. M. Maraldi apprehends, that this lining is formed of the ſkin of the worm thrown off at its entrance into the nymph ſtate; but it is urged, that if the cells are opened when newly covered by the *bees*, the worm within will be found in its own form, and detected in the art of ſpinning its web; and by means of glaſſes it will be found compoſed of fine threads, regularly woven together, like thoſe of other ſpinning animals.

In the ſpace of eighteen or twenty days the whole proceſs of transformation is finiſhed, and the *bee* endeavours to diſcharge itſelf from confinement, by forcing an aperture with its teeth through the covering of the cell; the paſſage is gradually dilated; ſo that one horn firſt appears, then the head, and afterwards the whole body: this is uſually the work of three hours, and ſometimes of half a day. The *bee*, after it has diſengaged itſelf, ſtands on the ſurface of the comb, till it has acquired its natural complexion, and full maturity and ſtrength, ſo as to become fit for labour. The reſt of the *bees* gather round it in this ſtate, congratulate its birth, and offer it honey out of their own mouths. The *exuviæ*, and ſcattered pieces of wax which are left in the cell, are removed by the working *bees*; and the *matrix* is no ſooner cleanſed, and fit for new fecundation, but the queen depoſits another egg in it; inſomuch that, Mr. Maraldi ſays, he has ſeen five *bees* produced in the ſame cell, in the ſpace of three months. The young *bees* are eaſily diſtinguiſhed from the others by their colour; they are grey, inſtead of the yellowiſh brown of the common *bees*. The reaſon of this is, that their body is black, and the hairs that grow upon it are white, from the mixture of which ſeen together reſults a grey; but this colour forms itſelf into a browniſh yellow by degrees, the rings of the body becoming more brown, and the hairs more yellow.

The *drones* owe their original to the ſame cauſe with the honey-*bees*; they are generated after the ſame manner, only in different cells deſignedly prepared for them in the drone-comb; of which there is one in each hive, often two, and ſometimes three. The circumſtances that attend the production of the *queen-bee* are more peculiar. See Drone and Queen-*bee*.

Bees, *government of*. See Queen-*bee*.

Bees, *hiving of*. See Hive and Hiving.

Bees, *oeconomy of*. Naturaliſts relate wonders on this ſubject. The moral virtues have been all, at one time or other, attributed to the *bees*; and they have been particularly celebrated for their prudence, induſtry, mutual affection, unity, loyalty to their ſovereign, public ſpirit, ſobriety, and cleanlineſs. The ſagacity of *bees* in foreſeeing rain has been often mentioned; but it is very queſtionable. Though ſome of the accounts that have been given of theſe inſects are fabulous, yet intimate acquaintance with them in their domeſtic operations hath furniſhed many real facts that are as ſurpriſing as thoſe which are groundleſs. It muſt not however be omitted, that at certain times, when they think their ſtores will fall ſhort, they make no ſcruple to throw out of the hives their own offſpring; the nymphs, and young *bees* of the drone kind, ſcarce extricated from their covering, have been carried away, and left to periſh. Though they are juſt in their own kingdom, and to thoſe who may properly be called their fellow-ſubjects, they rob and plunder ſtrangers and foreigners whenever they have power and opportunity; and they have frequent battles in committing depredations on neighbouring colonies and hives, or in ſelf-defence, which end fatally to many of their number. But it ſhould be obſerved that this never happens, unleſs in the ſpring or autumn, when the weather is warm, and honey ſcarce, and there are no flowers to produce it. In this caſe, when they have ranged the fields without ſucceſs, they endeavour to ſupply themſelves, at the hazard of their lives, from the ſtocks of other *bees*. However, if the queen of either hive that happens to be engaged is killed, the conteſt is finiſhed, and both parties unite under the ſurvivor.

The induſtry and activity of *bees* in their domeſtic labours afford a very inſtructive and amuſing ſpectacle; all are buſily engaged in their ſeveral departments; whilſt ſome are employed in gathering honey or wax, others repair rotten combs; others carry out the dead, and cleanſe the filth; others keep guard, placing themſelves in five or ſix files, eight or ten deep, upon the floor of the hives, ſo that all the *bees* at entrance muſt paſs between them; ſome are even ſaid to ſerve for bridges, or ladders, for others to paſs over; and when they are tired with labour, they recruit themſelves with reſt. For this purpoſe they form ſmaller or larger cluſters in the following manner: each *bee*, with its two fore-legs, lays hold of the hinder legs of the *bee* that is next above it, and thus a chain is made by the ſucceſſive application of one to another, and the firſt *bee* ſupports the weight of all the reſt to the bottom of the chain. The larger cluſters are only a multiplicity of theſe chains, of which there are ſometimes many hundreds together. The *bees* never lay hold of any part of one another, except the legs. In this way they likewiſe guard themſelves from the effects of cold, and continue for ſeveral weeks in a torpid ſtate.

Bees, *preſervation of.* The preſervation of this induſtrious and uſeful inſect is an object of great importance; and it chiefly depends on ſupplying them with a ſufficient quantity of food, on guarding them from their enemies, and collecting the produce of their labour, without deſtroying them. Beſide the attention which ſhould be paid to the neceſſities of *bees*, in chuſing the ſituation of an APIARY, it may be neceſſary to feed them toward the cloſe of autumn, and again in the ſpring, if they appear to have conſumed their winter ſtock. This ſhould be done, eſpecially in cloudy miſty weather, when they go little abroad, and when ſeveral days of bad weather immediately follow their ſwarming. Mr. Thorley directs, that no hive ſhould be kept which does not weigh twenty pounds; and that the ſupply ſhould be given in quantities of honey, which is their proper food, not leſs than a pound and a half, or two pounds, at a time. The honey ſhould be firſt diluted with water, or ſmall beer, and then poured into an empty comb; a drone-comb is the ſtrongeſt, and the beſt for the purpoſe; and in the evening, when the *bees* are quiet, the hive ſhould be gently raiſed on one ſide, and the comb put under it; the contents will be conveyed away the next day into the ſeveral magazines.

Reaumur recommends a plate of liquid honey, unmixed with water, croſſed with ſtraws, and covered with a paper full of holes, through which the *bees* will ſuck the honey, without daubing themſelves. But care ſhould be taken that the hive be well guarded from robbers, whenever it is provided with a freſh ſupply. The winter-quarters of *bees* ſhould likewiſe be well ſecured both againſt the weather, and againſt other enemies that would annoy them. Mild winters, as well as ſevere cold, are injurious; ſun-ſhine in winter tempts them to go abroad, and expoſes them to the fatal effects of ſudden changes, either of cold or rain. *Bees*, it has been remarked, are moſt likely to ſurvive in cold winters, becauſe they are then in a torpid ſtate, and require little nouriſhment, provided the apiary be well ſecured from northerly and eaſterly winds; whereas a ſmall degree of warmth enlivens them, and they conſume their winter ſtock, and are left deſtitute in a cold, wet ſpring. When they are chilled, and apparently dying by cold, and the cluſters of them are broken, ſo that they drop down in the hive, they may be recovered by a ſmall degree of heat. Varro and Columella adviſe hot aſhes to be laid about the hive, or ſprinkled over cluſters of *bees* which lie ſeemingly dead at the bottom. But a ſufficient warmth may be given them by putting them into a handkerchief, and breathing upon them, or by placing them in the ſun-beams, and laying them before the fire. This precaution ſhould be uſed in time; otherwiſe, when their vitals are impaired, it is impoſſible to recover them. However it is much to be wiſhed, that a method could be found of preſerving all the hives from injury, without removing them out of the places where they ſtand during the ſummer: Reaumur made many attempts for this purpoſe. Some hives he covered over with ſtraw, by means of ſticks fixed around them, and reaching a few inches above the top; but the moſt ſucceſsful method was that of preſerving them in large tubs with earth or hay; contriving, at the ſame time, to convey-air to them through a ſquare tube of wood, two inches in width, and half an inch in depth, which paſſed through the ſide of the tub, and of ſuch a length as to reach the mouth of the hive, and to project three or four inches from the ſides of the tub. After all, the common ſtone covering, which is generally uſed in England, is ſufficient for the purpoſe.

There are other enemies, beſide hunger and cold, againſt which the proprietors of *bees* ſhould be cautioned. It has been obſerved already, that different colonies of *bees* ſometimes plunder each other; and theſe rovers make their attacks chiefly in ſpring and autumn. The moſt effectual way to guard againſt their incurſions is to leſſen the entrance into the hive, ſo as to leave room only for two or three *bees* to paſs abreaſt; or to ſtop up the hives that are attacked, till the rovers diſappear; or if ſtrangers have gained admittance, the proper inhabitants of the hive may be rouſed to ſelf-defence by diſturbing them with a bunch of ſtinking madder, faſtened to the end of a ſmall ſtick of a convenient length; thus their reſentment will be rouzed, and they will inſtantly ſeize the robbers. This, indeed, is needleſs, if the queen is ſafe. However, if the hives that are attacked have but few *bees*, and little honey, it is better to take them than to ſtand a trial.

Hornets and waſps are alſo very formidable enemies; their neſts ſhould be carefully deſtroyed. Mice ſhould be guarded againſt, by diminiſhing the entrance into the hives as the cold comes on, and the *bees* are leſs able to defend themſelves; and the hives may be placed in ſuch a manner, that it will be impoſſible for the mice to reach them. Spiders and caterpillars are very deſtructive to *bees*; a ſpecies of the latter, called the wax-worm, or wax-moth, becauſe it feeds on wax, lays its eggs in the hive, which turn to maggots that are very noiſome and prejudicial. Hives of *bees* that have ſwarmed more than once, and ſuch as contain little honey, are moſt expoſed to theſe inſects; for the empty combs ſerve them for ſhelter, and the wax ſupplies them with food. Theſe hives ſhould be cleaned at leaſt once a week; and the ſtools on which they reſt, where the moths are laid by the *bees*, ſhould be cleaned every morning. But they cannot be entirely deſtroyed, without taking away the infected hive, removing the *bees*, and cleanſing it of the moths, before it is reſtored to its former occupiers. *Bees* are often troubled with lice, which may be deſtroyed by ſtrewing tobacco over them. The depredations of birds, and particularly of the houſe-lark and ſwallow, ſhould be carefully prevented.

Theſe inſects are ſubject to a kind of purging in the ſpring, which is often very fatal. Madame Vicat, in the Memoires, &c. of the Berne Society for 1764, aſcribes this diſtemper to the honey which the cold has candied in the hive. Columella ſuppoſes that it is an annual diſtemper, occaſioned by ſpurge bloſſoms and elm ſeeds; and he adviſes giving them roſemary and honey, diluted with water. The moſt effectual cure is that preſcribed by Ariſtomachus, which is the removal of the vitiated combs, or of thoſe in which there are open cells containing candied honey. Others attribute this diſeaſe to their feeding on pure honey, and recommend their being fed with a honey-comb taken out of another hive, the cells of which are filled with crude wax, or *bee*-bread. Perhaps the true cauſe, and the effectual remedy of this diſeaſe, are ſtill unknown.

For the method of preſerving *bees* in hives and boxes, and of collecting the produce of their labours without deſtroying them, ſee Hive, Honey, and Wax.

Bees, *ſex of.* There are in every hive or colony three ſorts of *bees*, viz. the ſovereign or queen, the working or honey-*bees*, and the drones. The working *bees* have generally been ſuppoſed to be neutral, or of neither ſex; but M. Schirach, in his Hiſtoire Naturelle de la Reine des Abeilles, &c. publiſhed in 1772, has advanced a new and ſingular opinion on this ſubject. He ſuppoſes that all the common, or honey-*bees*, are females in diſguiſe; in which the organs that diſtinguiſh the ſex, and particularly the *ovaria*, are obliterated, or, at leaſt, through their extreme minuteneſs, they have not yet been obſerved; and that every one of theſe *bees*, in the earlier period of its exiſtence, was capable of becoming a queen-*bee*, had it been lodged and fed, and brought up, when in the worm-ſtate, with that deſign. He adduces a great variety of experiments in confirmation of this hypotheſis: in one inſtance two ſpoonfuls of common *bees* were ſhut up in a ſmall box, four inches ſquare, with a piece of brood-comb of the ſize of a crown-piece, containing worms of three days. This ſmall colony, upon examining it four days afterwards, had completed two royal cells, which was a certain indication that one or more queens was to be produced. He likewiſe challenges any perſons to chooſe a piece of the common brood-comb, as ſmall as they pleaſe, and to deſtroy all the eggs, worms, and nymphs, contained in it, reſerving only one worm of their own choice, and leaving it in its cell; and he undertakes, by the aſſiſtance of the working *bees*, to produce this worm metamorphoſed into a queen-*bee*. M. Schirach has more than once fulfilled his engagement. M. Bonnet, the celebrated naturaliſt of Geneva, was proſelyted to this opinion.

The drones have been ſuppoſed by many to be the males; and later experiments and diſcoveries have confirmed this opinion. See Drones and Queen-*bee*.

There is in ſome parts of America a very different ſpecies of *bees* from ours; and the manner of erecting their combs, and lodging their honey, is not leſs different than their form. Their combs are compoſed of a ſeries of ſmall bottles or bladders of wax, of a duſky brown, or blackiſh colour; and each of theſe is much of the ſize and ſhape of a Spaniſh olive. They hang together in cluſters, almoſt like a bunch of grapes, and are ſo contrived, that each of them has its aperture, while the *bees* are at work upon it; but as ſoon as it is filled with honey, this aperture is cloſed, and the *bees* leave it, and go to work upon another veſſel. Their lodgings are uſually taken up in the hollow of an old tree, or in ſome cavity of a rock by the ſea-ſide. They are ſagacious in chooſing the moſt ſecure retreats, becauſe their honey is ſo delicious a bait, that they are hunted after by many animals; and they have no power of defending themſelves, having no ſtings, as our *bees* have. The combs are brittle; and the honey is clear and liquid like rock-water. It is uſed by the natives rather as a drink with their food, than as honey. They uſe it alſo in medicine as a purge, drinking half a pint of it in the morning, faſting. Phil. Tranſ. N° 172.

Mr. Dudley ſpeaks of a method of hunting *bees*, for finding their neſts, practiſed of late years in the woods in New England. It conſiſts in catching a *bee*, then letting it fly, and obſerving the way it ſteers; this ſhews the hunter the courſe or bearing of the neſt. To find the diſtance, he takes an offset of an hundred perches, and lets fly another *bee*, belonging to the ſame neſt; the angle or point wherein theſe two courſes interſect, is the place of the neſt. Phil. Tranſ. N° 376; or Abr. vol. vii. part 3. p. 403.

Bees, *ſwarming of*. See Swarm.

Bees, *writers on*. Many authors have written on *bees*. Among the ancients, Ariſtomachus is ſaid to have ſtudied them ſixty years; Philliſcus retired into a deſert wood, that he might have the opportunity of obſerving them to better advantage; Ariſtotle made a great number of curious obſervations on this inſect, which Virgil has put into Latin verſe: they have been enlarged and confirmed by Pliny and others. Theophraſtus has a fragment ſtill extant, Περι μελιτων, *concerning bees*; or, as entitled in Laertius, Περι μελιτος, *of honey*.

Among the moderns, prince Frederic Ceſi, inſtitutor of the Roman Academy of Sciences, wrote expreſly on *bees*; but it is not known what became of the MS. no more than of that promiſed by Swammerdam on the anatomy of the *bee*, the want of which has been much regretted among the French.

Maraldi, and Reaumur in his Hiſt. Inſect. have largely treated of *bees*.

Among the Engliſh, Butler, Gurnay, Mills, Levets, Thorley, Southern, Remnant, Hartlib, Ruſden, Warder, White, Wildman, and others, have diſcourſes expreſly on *bees*. Phil. Tranſ. N° 257. p. 365.

Bee, in *Aſtronomy*. See Apis.

Bee is alſo uſed figuratively to denote ſweetneſs, induſtry, &c. Thus Xenophon is called the Attic *bee*, on account of the great ſweetneſs of his ſtyle. Antonius got the denomination *meliſſa*, or *bee*, on account of his collection of common places.

Leo Allatius gave the appellation *apes urbanæ* to the illuſtrious men at Rome from the year 1630 to the year 1632.

Bee-*bird*. See Colibri.

Bee-*boxes*. See Hive.

Bees-*bread*. See Pain *d'Abeiles*. Thorley, p. 86.

Bee-*eater*, in *Zoology*. See Apivorus *buteo*.

Bee-*flower*, Ophrys. See Twyblade.

Bee-*fly*. See Drone-*fly*.

Bee-*glue*, a ſoft, unctuous matter, employed by *bees* to cement the combs to the hives, and to cloſe up the cells.

Bee-*hive*. See Hive.

Bee, *humble*. See Bombylius.

BEECH-*tree*, *Fagus*, in *Botany*, a tree of the maſt-bearing kind, the characters of which are theſe. It hath male and female flowers on the ſame tree; the male flowers are collected into globular heads, and have no petals, but have ſeveral ſtamina included in an empalement of one leaf. The female flowers have a one-leaved empalement, cut into four parts, but have no petals; the germen is fixed to the empalement, which afterward becomes a roundiſh capſule, armed with ſoft pines, opening in three cells, each containing a triangular nut. This genus belongs to the *monoecia polyandria* claſs of plants in the Linnæan ſyſtem, and comprehends the common chestnut-*tree*. See *Tab. I. of Botany, Claſs* 19.

This tree will grow to a conſiderable ſtature, though the ſoil be ſtony and barren; as alſo upon the declivities of hills, and chalky mountains, where it will reſiſt the winds better than moſt other ſorts of trees: but then the nurſeries for the young plants ought to be made on the ſame ſoil. For if they are raiſed in a good ground, and a warm expoſure, and afterward tranſplanted into a bleak and barren ſituation, they ſeldom thrive, which holds true in moſt other trees. The nurſery therefore ought to be made upon the ſame ſoil with the intended plantation; and the plants annually drawn, that the plantation may be extended.

Theſe trees are very proper to form large hedges to ſurround plantations, or wilderneſs quarters; and may be kept to a regular figure, if cut twice a year, eſpecially if they ſhoot ſtrong; in which caſe, if they are neglected for a ſeaſon or two, it will be difficult to reduce them again. The ſhade of this tree is very injurious to moſt ſorts of plants which grow near it; but is generally believed to be very ſalubrious to human bodies.

Beech-wood is whitiſh, hard, and dry. It crackles in the fire, and is uſed in building and furniture; alſo to make utenſils, as ſhovels, ladles, bellows, ſtools, ſhoes, diſhes, trays, trenchers, dreſſer-boards, fellies of carts, &c.

If *beech*-timber be kept altogether under water, it is little inferior to elm; but if kept dry, or partly wet, partly dry, it is liable to the worm.

That of the mountain-*beech* is whiteſt, and moſt fit for the turner's uſe; that of the field-*beech* is blacker, but more durable. In turning *beech*, it yields a well-ſcented effluvia, not unlike roſes.

The ſcale of *beech*-wood ſerves to make ſcabbards and band-boxes. The bark is uſed as floats for fiſhers nets, inſtead of cork. Its ſhavings are of uſe for fining wine.

Its aſhes, according to Creſcentius, with proper mixtures, are excellent to make glaſs.

Its leaves, gathered about the fall, before they are much froſt-bitten, afford the beſt matraſſes to lay under quilts, inſtead of ſtraw, as being very ſoft, and continuing ſweet for ſeven years. When chewed, they are held good for the gums and teeth.

The ſtagnant water gathered on the hollow of the *beech*-tree, is ſaid to cure tetter-ſcabs and ſcurfs in man and beaſt, by fomentation.

Beech-*galls*, in *Natural Hiſtory*, the name of a ſpecies of galls or protuberances found on the *beech*-tree, and ſerving for the lodgment of inſects.

Theſe galls are found on the leaves of the *beech*, and are ſometimes only one upon a leaf, ſometimes more; they always grow from the ſame point, owing, no doubt, to the fly's having laid ſo many eggs in the ſame ſpot.

Theſe galls are of an oblong figure, and ſomewhat flatted. They reſemble the ſtone of a plum in ſhape, and are ſo hard, that they are not to be broken between the fingers: their ſubſtance ſeems of the ſame nature with that of a nut-ſhell. In each gall there is only one cavity, inhabited by a white worm, which, in time, paſſes through the nymph ſtate into that of the fly, to which it owed its origin.

Beech-*maſt*, the fruit of the *beech*-tree. It fattens hogs and deer, and has ſometimes ſupplied men inſtead of bread. Chios is ſaid to have endured a memorable ſiege by means of it.

Beech-*oil*, an oil drawn from the fruit, or maſt, of the *beech-tree*.

The *beech-maſt* is a kind of triangular ſeed, in form of a nut, or rather acorn, containing a whitiſh, oleaginous pith, of a very agreeable taſte; whereof is made an oil much valued for ſallads, &c.

It is very common in Picardy, and other places, where the maſt abounds. They draw it cold by expreſſion, after the maſt has been ſhelled, and pounded.

An attempt was made, a few years ago, to introduce the manufacture of *beech-oil* in England, and a patent granted to the proprietor, but without ſucceſs; the country people, it ſeems, turning their maſt to better account in feeding the hogs with it, than in ſelling to the patentee, and his co-proprietors, for oil.

BEELE, in *Mining*, an inſtrument uſed by the workmen to break and pick out the ore from the rocks in which it lies. This inſtrument is called by the tin-men in Cornwall a *tubber*. It is an iron inſtrument of eight or ten pounds weight, made ſharp, and ſteeled on both ends, and having a hole in the middle, where the handle is fixed in. When the ore lies in hard rocks, this inſtrument wears out ſo faſt, that it muſt have new points made to it every fortnight. The miners, who dig up the ore in the mines, are, from the uſe of this inſtrument, called *beele*-men; and thoſe who attend them, and whoſe buſineſs it is to take up the matter the others looſen or break up, are, from their inſtrument, which is a broad and hollow iron ſhovel, or a wooden one, with a very ſtrong iron lip, called the *ſhovellers*. In Cornwall, when the ore lies in a hard bed, they allow two ſhovellers to three *beele*-men; and when it lies in a ſoft or earthy matter, two *beele*-men and three ſhovellers are the proportion. Phil. Tranſ. N° 69. p. 2104.

BEEMEN, or Sheemen, in *Aſtronomy*, ſeven ſtars of the fourth magnitude, following each other, in the fourth flexure of the conſtellation Eridanus.

BEER, a popular drink, prepared from MALT and HOPS. The word is Saxon, formed from the German *bier*, of the Latin *bibere*.

Matthiolus takes the *zythum* and *curmi* of the ancients to be the ſame with the *beer* and ALE of our days; and thinks the only difference between *zythum* and *curmi* to have conſiſted in ſome circumſtances of the preparation, which rendered the one ſtronger than the other.

Tacitus, in ſpeaking of the ancient Germans, as alſo Dioſcorides, Galen, &c. condemn *beer*, as prejudicial to the head, nerves, and membranous parts, as occaſioning a more laſting and more uneaſy drunkenneſs than wine, and as promoting a ſuppreſſion of urine, and ſometimes a leproſy.

Meſſ. Perrault, Rainſſant, and others, defend the modern *beer*; urging, that the hops uſed with us, and which the ancients were ſtrangers to, having a faculty of purifying the blood, and removing obſtructions, ſerve as a corrective, and free our drink from the inconveniences objected to that of the ancients.

For the manner of preparing *beer*, ſee HOPS, and BREWING. For its qualities, MALT-LIQUOR.

In New England they make *beer* from maize, or even the bread made thereof. Some phyſicians recommend *beer* made of oats and birch-water, as preferable, in nephritic caſes, to that made of barley. Phil. Tranſ. Nº 97. p. 6135. Nº. 138.

Sour or decayed *beer* may be reſtored divers ways; as by ſalt made of the aſhes of barley-ſtraw, put into the veſſel, and ſtirred; or by three or four handfuls of beech-aſhes thrown into the veſſel, and ſtirred; or, where the liquor is not very ſour, by a little put in a bag, without ſtirring; chalk calcined, oyſter-ſhells, egg-ſhells burnt, ſea-ſhells, crabs eyes, alcalized coral, &c. do the ſame, as they imbibe the acidity, and unite with it into a ſweetneſs.

Beer, it is ſaid, may be kept from turning ſour in ſummer, by hanging into the veſſel a bag containing a new-laid egg, prickt full of little pin-holes, ſome laurel-berries, and a few barley-grains; or by a new-laid egg and walnut-tree leaves. Laurel-berries alone, their ſkin being peeled off, will keep *beer* from deadneſs; and the throwing FIXT AIR into it will reſtore it. Glauber commends his ſal mirabile and fixed nitre, put in a linen bag, and hung on the top of the caſk, ſo as to reach the liquor, not only for recovering ſour *beer*, but preſerving and ſtrengthening it.

Beer taſting of the caſk, may be freed from it, by putting a handful of wheat in a bag, and hanging it to the veſſel. The grounds of *beer* form a very rich manure.

Beer, as a malt liquor, is of ſo great antiquity in this kingdom, that in the year 1492, we meet with a licence from Henry VII. to a Fleming, to export fifty tons of ale, called *beer*.

BEER-*poſſet*. See ZYTHOGALA.

BEER, *eager*, is uſed by callico-printers, chemiſts, lapidaries, ſcarlet-dyers, vinegar-merchants, white-lead-men, &c.

BEER-*meaſure*. See MEASURE.

BEER-*vinegar*. See VINEGAR.

BEES-WAX. See WAX.

BEESTINGS, or BREASTINGS, denote the firſt milk taken from a cow after calving.

The *beeſtings* are of a thick conſiſtence, and yellow colour, ſeemingly impregnated with ſulphur. Dr. Morgan imagines them peculiarly fitted and intended by nature to cleanſe the young animal from the recrements gathered in its ſtomach and inteſtines during its long habitation *in utero*. The like quality and virtue he ſuppoſes in womens firſt milk after delivery; and hence infers the neceſſity of the mother's ſuckling her own child, rather than committing it to a nurſe whoſe firſt milk is gone.

BEET, BETA, in *Botany*, the name of a genus of plants of the *pentandria digynia* claſs, of which the characters are theſe. The flower hath a five-leaved empalement, which is permanent, but no petal, and five ſtamina placed oppoſite to the leaves of the empalement. The germen is ſituated below the receptacle, which afterward becomes a capſule with one cell, having a ſingle ſeed wrapped up in the empalement. There are three ſpecies.

All the ſpecies of this plant are propagated by ſowing their ſeeds in February or March in a looſe, deep ſoil, not over dunged. When they are come up, they muſt be howed out, ſo as to leave them ten or twelve inches aſunder; for, if they have not room, the roots ſeldom grow large. It is a cuſtom with the gardeners about London to ſow carrots on the ſame ground with their *beets*. The carrots are drawn off in the ſummer-time, and the *beets* have then ſufficient time to grow to their ſize. *Beets* are more uſed as a pot-herb, and to eat with ſalt meat, than phyſically. They looſen the belly, and attemperate hot cholic humours. The juice of the roots is ſometimes uſed as an errhine, being ſnuffed up the noſe to clear the head of phlegm, and mucous humours; and by that means to help old head-achs.

The *beet* is one of the five emollient herbs.

BEET, *hare's*, *beta leporina*, a name given by ſome of the old Latin writers to a ſmall green plant of an acrid taſte.

BEET-*fly*, a very ſmall fly, found always among the flowers of the *beet*.

BEET-*gall-inſect*. See GALL-*inſect*.

BEETLE, in *Zoology*. See SCARABÆUS.

BEETLE, *Capricorn*, in *Zoology*, the Engliſh name for the CERAMBYX. The generical characters of theſe inſects are theſe: they have long and ſlender bodies; their horns are long and jointed; and they are fond of places in the neighbourhood of rivers. There are ſix different ſpecies of this inſect deſcribed by Liſter, in his treatiſe De Scarabæis, publiſhed at the end of Mr. Ray's Hiſtory of Inſects.

BEETLE, *oil*, *Meloe*, in *Zoology*, the name of a genus of four-winged flies, whoſe *antennæ* are ſlender and filiform; and the exterior wings are dimidiated. It is called in Engliſh the *oil-beetle*, as being ſoft and mucous to the touch. It is black, but not at all gloſſy, and has been deſcribed by authors under the names *ſcarabæus mollis*, *cantharus unctuoſus*, and *proſcarabæus*. See SCARABÆUS.

BEETLE, *ſtinking*, *Tenebrio*, in *Zoology*, the name of a genus of beetles, the *antennæ* of which are oblong, ſlender, and filiform.

It has no interior wings, in which ſingular deficiency it differs widely from all other beetles; but the form and ſtructure of all its other parts refer it to this claſs. See SCARABÆUS.

Mouffet has called it the *blatta fœtida*. There are ſeveral ſpecies of it.

BEETLE, *water*, *Dytiſcus*, in *Zoology*, the name of a genus of four-winged flies, the *antennæ* of which are ſlender and ſetaceous. They have likewiſe feet formed for ſwimming, and their habitation is generally in the water, whence they have been called in Engliſh, *water-beetles*.

BEETLE, in a mechanical ſenſe, denotes a large wooden inſtrument, formed after the manner of the mallet, having each face bound with a ſtrong iron hoop, to keep it from ſpreading, and uſed for driving piles, ſtakes, paliſades, wedges, and the like.

In this ſenſe, the word is alſo corruptly written in ſome places *boytle*. Skinner derives it from the Engliſh *beating*.

For the military uſe, *beetles*, called alſo *ſtampers*, are thick round pieces of wood, a foot and a half long, and eight or ten inches in diameter, having a handle of about four feet long. Their uſe is for beating or ſettling the earth of a parapet, or about paliſades; which is done by lifting up the *beetle* a foot or two, and letting it fall with its own weight.

The name *beetle* is alſo given to the paviour's rammer, or inſtrument, wherewith the ſtones are beaten down, and faſtened.

BEEVES, a general name for oxen.

BEG, or BEY, is a Turkiſh title, properly ſignifying *lord*.

The word is alſo written *begh*, or *beig*, ſometimes *bec*, or *bek*, or *bech*; but pronounced BEY.

BEGS, or BEGHS, of Egypt, denote twelve generals, who have the command of the militia, or ſtanding forces of the kingdom, and are to ſecure the country from the inſults of Arabs, as well as to protect the pilgrims in their annual expeditions to Mecca.

The *begs*, ſeveral of whom are deſcended from the ancient race of the Mamalukes, are very rich and powerful, maintaining each five hundred fighting men for their own guard, and the ſervice of their court. On diſcontents, they have frequently riſen in rebellion. They are often at variance with the *baſhaw*, whom they have more than once plundered and impriſoned.

BEGGAR. *Beggars* pretending to be blind, lame, &c. found begging in the ſtreets, are to be removed by the conſtables; and refuſing to be removed, ſhall be whipped, &c. ſtat. 12 Anne; and our ſtatutes have been formerly ſo ſtrict for puniſhing of *beggars*, that in the reign of king Henry VIII. a law was enacted, that ſturdy *beggars* convicted of a ſecond offence, ſhould be executed as felons. But this ſtatute was afterward repealed. See ROGUE and VAGABOND.

BEGGING *order*. See MENDICANT.

BEGHARDI, BEGUARDI, or BEGGHARDI, called alſo in Italy *bizochi*, and in France *beguins*, derive their name from the old German word *beggen*, *begguen*, which ſignifies to *ſeek any thing with zeal and importunity*. This was a general appellation given to no leſs than thirty ſects, or orders, that ſprung up in Europe in the thirteenth century, which differed widely from each other in their opinions, their diſcipline, and manner of living. It was at firſt indiſcriminately applied to all perſons, who embraced, with reſignation and free choice, the horrors of abſolutely poverty; begging their daily bread from door to door, and renouncing all their worldly poſſeſſions an occupations. It was afterwards reſtricted to thoſe, who diſtinguiſhed themſelves by an extraordinary appearance of devotion, and was uſed much in the ſame ſenſe with the term *methodiſt* among us. Theſe perſons formed a ſort of intermediate order between the monks and citizens, reſembling the former in their manner of living, without aſſuming their name, or contracting their obligations. They were divided into two claſſes, which derived their different denominations of *perfect* and *imperfect* from the different degrees of auſterity that they diſcovered in their manner of living. The *perfect* lived upon alms, abſtained from wedlock, and had no fixed habitations. The *imperfect* conformed to the cuſtoms of the reſt of their fellow-citizens in theſe reſpects. The name was at firſt honourable, but by degrees it ſunk into reproach; being adopted by many, who, under the maſk of religion, concealed the moſt abominable principles, and committed the moſt enormous crimes.

The *beghards* of Flanders is a denomination, by which certain unmarried perſons, both bachelors and widowers, are diſtinguiſhed, who formed themſelves into communities of the ſame kind with thoſe of the female *beguines*, reſerving to themſelves the liberty of returning to their former method of life. The firſt ſociety of theſe *beghards* was eſtabliſhed at Antwerp in the year 1228, and continues ſtill; though the brethren of which it is compoſed have long ſince departed from their primitive rule of diſcipline and manners. This firſt eſtabliſhment was ſucceeded by many others in Germany, France, Holland, and Flanders. Theſe fraternities long enjoyed the toleration of the Roman pontiffs; but moſt of their convents are now either demoliſhed, or converted to other uſes. See BRETHREN *of the free Spirit*. Moſheim's Ecc. Hiſt. vol. iii. p. 86. 8vo. 1758.

BEGINNING *of an eclipſe*. See ECLIPSE.

BEGINNING *of the action*. See ACTION.

BEGLERBEG, a Turkiſh title for the chief governor of a province, who has under him ſeveral *beys* or *ſangiacs*, that is, ſubgovernors.

The word is alſo written *beylerbey*, *beglerbey*, *beghelerbeghi*, and *beylerbeg*.—It is compounded of *begler*, *lords*; the plural of *beg*, *lord*, with the word *beg* ſubjoined; importing as much as *lord of lords*.

The next to the vizier *azem*, or the firſt vizier, are the *beglerbegs* in Turky, who, according to Rycaut, may be compared to archdukes in ſome other countries, being the next miniſters below the prime vizier, and having under their juriſdiction many *ſangiacs* or provinces, and their *begs*, *agas*, &c.

To every *beglerbeg* the grand ſignior gives three enſigns or ſtaves, trimmed with a horſe-tail, to diſtinguiſh them from the baſhaws, who have but two, and from ſimple *begs*, or *ſangiac-begs*, who have but one.

The province or government of a *beglerbeg* is called *beglerbeglik*, or *beglierbeglik*. Theſe are of two ſorts; the firſt called *baſile beglerbeglik*, which have a certain rent aſſigned out of the cities, countries, and ſignories allotted to the principality; the ſecond called *ſalianæ beglerbeglik*, for maintenance of which is annexed a certain ſalary or rent, collected by the grand ſignior's officers with the treaſure of the empire.

The *beglerbegs* of the firſt ſort are in number twenty-two, viz. thoſe of Anatolia, Caramania, Diarbekir, Damaſcus, Aleppo, Tripoli, Trebizond, Buda, Temiſwar, &c.

The *beglerbegs* of the ſecond ſort are in number ſix, viz. thoſe of Cairo, Babylon, &c.

Five of the *beglerbegs* have the titles of viziers, viz. thoſe of Anatolia, Babylon, Cairo, Romania, and Buda.

The *beglerbegs* appear with great ſtate, and a large retinue, eſpecially in the camp, being obliged to bring a ſoldier for every five thouſand aſpers rent which they enjoy.

The *beglerbegs* of Romania brought ten thouſand effective men into the field.

BEGLERBEG is alſo a title given to the chief governors of provinces in the Perſian empire, having the command over all kans, ſultans, &c. in their reſpective diſtricts.

BEGONIA, in *Botany*, the name of a genus of plants of the *polygamia monoecia* claſs; the characters of which are theſe: the flowers are of two kinds; the one kind is the barren, or male flower; this is compoſed of four leaves, ſome broader, and others narrower; the other kind, which produces the embryo-fruit, is of the roſaceous ſort, and is compoſed of ſeveral petals, arranged in a circular form, and placed on a foliated cup, which finally becomes a trigonal alated fruit, divided into three cells, and containing ſmall ſeeds.

BEGUINS, devout ſocieties of young women, eſtabliſhed in ſeveral parts of Flanders, Picardy, and Lorrain; who maintained themſelves by the work of their own hands; leading a middle kind of life, between the ſecular and religious, but make no vows. The poor and diſtreſſed were ſupported by the pious liberality of ſuch opulent perſons as were friends to the order.

Theſe ſocieties began at Nieville, in Brabant, A. D. 1226, though others ſay in the year 1207, and ſoon ſpread into France, Germany, Holland, and Flanders, where a conſiderable number of them ſtill ſubſiſt. Their habit was particular, but modeſt; they lived in common, and had men of great piety for their governors.

BEHEADING, a capital puniſhment, wherein the head is ſevered from the body by the ſtroke of an ax, ſword, or other cutting inſtrument.

Beheading was a military puniſhment among the Romans, known by the name of *decollatio*. Among them the head was laid on a *cippus* or block, placed in a pit dug for the purpoſe; in the army, without the *vallum*; in the city, without the walls, at a place near the *porta decumana*. Preparatory to the ſtroke, the criminal was tied to a ſtake, and whipped with rods. In the early ages the blow was given with an ax; but in after-times with a ſword, which was thought the more reputable manner of dying. The execution was but clumſily performed in the firſt times; but afterwards they grew more expert, and took the head off clean, with one circular ſtroke.

In England and France, *beheading* is the puniſhment of nobles; being reputed not to derogate from nobility, as hanging does.

In Scotland they do not behead with an ax, as in England; nor with a ſword, as in Holland and France; but with an edged inſtrument called the MAIDEN.

BEHMISTS, BOHMENISTS, or BOHMISTS, a kind of myſtic philoſophers and followers of Jacob Behmen, commonly called the Teutonic philoſopher.

The *Behmeniſts* are attached to that motley ſpecies of philoſophy firſt introduced by Paracelſus, under the name of THEOSOPHIA.

Behmen, or Bohmen, from whom the ſect takes its denomination, was born in 1575, near Gorlitz, and bred up to the trade of a ſhoe-maker, or taylor, having juſt learning enough to read and write a little, which he acquired at ten years of age. He derived the greateſt part of his myſtical doctrine from the writings of Robert Fludd, a native of England. Wood's Athenæ Oxon. vol. i. p. 610.

In 1600 he was ſeized with a ſpiritual rapture, and ten years after began to compoſe a book on the light he then received, entitled Aurora, being a mixture of *aſtrology*, *philoſophy*, *chemiſtry*, and *divinity*, written in a quaint obſcure ſtyle; ſeven years after he wrote divers others on the ſame model; the chief is the *Myſterium Magnum*. He died in 1624. All his works have been publiſhed together at Amſterdam in 1682, 8vo. His tenets are, that there is a great darkneſs among the ſtars, where the devil holds his principality; that all arts and ſciences flow from the ſiderial ſpirit of this world; that the ſeven liberal arts proceeded from ſeven ſpirits of nature; that all human things are compoſed of the four firſt properties, bitter, ſour, heat, and pain, (Angore).

Quirinus, Kuhlman, Abr. a Frackenberg, and Limmerman, are the moſt diſtinguiſhed among the *Behmeniſts*.

Mr. William Law, an Engliſh viſionary, was an induſtrious and zealous diſciple of Behmen; and he prepared a new edition and tranſlation of his works, which have been publiſhed in 2 vols. 8vo. ſince his deceaſe.

Gilbert Iſcheſchius, and Antagnoſſus, were great oppoſers of *Behmeniſm*.

Dr. Henry More has alſo a piece expreſs againſt *Behmeniſm*; Cenſura Philoſophiæ Teutonicæ, printed in his works, p. 520.

BEHEMOTH, a huge animal mentioned in Scripture, concerning which interpreters are much divided.

BEHEN. See BEN.

BEIBENIÆ *ſtellæ*, a name given by ſome aſtronomers to the principal fixed ſtars in each conſtellation.

The appellation is more particularly given to the ſtars of the firſt magnitude, otherwiſe called the hearts, *corda*, of the ſeveral conſtellations; though ſome would diſtinguiſh between *corda*, and *beibeniæ ſtellæ*, reſtraining the former to ſtars only of the firſt magnitude, and extending the latter to ſeveral of the ſecond, or even third.

Hermes has a treatiſe expreſs De Stellis Beibeniis, publiſhed by Junctinus, in his Speculum Aſtrologicum, and alſo in his commentaries upon Jo. de Sacroboſco's book De Sphæra.

BEIDELSAR, in *Botany*, a name by which ſome authors call the Syrian DOGS-*bane*, or *apocynum Syriacum*, a poiſonous plant.

BEISSKER, in *Ichthyology*, a name given by Geſner and others to the fiſh commonly called *muſtela foſſilis*: this is a ſpecies of the COBITIS, diſtinguiſhed by Artedi by the name of the bluiſh COBITIS, with fine black longitudinal lines on each ſide. Schonefeldt calls this the *pœcilia*, and Jonſon the *piſcis foſſilis*.

BEIZA, or BEZIATH, a Hebrew word, ſignifying an *egg*, in Jewiſh *Antiquity*, a certain meaſure in uſe among the Jews; they ſay that the *beiza* contains the ſixth part of a LOG.

The *beiza* is alſo a ſort of gold coin common among the Perſians; it weighs forty *drachmas*, and from this word, not from the city Byzantium, the *bezam* was formed. A *bezam* is worth two *dinars*, and every *dinar* twenty or five and twenty *drachmas*.

BEKKERANISM, or BEKKERIANISM, the ſyſtem or ſentiments of Balth. Bekker, who denied that ſpirits can act or operate on bodies.

The author of this ſyſtem was a Dutch divine, towards the cloſe of the ſeventeenth century, ſtrongly impreſſed with the Carteſian principle, that the eſſence of ſpirit conſiſts in thinking; hence he was led to conclude, that ſpirits cannot act, either on bodies, or on other ſpirits; and therefore he underſtood the declarations of Scripture concerning the operations of ſpirits, in a metaphorical ſenſe. He attributed the poſſeſſions recorded in the Goſpel to bodily diſeaſes, or mental diſorders. Budd. Elem. Phil. Theor. p. 5. cap. 2. § 1—12. See DEMONIAC.

BEL, in *Botany*, the name of a plant called by ſome the *cucumis capparis*, or *caper-cucumber*. This plant is very imperfectly deſcribed to us; and we find among the Arabian writers, that the fruit was called by this name as well as the whole plant. Avicenna, who gives the fulleſt account we have of it, ſays that it was an Indian plant, reſembling in growth the common cucumber-plant, but bearing a fruit like the caper; he tells us that this fruit was the only part of the plant uſed in medicine, and that it was very hot and bitter, being ſomewhat like ginger in the fiery heat of the taſte, and in qualities hot and dry in the ſecond degree, as they expreſſed it; or, according to Dioſcorides, in the third.

BELATUCADRUS, the name of an ancient Britiſh idol, recorded in old inſcriptions; and ſuppoſed by Selden and Voſſius to be the ſame with BELENUS.

BELAY, on board a ſhip, ſignifies the ſame as *faſten*.—Thus they ſay, *belay* the ſheet, or tack, that is, faſten it to the kevel, by winding it ſeveral times round a laſt, &c.

BELCHING. See RUCTATION.

BELEMNITES, or BELENITES, in *Natural Hiſtory*, a kind of figured ſtone, uſually hollow, and a little tranſparent, ſhaped ſomewhat like an arrow, formed of ſmall *ſtriæ*, or threads, radiating from the axis to the ſurface of the ſtone; and which when burnt, or rubbed againſt one another, or ſcraped with a knife, yields an odour like raſped horn. See its figure repreſented in *Tab. of Foſſils*, *Claſs* 10.

The word is formed from the Greek βελεμνον, *arrow*.

The *belemnites* is otherwiſe denominated *dactylus*, or *dactylus idæus*, on account of its bearing a reſemblance to the figure of a finger; by the ancients, *lyncurius lapis*, or *lapis lyncis*, as being ſuppoſed to be generated of the urine of the *lynx*.

Among us, popularly, it is called the thunderbolt, or thunder-ſtone, as having been ſuppoſed to fall in time of thunder.

Dr. Woodward, and a great many other authors, ſuppoſe the *belemnites* to be a native foſſil in its own proper figure; but it is more probably ſuppoſed by others to owe its preſent form to ſome animal body; and to be, like the other formed ſtones, the *echinitæ*, &c. a ſubſtance caſt in a ſhell. Ph. Tr. vol. xlviii. art. 97. and vol. liv. art. 5.

The general diſtribution of the *belemnitæ* is into three kinds; viz. the cylindric, conic, and fuſiform, of which the latter are moſt rare.

The *belemnitæ* are all of an alcalious nature, making a ſtrong effervеſcence with acids. Hence alſo they become abſorbent and reſolvent, and, on theſe accounts, are ranked by phyſicians among antinephritic medicines.

The German writers ſpeak much of the virtue of this foſſil, and it is kept in their ſhops, and ſometimes enters into extemporaneous preſcription. They give it in caſes of the gravel, and all nephritic complaints; and ſay, that it has great virtues againſt the night-mare. With us it is not uſed at all, except among farriers; but, in all probability, it will anſwer the purpoſe of ſpar in any other form; and ſpar has at all times been celebrated for its virtues as a lithontriptic, whether given under the form of the LAPIS JUDAICUS, or that of the OSTRACITES, or, finally, as diſſolved in the water of certain ſprings, which form incuſtrations on things that fall into them.

BELENNUS, in *Zoology*, the name of a ſmall anguilliform fiſh, called by others BLENNIS. It is a ſea-fiſh, and very ſcarce. It approaches much in figure to the Engliſh bull-head, or miller's thumb, the COTTUS of authors.

BELENUS, in *Mythology*, a name which the Gauls gave to the ſun, which they alſo called *Mithra*; and, as ſome ſuppoſe, the ſame with the *Baal* of Scripture, and the *Belus* of the Aſſyrians.

BELFRY, BELFREDUS, is uſed by military writers of the middle age for a ſort of tower, erected by beſiegers to overlook and command the place beſieged.

They were alſo called *berfredi*, *berefredi*, *verfredi*, and *belfragia*. Their ſtructure and uſe are deſcribed in verſe by a poet of thoſe days.

Belfry originally denoted a high tower, whereon centinels were placed to watch the avenues of a place, and prevent ſurprize from parties of the enemies, or to give notice of fires, by ringing a bell. Du-Cange.

In the cities of Flanders, where there is no *belfry* on purpoſe, the tower of the chief church ſerves the ſame end.

The word *belfry* is compounded of the Teutonic *bell* and *freid*, *peace*, becauſe the bells were hung for preſerving the peace.

BELFRY is alſo uſed for that part of a ſteeple wherein the bells are hung.

This is ſometimes called by middle-age writers *campanile*, *clocaria*, and *triſtegum*. Du-Cange.

BELFRY is more particularly uſed for the timber-work, which ſuſtains the bells in a ſteeple; or that wooden ſtructure, to which the bells in church-ſteeples are faſtened.

BELIDES, in *Antiquity*. See DANAIDES.

BELIEF, in its general and natural ſenſe, denotes a perſuaſion, or a ſtrong aſſent of the mind to the truth of any propoſition.

In which ſenſe, *belief* has no relation to any particular kind of means or arguments, but may be produced by any means whatever.—Thus we are ſaid to *believe* our ſenſes, to *believe* our reaſon, to *believe* a witneſs, &c. And hence, in rhetoric, all ſorts of proofs, from whatever topics deduced, are called πιςεις, becauſe apt to get *belief*, or perſuaſion, touching the matter in hand.

BELIEF, in its more reſtrained and technical ſenſe, invented by the ſchoolmen, denotes that kind of aſſent which is grounded only on the authority, or teſtimony, of ſome perſon or perſons, aſſerting or atteſting the truth of any matter propoſed.

In this ſenſe, *belief* ſtands oppoſed to knowledge and ſcience. We do not ſay we *believe* that ſnow is white, or that the whole is equal to its parts; but we ſee and know them to be ſo.—That the three angles of a triangle are equal to two right angles, or that all motion is naturally rectilinear, are not ſaid to be things *credible*, but *ſcientifical*; and the comprehenſion of ſuch truths is not *belief*, but *ſcience*.

But, when a thing propounded to us is neither apparent to our ſenſe, nor evident to our underſtanding; neither certainly to be collected from any clear and neceſſary connexion with the cauſe from which it proceeds, nor with the effects which it naturally produces; nor is taken up upon any real arguments, or relation thereof to other acknowledged truths; and yet, notwithſtanding, appears as true, not by a manifeſtation, but by an atteſtation of the truth, and moves us to aſſent, not of itſelf, but in virtue of a teſtimony given to it—this is ſaid to be properly *credible*; and an aſſent to this is the proper notion of *belief* or FAITH.

BELIEVERS, an appellation given toward the cloſe of the firſt century, to thoſe Chriſtians, who had been admitted into the church by baptiſm, and inſtructed in all the myſteries of religion: they had alſo acceſs to all the parts of divine worſhip, and were authorized to vote in the eccleſiaſtical aſſemblies. They were thus called in contradiſtinction to the *catechumens*, who had not been baptized, and were debarred from theſe privileges.

BELINGELA, in *Botany*, a name given by ſome authors to the *mala inſana*, or *mad-apples*. See MAD-*apple*.

BELL, a popular machine, ranked by muſicians among the number of muſical inſtruments of percuſſion. See MUSIC.

The parts of a *bell* are the body or barrel, the *clapper* within ſide, and the ear or *cannon*, whereby it is hung to a large beam of wood.—Its uſual matter is a kind of compound metal, called *bell-metal*. The thickneſs of its edges is uſually $\frac{1}{12}$ of the diameter, and its height twelve times its thickneſs.—The *bell*-founders have a diapaſon, or *bell*-ſcale, wherewith they meaſure the ſize, thickneſs, weight, and tone, of their *bells*.—For the method of caſting *bells*, ſee FOUNDERY.

The uſes of *bells* are ſummed up in the Latin diſtich:

Laudo Deum verum, plebem voco, congrego clerum,
Defunctos ploro, peſtem fugo, feſta decoro.

The firſt *bells* are ſaid to have been made about the year 400, at Nola, in Campania, whereof St. Paulinus was biſhop; at leaſt, it is aſſured, he was the firſt who brought them into uſe in the church. And hence, it is added, they had their Latin names, *Nolæ* and *Campanæ*: but others ſay, they take theſe names, not from their being invented in Campania, but becauſe it was here the manner of hanging and balancing them, now in uſe, was firſt practiſed; at leaſt, that they were hung on the model of a ſort of balance invented or uſed in Campania. For in Latin writers we find *Campana ſtatera*, for a *ſteel-yard*; and in the Greek καμπανιζειν, for *ponderare*, to weigh.

Polydore Virgil aſcribes the invention of church-*bells* to pope Sabinian, St. Gregory's ſucceſſor; but by miſtake: for St. Jerom, contemporary with Paulinus, makes mention of one. In effect, pope Sabinian did not invent *bells*; but he was the firſt who appointed the canonical hours to be diſtinguiſhed by them.

We even find mention made of *bells* in Ovid, Tibullus, Martial, Statius, Manilius, and the Greek authors, under the appellations of *tintinnabula*, and *ſounding braſs*. Suetonius, Dion, Strabo, Polybius, Joſephus, and others, mention them under the names of *petaſus*, *tintinnabulum*, *æramentum*, *crotalum*, *ſignum*, &c. But theſe appear to have been no more than baubles, and little like the huge *bells* in uſe among us.

Hieronymus Magius, who has a treatiſe on *bells* (written, when in chains, in Turky, and which is accounted very remarkable, purely from his memory, without the aſſiſtance of any books) makes large *bells* a modern invention. Indeed, we do not hear of any before the ſixth century: in 610, we are told, Lupus, biſhop of Orleans, being at Sens, then beſieged by the army of Clotharius, frighted away the beſiegers by ringing the *bells* of St. Stephen's.—The firſt large *bells* in England are mentioned by Bede towards the latter end of that century. They ſeem to have been pretty common in the year 816. The Greeks are uſually ſaid to have been unacquainted with them till the ninth century, when their conſtruction was firſt taught them by a Venetian.

Indeed, it is not true, that the uſe of *bells* was intirely unknown in the ancient eaſtern churches, and that they called the people to church, as at preſent, with wooden mallets. Leo Allatius, in his Diſſertation on the Greek Temples, proves the contrary from ſeveral ancient writers. It is his opinion that *bells* firſt began to be diſuſed among them, after the taking of Conſtantinople by the Turks; who, it ſeems, prohibited them, leſt their ſound ſhould diſturb the repoſe of ſouls, which, according to them, wander in the air. He adds, that they ſtill retain the uſe of *bells* in places remote from the intercourſe of the Turks; particularly, very ancient ones in mount Athos. F. Simon thinks the Turks rather prohibited the Chriſtians the uſe of *bells* out of political, than religious reaſons; inaſmuch as the ringing of *bells* might ſerve as a ſignal for the execution of revolts, &c.

The city of Bourdeaux was deprived of its *bells* for rebellion; and, when it was offered to have them reſtored, the people refuſed it, after having taſted the eaſe and conveniency of *being* freed *from the conſtant din and jangling of bells*.

Matthew Paris obſerves, that anciently the uſe of *bells* was prohibited in the time of mourning; though, at preſent, they make one of the principal ceremonies of mourning. Mabillon adds, that it was an ancient cuſtom to ring the *bells* for perſons about to expire, to advertiſe the people to pray for them; whence our *paſſing-bells*.

Lobineau obſerves, that the cuſtom of ringing *bells* at the approach of thunder, is of ſome antiquity; but, that the deſign was not ſo much to ſhake the air, and ſo diſſipate the thunder, as to call the people to church, to pray that the pariſh might be preſerved from miſchief from it.

The cuſtom of chriſtening, or bleſſing *bells*, is very ancient. Some ſay it was introduced by pope John XIII. in 972, but it is evidently of an older ſtanding; there being an expreſs prohibition of the practice in a capitular of Charlemagne in 789. See Hoſpinian de Origine Templorum, p. 113. where there is a particular account of all the ridiculous ceremonies practiſed about *bells*.—See Dr. Franklin's Obſervations on conſecrated Bells, and the form in conſecrating them, Experiments, Obſervations, &c. p. 448. ed. 1769.

Nankin, a city of China, was anciently famous for the largeneſs of its *bells*; but their enormous weight having brought down the tower, in which they were hung, the whole building fell to ruin, and the *bells* have ever ſince been diſregarded.—One of theſe *bells* is near twelve Engliſh feet high, the diameter ſeven and a half, and its circumference twenty-three; its figure almoſt cylindric, except for a ſwelling in the middle, and the thickneſs of the metal about the edges, ſeven inches.—From the dimenſions of this *bell*, its weight is computed at 50000 pounds, which is more than double the weight of that at Erfort, ſaid by father Kircher to be the greateſt *bell* in the world.—Theſe *bells* were caſt by the firſt emperor of the preceding dynaſty, about three hundred years ago. They have each their name, the hanger *tchoui*, the eater *che*, the ſleeper *choui*, the will *fi*.—Father le Comte adds, that there are ſeven other *bells* in Pekin, caſt in the reign of Youlo, each of which weighs 120,000 pounds. But the ſounds even of their biggeſt *bells* are very poor; being ſtruck with a wooden inſtead of an iron clapper.

The Egyptians have none but wooden *bells*, except one brought by the Franks into the monaſtery of St. Anthony.

The ſound of a *bell* ariſes from a vibratory motion of the parts thereof, much like that of a muſical chord. The ſtroke of the clapper, it is evident, muſt change the figure of the *bell*, and of round make it oval: but the metal having a great degree of elaſticity, that part which the ſtroke drove fartheſt from the centre will fly back again, and this even ſomewhat nearer to the center than before: ſo that the two points, which before were the extremes of the longer diameter, now become thoſe of the ſhorter. Thus, the circumference of the *bell* undergoes alternate changes of figure, and by means thereof gives that tremulous motion to the air, wherein SOUND conſiſts

M. Perrault maintains, that the ſound of the ſame *bell* or chord, is a compound of the ſounds of the ſeveral parts thereof; ſo that where the parts are homogeneous, and the dimenſions of the figure uniform, there is ſuch a perfect mixture of all theſe ſounds, as conſtitutes one uniform, ſmooth, even ſound; and the contrary circumſtances produce harſhneſs. This he proves from the *bells* differing in tune according to the part you ſtrike; and yet ſtrike it any where, there is a motion of all the parts. He therefore conſiders *bells* as compoſed of an infinite number of rings; which, according to their different dimenſions, have different tones, as chords of different lengths have; and, when ſtruck, the vibrations of the parts immediately ſtruck determine the tone; being ſupported by a ſufficient number of conſonant tones in the other parts. Mr. Haukſbee, and others, have found by experiment, that the ſound of a *bell* ſtruck under water is a fourth deeper than in the air: though Merſenne ſays, it is of the ſame pitch in both elements.

Bells are obſerved to be heard farther, placed on plains, than on hills; and ſtill farther, in valleys, than on plains: the reaſon of which it will not be difficult to aſſign, if it be conſidered, that the higher the ſonorous body is, the rarer is its medium; conſequently, the leſs impulſe it receives, and the leſs proper vehicle it has to convey it to a diſtance.

There is a curious obſervation in a paper of M. Reaumur's in the Memoirs of the Paris Academy, relating to the ſhape moſt proper for *bells*, to give them the loudeſt and cleareſt ſound. He obſerves, that as pots, and other veſſels more immediately neceſſary to the ſervice of life, were doubtleſs made before *bells*, it probably happened, that the obſerving theſe veſſels to have a ſound when ſtruck, gave occaſion to making *bells*, intended only for ſound, in that form: but that it does not appear that this is the moſt eligible figure; for lead, a metal which is, in its common ſtate, not at all ſonorous, yet becomes greatly ſo on its being caſt into a particular form, and that very different from the common ſhape of *bells*. In melting lead for the common occaſions of caſting in ſmall quantities, it is uſually done in an iron ladle; and as the whole is ſeldom poured out, the remainder, which falls to the bottom of the ladle, cools into a maſs of the ſhape of that bottom. This is conſequently a ſegment of a ſphere, thickeſt in the middle, and thinner towards the edges: nor is the ladle any neceſſary part of the operation, ſince if a maſs of lead be caſt in that form in a mould of earth or ſand, in any of theſe caſes it is found to be very ſonorous. Now, if this ſhape alone can give ſound to a metal which in other forms is perfectly mute, how much more muſt it neceſſarily give it to other metals naturally ſonorous in whatever form. It ſhould ſeem, that *bells* would much better perform their office in this than in any other form, and that it muſt particularly be a thing of great advantage to the ſmall *bells* of common houſe-clocks, which are required to have a ſhrill note, and yet are not allowed any great ſize. M. Reaumur very judiciouſly obſerves, that had our forefathers had opportunities of being acquainted with the ſound of metals in this ſhape, we ſhould probably have had all our *bells* at preſent of this form. Mem. Acad. Par. 1726.

BELLS, *foundery of*. See FOUNDERY.*

BELL, *diving*. See DIVING.

BELLS, *electrical*, are uſed in a variety of entertaining experiments by electricians. The apparatus, which is originally of German invention, conſiſts of three ſmall *bells* ſuſpended from a narrow plate of metal (*Plate Electricity, fig.* 2.); the two outermoſt by chains, and that in the middle, from which a chain paſſes to the floor, by a ſilken ſtring. Two ſmall knobs of braſs are alſo hung by ſilken ſtrings, one on each ſide of the *bell* in the middle, which ſerve for clappers. When this apparatus is connected with an electrified conductor, the outermoſt *bells* ſuſpended by the chains will be charged, attract the clappers, and be ſtruck by them. The clappers becoming electrified likewiſe will be repelled by theſe *bells*, and attracted by the middle *bell*; and diſcharge themſelves upon it by means of the chain extending to the floor. After this, they will be again attracted by the outermoſt *bells*, and thus, by ſtriking the *bells* alternately, occaſion a ringing, which may be continued at pleaſure. Flaſhes of light will be ſeen in the dark between the *bells* and the clappers; and if the electrification be ſtrong, the diſcharge will be made without actual contact, and the ringing will ceaſe. An apparatus of this kind, connected with one of thoſe CONDUCTORS that are erected for ſecuring buildings from lightning, will ſerve to give notice of the approach and paſſage of an electrical cloud.

Bell, in *Chemiſtry*, denotes a glaſs veſſel placed over ſome matter in a ſtate of exhalation, either to collect the vapour, or gather the flowers.

Chemical *bells* are a ſort of receptacles chiefly uſed in preparing the oil or ſpirit of ſulphur, for gathering and condenſing fumes into a liquor.

Bell, in *Building*, is uſed to denote the body of the Corinthian and Compoſite capital, by reaſon of its reſemblance to the figure of a *bell* inverted.

In this ſenſe, *bell* is the ſame with what we otherwiſe called *vaſe* and *tambour*, ſometimes alſo *corbeil*.

The naked of the *bell*, is always to be even and perpendicular with the bottom of the flutings of the column.

Bell *flower*, in *Botany*. See Campanula.

Bells, *hair*, in *Botany*. See Hyacinth.

Bell-*metal* is a compoſition of tin and copper melted together in due proportion; which has this property, that it is more ſonorous than any of the ingredients taken apart. The ordinary proportion is about twenty-two or twenty-three pounds of tin to one hundred weight of copper; though the proportion varies according to the ſize of the *bells*; a greater quantity of copper being uſed in the greater *bells* than in the ſmaller ones. Some add lead and braſs, others zinc or ſpelter, to the compoſition.

It has long been obſerved, that though tin is ſpecifically lighter than copper, yet the gravity of the compound *bell-metal* is greater than that of copper itſelf. Notice has been frequently taken of this not uncommon phænomenon in chemiſtry, from which it appears, that Archimedes's propoſition and tables, calculated upon that principle, for determining the proportion of two metals in any given compound, by hydroſtatical experiments, are leſs to be depended upon than has hitherto been ſuppoſed. Some alſo ſpeak of a native mineral under the denomination *bell-metal*, or *belmettel*, from which Becher affirms he procured zaffer and ſmalt.

Bell-*animal*, a name given by the writers on microſcopical diſcoveries to a very ſmall animal found at the roots of the common duckweed. The bodies of theſe animals are ſhaped like *bells*, and they have very long and ſlender tails, by which they faſten themſelves to the roots of theſe little plants. They are uſually found in great numbers together, in a ſort of cluſters or bunches; and all of the ſame bunch have always the ſame motion, very frequently contracting themſelves, and afterwards expanding all together to the full length of their tails. They uſually contract inſtantaneouſly; but are more ſlow in the expanding themſelves again. Baker's Microſ. p. 90.

Bell-*muſchus*, in *Botany*, a name given by ſome authors to the plant called *bamia moſchata*, and moſch-ſeed.

Bell-*pepper*, in *Botany*. See Capsicum.

Bell-*polype*, in *Zoology*, a particular ſpecies of POLYPE, the extremities of whoſe branches reſemble *bells*. See *Tab. of Microſcopical Objects*, *Claſs* 1.

Bell-*weed*, an Engliſh name uſed by ſome authors for the *jacea nigra*, or common knap-weed, called alſo by many Engliſh writers MATFELON.

BELLADONA *lily*. See Amaryllis.

Belladona, in *Botany*, a name given by the Italians to the *deadly* NIGHTSHADE, becauſe the ladies make a coſmetic of the juice, or diſtilled water, which they uſe to make their complexion fair and white. Ray.

Others derive the name from the intoxicating quality of this plant: *Quod inſomnis pulchras oſtendat virgines feminaſque.* Bod. Comment. in Theophraſt. p. 1078.

BELLATRIX, in *Aſtronomy*, a ruddy, glittering ſtar of the ſecond magnitude, in the left ſhoulder of Orion.

It takes its name from *bellum*, as being anciently ſuppoſed to have great influence in kindling wars, and forming warriors.

BELLE *de nuit*, in *Botany*, a name which the French give to the flower of the JALAP.

BELLICA *columna*, in *Antiquity*, a *column* near the temple of Bellona, from which the conſuls or feciales caſt javelins towards the enemy's country, by way of declaration of war.

BELLICULI, or **Bellirici** *Marini*, among *Naturaliſts*, denote a ſpecies of ſea-ſhells of an umbilical figure, ſometimes of a white colour, ſpotted with yellow; and ſometimes of a yellow, ſtreaked with black lines, after the ſnail-faſhion.

BELLING *of hops* denotes their opening and expanding to their cuſtomary ſhape, ſuppoſed to bear ſome relation to that of a bell.

Hops blow towards the end of July, and *bell* the latter end of Auguſt, or beginning of September.

BELLIS, in *Botany*. See Daisy.

BELLON, or **Belland**, in *Medicine*, a diſtemper very common in Derbyſhire, and other countries, where they ſmelt lead-ore; to which beaſts, and even poultry, as well as men, are ſubject; and for this reaſon, a certain ſpace round the ſmelting houſes, is called *bellon*-ground, where it is dangerous for any animal to feed. This diſorder is attended with languors, weakneſs, intolerable pains, ſenſation of gripings in the belly, and generally coſtiveneſs. It frequently proves fatal.

The method of cure which has been found moſt ſucceſsful on this diſtemper, is, to give *cremor*, or cryſtals of tartar, in ſmall doſes, and to repeat them frequently, as two or three times a day.

BELLONA, in *Mythology*; *a bello*, the goddeſs of war, ſiſter to Mars. Before her temple the herald ſet a ſpear on a pillar, when any war was proclaimed.

BELLONARII, in *Antiquity*, prieſts of Bellona, the goddeſs of war and battles.

The *bellonarii* cut and mangled their bodies with knives and daggers in a cruel manner, to pacify the deity. In this they are ſingular, that they offered their own blood, not that of other creatures, in ſacrifice. In the fury and enthuſiaſm wherewith they were ſeized on theſe occaſions, they ran about raging, uttering prophecies, and foretelling blood and ſlaughter, devaſtations of cities, revolutions of ſtates, and the like; whence Martial calls them *turba entheata Bellonæ*. Lactant. Inſt. lib. i. cap. 1. Lucan. lib. i. Tertull. Apoll. cap. 9. Minut. Felix. p. 298. In after-times, they ſeem to have abated much of their zeal and tranſport, and to have turned the whole into a kind of farce, contenting themſelves with making ſigns and appearances of cutting and wounds. Lampridius tells us, the emperor Commodus, out of a ſpirit of cruelty, turned the farce again into a tragedy, obliging them actually to cut and mangle their bodies. Lamp. in Commod. cap. 9.

BELLONIA, ſo called after the name of M. Bellon, a phyſician of Caen, in *Botany*, a genus of the *pentandria monogynia* claſs. The characters of this plant are, that the flower is wheel-ſhaped, of one leaf with a ſhort tube, but ſpread open above, and cut into five obtuſe ſegments; that it hath five ſtamina which cloſe together; that the germen is ſituated under the receptacle of the flower, which afterward becomes an open turbinated ſeed-veſſel, ending in a point, having one cell filled with ſmall round ſeeds.

We have but one ſpecies of this plant, viz. ſhrubby *bellonia*, with a rough balm leaf. This plant is very common in ſeveral of the warm iſlands in America.

BELLOWING, among *Sportſmen*, is uſed for the noiſe which roes make in RUTTING-*time*.

BELLOWS, a machine uſed to give a briſk agitation to the air, by enlarging and contracting its capacity, and thus expiring and inſpiring the air by turns.

Bellows are of various kinds, as *domeſtic bellows*, *enamellers bellows*, *ſmiths bellows*, &c.

There are ſome *bellows* triangular, which only move on one ſide: others, called *lantern bellows*, from their reſembling a paper lantern: theſe move every way, and yet ſtill continue parallel.

Mr. Triewald, engineer to his Swediſh majeſty, has contrived a kind of *water-bellows*.—This is not the firſt time that water has been applied to blow the fire. The ſame is done at Tivoli, and other parts of Italy, where the contrivances for this purpoſe are called *foſſi d'acqua*.—Phil. Tranſ. N° 448. p. 234.

Mr. Stirling has given the deſcription of a *water-bellows*, or machine to blow fire by the fall of water. Phil. Tranſ. N° 475. § 19. Dr. Lewis's Com. Ph. Techn. p. 269, &c. Where may be ſeen an account of *bellows*, and of BLOWING *machines*, of various conſtructions, for all kinds of furnaces; and many curious and important remarks on the various quantity of air afforded by them, &c.

The action and effect of *bellows* of every kind, whether leathern or wooden, wrought by water or men, depend on this, that the air which enters them, and which they contain when raiſed, is again compreſſed into a narrower ſpace when they are cloſed. And, as the air, like all other fluids, runs to that place where it meets the leaſt reſiſtance, the air muſt of conſequence fly out of the pipe or aperture with a velocity proportional to the force whereby the air is compreſſed, and muſt of conſequence blow ſtronger or weaker, as the velocity with which the top and bottom of the *bellows* meet is greater or leſſer. The blaſt alſo will laſt in proportion to the quantity of air that was drawn into the *bellows* through the valve or wind-clap.

The Heſſian *bellows* are a contrivance for driving air into a mine for the reſpiration of the miners. This M. Papin improved, changing its cylindrical form into a ſpiral one; and, with this, working it only with his foot, he could make a wind to raiſe two pound weight.

Anarcharſis the Scythian is recorded as the inventor of *bellows*. Strabo, lib. vii. p. 209.

The action of *bellows* bears a near affinity to that of the lungs; and what we call blowing in the latter, affords a good illuſtration of what is called reſpiring in the former.

There are *bellows* made wholly of wood, without any leather about them; one of which is preſerved in the repoſitory of the Royal Society; and Dr. Plott deſcribes another uſed in the copper-works at Ellaſton in Staffordſhire. Nat. Hiſt. Staff. chap. 4. ſect. 18.

We are alſo told of a new ſort of *bellows* to work in vacuo. Some have even pretended to effect a perpetual motion by a new-contrived *bellows*. Boyle's Works, abr. tom. ii. p. 503. Phil. Tranſ. N° 182.

Smiths and founders *bellows*, whether ſingle or double, are wrought by means of a rocker, with a ſtring or chain faſtened thereto, which the workman pulls. The *bellows*-pipe is fitted into that of the tewel. One of the boards is fixed, ſo as not to play at all. By drawing down the handle of the rocker, the moveable board riſes, and, by means of a weight on the top of the upper board, ſinks again.

The *bellows* of forges and furnaces of mines uſually receive their motion from the wheels of a water-mill. Others, as the *bellows* of enamellers, are wrought by means of one or more ſteps or treddles under the workman's feet.

Acoſta ſays, that the metal of the Peruvian mines of Porco is eaſily refined with *bellows*; but that of the mines of Potoſi cannot be fuſed with them, but only by the breath of their ſmall furnaces built upon the ſides of mountains, and directed where the wind lies.

The *bellows* of an organ are ſix feet long, and four broad; each having an aperture of four inches, that the valve may play eaſily. There ſhould likewiſe be a valve at the noſe of the *bellows*, that one may not take the air from the other. To blow an organ of ſixteen feet, there are required four pair of theſe *bellows*.

The *bellows* of organs are wrought by a man called the blower; and, in ſmall organs, by the foot of the player.

Bellows, *Bone*, φυσητηρες οστεινοι, occur in Herodotus for thoſe applied by the Scythians to the genitals of mares, in order to diſtend the *uterus*, and, by this compreſſion, make them yield a greater quantity of milk.

Bellows, *Hydroſtatic*; ſee HYDROSTATIC.

BELLUÆ, in *Zoology*, the ſixth order of the *mammalia*; the character of which is, that their fore-teeth are obtuſe, their feet hoofed, their walk heavy, and their food vegetables.

BELLUGA *ſtone*, in *Natural Hiſtory*, the name of a *calculus* or ſtone found in the *belluga*, a large fiſh, accounted a ſpecies of ſturgeon, and called by Artedi *accipenſer tuberculis carens*.

The fiſh is much like the ſturgeon in ſhape; but its ſnout is ſhorter and thicker. Of its row or ſpawn is made cavear; and ſome of them are ſo large as to yield two hundred weight of it. The fiſh is very common and very large in the Volga, near the city of Aſtracan. It has been caught there thirty-ſix feet long, and eighteen thick. It is alſo found in the Don, and other rivers, and in the Baltic and Caſpian ſeas. See ACCIPENSER.

It is not certainly known in what part of this fiſh the ſtone is found. It is found in both ſexes, but moſt frequently in the male; and is found in fiſh of all ages and ſizes. It is far from being common, however; for in a thouſand fiſhes, there ſometimes is not found one ſtone. It is hence evident, that theſe ſtones are no natural part of the fiſh; but are mere morbid concretions, like the bezoar ſtones in the animal which produces them, or like the ſtones in human bladders. The ſituation of the parts in which it is found, and other circumſtances, may allot it its particular appearances.

This ſtone is of various ſhapes and ſizes; but its moſt uſual figure is either globular or oval. It is of a yellowiſh-white colour, and of a ſmooth and naturally poliſhed ſurface; and it is found from the ſize of a pigeon's egg to that of a gooſe. They are uſually compact, ponderous, and ſolid, not friable, but requiring a ſtrong blow to break them. They yield eaſily to the ſaw: but this defaces their internal texture, which is naturally very elegant and regular. The ſtones conſiſt of ſeveral concentric coats, firmly adhering to one another, formed about a *nucleus*, which generally appears to be ſome heterogeneous ſubſtance.

But another very obvious circumſtance there is in its ſtructure, which makes it greatly different from all other ſtones of this kind, that is, its radiated ſtructure, it being compoſed of a number of regular and even *ſtriæ* running from the centre to the circumference, repreſenting, both in colour and form, the flakes of the *terra foliota tartari*, or the ſtriated *ſpiculæ* of antimony.

If the ſtone be ſcraped to powder, and ſprinkled upon a hot iron, it gives a faint urinous ſmell, and calcines into a light, inſipid, greyiſh earth.

The people about the Volga eſteem it greatly, and account it to have great virtues: they ſay it promotes delivery; and give it conſtantly in caſes of the ſtone, and diſorders of the urinary parts. Its doſe is from ten grains to a dram. Phil. Tranſ. vol. xliv. part ii. N° 4.

BELLULA *bos*, in *Ichthyology*, a name given by Paulus Jovius to that ſpecies of the ray-fiſh, which was called by the old Greek and Latin writers *bos marinus*, and by the later authors *raja oxyrynchus*. It is diſtinguiſhed by Artedi by the name of the variegated ray, with ten prickly tubercles on the middle of the back.

BELLY, in a general ſenſe, denotes the whole ABDOMEN, or that region of the body contained between the *ſeptum tranſverſum*, the *hypochondria*, and *pubes*.

Belly is alſo uſed, in a more confined ſenſe, for the inteſtines alone, as containing the *fæces*.

In this ſenſe it is we ſpeak of the looſeneſs or coſtiveneſs of the *belly*, &c.

Belly is alſo uſed ſometimes for a pregnant woman.

In this ſenſe we are to underſtand the phraſe among *Civil Lawyers*, to put the *belly* in poſſeſſion of an eſtate.

Belly is alſo uſed in ſpeaking of the bodies of beaſts. Thus, we ſay a light *belly*, meaning a ſlender or lank one: a cow *belly*, that where the ribs being unable to hold the *viſcera*, they preſs downwards, and bulge diſagreeably.

Feeding horſes with graſs, or much hay, and few oats, makes them grow cow-bellied. It is a maxim, that horſes which are light-bellied, and firey, ſoon deſtroy themſelves.

The *belly* of a horſe ſhould be of an ordinary bigneſs, except in draught horſes, where the larger the better, provided it be round, and well incloſed within the ribs; rather extending upon the ſides than downwards. Thoſe horſes are apt to be cow-bellied, which having ſtraight ribs, are great feeders.

The *belly* is ſometimes alſo denominated the body, cheſt, gut, or flank.

A horſe is ſaid to be thick-bellied, well-bodied or flanked, when he has large, long, and well-made ribs, neither too narrow, nor too flat. A horſe again is ſaid to have no *belly*, or body, or to be thin-flanked, when his ribs are too narrow or ſhort, and the flank turns up; ſo that his body looks flankleſs, like a greyhound. Such horſes are called by the French *eſtracs*, and generally prove fine and tender, not fit for travelling or fatigue, unleſs they feed very heartily. Coach-horſes are rejected when they are not well-bellied, or well-bodied, but narrow or thin-gutted, ſeeming to have the ſkin of their flanks ſtitched on their ribs. But a hunter is not the worſe liked for being light-bellied. Horſes pained, or weak in their hind-quarters, are commonly light-bellied. Such as have painful ſcratches in their hind-legs, are found to loſe their *bellies* extremely.

Belly *of a* MUSCLE, in *Anatomy*, denotes the body thereof; as contradiſtinguiſhed from the two extremities, or tendons.

From the conditions of this, muſcles are divided into monogaſtric, or ſingle-bellied; and digaſtric, or double-bellied. Phil. Tranſ. N° 258.

Lower will have all the muſcles to be digaſtric, or double-bellied; in which he is ſeconded by Hoffman, and others.

Belly-*ach weed*, a name given in America to a ſpecies of the *jatropha*. See CASSADA.

Belly, *Dragon's*, *venter draconis*, is uſed by ſome *Aſtronomers* to denote the point in a planet's orbit, wherein it has its greateſt latitude, or is fartheſt diſtant from the ecliptic; more frequently called its limit.

BELOAR, a name given by ſome to a ſtone, otherwiſe called WIDURIS.

BELOMANCY, **Belomantia**, a kind of divination by means of arrows, practiſed in the Eaſt, but chiefly among the Arabians.

The word is of Greek origin; compounded of βελος, *arrow*, and μαντεια, *divination*.

Belomancy has been performed in different ways: one was, to mark a parcel of arrows, and put eleven, or more of them, into a bag; theſe were afterwards drawn out, and according as they were marked, or not, they judged of future events.

Another way was, to have three arrows, upon one of which was written, *God orders it me*; on another, *God forbids it me*; and upon the third, nothing at all. Theſe were put into a quiver, out of which they drew one of the three at random; if it happened to be that with the firſt inſcription, the thing they conſulted about was to be done; if it chanced to be that with the ſecond inſcription, it was let alone; and if it proved to be that without inſcription, they drew over again.

Belomancy is an ancient practice, and probably that which Ezekiel mentions, chap. xxi. ver. 21. At leaſt St. Jerom underſtands it ſo, and obſerves that the practice was frequent among the Aſſyrians and Babylonians. Something like it is alſo mentioned in Hoſea, chap. iv. only that *ſtaves* are there mentioned inſtead of *arrows*, which is rather *rhabdomancy* than *belomancy*.—Grotius, as well as Jerom, confounds the two together, and ſhews that they prevailed much among the Magi, Chaldeans, and Scythians; whence they paſſed to the Sclavonians, and thence to the Germans, who, as Tacitus obſerves, made uſe of *belomancy*.

BELONE, in *Zoology*, a name by which ſome of the old naturaliſts have called the ACUS *Oppiani*, called in Engliſh the horn-fiſh, or gar-fiſh, a ſpecies of the ESOX. The name is retained by Linnæus.

BELSEBUL, a ſpecies of the *ſimia*, with a bearded black tail.

BELT, BALTHEUS, properly denotes a kind of military girdle, uſually of leather, wherewith the ſword or other weapons are ſuſtained.

Belts are known among the ancient and middle-age writers by divers names, as *ζωνη*, *ζωμα*, *zona*, *cingulum*, *reminiculum*, *rinca*, or *ringa*, and *baldrellus*.

The *belt* was an eſſential piece of the ancient armour; inſomuch that we ſometimes find it uſed to denote the whole armour. Pott. Arch. Græc. tom. ii. lib. 3. cap. 4.

In later ages, the *belt* was given to a perſon when he was raiſed to knighthood; whence it has alſo been uſed as a badge or mark of the knightly order.

The denomination *belt* is alſo applied to a ſort of BANDAGES in uſe among ſurgeons, &c.

Thus we meet with quick-ſilver *belts*, uſed for the itch. A late writer deſcribes a *belt* for keeping the belly light, and diſcharging the water in the operation of tapping. Medic. Eſſ. Edinb. tom. i. p. 218.

Belt, or **Beltis**, in *Eccleſiaſtical Writers of the Middle Age*, denotes a ſort of ſtring of beads.

Belt is alſo a frequent diſeaſe in ſheep, cured by cutting their tails off, and laying the ſore bare; then caſting mould on it, and applying tar and gooſe-greaſe.

Belts, *Faſciæ*, in *Aſtronomy*, two zones or girdles ſurrounding Jupiter's body, more lucid than the reſt, and terminated by parallel lines; being ſometimes broader, and ſometimes narrower, nor conſtantly taking up the ſame places in his diſk.

Dark ſpots have been frequently obſerved on Jupiter's *belts*. Caſſini has alſo diſcovered a permanent one in the moſt northern part of the moſt ſouthern *belt*: by this he has determined the length of Jupiter's day; that is, the time of his revolution on his axis, which is finiſhed in 9 hours 56 minutes. Phil. Tranſ. N° 10, and vol. lxiii. part I. N° 11. p. 73.

Some aſtronomers take the *belts* to be ſeas, which alternately cover, and leave bare large countries of the Jovial world. The ſpots are by theſe writers conjectured to be gulphs in thoſe ſeas, perhaps as big as our ocean, and ſometimes full, ſometimes dry. M. Azout rather imagined the ſpots to be protuberances of the *belts*. Hiſt. Acad. Sc. 1708. 1692. Phil. Tranſ. N° 34. I. 15.

But the generality of aſtronomers take the ſpots, we mean the tranſparent and moveable ones, for the ſhadows of Jupiter's ſatellites.

The *belts* of Jupiter were firſt obſerved, and deſcribed by Huygens, in his Syſt. Saturnin. p. 7.

Caſſini alſo ſpeaks of *belts* of Saturn; being three dark, ſtraight, parallel bands, or *faſciæ*, on the diſk of that planet.

Saturn's *belts* do not appear to be inherent on his globe, as thoſe of Jupiter are; but rather to be large dark rings at a diſtance from the planet, and ſurrounding his body. Some imagine them to be clouds in his atmoſphere. The middlemoſt ſeems to be the ſhadow of Saturn's ring. Hiſt. Acad. Sc. 1715.

Belts, in *Navigation*, denote certain ſtreights near the ſound, through which ſhips muſt paſs going between the Baltic and the German ocean.

The *Belts* belong to the king of Denmark, who exacts a toll of all ſhips which paſs them, excepting the Swedes, who are exempt from it.

BELVIDERE, an Italian term, denoting a fine proſpect.

The name is more peculiarly given to a pavilion on the top of a building, or an eminence in manner of a platform in a garden, ſuſtained by a terrace-wall, or a maſſive of turf, contrived for the ſake of commanding a large or beautiful proſpect.

Belvidere, in *Botany*, a ſpecies of the CHENOPODIUM.

BELULCUM, a chirurgical inſtrument of various figures, contrived for extracting darts, arrows, or the like, from wounds.

Hence alſo the denomination *belulcum*; *quaſi* το βελος ελκων.

BELUS, in *Mythology*, the principal deity of the Babylonians; and if, as ſome ſuppoſe, the tower of Babel was his temple, one of the moſt ancient among the pagans. The kings of Babylon amaſſed immenſe treaſures in this place, which were pillaged by Xerxes on his return from the expedition into Greece. Herod. lib. i.

BEMA, *βεμα*, in *Antiquity*, denotes a ſtep or pace.

The *bema* made a kind of itinerary meaſure among the Greeks, whoſe length was equivalent to on cubit, and two thirds, or to ten palms.

Whence alſo the term *βηματιζειν*, *to meaſure a road.*

Bema, in *Eccleſiaſtical Writers*, denotes the altar-part, or ſanctuary, in the ancient churches.

In which ſenſe, *bema* made the third, or innermoſt part of the church, anſwering to the chancel among us.

Bema was alſo uſed for the biſhop's chair, ſeat, or throne, placed in the ſanctuary. It was called *bema* from the ſteps by which it was to be aſcended.

Bema was alſo uſed for the reader's deſk.

This in the Greek church was denominated *βημα γνοςων*, in the Latin church AMBO.

Bema is more peculiarly uſed for the *Manichees* altar, which was in a different place from that of the catholics.

Bema was alſo a denomination given by this ſect to the anniverſary of the day when *Manes* was killed, which with them was a ſolemn feaſt, and day of rejoicing.

One of the chief ceremonies of the feaſt conſiſted in ſetting out and adorning their *bema*, or altar, with great magnificence.

BEMETRE, in *Zoology*, a name by which the Portugueſe in the Braſils call a greeniſh black-bird of the ſtarling kind, common there, and more commonly known by its Braſilian name PITANGUA-GUACU.

BEMILUCIUS, in *Mythology*, a ſurname of Jupiter, repreſented young and beardleſs.

BEN, or **Behen**, in *Pharmacy*, denotes a medicinal root, celebrated, eſpecially among the Arabs, for its aromatic, cardiac, and alexiterial virtues.

There are two kinds of *bens*, viz. the *white ben*, which is inſipid, making little impreſſion on the tongue, beſides that of a little bitterneſs which it leaves behind it, and ſuppoſed by ſome modern botaniſts to be the ſame with our *lychnis terreſtris*, by others called the *papaver ſpumeum*. *Red ben*, is fibrous, brown without, and reddiſh within; ſuppoſed to be the root of a ſpecies of *limonium*, or *ſea*-LAVENDER.

They are both brought from the Levant, and have much the ſame virtues, being ſubſtituted for each other; they muſt be choſen dry, and of an aromatic aſtringent taſte.

Ben, or **Ben**-*nut*, a fruit about the ſize of a filberd, the product of a middle-ſized tree, ſaid to reſemble the birch, and to grow ſpontaneouſly in the Eaſt Indies, and in America. Lemery, in his Dictionnaire des Drogues, mentions ſeveral kinds of this fruit. It is called *glans unguentaria*, becauſe it yields an oil by expreſſion, which is uſed by perfumers in perfuming other oils, and never turns rancid; as being a detergent, it is thought proper in cutaneous diſeaſes, &c. Geoffroy.

To impregnate oil of *ben* with the odour of flowers, dip ſome fine carded cotton in the oil, and put it in the bottom of ſome proper veſſel; on this ſpread a thick layer of freſh flowers, and above them more cotton dipped in oil, and thus alternately *ſtratum ſuper ſtratum*, till the veſſel be full; and then by DIGESTION, during twenty-four hours in a *water*-BATH, the oil will receive the odour of the flowers. As the oil of *ben* does not become rancid, at leaſt for years, it is the beſt *menſtruum* for extracting the odoriferous parts of roſes, jonquils, and many other flowers, which yield little or no eſſential oil by *diſtillation*, but impart their fragrance to expreſſed oils.

BENÆ *lapis*, in the *Natural Hiſtory of the Ancients*, the name given by the earlieſt writers to that foſſile body, afterwards called THRACIUS *lapis*.

BENCH. See BANC, BANK, &c.

Bench, *King's*. See COURT *of King's Bench.*

Bench, *free*. See FREE-*Bench.*

Bench, *widow*. See WIDOW.

BENCHERS, in an INN *of court*, the ſeniors of the houſe, who have the government and direction thereof; and out of whom is yearly choſen a treaſurer, &c.

BEND, in *Heraldry*, an ordinary or bearing, formed by two lines, drawn diagonally, or athwart, from the dexter chief of the ſhield to the ſiniſter baſe; being ſuppoſed to repreſent a ſhoulder-belt, or ſcarf, worn over the ſhoulder.—See *Tab. Herald. fig.* 7.

The *bend* is one of the ten honourable ordinaries, containing a third part of the field when charged, and a fifth when plain.—It is ſometimes indented, ingrailed, &c. Heralds ſpeak of a *bend dexter*, and a *bend ſiniſter*.

A *bend* is ſubdivided into a *benlet*, or *bandelet*, which is the ſixth part of the field; a *garter*, which is the moiety of a *bend*; a *coſt*, which is the fourth part of a *bend*; and a *ribband*, which is the moiety of a *coſt*.

Bend *dexter*, is that properly and abſolutely called a *bend*, as above defined.—The word *dexter* is uſually annexed to prevent miſtakes, and diſtinguiſh it from the

Bend *ſiniſter*, which is the ſame with what is otherwiſe called after the French heralds, a BAR, *barre*.

The *bend ſiniſter* is ſubdivided into the *ſcarf*, or *ſcarp*, and the *batoon*; which latter is the fourth part of the *bend*, and the moſt uſual mark of illegitimacy; but then it never extends itſelf quite athwart the ſhield, but is cut off a little at each end. See BASTON, and *fig.* 6.

When two ſtrait lines drawn within the *bend* run nearly parallel to the outward edges of it, this is called *voiding*; and, he that bears it, is ſaid *to bear a bend voided.*

Party per BEND *dexter.* See PARTI.

Point in BEND. See POINT.

BENDIDIA, βενδιδεια, in *Antiquity*, ſolemn feaſts held by the Athenians on the twenty-firſt day of the month Tragelion, in honour of the goddeſs Diana.

The word is formed of βενδις, a denomination of Diana, according to Strabo, or of the moon according to Suidas, which amounts to the ſame.

The *bendidia* were held in the Piræus, and bore ſome reſemblance to the BACCHANALIA.

BENDING. M. Bernouilli has a diſcourſe on the *bending* of ſprings, or elaſtic bodies. M. Amontons gives ſeveral experiments concerning the *bending* of ropes. The friction of a rope *bent*, or wound round an immoveable cylinder, is ſufficient, with a very ſmall power, to ſuſtain very great weights. Mem. Acad. Sc. 1703. 1705. 1699.

Divers methods have been contrived for *bending* timber, in order to ſupply crooked planks, and pieces for building ſhips: M. Daleſme ingeniouſly enough propoſed to have the young trees bent, while growing in the foreſt.

The method of *bending* planks by a ſand-heat, now uſed in the king's yards at Deptford, was invented by captain Cumberland. Phil. Tranſ. N° 371. p. 75.

The *bending* of boards, and other pieces of timber for curved works in joinery, is effected by holding them to the fire, then giving them the figure required, and keeping them in this figure by tools for the purpoſe.

A method has been lately invented and practiſed for *bending* pieces of timber, ſo as to make the wheels of carriages without joints. See WHEELS.

BENDING, in the *Sea Language.*—They ſay, *bend the cable*, when it is to be made faſt to the ring of the anchor.—To *bend two cables*, ſignifies to tie them together with a knot, which, though leſs ſure than ſplicing, is ſooner done.

To *unbend the cable*, is to looſen it from the ring of the anchor; which is done when a ſhip deſigns to be long at ſea.

To *bend a main ſail*, is to make it faſt to the yard in its proper place.

BENDS, in a ſhip, are the ſame with *wailes*, or *wales*, which are the outermoſt timbers of a ſhip, on which men ſet their feet in climbing up.

They are reckoned from the water, the *firſt*, *ſecond*, and *third bend*: they help much to ſtrengthen the ſhip, and have the beams, knees, and foothooks, bolted into them.

BENDY, BANDÉ, in *Blazonry*, denotes an eſcutcheon's being divided bend-wiſe into an even number of partitions, varying in metal and colour.—If they be odd, the field muſt firſt be named, and then the number of bends. In England, the number is always made even; in other countries this is not regarded.

They ſay, *bendy* of four, *bendy* of ſix, &c.

Barry-BENDY. See BARRY.

Counter-BENDY. See COUNTER.

Paly-BENDY. See PALY.

BENE. See DE *Bene Eſſe*.

BENEAPED, in the *Sea Language*, is ſaid of a ſhip, when the water does not flow high enough to bring her off the ground, out of the dock, or over the bar.

BENEDICITE is a name given to the hymn, or ſong of the three children, in the fiery furnace; by reaſon of its beginning with the words *benedicite omnia opera Dominum*.

The uſe of the *benedicite* is very ancient; it appearing to have been ſung in all the Chriſtian churches, as early as St. Chryſoſtom's time.

BENEDICTINS, or BENEDICTIN *order*, is an order of monks, who profeſs to follow the rule of St. Benedict, or Benet, of Nurſia, who was born about the year 480.

The *Benedictins* are thoſe properly called *monachi*, *monks*; the other orders are better denominated *friers*, or *religious*.

In the canon law, the *Benedictins* are called *black monks*, being diſtinguiſhed from the other orders by the colour of their habit; and not by the name of their patriarch, St. Benedict.—Among us they were formerly alſo denominated *black friers*.

The *Benedictins* wear a looſe black gown, with large wide ſleeves, and a capuche on their heads, ending in a point behind.

The liſt of ſaints of the *Benedictin* order is very ample; but they are accuſed by Baronius, and many other writers, of putting many in the liſt who were never of the order.

For ſix hundred years after the erection of the *Benedictin* order, moſt of the European monks were followers of this rule; whatever other names they went by, Carthuſians, Ciſtercians, Grandimontenſes, Premonſtratenſes, Cluniacs, &c. they were but different branches of the *Benedictins*, till about the year 1220, when the Dominicans and Franciſcans took new rules.

Hoſpinian reckons no leſs than twenty-three religious orders that ſprang from this one.

According to the *Benedictin* computation, there have been of this order 24 popes, 200 cardinals, 7000 archbiſhops, 15000 biſhops, 15700 abbots, 4000 ſaints, 40,000 confeſſors, above 3000 martyrs and apoſtles, who have converted 30 provinces to the Chriſtian faith, beſides emperors, kings, &c.

The *Benedictins*, though but one order, are divided into ſeveral congregations, which have their peculiar cuſtoms and obſervances different from the reſt.

Each of thoſe are ſubdivided into provinces, which have their general chapters. This order is ſaid to have been brought into England about the year 596.

The Engliſh congregation, which had ſubſiſted from the time of the miſſion of St. Auſtin, was deſtroyed under Henry VIII. and by degrees reduced to one ſingle man; father Buckley, who in 1607, procured a re-eſtabliſhment of the congregation, at Doway, in the Netherlands, where it ſtill ſubſiſts in a kind of dependency on that of St. Valladolid in Spain.

At the general chapters they chooſe provincials, with their aſſiſtants, for each of the provinces of Canterbury and York, who have juriſdiction over the miſſionaries employed therein. They are governed by a preſident-general, and three DEFINITORS, choſen every three years.

At their admiſſion they make a fourth vow, viz. that they will go to the miſſion in England, and return, when their ſuperiors think fit.

BENEDICTIN *nuns*, are religious women who embrace the rule of St. Benedict.

BENEDICTION, in a general ſenſe, the act of bleſſing, or giving praiſe to God, or returning thanks for his favours.

Hence alſo *benediction* is ſtill applied to the act of ſaying grace, before or after meals.

Neither the ancient Jews, nor Chriſtians, ever eat without a ſhort prayer.

The Jews are obliged to rehearſe an hundred *benedictions* per day; of which, eighty are to be ſpoken in the morning. Vitring. de Synag. Vet. lib. iii.

Rabbi Nehemiah Baruch, in 1688, publiſhed a diſcourſe on the manner wherein the ſacerdotal *benediction* is to be pronounced. In the ſynagogue of Ferrara, it is rather ſung than ſpoken.

The cuſtom of receiving *benediction*, by bowing the head before the biſhops, is very ancient, and was ſo univerſal, that emperors themſelves did not decline this mark of ſubmiſſion.

Under the name *benediction*, the Hebrews alſo frequently underſtand the preſents which friends make to one another, in all probability becauſe they are generally attended with bleſſings and compliments, both from thoſe who give, and thoſe who receive them.

BENEDICTION, *nuptial*, the external ceremony performed by the prieſt in the office of matrimony.

The *nuptial benediction* is not eſſential to, but the confirmation of a marriage in the civil law.

BENEDICTION, *beatic*, *benedictio beatica*, is the *viaticum* given to dying perſons.

The pope begins all his bulls with this form: *Salutem & apoſtolicam benedictionem*.

BENEDICTION, *regular*, that conferred by abbots on their monks, or by a ſenior monk on a junior.

BENEDICTIONE *privari*, to be deprived of benediction, was a kind of puniſhment inflicted on monks, whereby, when the reſt received the abbot's bleſſing, the offenders were diſmiſſed without it.

BENEDICTION is alſo uſed for an eccleſiaſtical ceremony, whereby a thing is rendered ſacred, or venerable.

In this ſenſe *benediction* differs from conſecration, as in the latter unction is applied, which is not in the former. Thus the chalice is conſecrated, and the pix bleſſed, as the former, not the latter, is anointed; though in the common uſage theſe two words are applied promiſcuouſly.

The ſpirit of piety, or rather of ſuperſtition, has introduced into the Romiſh church *benedictions* for almoſt every thing.—We read of forms of *benediction* for wax-candles, for boughs, for aſhes, for church-veſſels, and ornaments; for flags or enſigns, arms, firſt-fruits, houſes, ſhips, paſchal eggs, *cilicium*, or the hair-cloth of penitents, church-yards, &c.

BENEDICTION *of arms* was a ſort of public conſecration of the weapons, and enſigns, before the entering on a war, by a *formula* of words, and ceremonies appointed for that purpoſe.

BENEDICTIONALIS *liber*, an ancient church book, containing the forms of the divers ſorts of *benedictions* given by biſhops, prieſts, &c.

Such was the *benedictionalis liber* of Gregory the Great, deſcribed by Lambecius.

BENEDICTUM, an epithet formerly given to lenient, or gently operating medicines; more eſpecially rhubarb.

In this ſenſe we find, in ſome diſpenſatory writers, *benedictum laxativum*, uſed for lenitive electary. Though in others, *benedicta laxativa*, or the *bleſſed laxative*, denotes another eaſy purge, made up of turbith, *diagrydium*, ſpurges, hermodactyls, aniſe-ſeeds, fennel-ſeeds, *ſal gemmæ*, and honey.

Schroder alſo gives the appellation *aqua benedicta* to his emetic; and Mynſicht does the ſame to his *aqua ſerpylli*, or water of wild thyme.

Some have called the philoſopher's ſtone *lapis benedictus*.

BENEDICTUM *vinum*. See VINUM.

BENEDICTUS, *carduus*. See THISTLE.

BENEDITTO *ſacco*. See SAN BENITO.

BENEFICE, BENEFICIUM, in an eccleſiaſtical ſenſe, a church endowed with a revenue for the performance of divine ſervice; or the revenue itſelf, aſſigned to an eccleſiaſtical perſon for life, in return for his performing the ſervice of the church.

All church preferments, except biſhoprics, are called *benefices*; and all *benefices* are, by the canoniſts, ſometimes called *dignities*: but we now ordinarily diſtinguiſh between *benefice* and *dignity*, by applying the word *dignity* to biſhoprics, deanries, archdeaconries, and prebends; and *benefice* to parſonages, vicarages, and donatives.

The term *benefice* comes to us from the old Romans, who uſing to diſtribute part of the lands they had conquered on the frontiers of the empire to their ſoldiers; thoſe who enjoyed ſuch rewards, were called *beneficiarii*, and the lands themſelves *beneficia*, as being held on the pure beneficence and liberality of the ſovereign. Theſe *benefices* at firſt were given for life only; but afterwards they became hereditary and patrimonial.

From the Romans, both the name and the thing paſſed into France and England, with this difference, as Mr. Blount obſerves, that *benefices* were not given as mere gratuities for paſt ſervices, but as warrants for future ones, and were accordingly held by the tenure of ſerving, on occaſion, in the wars, &c. So that what was before a *benefice*, became now converted into a FEE, and SERVICE. There is an obvious reference in the term *benefice* to the feudal ſyſtem, which was incorporated in all the governments of Europe. As the lands of all private proprietors were holden of the prince, and becauſe they were originally gratuitous donations, denominated *beneficia*, the pope aſſumed the privilege of a feudal lord, and claimed the authority of diſtributing the preferments of the church at pleaſure; and hence the care of the ſouls of a pariſh came to be called a *benefice*. Blackſtone's Comm. vol. iv. p. 106. ed. 1769.

Hence, doubtleſs, came the term *benefice* to be applied to church livings; for, beſides that the eccleſiaſtics held for life like the ſoldiers, the riches of the church aroſe from the beneficence of princes.

As to the origin of eccleſiaſtical *benefices*, it is hard to determine when the revenues of the church were firſt divided: it is certain, till the fourth century, all the revenues were in the hands of the biſhops, who diſtributed them by their œconomy; they conſiſted principally in alms, and voluntary contributions.—As the church came to have lands, parts thereof were aſſigned for the ſubſiſtence of the clerks, and called *benefices*; of which we find ſome traces in the fifth and ſixth century: but then there does not appear to have been any certain partition, nor any preciſe quota allotted to each particular; but the allotments were abſolutely diſcretional till about the twelfth century.

At firſt, each was contented with a ſingle *benefice*; but pluralities were, by degrees, introduced, on pretence of equity: for, a ſingle *benefice* being ſometimes ſcarce thought a competency, the prieſt was allowed two: as his quality, or occaſions, increaſed, ſo the number of *benefices* that were to ſupport him were increaſed too. Hence ſome, affecting to equal princes in quality, pretend to revenues anſwerable to it.

The canoniſts diſtinguiſh three ways of vacating a *benefice*, viz. *de jure*, *de facto*, and *by the ſentence of a judge*.—A *benefice* is vacated *de jure*, when the perſon enjoying it is guilty of certain crimes, expreſſed in laws, as hereſy, ſimony, &c.—A *benefice* is vacated *de facto*, as well as *de jure*, by the natural death, or the reſignation of the incumbent: which reſignation may be either expreſs, or tacit; as when he engages in a ſtate, &c. inconſiſtent with it; as among the Romaniſts, by marrying, entering a religious order, or the like.—A *benefice* becomes vacant by the *ſentence of a judge*, by way of puniſhment for certain crimes, as concubinage, perjury, ſorcery, &c. See DEGRADATION.

Benefices are divided by the canoniſts into *ſimple*, and *ſacerdotal*: in the firſt, there is no obligation but to read prayers, ſing, &c. Such are canonries, chaplainſhips, chantries, &c.—The ſecond are charged with a cure of ſouls, or the direction and guidance of conſciences. Such are the vicarages, rectories, &c.

The Romaniſts, again, diſtinguiſh *benefices* into *regular* and *ſecular*.

Regular or *titular* BENEFICES, are thoſe held by a religious, or a regular, who has made profeſſion of ſome religious order. Such are abbeys, priories conventual, &c.

Or rather, *regular benefice* is that which cannot be conferred on any but a religious; either by its foundation, by the inſtitution of ſome ſuperior, or by preſcription. For preſcription, forty years poſſeſſion by a religious, makes the benefice regular.

Secular BENEFICES, are thoſe which are only to be given to ſecular prieſts, i. e. to ſuch as live in the world, and are not engaged in any monaſtic order.

All *benefices* are reputed ſecular, till the contrary is made appear. They are called *ſecular benefices*, becauſe held by ſeculars. Of which kind are almoſt all cures.

Some *benefices*, regular in themſelves, have been ſeculariſed by the pope's bull. See REGULAR and SECULAR.

A BENEFICE *in commendam*, is that, the direction and management whereof, upon a vacancy, is given, or recommended to an eccleſiaſtic for a certain time, till it may be conveniently provided for. See COMMENDAM.

BENEFICES, *Conſiſtorial*, in the *French Cuſtoms*, are thoſe of royal foundation, which were elective before the concordat, and are now nominated by the king of France.

They are called *conſiſtorial*, becauſe, on the king's nomination, they are to be propoſed in the papal conſiſtory, that is, in the congregation of cardinals, where the pope preſides.

To this claſs belong archbiſhoprics, biſhoprics, and abbies. Theſe *benefices* were formerly elective; but by the concordat, which aboliſhed all elections, they are to be conferred by the pope, on the king's nomination. Annates are to be paid, and the pope's bulls obtained, for *conſiſtorial benefices*.

BENEFICES, *Non-conſiſtorial*, are either elective, or collative, or in patronage.

BENEFICES, *Elective*, are thoſe which are to be filled or ſupplied in the way of election; only this election to be confirmed by the proper ſuperior.

BENEFICES, *Collative*, are thoſe in the free diſpoſal of the collator, and which need no confirmation; provided the party have the qualifications required.

BENEFICES *in patronage*, are thoſe which the collator is obliged to confer upon thoſe preſented by the patron.

BENEFICES *vacant in curia*, are thoſe, whoſe incumbents or beneficiaries die *in curia*, that is, within ten leagues round Rome.

BENEFICE, *Manual*, is that depending on an abbey, and ſerved by a religious ſent thither, who is removeable at pleaſure by the ſuperior.

We alſo meet with *manual benefices*, *beneficia manualia*, uſed for thoſe, where the daily allowances of proviſions were only diſtributed to the reſidents.

Theſe are alſo denominated *victual benefices*, *beneficia victualia*.

Poſſeſſion of a BENEFICE; ſee POSSESSION.

BENEFICIARII, in *Roman Antiquity*, denote ſoldiers who attended the chief officers of the army, being exempted from other duty.

Beneficiarii were alſo ſoldiers diſcharged from the military ſervice or duty, and provided with *beneficia* to ſubſiſt on.

Theſe were probably the ſame with the former, and both might be compriſed in the ſame definition. They were old, experienced ſoldiers, who having ſerved out their legal time, or received a diſcharge as a particular mark of honour, were invited again to the ſervice, where they were held in great eſteem, exempted from all military drudgery, and appointed to guard the ſtandard, &c.

Theſe, when thus recalled to ſervice, were alſo denominated *evocati*; and before their recal, *emeriti*.

BENEFICIARII was alſo uſed for thoſe raiſed to a higher rank by the favour of the tribunes, or other magiſtrates.

The word *beneficiarius* frequently occurs in the Roman inſcriptions found in Britain, where *conſulis* is always joined with it; but beſides *beneficiarius conſulis*, we find in Gruter *beneficiarius tribuni*, *prætorii*, *legati*, *præfecti*, *proconſulis*, &c.

BENEFICIARY, in a general ſenſe, ſomething that relates to BENEFICES.

Rebuffe has collected ſix volumes on *beneficiary* matters. F. Paul has alſo a treatiſe on them.

BENEFICIARY, *beneficiarius*, is more particularly uſed for a beneficed perſon, or him who receives and enjoys one or more benefices.

Beneficiary is more particularly uſed, among *Roman Writers*, for a perſon exempt from public offices.

In which ſenſe, BENEFICIARII ſtand contradiſtinguiſhed from *municipes*.

Beneficiary is alſo uſed, in *Middle Age Writers*, for a feudatory or vaſſal.

Beneficiary is alſo uſed for a clerk or officer, who kept the account of the *beneficia*, and made the writings neceſſary thereto.

The ſame denomination was alſo given to the officers who collected the rents and duties belonging to the *fiſcus*.

BENEFICIO; ſee Deprivation *à beneficio*.

Suſpenſio à **Beneficio**; ſee Suspension.

Primo **Beneficio** *eccleſiaſtico habendo*; ſee Primo.

BENEFIT is uſed for a privilege granted to ſome perſon, as of an immunity, or the like.

Benefit *of ceſſion*, in the *French Law*, is when a debtor is admitted to ſurrender all his effects to his creditors, and in conſequence thereof ſet at liberty.

Benefit *of age*, in France, is when a minor obtains the king's letters, whereby he is emancipated, and impowered to manage his own income from eighteen years to his full majority.

Benefit *of clergy*; ſee Clergy.

BENENAIM, **Benenath**, **Benenasch**, or **Benenat**, in *Aſtronomy*, the outermoſt ſtar, of the ſecond magnitude, in the tail of the URSA *major*.

This is ſometimes alſo called *alalioth*.

BENEVOLENCE, *Univerſal*, in *Ethics*, denotes a hearty deſire of the good of mankind, evidencing itſelf, as ability and opportunity offer, in the chearful and diligent practice of whatever may promote the well-being of all. Some have traced the origin of this affection in ſelf-love: others again in ſome INSTINCT or determination of our nature, antecedent to all reaſon from intereſt, which influences us to the love of others, and they have accordingly made it the foundation of univerſal VIRTUE: others more properly aſcribe it to the *intelligent* conſtitution of human nature, and obſerve, that it ariſes not from inſtinct, but from the natures and neceſſity of things. Hutcheſon's Inquiry concerning Moral Good and Evil. Price's Review, &c. chap. iii.

Benevolence is uſed, both in our ſtatutes and chronicles, for a voluntary gratuity given by the ſubjects to their ſovereign, to which each perſon contributes in proportion to his eſtate: and as *benevolences* had been extorted under many ſucceeding princes, without a real and voluntary conſent, it was made an article in the petition of right, 3 Car. I. that no man ſhall be compelled to yield any gift, loan, or *benevolence*, &c. without common conſent by act of parliament.

In this ſenſe, *benevolence* amounts to much the ſame with what in other nations is called *ſubſidium charitativum*, given ſometimes by tenants to their lords, by the clergy to their biſhops, &c.—In France it is called *free gift*, excepting that this latter is reſtrained to the act of the clergy.

Among us, there are ſeveral ſtatutes againſt charging the people with *benevolences*; ſee 1 Rich. III. c. 2. 13 Car. II. ſtat. 1. c. 4.

BENJAMIN, in *Pharmacy*, a reſin. See Asa *dulcis*, and Benzoin.

Benjamin *tree*, in *Botany*, a ſpecies of the BAY.

BENISH *Days*, among the Egyptians, a term for three days of the week, which are days of leſs ceremony in religion than the other four, and have their name from the *beniſh*, a garment of common uſe, not of ceremony.

In Cairo, on Sundays, Tueſdays, and Thurſdays, they go to the baſhaw's divan; and theſe are the general days of buſineſs. Fridays they ſtay at home, and go to their *moſques* at noon; but, though this is their day of devotion, they never abſtain from buſineſs. The three other days of the week are the *beniſh* days, in which they throw off all buſineſs and ceremony, and go to their little ſummer-houſes in the country.

BENLOJA, in *Ichthyology*, the name by which the Swedes call that ſpecies of CYPRINUS, which we call the *bleak*. It is the ALBURNUS of authors.

BENNET *Herb*, in *Botany*; ſee Herb *Bennet*.

BENZOIN, a medicinal kind of reſin, imported from the iſlands Siam and Sumatra, and ſeveral other parts of the Eaſt Indies.

Benzoin is the ſame with what is popularly called *benjamin*, or *benjoin*, ſometimes alſo ASA *dulcis*.

It is procured by a wound, or inciſion made in a tree, whoſe leaves reſemble thoſe of the lemon-tree. The *benzoin*-tree is plentiful in Virginia and Carolina, and has been brought from thence into England, where it grows with vigour in the open ground. The bark and leaves yield with rectified ſpirit a reſin like *benzoin*, though this tree diſcharges none naturally in our clime nor in America. It is of a yellowiſh colour, of an agreeable ſcent, and melts eaſily.

There are three ſorts of *benzoin*. The firſt is called *amygdaloides*, becauſe of its being interſperſed with ſeveral white ſpots, which reſemble broken almonds: this comes from Siam, and is eſteemed the beſt. The ſecond is black, and very odoriferous; it drops from young trees; and comes from Sumatra; it is called *benzoinum de Boninas*. The third ſort is alſo black, but leſs odoriferous; this is found in the iſlands of Java and Sumatra. See Geoffroy, p. 354.

Benzoin is uſed in phyſic, as a pectoral, and anti-aſthmatic; and thrown on live coals, it ſerves to perfume houſes, &c.

Some recommend *benzoin* diſſolved in ſpirit of wine as a cephalic. It makes a tincture, commended for taking away freckles. It alſo enters the compoſition of ſome plaſters, as a diſcutient and ſtrengthener.

Pharmaceutic writers ſpeak of a water and tincture of *benzoin*, drawn with the ſpirit of wine, ſaid to be good againſt aſthmas, &c. Flowers of *benzoin*, procured by ſublimation, are eſteemed a powerful pectoral. Spirit of *benzoin* is uſed as a diuretic; and oil of *benzoin* is accounted a good vulnerary.

If two or three pounds of *benzoin* be diſtilled dry in a retort, with a mixture of a little ſand, there will ariſe ſpirit, oil, and flowers. This ſpirit being ſeparated from the reſt by filtration, and mixed with *ſal ammoniac*, two parts of the ſpirit of *benzoin* to one part of the other, though both are ſeparately clear and colourleſs, the mixture will become red. Phil. Tranſ. Nº 225.

The principal uſe of this fragrant reſin, is in perfumes, and as a coſmetic for ſoftening and ſmoothing the ſkin. For this laſt purpoſe it is diſſolved in ſpirit of wine, with an addition ſometimes of ſtorax, and the ſolution mixed with water makes a white liquor, which is called VIRGIN'S *milk*.

BER, in *Botany*, a name uſed by ſome authors for the Indian *jujube*; that ſpecies of the jujube-tree, on which the gum *lacca* of the ſhops is uſually found.

BERBENGINE, a name given by the *Arabian Phyſicians* to the *pomum amoris*, or *love-apple*, a kind of eſculent nightſhade; and by ſome to a tree producing the nut *metel*, becauſe of its likeneſs to the plant which produces the *melongena* in the ſhape of its leaves.

BERBERII, in *Medicine*; ſee Palsy.

BERBERIS; ſee Barberry-*tree*.

BERCARIA, **Berqueria**, or **Berkeria**, in *Middle Age Writers*, denotes a ſheep-fold, ſheep-cote, ſheep-pen, or other incloſure, for the ſafe-keeping a flock of ſheep.

The word is abbreviated from *berbicaria*; of *berbex*, detorted from *vervex*. Hence alſo a ſhepherd was denominated *berbicarius*, and *berquarius*.

BERCHEROIT, or **Berkcoits**, a weight uſed at Archangel, and in all the Ruſſian dominions. It is equal to about 364 pounds Engliſh avoirdupois.

BERDASH, in *Antiquity*, was a name formerly uſed in England for a certain kind of neck-dreſs; and hence a perſon who made or ſold ſuch neck-cloths was called a *berdaſher*, from which is derived our word HABERDASHER.

BERDIN, in *Natural Hiſtory*, a name given to the PATELLA, or limpet, in Normandy, and other places. In ſome it is pronounced *berlin*.

BERENGARIANS, a religious ſect, adhering to the opinions of Berengarius, archdeacon of Anjou, who, in the latter part of the eleventh century, a conſiderable time before Luther, oppoſed the doctrine of tranſubſtantiation, and the real preſence, ſtrenuouſly maintained by Lanfranc and Anſelm.

He is further charged by the Romaniſts with decrying marriage, and maintaining the common uſe of all ſorts of women, and aſſerting infant-baptiſm of no effect.

His followers were divided on the head of the euchariſt: though they all agreed, that the bread and wine were not eſſentially changed, yet ſome allowed, that the body and blood of Chriſt were contained in them, though concealed under an impanation, which was the opinion of Berengarius himſelf: others denied any change at all, and reſolved the whole into figure; others again allowed a change in part; and others an entire change with this reſtriction, that to thoſe who preſented themſelves unworthily, it was changed back again. See Moſheim's Ecc. Hiſt. vol. ii. p. 321, &c.

Mabillon has a diſſertation expreſs on the manifold condemnations of Berengarius, his retractions, relapſes, and repentance.

BERENICE's *Hair*; ſee Coma *Berenices*.

BEREWICHA, or **Berewica**, in our *Old Writers*, denotes a village or hamlet belonging to ſome town or manor, ſituate at a diſtance therefrom.

The word frequently occurs in Doomſday-book: *Iſtæ ſunt berewichæ ejuſdem manerii.*

BERFISCH, in *Ichthyology*, a name given by the Germans to the common PEARCH, or *perca*.

BERG-*gruen*, in *Natural Hiſtory*, the name of an earth uſed in painting, and properly called *green ochre*, though not known among the colour-men under that name. It is found in many parts of Germany, Italy, and England, commonly in the neighbourhood of copper-mines, from particles of which metal it receives its colour. The characters by which the native kind is known from other green earths, are theſe: it is a denſe, compact ſubſtance, conſiderably heavy, and of a pale, but not diſagreeable green; of a rough and uneven, but not duſty ſurface, and ſomewhat unctuous to the touch. It adheres firmly to the tongue; does not break eaſily between the fingers; nor at all ſtain the hands. It is of a brackiſh diſagreeable taſte, and does not ferment with acids.

BERGAMOT gives the denomination to a kind of eſſence, drawn from a fruit, produced by ingrafting the lemon-tree on the *bergamot* pear-ſtock. It is properly the oily fluid of the peels of theſe lemons, expreſſed by the fingers.

There is likewiſe a kind of ſnuff of the ſame name, which is only clean tobacco, with a little of the eſſence rubbed into it.

BERGAMOT is alſo the denomination of a coarſe tapeſtry, manufactured with flocks of ſilk, wool, cotton, hemp, ox, cow, or goat's hair, and ſuppoſed to be invented by the people of Bergamo in Italy.

BERGANDER, in *Zoology*, a name by which ſome have called the ſhell-drake, or burrough-duck, a very beautiful ſpecies of duck, common on the coaſts of Lancaſhire; but not much eſteemed for eating, called TADORNA.

BERGHMOT, or BERGHMOTE, vulgarly BARMOTE, a court held on a hill for deciding pleas and controverſies among the Derbyſhire miners.

The word is formed from the Saxon *berg*, *mons*; and *mote*, *conventus*, *aſſembly*, or *meeting*.

BERIBERI, the name of a diſeaſe among the Indians, being a ſpecies of PALSY.

BERICARIA, BERCARIA, or BERQUARIA, a ſheep-down, or ground whereon to feed ſheep.

BERITH, a ſimple mentioned in Scripture, uſed for cleanſing or taking out ſpots. Jerem. chap. ii. ver. 22. Some will have it to be the *kali*, or ſalt-wort, from the aſhes of which ſoap is made; and in our verſion it is rendered *ſoap*: others, after Rudbeck, make it to be the dye of the purple-fiſh.

BERLIN, a ſort of vehicle, of the chariot kind; taking its name from the city of Berlin, in Germany: though ſome attribute the invention of it to the Italians, and derive the word from *berlina*, a name given by them to a ſort of ſtage, whereon perſons are expoſed to public ſhame.

The *berlin* is a very convenient machine to travel in, being lighter, and leſs apt to be overturned, than a chariot. The body of it is hung high, on ſhafts, by leathern braces; there being a kind of ſtirrup, or footſtool, for the conveniency of getting into it: inſtead of ſide-windows, ſome have ſcreens to let down in bad weather, and draw up in good weather.

BERLIN, in *Natural Hiſtory*; ſee LIMPET.

BERLUCCIO, in *Zoology*, the name of a ſmall bird of the *hortulanus* kind, and much reſembling the *yellow-hammer*; but ſomething ſmaller, and longer bodied.

BERME, in *Fortification*, a ſmall ſpace of ground, four or five feet wide, left without the rampart, between its foot and the ſide of the moat, to receive the earth that rolls down from the rampart, and prevent its falling into, and filling up the moat.

This is alſo called *liſiere*, *relais*, *retraite*, *pas de ſouris*, *fore-land*, &c.

Sometimes, for greater ſecurity, the *berme* is paliſadoed.

BERMUDIANA, in *Botany*; ſee SISYRINCHIUM.

BERNACLE, in *Ornithology*; ſee BARNACLE.

BERNARD *the hermit*, in *Ichthyology*; ſee SQUILLA.

BERNARDINS, or BERNARDITES, the name of a religious order, differing very little from the CISTERCIANS. Their uſual habit is a white gown, with a black ſcapulary; but when they officiate, they put on a large white coul with great ſleeves, and a hood of the ſame colour.

BERNHARDIA, in *Botany*, a name given by Houſton to a genus of plants, characteriſed by Linnæus under the name of CROTON.

BERNICLE, in *Natural Hiſtory*, the name of a ſpecies of ſhell-fiſh, called by authors CONCHA *anatifera*.

This is compoſed of five ſhells or valves, and agrees, according to Liſter, with the *pholas*, as well in the diſpoſition as in the number of the valves. Liſt. Hiſt. Nat. p. 360.

BERNICLE is alſo a name given by the people of many parts of France to the *patella*, or LIMPET.

BEROE, in *Natural Hiſtory*, is a marine animal found on our coaſts, of a gelatinous tranſparent nature, and of an oval or ſpherical form, about half an inch to an inch diameter, divided like a melon into longitudinal ribs, each of which is furniſhed with rows of minute fins, by means of which this animal, like the *animalia infuſoria*, can ſwim in all directions with great ſwiftneſs. The excellent Linnæus, ſays Mr. Ellis (who gives the above mentioned deſcription of this animal), has joined the *beroe* to the *volvox*, one of the *animalia infuſoria*.

BERRY, *bacca*, a grain, fruit, or ſeed, produced by ſeveral herbs, trees, and ſhrubs, thence called BACCIFEROUS, for the conſervation, and reproduction of their kind.

Some define *berries* as a fruit ſmaller than apples, growing in bunches, but not ſo thick or cloſe as grapes. Others a ſoft, fleſhy, ſucculent fruit, having ſtones or kernels within them.

Such are the fruits of laurels, olives, currants, and the like.

Berries are of various ſizes, forms, properties, and uſes, according to the plants whereon they grow.—Some are uſed in medicine, as juniper *berries*, buckthorn *berries*, &c.—Others in dying, as French or yellow *berries*, &c. The yellow *berry* waſh may be thus prepared: take a pound of the French *berries*, and put them to a gallon of water, with half an ounce of alum; boil them an hour in a pewter veſſel, and filter off the fluid: put them again into the boiler, and evaporate the fluid till the colour appear of the required ſtrength.

BERRY likewiſe denotes a pulpy *pericarpium* without valves, in which the ſeeds are naked.

BERRY, *Avignon*; ſee AVIGNON.

BERRY, *Ale*; ſee ALE.

BERS, in *Ancient Medicine*, an electary uſed by the Egyptians to excite deliriums.

BERSARII, in *Writers of the Middle Age*, a kind of hunters or ſportſmen, who purſued wild beaſts in foreſts and chaces.

The word ſeems derived from the barbarous Latin *berſare*, *to ſhoot with a bow*. On which principle, it ſhould properly denote archers only, or bowmen. Or it might be derived from *berſa*, the *fence* or *pales of a park*. In which view, it ſhould primarily import thoſe who hunt or poach in parks or foreſts.

Hincmar ſpeaks of a kind of inferior officers in the court of Charlemagne, under the denomination of *berſarii*, *veltrarii*, and *beverarii*. Spelman takes the firſt to denote thoſe who hunted the wolf; the ſecond, thoſe who had the ſuperintendency of the hounds for that uſe; and the third, thoſe who hunted the beaver.

BERSE, in *Botany*, the name given by the French writers to the *ſphondylium*, or *cow*-PARSNEP, a ſpecies of umbelliferous plants common in our meadows, and known by its large rough leaves and remarkable height.

BERTH, in the *Sea-language*, denotes a convenient diſtance or room to moor a ſhip in.

To take a good **BERTH**, ſignifies to go ſome diſtance to ſea-board off any point, rock, or other thing which the ſeamen would go clear of.

BERTHING, in the *Sea-language*, denotes the raiſing or bringing up of ſhip-ſides. Thus they ſay, a clincher hath her ſides *berthed* up before any beam is put into her.

BERTONA, BERTONIA, BERTHONA, BERTON, or BARTON, properly denotes that part of a country farm, where the barns and other inferior offices ſtand, and wherein the cattle are foddered, and other buſineſs is managed.

BERTON is alſo uſed to ſignify a farm, as diſtinct from a manor. Du-Cange.

In ſome parts of the weſt of England, they call a great farm a *berton*; and a ſmall one a *living*.

Hence alſo *bertonarii* was anciently uſed for thoſe we now call farmers, or tenants of *bertons*.

BERULA, in *Botany*, a name given by ſome authors to the common upright water-parſnep, or *ſium erectum umbellatum*. See SKIRRET.

BERUS, a ſpecies of the COLUBER.

BERY, BERIA, or BERIE, in *Middle Age Writers*, denote a flat, wide champaign.

In which ſenſe, the word differs from *bury* or *borough*, *a town*, though uſually confounded with it by gloſſographers. Hence *Beria S. Edmundi*, mentioned by Matt. Paris under the year 1174, is not to be underſtood of the town, but of the adjoining plain.—And hence the denomination *bery-field*, and *bery-meadow*, is ſtill retained to divers flat and wide meads, and open grounds. Hence alſo *berras aſſartare* is to dry or plow up heaths or downs. And hence our warrens are called *coney-beries*.

Bery is either uſed ſeparately, or in compoſition with the names of divers places; as *Mixbery*, *Acornbery*, &c.

BERYL, or BERYLL, βηρυλλος, in the *Ancient Phyſiology*, denotes a tranſparent ſtone, or gem, brought from India, of a light, or pale green colour; inſomuch that ſome have repreſented it as of two colours, the one green, the other pale.

The *beryl* of the ancients is the ſame with what in latter times has been denominated AQUA *marina*, by reaſon of its glaucous, or ſea-green colour.

The *beryl* differs from the *chryſoberyl*, which is ſomewhat paler, and partakes more of the yellow; and from the *chryſophraſus*, which partakes more of the green.

Some authors take the *beryl* to be the diamond of the ancients.

The *beryl* is ſometimes found in pieces large enough to form fine vaſes. It is ſaid there are many of theſe in Cambaya, Martaban, Pegu, and Ceylon.

The *beryl*, in its fineſt ſtate, approaches to the hardneſs of the garnet; but it is often much ſofter, and conſequently of the leſs value. There is, however, a common error which gives our jewellers an idea of this, and other of our gems, being much ſofter than they really are, which is, the miſtaking the common tinged cryſtals, frequent in mines, and called by authors *pſeudoberyllus*, &c. for the genuine gems of thoſe names. It is eaſy to conceive theſe cannot be any harder, and it is natural enough to ſuſpect they cannot be ſo hard as cryſtal in its common colourleſs ſtate.

The *beryl* parts with its colour in a very ſmall fire; but is, when colourleſs, greatly inferior to the amethyſt or ſapphire. It is found in great abundance in the iſland of Ceylon, and in many other parts of the Eaſt Indies, as alſo in America: many of them are found alſo in Sileſia, and ſome other parts of Europe; but in this, as in all other gems, the oriental are vaſtly ſuperior to thoſe of any other part of the world in hardneſs, as well as in luſtre, and the beauty of their colour.

Gorræus gives a liſt of eight ſorts of *beryls*, diſtinguiſhed only by the diverſity of their colour.

Mr. Boyle alſo ſpeaks of a white kind of *beryl*.

BERYL is alſo a name given by ſeveral of our jewellers to a ſpecies of brown ſprig cryſtal, with a remarkably long pyramid.

This is the brighteſt of all the brown cryſtals, and is eſſentially different from the ſpecies commonly known by that name. It is found in Italy, and ſome parts of Germany. The Italians call it, by way of eminence, the *beryl cryſtal*; but our jewellers drop the word cryſtal, and call it ſimply the *beryl*. Hence any tolerably clear brown cryſtal was ſome time ago cut, to ſupply its place; and good brown cryſtal was generally accounted the *beryl* of the ancients.

BERYL, *berillus*, is alſo a name given to a kind of cryſtal looking-glaſs, ſuperſtitiouſly conſecrated to the purpoſes of conjuring and divination.

Hence alſo the term *berillyſtica*, uſed for the myſterious art of ſeeing future or diſtant events in ſuch glaſſes.

BERYTIUM, in the *Ancient Phyſic*, an ophthalmic medicine or collyrium, invented by Berytius againſt the ſevereſt epiphoras.

The ſame denomination is alſo given to a ſort of paſtil, of uſe in dyſenteries.

BES, or BESSIS, an ancient Roman weight, containing two thirds of the AS; that is, eight *unciæ*.

The *bes* originally weighed two aſſes; whence the origin of the word *quaſi binus as*. Though Scaliger conjectures it to have been formed from *dues*; as *bellum* from *duellum*, or *bonum* from *duonum*.

BES was alſo uſed in the menſuration of lands, to denote two thirds of a *jugerum*, or acre.

BESAILE, in the *Common Law*, a writ that lies where the great-grandfather or great-grandmother was ſeiſed the day that he or ſhe died of any lands or tenements in fee-ſimple; and after his or her death, a ſtranger entered the ſame upon him, and keeps out the heir.

The word is French, *beſaile*, or *biſayeul*, *a great-grandfather*.

BESANT, BEZANT, BISANT, or BYZANT, a ſort of coin, ſtruck at Byzantium, in the time of the Chriſtian emperors.

The *beſant* was pure gold, or twenty-four carats fine: but writers are not generally agreed with reſpect to its value.

Hence alſo the gold offered by the king at the altar, on feſtivals, is ſtill called *beſant*, or *biſant*.

Thirteen *beſants*, or *beſantins*, are preſented at the maſs at the coronation of the kings of France. Henry II. had that number coined on purpoſe.

BESANTS, or BEZANTS, in *Heraldry*, are repreſentations of round, flat pieces of money or bullion, without ſtamp or impreſs, introduced into coat-armour by thoſe who were at the holy war.

Beſants are ever of metal, and when blazoned, ſhould be expreſly ſaid to be of *or*, or *argent*. The Engliſh heraldry knows only the gold; but foreigners have alſo the ſilver kind.

When a field or charge contains above eight *bezants*, ſo placed as to fill the ſame equally on all ſides, and repreſenting a promiſcuous ſtrewing of pieces over the whole, ſome blazon the field or charge *bezanted*, *bezantée*: but if there be ten, twelve, fifteen, or more, confined to any particular form or poſition, the number and form muſt be particularly mentioned. Coat's Dict. Her. p. 49.

Croſs BESANTED, *bezantée*, denotes a croſs made up of *beſants*, or pieces of money.

This amounts to the ſame with what Upton calls a *croſs talented*, *crux talentata*, or made up of talents.

BESBASE, in the *Materia Medica*, a name given by the Arabian writers Serapion and Avicenna to mace; but as the names *macis* and *macir* are very much alike in ſound, though different in ſenſe, they have confounded theſe two things under the ſame term *beſbaſe*; the one meaning the covering of the nutmeg, and the other the bark of a tree uſed as an aſtringent; ſo that this word *beſbaſe* is to be underſtood as meaning the one or the other of theſe, according to the virtues aſcribed to it.

BESD, a term often uſed by Arabian writers for the plant called MARGIAN.

BESLERIA, in *Botany*, the name given by Plumier, and afterwards by Linnæus, to a genus of the *didynamia angioſpermia* claſs of plants; the characters of which are theſe: the flower is of the lip kind, and of one leaf; it hath four *ſtamina* in the tube of the flower, two of which are longer than the other; with an oval *germen*, which afterward becomes an oval berry, with one cell filled with ſmall ſeeds. There are three ſpecies, which grow naturally in the warm parts of America, but are too tender to live in this country, without artificial heat.

BESORCH, a coin of tin, or of ſome alloyed metal, current at Ormus, at the rate of about $\frac{7}{49}$ parts of a farthing ſterling.

BESSIS *centeſimæ*, denotes two thirds of centeſimal intereſt, or uſury at eight *per cent*.

BESTAIL, or BESTIAL, in *Ancient Statutes*, is uſed for CATTLE. 5 Ed. III. c. 2.

BESTARCHA, a dignity in the courts of the emperors of Conſtantinople, ſuppoſed to anſwer to that of the *maſter of the wardrobe* among us.

The word *beſtarcha* ſeems to have been formed from *veſtarcha*, by a change of the *v* into *b*.

BESTIARII, among the *Ancient Romans*, thoſe who were hired to combat with beaſts, or thoſe who were expoſed to them, by ſentence of law.

We uſually diſtinguiſh two kinds of *beſtiarii*: the firſt were thoſe condemned to the beaſts; either as being enemies taken priſoners, or as being ſlaves, and guilty of ſome enormous crime.—Theſe were all expoſed naked, and without defence, to the beaſts; nor did it aught avail to conquer and kill the beaſt, freſh ones being continually let looſe on them, till they were dead. But it ſeldom happened, that two were required for the ſame man; on the contrary, one beaſt frequently diſpatched ſeveral men. Cicero mentions a lion, which alone diſpatched two hundred *beſtiarii*.—Thoſe who ſucceeded the firſt were called εφεδροι, and the laſt εσχατοι; among the Romans, *meridiani*.

The Chriſtians were *beſtiarii* of this kind, even ſome of them who were Roman citizens; though it was the legal right of ſuch to be exempt from it.

The ſecond kind of *beſtiarii*, Seneca obſerves, conſiſted of young men, who, to become expert in managing their arms, fought ſometimes againſt beaſts, and ſometimes againſt one another; and of bravoes, who, to ſhew their courage and dexterity, expoſed themſelves to this dangerous combat. Auguſtus encouraged this practice in young men of the firſt rank; Nero expoſed himſelf to it; and it was for the killing beaſts in the amphitheatre, that Commodus acquired the title of the *Roman Hercules*.

Vigenere to theſe adds two kinds of *beſtiarii* more: the firſt were thoſe who made a trade of it, and fought for money; the ſecond was where ſeveral *beſtiarii*, armed, were let looſe at once, againſt a number of beaſts.

BETA, in *Botany*, the BEET.

BETEL, in *Botany*, an Indian plant, in great uſe and eſteem throughout the Eaſt, where it makes a conſiderable article of commerce.

The *betel* bears ſome reſemblance to the pepper-tree. Its leaves are like thoſe of ivy, only ſofter, and full of red juice, which, among the Orientals, is reputed of wonderful virtue for fortifying the teeth, and rendering the breath ſweet. The Indians are continually chewing theſe leaves, which renders their lips ſo red, and teeth black, a colour by them vaſtly preferred to the whiteneſs affected by the Europeans.

The conſumption of *betel* leaves is incredible, no body, rich or poor, being without their box of *betel*, which they preſent to each other by way of civility, as we do ſnuff. In many places they chew the *areca* nut, either alone or mixt with the *betel* leaf and lime, and the leaves of this plant are ſometimes chewed alone; but they are too ſharp, and uſually injure the teeth, and it is not uncommon to find men of twenty-five wholly toothleſs in this part of the world, merely from their having chewed this plant to an exceſſive degree. The prepared *betel* is a very common preſent among the poorer ſort; and, on taking leave of a friend, it is always the cuſtom to make him a preſent of a purſe of the leaves prepared for uſe. When the poorer ſort are to appear before the rich, they always chew a large quantity of *betel*, to give them a ſweet breath; and the women, on certain occaſions, never fail to take largely of it as a provocative. On all viſits, the company is regaled with prepared *betel*. The principal time of uſing it is after dinner, at which time, they ſay, it prevents ſickneſs of the ſtomach; and they never abſtain from it, except on the ſolemn occaſions of the funerals of their relations, and their days of faſting. Moderately uſed, it ſtrengthens the gums, corroborates the heart and ſtomach, diſcuſſes flatulencies, and purges both the ſtomach and brain. If chewed after breakfaſt, it makes the breath ſweet for the whole day. The Portugueſe women are as fond of the *betel* as the Indians themſelves, and cannot live a day without it.

BETELGEULE, or BEDELGAEZE, a fixed ſtar of the firſt magnitude in ORION's hind-ſhoulder.

BETH, in *Literary Hiſtory*, makes the title of a multitude of books in the Hebrew language; e. gr. *beth avoth*, or *the houſe of the fathers*; *beth Elohim*, or *the houſe of God*; *beth Iſrael*, or *the houſe of Iſrael*, &c.

BETHLEHEM *ſtar*, in *Botany*; ſee STAR *of Bethlehem*.

BETHLEHEMITES, or BETHLEMITES, in *Church Hiſtory*, a ſort of monks introduced into England in the year 1257, habited like the Dominicans, except that, on their breaſt, they wore a ſtar with five rays, in memory of the ſtar or comet which appeared over Bethlehem at the nativity of our Saviour. They were celled at Cambridge, and had only one houſe in England.

There is alſo an order of *Bethlehemites* ſtill ſubſiſting in Peru, who have convents at Lima; one called of the incurables, the other of our Lady of mount Carmel.

Theſe *Bethlehemites* came originally from the city of Guatimala in Mexico, where they were inſtituted by the venerable Peter Joſeph of Betaneur, for the ſervice of the poor. Innocent XI. in 1687, approved the inſtitute. They have already nine convents in Peru.

The *Bethlehemites*, though outwardly of great ſimplicity, paſs for the moſt refined politicians; inſomuch as to be called the quinteſſence of the Carmelites and Jeſuits. They are all friars. For their almoner they chooſe a ſecular prieſt, whom they hire, and who has no vote in the chapter.

BETON, a name given by the French engineers to a kind of mortar, which they uſe in raiſing the foundations of maſonry under water. It conſiſts of twelve parts of pozzolans, or Dutch terraſs, ſix of good ſand, nine of unſlaked lime, thirteen of ſtone ſplinters about the ſize of an egg, and three of tile duſt, or cinders, or ſcales of iron out of a forge; this being well worked together, is left to ſtand for about twenty-four hours, or till it becomes ſo hard as not to be ſeparated without a pick-ax.

BETONY, BETONICA, in *Botany*, a genus of plants, of the *didynamia gymnoſpermia* claſs; the characters of which are theſe: the flower is of one leaf, of the lip kind, with a cylindrical incurved tube; the upper lip is roundiſh, plain, erect, and entire; the lower lip is cut into three parts. It hath four *ſtamina*, two long, and two ſhorter, which incline to the upper lip. The *germen* is quadripartite, which afterward becomes four naked oval ſeeds, lodged in the empalement. There are ſeven ſpecies.

This plant has been celebrated for abundance of medicinal virtues, but does not promiſe to have any conſiderable activity. Its principal uſe is in herb ſnuffs, and as a ſubſtitute for tea. Its root, like the root of hellebore, operates both upwards and downwards.

Betony is eſteemed a good cephalic, vulnerary, cardiac, diuretic, and dryer. Some alſo make *betony* a good ſplenetic, hepatic, thoracic, uterine, &c.

The Italians, when they would praiſe any body, ſay, *tu hai piu di virtu che non ha betonica*; that is, *you have more virtues than betony*; and proverbially deſire, *vende la tunica & compra la betonica*; that is, *ſell your coat and buy betony*.

Ant. Muſa, phyſician of the emperor Auguſtus, wrote a treatiſe expreſs, *De betonica*, ſtill extant; wherein he commends it greatly as a vulnerary, eſpecially in wounds of the head, and enumerates its uſes in the cure of no leſs than forty-ſeven diſeaſes.

Betony is chiefly adminiſtered in the way of decoction, ſometimes of ſmoak, ſometimes as an ingredient of a cerat or plaſter, hence called *emplaſtrum de betonica*. Some alſo give its juice, boiled to the conſiſtence of honey, mixed with a little balſam of Peru, as a pectoral healer.

Foreign diſpenſaries alſo give the preparations of a *betony* water, a ſyrup, conſerve, and extract of *betony*.

BETONY, *Water*, in *Botany*; ſee FIG-*wort*.

BETONICA *Pauli*, in *Botany*, a name given by many to ſome of the ſpecies of the *veronica*, or SPEEDWELL.

BETROTHMENT, a mutual promiſe or compact between two parties, for a future marriage.

The word imports as much as giving one's troth; that is, true faith, or promiſe.

Betrothment amounts to the ſame with what is called by civilians and canoniſts *ſponſalia*, or *eſpouſals*; ſometimes *deſponſation*; and, by the French, *fiançailles*.

Betrothment is either ſolemn, made in the face of the church, or private, made before witneſſes out of the church. *To betroth by giving arrhæ*, or earneſt, is called by *Middle Age Writers*, *ſubbarrare*.

The nuns of the *annunciada*, hold an annual feaſt, in honour of the deſponſation, or *betrothment* of the Virgin Mary to Joſeph.

BETULA, in *Botany*, the BIRCH.

BEVEL, in *Maſonry*, and among *Joiners*, a kind of ſquare, one leg whereof is frequently ſtrait, and the other crooked, according to the ſweep of an arch, or vault; being withal moveable, on a point, or centre, ſo that it may be ſet to any angle.

The make and uſe of the *bevel* are pretty much the ſame as thoſe of the common ſquare and mitre, except that theſe latter are fixed; the firſt at an angle of ninety degrees, and the ſecond at forty-five; whereas the *bevel*, being moveable, may, in ſome meaſure, ſupply the office of both, and yet, which it is chiefly intended for, ſupply the deficiencies of both, ſerving to ſet off, or transfer angles, either greater or leſs than ninety, or forty-five degrees.

Bricklayers have alſo a *bevel*, by which they cut the under ſides of the bricks of arches ſtraight or circular, to ſuch oblique angles as the arches require, and alſo for other uſes.

BEVEL, *Graduated*, is that which has about the centre of one of its arms a ſemicircle graven, and divided into 180 degrees, whoſe diameter ſtands ſquare with the ſides of the ſame arm; ſo that the end of the other arm, being divided at right angles, almoſt to the centre, ſhews by its motion the number of degrees contained in the angle to be meaſured.

This is alſo called *recipiangle*, and *pantametre*.

BEVEL *angle* is uſed among the workmen, to denote any other angle beſide thoſe of ninety or forty-five degrees.

BEVELLING, in *Ship-building*, the art of hewing timber with a proper and regular curve, according to a mould which is laid on one ſide of its ſurface.

BEVERAGE, in a general ſenſe, ſignifies a drink. Hence nectar is ſaid to be the *beverage* of the gods. In *Writers of the Middle Age*, *beverage*, *beveragium*, or *biberagium*, denotes money given to an artificer, or other perſon, to drink, over and above his hire or wages. Du-Cange.

BEVILE', in *Heraldry*, denotes a thing broken, or opening like a carpenter's rule.—Thus he beareth argent a chief *bevilé* vert, by the name of *Beverlis*.—Vid. *Tab. Herald. fig.* 8.

BEWITS, in *Falconry*, denote pieces of leather to which a hawk's bells are faſtened, and buttoned to his legs.

BEXUQUILLO, in the *Materia Medica*, a name given to the white *ipecacuanha*, which the Spaniards bring from Peru, as the Portugueſe do the brown from Braſil.

BEY, or BEG, denotes a governor of a country, or town, in the Turkiſh empire.

The Turks write the word *begh*, or *bek*, but they pronounce it *bey*: properly it ſignifies *lord*, but is particularly applied to a *lord of a banner*, whom in the ſame language they call *ſangiakbeg*, or *bey*; *ſangiak*, which among them ſignifies *banner*, or *ſtandard*, being the badge of him who commands in an important place of ſome province, having under him a conſiderable number of ſpahis, or horſe.

Each province in Turky is divided into ſeven of theſe *ſangiaks*, or banners, each of which qualifies a *bey*; and theſe are all commanded by the governor of the province, whom they alſo call *beghiler-beghi*, or *beyler-bey*, i. e. *lord of the lords* or *beys* of the province.

Theſe *beys* are, in a great meaſure, the ſame that *bannerets* formerly were in England.

BEY, of Tunis, denotes a *prince*, or *king* thereof; anſwering to what at Algiers is called the *dey*.

In the kingdom of Algiers, each province is governed by a *bey*, or vice-roy; who is appointed and removed at pleaſure by the dey; but has a deſpotic power within his juriſdiction; and at the ſeaſon for collecting the tribute from the Arabs, is aſſiſted by a body of troops from Algiers.

BEZANT; ſee BESANT.

BEZANTLER, among *Sportſmen*, that branch of a deer's horn next below the brow antler.

BEZOAR, or **Bezoard**, primarily denotes an antidote, or counter-poiſon.

The word is formed from the Perſian *pa-zahar*, which denotes the ſame; *pa* ſignifying *againſt*; and *zahar*, *poiſon*.

In this ſenſe the name is applied to divers chemical compoſitions of that intention; as the *mineral*, *ſolar*, and *jovial bezoards*.

Some have alſo given the appellation *animal bezoard*, to a powder, made of the heart and liver of vipers, pulverized together.

Bezoar, or **Bezoard**, in a more proper ſenſe, denotes a medicinal ſtone, brought from the Eaſt or Weſt Indies, compoſed of ſeveral coats, or *laminæ*, laid one over another, like an onion, generated in the ſtomach of an animal of the goat kind, and eſteemed a powerful antidote and cardiac. See Ægagropilus.

This is ſometimes alſo called the *true bezoar*; and is of two kinds, *oriental* and *occidental*.

Bezoar, *Oriental*, is in the moſt eſteem, and is brought from ſeveral parts of the Eaſt Indies, chiefly Golconda and Cananor: it is there found mingled with the dung of an animal of the goat kind, called *pazan*; in the belly whereof this ſtone is found.

There is generally, if not always, ſome foreign body in the centre of the *bezoar*, around which, as a *nucleus*, the bezoartic coats, or *ſtrata*, are ranged; as ſtraws, hair, marcaſites, pebbles, talc, ſand, &c. and ſtones like cherry-ſtones; but the common *nucleus* is the pod of a fruit much like that of the ACACIA *vera Ægyptiaca*; though at firſt ſight it reſembles a *caſſia*, or tamarind-ſtone. This fruit being taken into the ſtomach, cauſes, by its aſtringency, a condenſation of the liquors it there meets with, from which in time ariſes the *bezoar*. Phil. Tranſ. N° 282. p. 1284.

In ſome of the ſtones alſo found on this *nucleus*, the outer membrane of the bean having periſhed, and the bean ſhrunk in drying, there remains a vacuity between it, and the next coat of the *bezoar*; ſo that it rattles within it, when ſhaken in the manner of an *ætites*.

The formation of the *bezoar* ſeems to be this, that the undigeſted matter, be it what it will, remaining in the ſtomach of the animal, irritates the glands, and makes them diſcharge their contents, which, mixing with the juices of the ſtomach, impregnated with the virtues of the aromatic plant on which the animal feeds; theſe may together collect, and harden by degrees about this ſubſtance. In fine, their coats ſurrounding one another; the conſequence of which muſt be, that the whole *bezoar* muſt be of the ſhape of the accidental matter, on which it was formed. If it be a ſtraw, the *bezoar* will be long; if a ſmall pebble, the *bezoar* will exactly be of its ſhape, however irregular that be; and, if a kidney-bean, there will be ſeen on the *bezoar* the ſeveral lineaments of that fruit. Mem. Acad. Par. 1711.

The ſtones produced by each animal may be felt and numbered on the outſide, by which in trade the price of the animal is regulated.

Bezoar ordinarily grows to the bigneſs of an acorn, ſometimes of that of a pigeon's egg: it is compoſed of ſeveral ſhining ſkins, or coats, like an onion, ſometimes of a blood colour, ſometimes a greeniſh yellow, a browniſh red, and honey colour.—The number of *bezoars* produced by each animal is various, ſome yielding one, two, &c. to ſix, and others none at all.

The larger the ſtone, the more valuable it is held; its price increaſing like that of the diamond.—A ſtone of one ounce is ſold in the Indies for 100 livres, and one of four ounces and a quarter for 2000 livres.

The genuine *bezoar* ſtones are ſo ſcarce even in the Indies, that few, if any of them, are brought into Europe. The greater number are no other than artificial compounds made there. Theſe, which are ſuppoſed to be genuine, Mr. Neumann obſerves, are compounded of plaſter of Paris, chalk, or other earths, impregnated with a vegetable green tincture: thoſe which are acknowleged to be counterfeit, are formed chiefly of reſinous ſubſtances, and are diſtinguiſhable by their liquefying in the fire, and diſſolving in ſpirit of wine. He never could diſcover in either of theſe any mark of an animal nature. Chemical Works, by Dr. Lewis, p. 533, &c.

Oriental *bezoar* muſt be choſen gloſſy, of a ſmell like that of ambergris, ſmooth to the touch, and in large pieces; its figure is indifferent, its colour uſually olive.

Bezoar is eaſily ſophiſticated; but the deceit is as eaſily diſcovered. The methods of proving it are, 1ſt, To ſteep it three or four hours in luke-warm water; if the water be not tinged, nor the *bezoar* loſe of its weight, it is pure. 2dly, To try it with a ſharp, red-hot iron; if it enters the ſtone, and the heat makes it fry and ſhrivel, it is factitious. 3dly, To rub it over a paper ſmeared with chalk, or quick-lime; if it leave a yellow teint on the former, or a green one on the latter, it is good.

We are, however, told of *artificial bezoars* in the iſle of Ormus, made ſo dexterouſly, as not to be diſcernible from the *natural*, unleſs they be firſt broken. *Bezoar* is ſaid to be adulterated among us with powders, roſin, and mucilage. Le Mort deſcribes a factitious *bezoar*, reſembling the native one, and ſhews how it may be prepared, from the magiſtery of alexipharmic herbs.

The true oriental *bezoars* were, about eighty years ago, ſo common in Cananor, that thoſe of the bigneſs of a pigeon's egg were frequently brought to market at ſix or ſeven reals a piece, and thoſe of the bigneſs of a hen's egg at twelve reals. The method of trying the genuineneſs of the *bezoar* by water, was firſt brought into uſe in that place.

Bezoar is given in vertigoes, epilepſies, palpitations of the heart, jaundice, colic, and ſo many other diſeaſes, that were its real virtues anſwerable to its reputed ones, it were doubtleſs a *panacea*. Indeed, its rarity, and the peculiar manner of its formation, have contributed as much to its reputation, as any intrinſic worth. At preſent it begins to be prized leſs, and a great many able phyſicians regard it, as of no uſe or efficacy at all.

Bezoar, *Occidental*, is heavier, more brittle, of a dirtier green colour, as alſo leſs gloſſy, and generally held much inferior in virtue to the oriental kind.—It is ſaid to be found in the belly of ſeveral animals, eſpecially in Peru; as the *guanacos*, *jachos*, *vicunnas*, and *taraguas*; the *bezoar* of which laſt is the moſt eſteemed, this animal being much like the goat that produces the oriental. But that of the firſt is more common, viz. the *guanacos*, a creature about the ſize of a horſe, by ſome deſcribed, as a ſpecies between a camel and a wild goat.

In ſome, this ſtone is of the bigneſs of a nut, in others of a pullet's egg: in ſome it is oval, in others flat, in others round; it is uſually of an aſh-colour, ſometimes duſky; and formed of ſcales, like the oriental, but much thicker: it is ſmooth and even without-ſide, but when broken, looks as if it had been ſublimated, by reaſon of the little ſhining needles whereof it appears to be compoſed.

This kind of *bezoar*, Mr. Neumann apprehends, is more likely to be an animal production than the former, as it yields in diſtillation ſome ſmall portion of volatile urinous matter. Chem. Works, p. 537.

Bezoar, in a more extenſive ſenſe, includes all animal ſubſtances formed *ſtratum ſuper ſtratum*, in the ſtomachs or inteſtines of animals. Geoffr. in Mem. Acad. Scienc. 1712. p. 268.

In which ſenſe, pearls, the ſtones found in *caſtoreum*, &c. belong to the claſs of *bezoars*. Fonten. Hiſt. Acad. Scienc. 1717. p. 32.

Human *bezoars* are ſtony ſubſtances found in the inteſtines of ſeveral perſons, formed from the ſtones of plums, or other fruits, retained in the *cæcum*, or other guts, and growing coated over; of which we have an inſtance given by Dr. Cole, Phil. Tranſ. N° 235. p. 30.

To this kind alſo belongs the *hippolithes*, or *bezoar equinum*, a ſort of ſtone ſometimes voided by theſe creatures by ſiege. Ibid. N° 250. p. 99.

Bezoar, *German*, which ſome call *cow's egg*, is ſaid to be found in the ſtomach of ſome cows, but more frequently in that of the *chamois*, a ſort of *rupicapra*, or wild goat.

Theſe *bezoars* are ſuppoſed to be nothing elſe but the hair of thoſe animals, which being occaſionally licked off by the tongue, is ſwallowed down, and being impregnated with the *ſaliva*, &c. is condenſed into balls.

Some of them weigh eighteen ounces; but they are not much eſteemed, though they are uſed in ſome medicines, and by the painters in miniature, to make a yellow colour.

Beſides theſe, there are other kinds, viz.

The *Hog* or *Boar* **Bezoar**, called by the Dutch, *pedro de porco*; and by the Portugueſe, who firſt brought it into Europe, *pedro de vaparis*, found in the gall-bladder of a boar in the Eaſt Indies.

In figure and ſize it reſembles a filberd, though more irregular; its colour not fixed, but moſt commonly white, with a teint of green; it is ſmooth and ſhining; and is valued at ten times its weight in gold.

The Indians attribute infinite virtues to this *bezoar*: they call it *maſtica de ſoho*, and prefer it to the *goat bezoar*; not ſo much on account of its being ſuppoſed the beſt preſervative in the world againſt poiſons, as on account of its being ſovereign in the cure of the *mordoxi*, a diſeaſe they are very liable to, and which is not leſs dangerous than the plague in Europe. Other properties which they aſcribe to it are, that it is admirable againſt malignant fevers, ſmall-pox, and moſt diſeaſes of women not with child; experience ſhewing, that it promotes abortion in thoſe who are, if they uſe it indiſcreetly. To uſe it, they infuſe it in water, or wine, till it has communicated a little bitterneſs to it. To facilitate the infuſion, and at the ſame time preſerve ſo precious a ſtone, they uſually ſet it in a gold caſe pierced with holes.

The *Porcupine* and *Monkey* BEZOARS only differ from thoſe of the hog, in that they are found in the gall-bladders of thoſe animals; unleſs we ſay with Tavernier that theſe two, which he calls *Malacca ſtones*, are not taken from the gall-bladders, but from the heads, of the monkey and porcupine, and that they are held in ſuch eſteem by the natives of Malacca, that they never part with them, unleſs as preſents to embaſſadors, or the greateſt princes of the Eaſt.

The *bezoar* of the ape, and that of the porcupine, called *piedra del porco*, have been valued moſt. Single ſtones have been ſold for ſixty and eighty pounds ſterling. Neumann.

Some add, that they are likewiſe found in Siam.—Indeed, the form, colour, and properties of theſe three *bezoars* are ſo near akin, that it is more than probable, they are all the ſame ſtone under three different names.

The *cow bezoar*, in the Chineſe cabinet, in the repoſitory of the Royal Society, though compoſed of *laminæ* or coats, is apparently factitious, becauſe it melts, when applied to the candle. Sloan, Phil. Tranſ. Nº 250. p. 70.

The forms in which *bezoars* appear, when genuine, are very different; the moſt frequent figure is round, but many are oblong; ſome of the ſhape of a kidney, and ſome perfectly irregular: they are of a greeniſh, or olive colour, and are ſpotted with pale, or whitiſh ſpots in different places; when tried by burning, they are found to be eaſily inflammable, and to contain a volatile ſalt, and an oil; and the *reſiduum* much reſembles the *caput mortuum* left in the retort, after the diſtillation of different animal ſubſtances; a gentle heat will often make the ſeveral beds or *laminæ*, of which a *bezoar* is compoſed, ſeparate from one another. If *bezoar* ſtones are put to infuſe in ſpirit of wine, or in common water, both liquors will thoroughly penetrate their ſubſtance, but neither will receive any change from them.

BEZOAR *goat*, in *Zoology*, a name uſed for the Indian ANTELOPE, on account of the *bezoar* ſtone found in its ſtomach.

BEZOAR is alſo applied to a kind of foſſile figured ſtone, formed like the animal *bezoar* of ſeveral coats, or *ſtrata*, ranged round ſome extraneous body, which forms a *nucleus*, and is ſuppoſed to have the ſame virtues with the other. Mem. Acad. Scienc. an. 1710. p. 316.

It is found in Italy, eſpecially Sicily; and in France, eſpecially Languedoc. We have alſo inſtances of it in England. Woodw. Nat. Hiſt. Engl. Foſſ. tom. ii. p. 9.

The foſſile, or mineral *bezoar*, is a cruſtated ferruginous body.

The Sicilian *bezoar*, or *bezoar minerale Siculum*, is by ſome, with Boccone, taken for a ſpecies of *geodes*, from which Dr. Woodward diſtinguiſhes it, as well as from the *enhydros* and *ætites*, in that it has properly no cavity with matter in it, as thoſe bodies have. Phil. Tranſ. Nº 311. p. 406. and Nº 249. p. 54.

Boccone mentions *nuclei* of different matters, as flints, gravel, wood, metal, coal, &c. M. Geoffroy even found rock cryſtal in the middle of a mineral of this ſpecies, called *priapolites*.

BEZOARDIC is applied to certain medicinal powders, ſtones, &c. wherein *bezoar* is an ingredient.

To the claſs of *bezoardic* powders belong the Gaſcoyn's, and counteſs of Kent's powders, and others formed thereof. Among *bezoardic* ſtones is found the *lapis de Goa*, or Goa ſtone. We alſo meet with *bezoardic* tinctures given in fevers, &c.

BEZOARDIC is more generally applied to all medicines endowed with a powerful alexiterial virtue, uſed for expelling poiſons, and other malignities.

In this ſenſe, *bezoardics* are either ſimple or compound, and derived either from the vegetable or animal kingdoms.

The chief in the vegetable kind is the root of *anthora*, or *contrayerva*; and in the animal kingdom, hartſhorn, or, according to ſome, the unicorn's horn.

Among the compound kind, the *tinctura bezoardica Michaelis* is in much repute, at leaſt abroad. Salt of hartſhorn is by ſome called *bezoar ſeptentrionalis*. Willius has a poem on the uſe and abuſe of the *northern bezoar*.

BEZOARDICA *terra*, a name uſed by ſome authors for a medical earth dug in the pope's territories, and more frequently called TERRA *noceriana*.

BEZOARDICUM *Minerale*, or *Mineral* BEZOAR, is a preparation of antimony corrected with ſpirit of nitre, and ſoftened by repeated lotions, which carry off the purgative virtue, and ſubſtitute a diaphoretic one; by which it promotes ſweat, like the ſtone of that name. See *Butter of* ANTIMONY.

It appears to have been the invention of Baſil Valentine, though later chemiſts have given other proceſſes for preparing it. It is much adulterated, by adding to it half, or two thirds the quantity of *ſal ammoniac*.

Sylvius firſt ventured to introduce it into medicine, and frequently gave it with very bad ſucceſs. Yet many are to this day perſuaded with him, that it is poſſeſſed of wonderful antidotal virtues, as being obtained innocent and harmleſs from that violent poiſon, butter of antimony; whence they conclude, it muſt needs have a magnetical power of attracting to itſelf, like the *bezoar* ſtone, all the poiſon in the body.

Boerhaave, however, conteſts all its virtues, chiefly from the manner of preparing it. The acid of the antimony, he argues, being driven away by the violence of the fire, nothing remains but the ſluggiſh and calcined metalline part, which, though dignified with the name of *mineral bezoar*, is deſtitute of all medicinal virtues, and only ſerves to oppreſs the body by its gravity, being perfectly indigeſtible therein. Meth. Chym. P. iii. p. 318.

From the *bezoar mineral*, mixed with other metals in various ways, with or without detonation, ariſe other compound *bezoardics*, which is a common appellation in Germany, &c. for all medicines ſuppoſed to be of alexipharmic powers. Neumann, p. 533.

BEZOARDICUM *ſolare*, a name given by the chemiſts to a preparation of gold. It is made by diſſolving plates of gold in the *ſpiritus nitri bezoardicus*, and fixing it by pouring it on butter of antimony. It is ſaid to be a great ſudorific, and of great uſe in the pox, the plague, the gout, the dropſy, fevers, and obſtructions of the ſpleen. Its doſe is from three to eight grains.

BEZOARDICUM *Veneris*, *bezoar* of copper, a name given by the chemiſts to a preparation of copper, made by extracting a tincture from the filings of copper with rectified butter of antimony, and fixing it according to art with ſpirit of nitre. It is given by ſome in leproſies, and diſeaſes of the head and brain. It doſe is ſix grains. Externally it is of uſe in old ulcers, fiſtulas, and impetigoes.

BEZOARDICUM *Saturni*, *bezoar* of lead, the name given by the chemiſts to a preparation of lead; it is made by extracting a tincture from glaſs of lead, prepared from red lead and flints, and mixing this with unrectified butter of antimony, and fixing it by means of ſpirit of nitre. It is eſteemed an anti-hyſteric, and is ſaid to be good in diſorders of the ſpleen; the doſe is ſix grains.

BEZOARDICUM *Joviale*, or BEZOAR *of Jupiter*, is a regulus made by melting three ounces of regulus of antimony, and two of block-tin, powdered and mixed with ſix ounces of corroſive ſublimate, and diſtilled off in a kind of butter, and that diſſolved in ſpirit of nitre, and the ſolution diſtilled three times; the *bezoar* remaining at the bottom is to be powdered, waſhed, and mingled with ſpirit of wine, till it grow inſipid. See ANTIHECTICUM *Poterii*.

BEZOARDICUM *lunale*, or of ſilver, is made by mixing rectified butter of antimony with fine ſilver, diſſolved in ſpirit of nitre; upon which, a powder falls to the bottom, which is the *bezoar*.

It is eſteemed a ſpecific in epilepſies, convulſions, and apoplexies; and is ſaid to be anodyne and ſudorific, and of great uſe againſt the eryſipelas. The doſe is from ſix to ten grains.

BEZOARDICUM *martiale*, is a diſſolution of *crocus Martis* by reverberation in butter of antimony, with ſpirit of nitre poured on it: commended by ſome againſt hyſterical, hypochondriacal, and icterical diſorders.

BEZOLA, in *Zoology*, the name of a truttaceous fiſh of the *albula* kind, and called by Geſner the *albula cærulea*. It reſembles the herring in ſhape, is of a duſky bluiſh colour, and does not eſſentially differ from the LAVARETUS.

BIA, a name given by the Siameſe to a ſort of little white ſhells brought from the Maldive iſlands, and uſed throughout moſt part of the Eaſt Indies for ſmall money. Nine of theſe are equal in value to the French *denier*.

Theſe are otherwiſe called *coris*, or *cowries*.

BIÆUM, from βια, *oppoſition*, in *Rhetoric*, denotes a kind of counter-argument, whereby ſomething alleged for the adverſary is retorted againſt him, and made to conclude a different way; for inſtance, *Occidiſti, quia adſtitiſti interfecto.—Immo quia adſtiti interfecto, non occidi*; *nam ſi id eſſet, in fugam me conjeciſſem.* "You killed the perſon, becauſe you were found ſtanding by his body." *(Biæum.)* "Rather I did not kill him, becauſe I was found ſtanding by his body; ſince, in the other caſe, I ſhould have fled away."

BIÆUM, in the *Grecian Laws*, was an action brought againſt thoſe who raviſhed women, or uſed violence to any man's perſon. Potter, Archæol. lib. i. c. 24.

BIÆUM alſo denotes a kind of ſaline or ſea-wine, uſed by the ancient Greeks in various diſorders. It was made of grapes gathered a little before ripe, and dried in the ſun; then preſſed, the juice put up in caſks, and mixed with a large proportion of ſea-water; though Dioſcorides ſeems to deſcribe it as made of grapes ſteeped in ſea-water, and then preſſed. Gorr. Def. Med. p. 75.

BIAFORA, in the *Cuſtoms of the Middle Age*, a form of cry, or alarm to arms; on the hearing whereof, the inhabitants of towns, or villages were to iſſue forth, and attend their prince. The word ſeems originally from Gaſcony; and the Italians even now, on a ſudden inſurrection of the people, commonly cry, *Via fora*, by an uſual change of the letter B into V.

BIARCHUS, an officer in the court of the emperors of Conſtantinople, intruſted with the care and inſpection of the proviſions of the ſoldiery.

The word is formed from βιος, *annona*, *victuals*, and αρχη, *chief*.

The *biarchus* was the ſame with what the Latins call *præfectus annonæ*. His function was called *biarchia*; by the Latins, *præfectura rei cibariæ*. He belonged to the *ſcholia agentium in rebus*. See AGENTES.

BIARUM, in *Botany*, a name by which the people of Egypt at this time call the root of the NILUFAR, or *faba Ægyptia*, growing on the Nile.

BIAS, or BIASS, the tendency or propenſity of a thing towards one ſide more than the other; particularly the deviation of a body, or a plane, from its rectilinear courſe, or its level. See INCLINATION.

The word is French, *biais*, which ſignifies the ſame. Menage deduces this further from the Italian *biaco*; and that again from the Latin *obliquus*.

BIAS *of a bowl*, is a piece of lead put into one ſide, to load and make it incline towards that ſide.

BIATHANATI, βιαθανατοι, from βια, *violence*, and θανατος, *death*; the ſame with ſuicides, or thoſe who kill themſelves. Dr. Donne, dean of St. Paul's, has a work under the title of *Biathanatos*; wherein he undertakes to prove this poſition, or paradox: "That ſuicide is not ſo naturally "ſin, as that it may never be otherwiſe." Lond. 4to. 1644.

BIBIO, the *wine-fly*, in the *Hiſtory of Inſects*, a very ſmall fly, found frequently among empty wine-caſks. It is produced from a ſmall, oblong, red worm, very common in the ſediments of wine.

BIBITORY *Muſcle*; ſee ADDUCTOR *Oculi*.

BIBLE, a book, by way of eminence ſo called, containing the Scriptures, i. e. the writings of the Old and New Teſtament.

The word *Bible* comes from the Greek Βιϐλια, or Βιϐλιον, uſed to denote any book; but, by way of eminence, applied to the book of Scripture. Βιϐλιον again comes from βιϐλος, the Egyptian reed, from which the ancient paper was procured. See BIBLUS.

The *Bible* is known by various other appellations, as the *ſacred books*, the *inſpired writings*, *holy writ*, *ſacred text*, &c. By the Jews it is called *mikra*, that is, *lecture*, or *reading*; by the Chriſtians uſually *ſcripture*, q. d. *writing*; ſometimes alſo the *book of God*, the *canon*, *rule of faith*, &c.

Bibles are diſtinguiſhed, according to their language, into Hebrew, Greek, Latin, Chaldee, Syriac, Arabic, Cophtic, &c. Some account of each, and their ſeveral editions, &c. we ſhall here ſubjoin.

The liſt of the books contained in the *Bible* is called the CANON of ſcripture.

The books of the *Bible* are ſaid to be *canonical*, by way of contradiſtinction from others called *deutero-canonical*, *apocryphal*, *pſeudo-apocryphal*, &c.

For the authors of the *Bible*, the names of moſt of them are prefixed to the books ſuppoſed to be written by them; as the Pentateuch by Moſes; Joſhua by the general of that name, &c. though many objections have been made to divers of them.

Aben Ezra, followed by Hobbes, Pereyra, Spinoſa, and ſome others, deny the five firſt books to have been written by Moſes. F. Simon in particular aſſerts, that the books, as we now have them, are not the originals written by the inſpired pen-men, but abridgments of them made in after-times by a kind of college or order of public actuaries or ſcribes appointed for that end.

The original language of the Old Teſtament was doubtleſs the old Hebrew, at leaſt the greateſt part; for all the books do not appear to have been written in the ſame. Some chapters of Eſdras and Daniel are judged to have been compoſed in Chaldaic; and other chapters of this latter writer, as alſo the apocryphal books of Maccabees, of Wiſdom, &c. in Greek; Tobit and Eccleſiaſtes either in Greek or Syriac. Du-Pin, Diſſ. Prel. § 3. Calmet's Dict. Bib. tom. i. p. 293.

As for the New Teſtament, it was written in Greek, except the Goſpel of St. Matthew, which is thought by many to have been compoſed in the later Hebrew, that is, the Syriac. Some will have Mark's Goſpel to have been written in Latin; and the Epiſtle to the Hebrews in Hebrew. Calmet.

Divers of the ancient *Bible* books appear to have been irrecoverably loſt, whether it be that the copies of them periſhed, or that Eſdras threw them out of his canon. Hence it is, that, in the books ſtill extant, we find divers citations of, and references to others, which are now no more; as the book of Jaſher, the book of the wars of the Lord, annals of the kings of Judah and Iſrael, part of Solomon's three thouſand Proverbs, and his thouſand and five Songs, beſides his books on plants, animals, fiſhes, inſects, &c. To which may be added a book of Jeremiah, wherein he enjoined the captives who went to Babylon to take the ſacred fire and conceal it; alſo the precepts which that prophet gave the Jews to preſerve themſelves from idolatry, and his lamentations on the death of king Joſiah.

In the time of Joſiah, through the impiety of the two preceding reigns of Manaſſeh and Ammon, the book of the law was ſo totally loſt, that, beſides a copy of it found by Hilkiah in the temple, none other appears to have been known; at leaſt, the ſurpriſe which Hilkiah ſhewed at the finding it, and the grief which Joſiah expreſſed at the hearing it read, ſhew, that neither of them had ever ſeen it before. 2 Kings, chap. xxii. ver. 8—13, 2 Chron. chap. xxxiv.

Copies were now made and diſperſed; yet, within a few years after, the authentic copy, preſerved in the temple, was burnt, with the temple, by the Babylonians. It was reſtored again after the return of the Jews from the Babylonian captivity by Nehemiah, or rather by Ezra; ſome ſay by divine inſpiration; others, with greater probability, by collecting the fragments and copies which were ſtill remaining, comparing them together, and, out of them all, framing one complete copy, where the readings were adjuſted, and the ſeveral books ranged in their proper order. Prid. Conn. P. i. lib. v. Du-Pin, Diſſ. Prel.

Ezra made additions in ſeveral parts of the book, among which is to be reckoned the laſt chapter of Deuteronomy, wherein Moſes ſeems to give an account of his own death and burial, and of the ſucceſſion of Joſhua after him. To the ſame cauſe are to be attributed many other interpolations in the *Bible*, which created difficulties and objections to the authenticity of the ſacred text, no ways to be ſolved without allowing them. Prideaux.

The preſent Samaritan and Jewiſh copies of the *Bible* differ in many reſpects, chiefly in the chronology of the patriarchs, where the Samaritan comes nearer to the Septuagint. Other variations may be reſolved into the errors of tranſcribers, interpolations for explication's ſake, and, perhaps, the deſigned corruption of the Samaritan.

The books of the *Bible* are divided by the Jews into three claſſes, viz. the law, the prophets, and the hagiographers; a diviſion which they are ſuppoſed to borrow from Ezra himſelf.

The Jews, at firſt, were very reſerved in communicating their ſcripture to ſtrangers: deſpiſing and ſhunning the Gentiles, they would not diſcloſe to them any of the treaſures concealed in the *Bible*. We may add, that the people bordering on the Jews, as the Egyptians, Phœnicians, Arabs, &c. were not very curious to know the laws or hiſtory of a people, whom in their turn they hated and deſpiſed. Their firſt acquaintance with theſe books was not till after the ſeveral captivities of the Jews, when the ſingularity of the Hebrew laws and ceremonies induced ſeveral to deſire a more particular knowledge of them. Joſephus ſeems ſurpriſed to find ſuch ſlight footſteps of the ſcripture-hiſtory interſperſed in the Egyptian, Chaldean, Phœnician, and Grecian hiſtory; and accounts for it hence, that the ſacred books were not as yet tranſlated into Greek or other languages, and conſequently not known to the writers of thoſe nations. Contra Appion. p. 1038. Calmet.

The firſt verſion of the *Bible* was that of the SEPTUAGINT into Greek, in the time of Ptolemy Philadelphus; though ſome maintain that the whole was not then tranſlated, but only the Pentateuch; between which and the other books in the verſion called of the Seventy, the critics find a great diverſity in point of ſtyle and expreſſion, as well as of accuracy.

Divers kinds of books have been compoſed on the *Bible*, either to explain the ſenſe, or make its doctrine more obvious, to facilitate the remembrance of it, or to eſtabliſh particular opinions from it; as introductions, apparatuſes, ſummaries, manuals, hiſtories, expoſitions, commentaries, harmonies, &c.

BIBLES, *Hebrew*, are either manuſcript, or printed.—The beſt *manuſcript Bibles* are thoſe copied by the Jews of Spain. Thoſe copied by the Jews of Germany are leſs exact, but more common. The two kinds are eaſily diſtinguiſhed from each other; the former being in beautiful characters, like the Hebrew *Bibles* of Bomberg, Stephens, and Plantin; the latter in characters, like thoſe of Munſter and Gryphius.—F. Simon obſerves, that the oldeſt manuſcript Hebrew *Bibles* are not above ſix or ſeven hundred years old; nor does rabbi Menaham, who quotes a vaſt number of them, pretend that any of them exceed ſix hundred years.

The moſt ancient *printed* Hebrew *Bibles* are thoſe publiſhed by the Jews of Italy, eſpecially of Peſaro and Breſſe. Thoſe of Portugal alſo printed ſome parts of the *Bible* at Liſbon, before their expulſion.—This may be obſerved in the general, that the beſt Hebrew *Bibles* are thoſe printed under the inſpection of the Jews; there being ſo many *minutiæ* to be obſerved, that it is ſcarce poſſible for any other to ſucceed in it.

The Complutenſian *Bible* was printed in 1515. See BIBLES, *Greek*.

In the beginning of the ſixteenth century Dan. Bomberg printed ſeveral Hebrew *Bibles* in folio and quarto at Venice, moſt of which are eſteemed both by the Jews and Chriſtians: the firſt in 1517, which is the leaſt exact, and generally goes by the name of Felix Pratenſis, the perſon who reviſed it. This edition contains the Hebrew text, the targum, and the commentaries of ſeveral rabbins. In 1528, the ſame Bomberg printed the folio *Bible* of rabbi Benchajim, with his preface, the maſoretical diviſions, a preface of Aben Ezra, a double *maſora*, and ſeveral various readings. The third edition was printed in 1618; it is the ſame with the ſecond, but much more correct. From the former editions it was, that Buxtorf, the father, printed his rabbinical Hebrew *Bible* at Baſil, in 1618; which, though there are many faults in it, is more correct than any of the former. In 1623 appeared at Venice a new edition of the rabbinical *Bible* by Leo of Modena, a rabbin of that city, who pretended to have corrected a great number of faults in the former edition; but, beſides that it is much inferior to the other Hebrew *Bibles* of Venice, with regard to paper and print, it has paſſed through the hands of the inquiſitors, who have altered many paſſages in the commentaries of the rabbins.

As to Hebrew *Bibles* in 4to. that of R. Stephens is eſteemed for the beauty of the characters; but it is very incorrect. Plantin alſo printed ſeveral beautiful Hebrew *Bibles* at Antwerp: one, in eight columns, with a preface by Arias Montanus in 1571, which far exceeds the Complutenſian in paper and print, and contents; this is called the Royal *Bible*, becauſe it was printed at the expence of Philip II. of Spain: another at Geneva, in 1619; beſides many more of different ſizes, with and without points. Manaſſeh Ben Iſrael, a learned Portugueſe Jew, publiſhed two editions of the Hebrew *Bible* at Amſterdam; the one in 4to. in 1635; the other in 8vo. in 1639: the firſt has two columns, and for that reaſon is commodious for the reader. In 1639, R. Jac. Lombroſo publiſhed a new edition in 4to. at Venice, with ſmall literal notes at the bottom of each page, where he explains the Hebrew words by Spaniſh words. This *Bible* is much eſteemed by the Jews at Conſtantinople: in the text they have diſtinguiſhed between words where the point *camets* is to be read with a *camets-katuph*, that is, by *o*, and not an *a*.

Of all the editions of the Hebrew *Bible* in 8vo. the moſt beautiful and correct are the two of Jo. Athias, a Jew of Amſterdam. The firſt, of 1661, is the beſt paper; but that of 1667, is the moſt exact: that, however, publiſhed ſince at Amſterdam by Vander Hooght, in 1705, is preferable to any of them.

After Athias, three Hebraizing proteſtants engaged in reviſing and publiſhing the Hebrew *Bible*; viz. Clodius, Jablonſki, and Opitius.—Clodius's edition was publiſhed at Frankfort, in 1677, in 4to. At the bottom of the page it has the various readings of the former editions; but the author does not appear ſufficiently verſed in the accenting, eſpecially in the poetical books; beſides, as it was not publiſhed under his eye, many faults have crept in. That of Jablonſki in 1699, in 4to. at Berlin, is very beautiful as to letter and print: but, though the editor pretends he made uſe of the editions of Athias and Clodius, ſome critics find it ſcarce in any thing different from the 4to. edition of Bomberg.—That of Opitius is alſo in 4to. at Keil, in 1709; the character is large and good, but the paper bad: it is done with a great deal of care; but the editor made uſe of no manuſcripts but thoſe of the German libraries; neglecting the French ones, which is an omiſſion common to all three.—They have this advantage, however, that beſides the diviſions uſed by the Jews, both general and particular, into *paraſkes* and *peſukim*, they have alſo thoſe of the Chriſtians, or of the Latin *Bibles*, into chapters and verſes; the *keri ketib*, or various readings, Latin ſummaries, &c. which made them of conſiderable uſe, with reſpect to the Latin editions, and the concordances. See CHAPTERS.

The little *Bible* of R. Stephens, in 16to. is very much prized for the beauty of the character. Care, however, muſt be taken; there being another edition of Geneva, exceedingly like it, excepting, that the print is worſe, and the text leſs correct.—To theſe may be added ſome other Hebrew *Bibles* without points, in 8vo. and 24to. which are much coveted by the Jews; not that they are more exact, but more portable than the reſt; and are uſed in their ſynagogues and ſchools: of theſe there are two beautiful editions, the one of Plantin, in 8vo. with two columns, and the other in 24to. reprinted by Raphalengius at Leyden, in 1610. There is alſo an edition of them by Laurens at Amſterdam, in 1631, in a larger character; and another in 12mo. at Frankfort, in 1694, full of faults, with a preface of M. Leuſden at the head of it.

Houbigant publiſhed an elegant edition of the Hebrew *Bible* at Paris, in 1753, contained in four volumes, folio. The text is that of Van der Hooght, without points, to which he has added marginal notes, ſupplying the variations of the Samaritan copy. Dr. Kennicott, after almoſt twenty years laborious collation of near ſeven hundred copies, manuſcript and printed, either of the whole, or of particular parts of the *Bible*, did, in 1776, publiſh the firſt volume of his Hebrew *Bible*, in folio. The text is that of Everard Van der Hooght, already mentioned; differing from it only in the diſpoſition of the poetical parts, which Dr. Kennicott has printed in hemiſtichs, into which they naturally divide themſelves; however the words follow one another in the ſame order as they do in the edition of Van der Hooght. This edition is printed on an excellent type; the Samaritan text, according to the copy in the London Polyglott, is exhibited in a column parallel with the Hebrew text; thoſe parts of it only being introduced, in which it differs from the Hebrew. The numerous variations both of the Samaritan manuſcripts from the printed copy of the Samaritan text, and of the Hebrew manuſcripts from the printed text of Van der Hooght, are placed ſeparately at the bottom of the page, and marked with numbers referring to the copies from which they are taken. The editor regrets, that the Diſſertatio Generalis, which would help much to enrich this article, is not to be publiſhed till the ſecond volume is ready.

BIBLES, *Greek*.—There is a great number of editions of the *Bible* in Greek; but they may be all reduced to three or four principal ones, viz. that of Complutum, or Alcala de Henares, that of Venice, that of Rome, and that of Oxford.—The firſt was publiſhed in 1515, by cardinal Ximenes, and inſerted in the *Polyglot Bible*, uſually called the *Complutenſian Bible*: this edition is not juſt, the Greek of the Seventy being altered in many places according to the Hebrew text.—It has, however, been reprinted in the *Polyglot Bible* of Antwerp, in that of Paris, and in the 4to. *Bible*, commonly called, *Vatablus's Bible*.

The ſecond Greek *Bible* is that of Venice, printed by Aldus, in 1518. Here the Greek text of the Septuagint is reprinted juſt as it ſtood in the manuſcript, full of faults of the copyiſts, but eaſily amended.—This edition was reprinted at Straſburg, in 1526, at Baſil, in 1545, at Frankfort, in 1597, and other places, with ſome alterations to bring it nearer the Hebrew. The moſt commodious is that of Frankfort; there being added to this, little *ſcholia*, which ſhew the different interpretations of the old Greek tranſlators: the author of this collection has not added his name; but it is commonly aſcribed to Junius.

The third Greek *Bible* is that of Rome, or the Vatican, in 1587, with Greek *ſcholia* collected from the manuſcripts in the Roman libraries by Pet. Morin. It was firſt ſet on foot by cardinal Montalbo, afterwards pope Sextus Quintus. This fine edition has been reprinted at Paris in 1628, by J. Morin, prieſt of the oratory, who has added the Latin tranſlation, which in the Roman was printed ſeparately, with *ſcholia*.—The Greek edition of Rome has been printed in the *Polyglot Bible* of London; to which are added, at bottom, the various readings of the Alexandrian manuſcript. This has been alſo reprinted in England in 4to. and 12mo. with ſome alterations. It has been again publiſhed at Franeker in 1709, by Bos, who has added all the various readings he could find.

The fourth Greek *Bible* is that done from the Alexandrian manuſcript, begun at Oxford by Dr. Grabe in 1707. In this the Alexandrian manuſcript is not printed ſuch as it is, but ſuch as it was thought it ſhould be; i. e. it is altered wherever there appeared any fault of the copyiſts, or any word inſerted from any particular dialect: this ſome think an excellence, but others a fault; urging, that the manuſcript ſhould have been given abſolutely and intirely of itſelf, and all conjectures, as to the readings, ſhould have been thrown into the notes. See SEPTUAGINT.

Bibles, *Latin*, how numerous ſoever, may be all reduced to three claſſes; the *ancient* VULGATE, called alſo *Italica*, tranſlated from the Greek *Septuagint*: the *modern* VULGATE, the greateſt part of which is done from the Hebrew text; and the *new Latin tranſlations*, done alſo from the Hebrew text in the ſixteenth century.—We have nothing remaining of the *ancient Vulgate*, uſed in the primitive times in the Weſtern churches, but the Pſalms, Wiſdom, and Eccleſiaſtes. Nobilius has endeavoured to retrieve it from the works of the ancient Latin fathers; but it was impoſſible to do it exactly, becauſe moſt of the fathers did not keep cloſe to it in their citations.

As to the *modern* VULGATE, there are a vaſt number of editions very different from each other. Cardinal Ximenes has inſerted one in the *Bible* of *Complutum*, corrected and altered in many places. R. Stephens, and the doctors of Louvain, have taken great pains in correcting the modern vulgate.

The beſt edition of Stephens's Latin *Bible* is that of 1540, reprinted in 1545, in which are added, on the margin, the various readings of ſeveral Latin manuſcripts, which he had conſulted. The doctors of Louvain reviſed the modern vulgate after R. Stephens; and added the various readings of ſeveral Latin manuſcripts. The beſt of the Louvain editions are thoſe, at the end of which are added the critical notes of Francis Lucas of Bruges.

All theſe reformations of the Latin *Bible* were made before the time of pope Sixtus V. and Clement VIII. ſince which, people have not dared to make any alterations, excepting in comments, and ſeparate notes. The correction of Clement VIII. in 1592, is now the ſtandard throughout all the Romiſh churches: that pontiff made two reformations; but it is the firſt of them that is followed. From this the *Bibles* of Plantin were done, and from thoſe of Plantin all the reſt; ſo that the common *Bibles* have none of the after-corrections of the ſame Clement VIII.—It is a heavy charge that lies on the editions of pope Clement, viz. that they have ſome new texts added, and many old ones altered, to countenance and confirm what they call the Catholic doctrine; witneſs that celebrated paſſage of St. John, *tres ſunt*, &c.

There are a great number of Latin *Bibles* of the third claſs, comprehending the verſions from the originals of the ſacred books made within theſe two hundred years.—The firſt is that of Santes Pagninus, a Dominican, under the patronage of pope Leo X. printed at Lyons in 4to. in 1527, much eſteemed by the Jews. This the author improved in a ſecond edition. In 1542, there was a beautiful edition of the ſame at Lyons in folio, with *ſcholia*, publiſhed under the name of Michael Villanovanus, i. e. Michael Servetus, author of the *ſcholia*. Thoſe of Zurich have likewiſe publiſhed an edition of Pagninus's *Bible* in 4to. And R. Stephens reprinted it in folio, with the vulgate, in 1557, pretending to give it more correct than in the former editions. There is alſo another edition of 1586, in four columns, under the name of *Vatablus*: and we find it again in the Hamburgh edition of the *Bible* in four languages.

In the number of Latin *Bibles* is alſo uſually ranked the verſion of the ſame Pagninus corrected, or rather rendered literal, by Arias Montanus; which correction being approved of, by the doctors of Louvain, &c. was inſerted in the *Polyglot Bible* of Philip II. and ſince in that of London. There have been various editions of this in folio, quarto, and octavo; to which have been added the Hebrew text of the Old Teſtament, and the Greek of the New. The beſt of them all is the firſt, which is in folio, 1571.

Since the Reformation, there have been ſeveral Latin verſions of the *Bible* from the originals, by proteſtants. The moſt eſteemed are thoſe of Munſter, Leo Juda, Caſtalio, and Tremellius: the three laſt whereof have been reprinted various times. Munſter publiſhed his verſion at Baſil in 1534, which he afterwards reviſed; he publiſhed a correct edition in 1546.—Caſtalio's fine Latin pleaſes moſt people; but there are ſome who think it too much affected; the beſt edition thereof is that in 1573. Leo Juda's verſion, altered a little by the divines of Salamanca, was added to the ancient Latin edition, as publiſhed by R. Stephens with notes, under the name of *Vatablus's Bible*, in 1545. It was condemned by the Pariſian divines, but printed with ſome alterations by the Spaniſh divines of Salamanca. That of Junius and Tremellius is preferred, eſpecially by the Calviniſts, and has undergone a great number of editions.

One may add a fourth claſs of Latin *Bibles*, comprehending the *vulgate* edition corrected from the originals. The *Bible* of Iſidorus Clarus is of this number: that author, not being contented with reſtoring the ancient Latin copy, has corrected the tranſlator in a great number of places, which he thought ill rendered. Some proteſtants have followed the ſame method; and, among others, Andrew and Luke Oſiander, who have each publiſhed a new edition of the *vulgate*, corrected from the originals.

Bibles, *Oriental*.—At the head of the Oriental verſions of the *Bible* muſt be placed the Samaritan; as being the moſt ancient of all, though neither its age nor author have been yet aſcertained, and admitting no more for holy Scripture but the Pentateuch, or five books of Moſes.—This tranſlation is made from the Samaritan Hebrew text, which is a little different from the Hebrew text of the Jews. This verſion has never been printed alone; nor any where but in the *Polyglots* of London and Paris.

Bibles, *Chaldee*, are only the gloſſes or expoſitions made by the Jews in the time when they ſpake the Chaldee tongue. Theſe they call by the name of *Targumim*, or *paraphraſes*, as not being any ſtrict verſions of the Scripture. They have been inſerted entire in the large Hebrew *Bibles* of Venice and Baſil; but are read more commodiouſly in the *Polyglots*, being there attended with a Latin tranſlation.

Bibles, *Syriac*.—There are extant two verſions of the Old Teſtament in the Syriac language: one from the Septuagint, which is ancient, and made probably about the time of Conſtantine; the other called *antiqua & ſimplex*, made from the Hebrew, as ſome ſuppoſe, about the time of the apoſtles. This verſion is printed in the *Polyglots* of London and Paris.

In the year 1562, Widmanſtadius printed the whole New Teſtament in Syriac, at Vienna, in a beautiful character: after him there were ſeveral other editions; and it was inſerted in the *Bible* of Philip II. with a Latin tranſlation. Gabriel Sionita alſo publiſhed a beautiful Syriac edition of the Pſalms, at Paris, in 1525, with a Latin interpretation.

Bibles, *Arabic*.—In the year 1516, Aug. Juſtinian, biſhop of Nebio, printed at Genoa an Arabic verſion of the Pſalter, with the Hebrew text, and Chaldee paraphraſe, adding Latin interpretations. There are alſo Arabic verſions of the whole Scriptures in the *Polyglots* of London and Paris; and we have an edition of the Old Teſtament entire, printed at Rome in 1671, by order of the congregation *de propaganda fide*; but it is of little eſteem, as having been altered agreeably to the *vulgate* edition. The Arabic *Bibles* among us are not the ſame with thoſe uſed with the Chriſtians in the Eaſt.—Some learned men take the Arabic verſion of the Old Teſtament, printed in the *Polyglots*, to be that of Saadias, who lived about the year 900; at leaſt in the main. Their reaſon is, that Aben Ezra, a great antagoniſt of Saadias, quotes ſome paſſages of his verſion, which are the ſame with thoſe in the Arabic verſion of the *Polyglots*; yet others are of opinion, that Saadias's verſion is not extant. In 1622, Erpenius printed an Arabic Pentateuch, called alſo the Pentateuch of Mauritania, as being made by the Jews of Barbary, and for their uſe. This verſion is very literal, and eſteemed very exact. The four Evangeliſts have alſo been publiſhed in Arabic, with a Latin verſion, at Rome, in 1591, folio. Theſe have been ſince reprinted in the *Polyglots* of London and Paris, with ſome little alterations of Gabriel Sionita. Erpenius publiſhed an Arabic New Teſtament, entire, as he found it in his manuſcript copy, at Leyden, in 1616.

There are ſome other Arabic verſions of late date mentioned by Walton in his Prolegomena; particularly a verſion of the Pſalms preſerved in Sion College, London, and another of the Prophets, at Oxford; neither of which have been publiſhed.

Bibles, *Cophtic*.—There are ſeveral manuſcript copies of the Cophtic *Bible* in ſome of the great libraries, eſpecially in that of the French king.

Dr. Wilkins publiſhed the Cophtic New Teſtament in 4to. in the year 1716, and the Pentateuch alſo in 4to. in 1731, with Latin tranſlations. He reckons theſe verſions to have been made in the end of the ſecond, or the beginning of the third century.

Bibles, *Ethiopic*.—The Ethiopians have alſo tranſlated the *Bible* into their language.—There have been printed ſeparately, the Pſalms, Canticles, ſome chapters of Geneſis, Ruth, Joel, Jonah, Zephaniah, Malachi, and the New Teſtament; all which have been ſince reprinted in the *Polyglot* of London.—As to the Ethiopic New Teſtament, which was firſt printed at Rome in 1548, it is a very inaccurate work, and is reprinted in the Engliſh *Polyglot* with all its faults.

Bibles, *Armenian*.—There is a very ancient Armenian verſion of the whole *Bible*, done from the Greek of the Seventy, by ſome of their doctors about the time of St. Chryſoſtom. This was firſt printed entire in 1664, by one of their biſhops at Amſterdam in 4to; with the New Teſtament in 8vo.

Bibles, *Perſian*.—Some of the fathers ſeem to ſay, that all the Scripture was formerly tranſlated into the language of the Perſians; but we have nothing now remaining of the ancient verſion, which was, certainly, done from the Septuagint. The Perſian Pentateuch printed in the London

don *Polyglot* is, without doubt, the work of Rabbi Jacob, a Perſian Jew. It was publiſhed by the Jews at Conſtantinople, in the year 1551. In the ſame *Polyglot* we have likewiſe the four Evangeliſts in Perſian, with a Latin tranſlation; but this appears very modern, incorrect, and of little uſe. Walton ſays this verſion was written above four hundred years ago. Another verſion of the Goſpels was publiſhed at Cambridge by Wheloc in the laſt century: there are alſo two Perſian verſions of the Pſalms made in the laſt century from the vulgar Latin.

Bibles, *Gothic.*—It is generally ſaid, that Ulphilas, a Gothic biſhop, who lived in the fourth century, made a verſion of the whole *Bible*, excepting the book of Kings, for the uſe of his countrymen. That book he omitted, becauſe of the frequent mention of the wars therein; as fearing to inſpire too much of the military genius into that people. We have nothing remaining of this verſion, but the four Evangeliſts, printed in 4to. at Dort, in 1665, from a very ancient MS.

Bibles, *Muſcovite.*—An intire *Bible*, in the Sclavonic tongue, was printed at Oſtravia in Volhinia, in the year 1581, and this is what we commonly call the *Muſcovite* Bible. It was printed at the expence of Con. Baſil, duke of Oſtravia, for the common ſervice of all Chriſtians, who ſpake the Sclavonic language, whereof the Muſcovitiſh is a dialect.

Bibles, *Spaniſh.*—There are two tranſlations of the *Bible* into this language; one done by the Jews, and firſt printed at Ferrara in 1553; the other by Caſſiodore, printed at Baſil in 1569. A corrected edition of it was printed at Amſterdam in 1602.

Bibles, *Italian.*—There are four Italian verſions: the firſt towards the cloſe of the thirteenth century, by James de Voragine, archbiſhop of Genoa; the ſecond by Brucciolus, in 1530; the third by Malermi, printed at Venice in 1541; and the fourth by Diodati, a proteſtant, which is much eſteemed, and has been often printed.

Bibles, *French.*—There are nine French verſions.

There are alſo Dutch, Flemiſh, Poliſh, Hungarian, and Croatian verſions. Luther, with the aſſiſtance of Melancthon, and others of his diſciples, tranſlated the *Bible* into the German tongue in 1524, and the publication of it very much contributed to the progreſs of the Reformation.

Bibles, *Saxon.*—The whole ſcripture is ſaid by ſome to have been tranſlated into the Anglo-Saxon by Bede, about the year 701; though others contend he only tranſlated the Goſpels.

We have certain books or parts of the *Bible* by ſeveral other tranſlators; as, 1. The Pſalms, by Adelm biſhop of Shireborn, contemporary with Bede; though by others this verſion is attributed to king Alfred, who lived two hundred years after. Another verſion of the Pſalms in Anglo-Saxon was publiſhed by Spelman in 1640. 2. The Evangeliſts, ſtill extant, done from the ancient vulgate, before it was reviſed by St. Jerom, by an author unknown, and publiſhed by Matth. Parker in 1571. An old Saxon verſion of ſeveral books of the *Bible*, made by Elfric abbot of Malmeſbury, ſeveral fragments of which were publiſhed by Will. Lilly in 1638, the genuine copy by Edm. Thwaites in 1699, at Oxford.

Bibles, *Indian.*—A tranſlation of the *Bible* into the North American Indian language, by Elliot, was publiſhed in 4to. at Cambridge, in 1685.

Bibles, *Engliſh.*—The firſt Engliſh *Bible* we read of was that tranſlated by J. Wickliffe about the year 1360; but never printed, though there are MS. copies of it in ſeveral of the public libraries. J. de Treviſa, who died about the year 1398, is alſo ſaid to have tranſlated the whole *Bible*; but whether any copies of it are remaining, does not appear.

Bible, *Tindal's.*—The firſt printed *Bible* in our language was that tranſlated by Will. Tindal, aſſiſted by Miles Coverdale, printed abroad in 1526; but moſt of the copies were bought up and burnt by biſhop Tunſtal and Sir Thomas More. It only contained the New Teſtament, and was reviſed and republiſhed by the ſame perſon in 1530. The prologues and prefaces added to it, reflect on the biſhops and clergy; but this edition was alſo ſuppreſſed, and the copies burnt.

In 1532, Tindal and his aſſociates finiſhed the whole *Bible*, except the Apocrypha, and printed it abroad: but while he was afterwards preparing for a ſecond edition, he was taken up, and burnt for hereſy in Flanders.

Bible, *Matthews's.*—On Tindal's death, his work was carried on by Coverdale and John Rogers, ſuperintendant of an Engliſh church in Germany, and the firſt martyr in the reign of queen Mary, who tranſlated the Apocrypha, and reviſed Tindal's tranſlation, comparing it with the Hebrew, Greek, Latin, and German, and adding prefaces and notes from Luther's *Bible*. He dedicated the whole to Henry VIII. in 1537, under the borrowed name of Thomas Matthews; whence this has been uſually called *Matthews's Bible.* It was printed at Hamburgh, and licence obtained for publiſhing it in England by the favour of archbiſhop Cranmer, and the biſhops Latimer and Shaxton.

Bible, *Cranmer's.*—The firſt *Bible* printed by authority in England, and publicly ſet up in churches, was the ſame Tindal's verſion, reviſed, compared with the Hebrew, and in many places amended, by Miles Coverdale, afterwards biſhop of Exeter; and examined after him by archbiſhop Cranmer, who added a preface to it: whence this was called *Cranmer's Bible.* It was printed by Grafton, of the largeſt volume, and publiſhed in 1540; and, by a royal proclamation, every pariſh was obliged to ſet one of the copies in their church, under the penalty of forty ſhillings a month; yet two years after, the popiſh biſhops obtained its ſuppreſſion of the king. It was reſtored under Edward VI. ſuppreſſed again under queen Mary, and reſtored again in the firſt year of queen Elizabeth; and a new edition of it given in 1562.

Bible, *Geneva.*—Some Engliſh exiles at Geneva in queen Mary's reign, Coverdale, Goodman, Gilbie, Sampſon, Cole, Whittingham, and Knox, made a new tranſlation, printed there in 1560; the New Teſtament having been printed in 1557; hence called the *Geneva Bible*, containing the variations of readings, marginal annotations, &c. on account of which it was much valued by the puritan party in that and the following reigns.

Bible, *Biſhop's.*—Archbiſhop Parker reſolved on a new tranſlation for the public uſe of the church, and engaged the biſhops and other learned men to take each a ſhare or portion. Theſe being afterwards joined together, and printed, with ſhort annotations, in 1568, in a large folio, made what was afterwards called the *Great Engliſh Bible*, and commonly the *Biſhop's Bible.* The following year it was alſo publiſhed in 8vo. in a ſmall but fine black letter: and here the chapters were divided into verſes; but without any breaks for them, in which the method of the Geneva *Bible* was followed, which was the firſt Engliſh *Bible* where any diſtinction of verſes was made. It was afterwards printed in large folio, with corrections, and ſeveral *prolegomena*, in 1572; this is called *Matthew Parker's Bible.* The initial letters of each tranſlator's name were put at the end of his part, e. gr. at the end of the Pentateuch, W. E. for William Exon; that is, William biſhop of Exeter, whoſe allotment ended there: at the end of Samuel, R. M. for Richard Menevenſis, or biſhop of St. David's, to whom the ſecond allotment fell: and the like of the reſt. The archbiſhop overſaw, directed, examined, and finiſhed the whole. This tranſlation was uſed in the churches for forty years, though the Geneva *Bible* was more read in private houſes, being printed above thirty times in as many years. King James bore it an inveterate hatred on account of the notes, which, at the Hampton-court conference, he charged as partial, untrue, ſeditious, &c. The *Biſhop's Bible* too had its faults; the king frankly owned he had yet ſeen no good tranſlation of the *Bible* in Engliſh; but he thought that of Geneva the worſt of all.

Bible, *Rhemiſh.*—After the tranſlation of the *Bible* by the biſhops, two other private verſions had been made of the New Teſtament; the firſt by Laur. Thomſon, made from Beza's Latin edition, together with the notes of Beza, publiſhed in 1582, in 4to. and afterwards in 1589, varying very little from the Geneva *Bible*; the ſecond by the papiſts at Rheims in 1584, called the *Rhemiſh Bible*, or *Rhemiſh tranſlation.* Theſe finding it impoſſible to keep the people from having the ſcriptures in the vulgar tongue, reſolved to give a verſion of their own, as favourable to their cauſe as might be. It was printed on a large paper, with a fair letter and margin. One complaint againſt it was its retaining a multitude of Hebrew and Greek words untranſlated, for want, as the editors expreſs it, of proper and adequate terms in the Engliſh to render them by; as the words *azymes*, *tunike*, *rational*, *holocauſt*, *præpuce*, *paſche*, &c. However, many of the copies were ſeiſed by the queen's ſearchers, and confiſcated; and Th. Cartwright was ſolicited by ſecretary Walſingham to refute it; but, after a good progreſs made therein, archbiſhop Whitgiſt prohibited his further proceeding therein, as judging it improper the doctrine of the church of England ſhould be committed to the defence of a puritan, and appointed Dr. Fulke in his place, who refuted the Rheimiſts with great ſpirit and learning. Cartwright's refutation was alſo afterwards publiſhed in 1618, under archbiſhop Abbot. About thirty years after their New Teſtament, the Roman catholics publiſhed a tranſlation of the Old at Doway, 1609 and 1610, from the vulgate, with annotations; ſo that the Engliſh Roman catholics have now the whole *Bible* in their mother-tongue; though, it is to be obſerved, they are forbidden to read it without a licence from their ſuperiors.

BIBLE, *king James's*.—The laſt Engliſh *Bible* was that which proceeded from the Hampton-court conference in 1603, where many exceptions being made to the Biſhop's *Bible*, king James gave order for a new one; not, as the preface expreſſes it, for a tranſlation altogether new, nor yet to make of a bad one a good one, but to make a good one better, or of many good ones one beſt. Fifty-four learned perſons were appointed for this office by the king, as appears by his letter to the archbiſhop, dated in 1604; which being three years before the tranſlation was entered upon, it is probable ſeven of them were either dead, or had declined the taſk, ſince Fuller's liſt of the tranſlators makes but forty-ſeven; who being ranged under ſix diviſions, entered on their province in 1607. It was publiſhed in 1613, with a dedication to James, and a learned preface, and is commonly called *King James's Bible*. After this, all the other verſions dropped, and fell into diſuſe, except the Epiſtles and Goſpels in the Common-Prayer Book, which were ſtill continued, according to the biſhops tranſlation, till the alteration of the liturgy in 1661, and the Pſalms and Hymns, which are to this day continued as in the old verſion.

There was a Welch tranſlation of the *Bible* made from the original in the time of queen Elizabeth, in conſequence of a bill brought into the houſe of commons for this purpoſe in 1563. It was printed in folio in 1588. Another verſion, which is the ſtandard tranſlation for that language, was printed in 1620. It is called Parry's *Bible*. An impreſſion of this was printed in 1690, called Biſhop Lloyd's *Bible*. Theſe were in folio: the firſt 8vo. impreſſion of the Welch *Bible* was made in 1630.

There is alſo a verſion of the *Bible* in the Iriſh language.

BIBLIA, or BIBLIA *petraria*, in a military ſenſe, denotes a machine uſed by the ancients for throwing ſtones or darts.

BIBLIOGRAPHIA, a branch of ARCHÆOGRAPHIA, employed in the judging and peruſing of ancient manuſcripts, whether written in books, paper, or parchment.

The ſenſe of it is now extended, and it ſignifies a work, intended to give information concerning the firſt, or beſt editions of books; and the ways of ſelecting and diſtinguiſhing them properly. In ſhort, it is uſed for a *notitia* or deſcription of printed books, either in the order of the alphabet, of the times when printed, or of the ſubject-matters.

In which ſenſe, *bibliographia* amounts to much the ſame with what is otherwiſe called BIBLIOTHECA.

Literary journals afford alſo a kind of *bibliographia*.

BIBLIOMANCY, a kind of divination performed by means of the BIBLE.

This amounts to much the ſame with what is otherwiſe called *ſortes biblicæ*, or *ſortes ſanctorum*.

It conſiſted in taking paſſages of ſcripture at hazard, and drawing indications thence concerning things future; as in Auguſtin's *tolle & lege*. It was much uſed at the conſecration of biſhops.

F. J. Davidius, a Jeſuit, has publiſhed a *bibliomancy*, under the borrowed name of *Veridicus Chriſtianus*.

BIBLIOMANIA, an extravagant paſſion for books, to a degree of madneſs; or a deſire of accumulating them beyond all reaſon and neceſſity.

BIBLIOTHECA, from βιϐλος, *book*, and θηκη, *repoſitory*, from τιθημι, *I lay up*, properly ſignifies a LIBRARY, or repoſitory of books.

It is alſo uſed for a compilation of all that has been written on a certain ſubject; or a digeſt of all the authors who have treated of it.

In this ſenſe, we have hiſtorical *bibliothecæ*, as that of Diodorus Siculus; mythological *bibliothecæ*, as that of Apollodorus; theological and ſacred *bibliothecæ*, as thoſe of Ravanellus, &c.

It is alſo uſed for a catalogue of the books in a library: ſuch are the *bibliotheca Coiſliniana*, *bibliotheca Cordeſiana*, *bibliotheca Thuanæa*, *bibliotheca Bignoniana*, *bibliotheca du Boiſiana*, &c.

L'Abbe has publiſhed a *bibliotheca* of *bibliothecæ*, or a catalogue of the names of thoſe who have written *bibliothecæ*, which has ſince been continued, and improved under another title by Teſſier, from 800 writers to the number of no leſs than 2500. Schrammius has alſo publiſhed a *programma* on the writers of theological *bibliothecæ*.

BIBLIOTHECA is a name given to the books of the Old and New Teſtament, in reſpect of their excellency, and ſufficiency for the uſes of the Chriſtian life; and it is alſo a title given to divers journals, or periodical accounts in French of new books.

BIBLIOTHECA *patrum*, or *of the fathers*, is a collection of the writings of the leſſer fathers, printed in one or more volumes. The firſt of this kind was publiſhed at Paris by Marg. de la Bigne in 1576.

BIBLIOTHECARIAN, a library-keeper, otherwiſe called LIBRARIAN.

The word is alſo uſed for the author of a BIBLIOTHECA, or a catalogue of books.

In this ſenſe, P. L'Abbe has given a *bibliotheca*, or catalogue of *bibliothecarians*. Geſner, Lipenius, Struvius, Fabricius, &c. are celebrated *bibliothecarians*.

BIBLISTS, *bibliſtæ*, an appellation given by ſome Romiſh writers to thoſe who profeſs to adhere to ſcripture alone as the ſole rule of faith, excluſive of all tradition, and the ſuppoſed authority of the church.

In which ſenſe, all proteſtants are, or ought to be, BIBLISTS.

Bibliſts, among Chriſtians, anſwer nearly to CARAITES or TEXTUARIES among the Jews. The Chriſtian doctors were divided, towards the cloſe of the twelfth century, into two claſſes; viz. the *biblici*, and the ſcholaſtics: the former were called *doctors of the ſacred page*, becauſe they explained the doctrines of Chriſtianity in their manner by the ſacred writings; however, their reputation declined, and the ſcholaſtic theology prevailed in all the European colleges till the time of Luther.

BIBLUS, in *Botany*, an aquatic plant in Egypt, called alſo PAPYRUS; of the ſkin whereof the ancient Egyptians made their PAPER.

Hence alſo the Greeks gave the denomination βιϐλος, to books made hereof.

BICAUDA, from *bis*, *double*, and *cauda*, *tail*; in *Zoology*, the name of a fiſh of the *xiphias* or SWORD-*fiſh* kind.

It is five feet long, or more, and a foot and half broad at the breaſt, tapering gradually towards the tail. It is covered with a thick and rough ſkin, and is brown on the back and ſides; and has there ſeveral ſhort bony prickles: its belly is white: its fins are all of a browniſh grey, and the back one has ſeveral beautiful black ſpots. It is a very well-taſted fiſh.

BICAUDALIS, in *Anatomy*, an appellation given by ſome to a muſcle of the external ear, on account of its having two tails; but which is ſubject to great variety, having ſometimes only one, and ſometimes three tails: in which caſes, it is called *intricalis* and *tricaudalis*.

BICE, or BISE, among *Painters*, a blue colour, prepared from the LAPIS ARMENUS, formerly brought from Armenia, but now from the ſilver mines in Germany. Phil. Tranſ. Nº 179. p. 26.

The word comes from the barbarous Latin *biſus*, or *biſius*; and that, perhaps, from the French *bis*, *grey*, *griſius*; whence *biſius panis*. Vid. Du-Cange, Gloſſ. Lat. tom. i. p. 565. Skin. Etym. in voc.

Bice bears the beſt body of all bright blues, uſed in common work; but it is the paleſt in COLOUR. It works indifferently well; but inclines a little to be ſandy, and therefore requires good grinding on a very hard ſtone, and ſhould be waſhed before it is uſed. It lies beſt near the eye of any blue now in uſe, except ULTRAMARINE.

We have alſo a green *bice*, made of the blue, with the addition of orpiment.

BICEPS, from *bis*, and *caput*, *head*; in *Anatomy*, is a name common to ſeveral muſcles, which are ſeparated into two diſtinct portions called *heads*.—Such is the

BICEPS *cubiti*, or *humeri*, a muſcle of the arm, one of whoſe heads ariſes from the upper edge of the cavity of the head of the *ſcapula*, and is round and tendinous, and incloſed in the channel in the head of the *humerus*: the other ariſing from the *proceſſus coracoides*, is broad and tendinous: and both *unite* about the middle and fore-part of the arm, and make one belly, which is *inſerted* by a ſtrong and round tendon into the tuberoſity at the upper end of the *radius*.—See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 24. *fig.* 2. *n.* 20. *fig.* 6. *n.* 15.

Some of the fibres of the tendon form a large and thin *aponeuroſis*, which covers all the muſcles of the *radius* and fingers externally.—Care ought to be taken in bloodletting, not to cut a-croſs, but according to the length of the fibres of this *aponeuroſis*.—This muſcle, with the BRACHIÆUS *internus*, bends the arm.

BICEPS *externus*, is called alſo GEMELLUS.

BICEPS *tibiæ*, or *femoris*, a muſcle made up of two portions, one long, the other ſhort, and ending in one common tendon. Both portions are fleſhy, and conſiderably thick, and are ſituated on the back and outſide of the thigh, between the buttock and the ham. The great portion is fixed above by a ſtrong tendon, in the poſterior and lower part of the tuberoſity of the *iſchium*, under the inſertion of the inferior *gemellus*, and cloſe behind that of the *ſeminervoſus*: from thence it runs down towards the lower extremity of the thigh, where it meets the other portion, and joins with it, forming a common tendon. The ſmall portion is fixed by fleſhy fibres to the outſide of the *linea aſpera*, below its middle, and to the *faſcia lata*, where it forms a *ſeptum* between the *triceps* and *vaſtus externus*: from thence the fibres run down a little way, and then meeting the great portion, a common tendon is formed between them. This ſtrong tendon runs down to the outer and back-part of the knee, and is inſerted in the lateral ligament of the joint, and in the head of the *fibula*, by two very ſhort tendinous branches. It ſometimes ſends off a tendinous expanſion, which is often unſkilfully cut off with the fat. As they run down they become contiguous, and afterwards cloſely united by one common broad tendon.

Both the fleſhy bodies of the *biceps* contribute to the formation of the *aponeuroſis*, each of the two portions, of which the common tendon is made up, furniſhing a ſeries of tendinous fibres, which covering the fore-ſide of the true tendon, unite near the internal condyle by a particular kind of inter-texture, and thus form the *aponeuroſis*. Winſlow.

Its uſe is to help to bend the *tibia*, and it is likewiſe employed in turning the leg, together with the foot and toes, outward, when we ſit down.—See *Tab. Anat.* *(Myol.) fig.* 6. *n.* 40.

BICHET, a corn meaſure, containing about a Paris *minot*, chiefly uſed in Burgundy and the Lyonois.

BICHET denotes alſo a certain quantity of land, as much as may be ſown by a *bichet* of corn.

BICINIUM, from *bis*, and *cano*, *I ſing*; in *Church Muſic*, the ſinging of two, either together or alternately.

In which ſenſe, the word ſtands oppoſed to MONODY.

BICKERN *of an* ANVIL, the pike or beak-iron.

BICLINIUM, from *bis*, and *κλινη*, *bed*; in *Antiquity*, two beds about a table; or, as ſome ſay, rather a BED whereon two perſons lay to eat.

BICORNES, from *bis*, and *cornu*, *horn*; in *Botany*, plants whoſe *antheræ* have the appearance of two horns. The term likewiſe expreſſes an order of plants in the *Fragmenta Methodi Naturalis* of Linnæus.

BICORNE *os*, or *two-horned bone*, in *Anatomy*, the ſame with the *os* HYOIDES.

BICORNIS, in *Anatomy*, an extenſor muſcle of the arm, otherwiſe denominated RADIÆUS *externus*, and EXTENSOR *carpi radialis*.

BICORNIS *pollicis manus*, is the proper extenſor muſcle of the thumb: ſometimes alſo, from the number of its horns, called *tricornis*.

It takes its riſe from the poſterior and middle part of the *radius* and *ulna*, and is inſerted in the firſt, ſecond, and third phalanx.

BICORPOREA *ſigna*, from *bis*, and *corpus*, *body*; thoſe ſigns of the zodiac which have two bodies, or conſiſt of two figures.

Such are *gemini*, or the twins; alſo *piſces*, and *ſagittarius*, conſiſting of a man and a horſe.

BICUIBA, in *Botany*, the name of an Indian nut, uſed for relieving colics; and from which an oil is extracted for the cure of cancers.

BIDAL, or BIDALE, in our *Ancient Cuſtoms*, denotes the invitation of friends to drink ale at ſome poor man's houſe, who, in conſideration hereof, expects ſome contribution for his relief.

This cuſtom ſtill obtains in the weſt of England, and is mentioned in ſome of our ancient ſtatutes. 26 Hen. VIII. c. 6.

BIDALDI, an ancient kind of foot-ſoldiers mentioned by the French hiſtorians, armed with two darts.

Hence the origin of the word, which ſeems to be a corruption for *bidardi* or *à binis dardis*. They are alſo called *bidarii*, *bidaus*, *bideaux*, *bidauts*, and *pitauts*.

BIDDING, is uſed for proclaiming or notifying; alſo for offering a price for goods put up by auction.

BIDDING *of the beads*, a charge or warning which the pariſh-prieſt gave to his pariſhioners at certain ſpecial times, to ſay ſo many *pater-noſters*, &c. on their beads.

BIDENS, in *Botany*; ſee *Water-hemp* AGRIMONY.

BIDENTAL, in *Antiquity*, a place ſtruck with a thunderbolt, and on that account conſecrated to the gods, and forbidden to be trod on. *Bidental* only differed from *puteal*, as in the latter the thunderbolt was ſuppoſed to be hidden, or buried with ceremony under the ground. The fall of lightning, or a thunderbolt, on any place, was judged by the Romans an indication that Jupiter demanded it for himſelf. Hence they ſurrounded it with a wall, rail, ſtakes, or even a rope; and expiated it, by the ſacrifice of a *bidens*, or ſheep of two years old. Feſtus repreſents the *bidental* as a temple, where ſheep of two years old were offered in ſacrifice. But by temple he here means no more than a place incloſed, and conſecrated to the gods.

BIDENTALES, prieſts among the ancient Romans, inſtituted for the performance of the ceremonies of a *bidental*.

The *bidentales* conſtituted a college, or decury, who had the ſervice and procuration, or interpretation of thunder and lightning.

The firſt and principal part of their office was, the ſacrificing a ſheep of two years old, which in their language was called *bidens*, as having only two teeth, one on each ſide; or rather from *bidennis*, anciently written for *biennis*, *two years old*.

BIDENTES, in *Middle Age Writers*, denotes two yearlings, or ſheep of the ſecond year.

The wool of theſe *bidentes*, or two year old ſheep, being the firſt ſheering, was ſometime claimed as a heriot to the king, on the death of an abbot.

Among the ancient Romans, the word was extended further to any ſorts of beaſts uſed for victims, eſpecially thoſe of that age: whence we meet with *ſues bidentes*.

BIDET, a nag, or little horſe, formerly allowed each trooper, and dragoon, for his baggage, and other occaſions.

Bidets are grown into diſuſe, on account of the expences thereof, and the diſorders frequently ariſing from thoſe who attended on them, &c.

BIDIÆI, an order of magiſtrates at Sparta, five in number, whoſe buſineſs was to ſuperintend the *ephebi*, and be preſent at their exerciſes, wreſtlings, &c.

BIDON, a liquid meaſure of about five quarts Engliſh meaſure; ſeldom uſed except among ſhip's crews.

BIER, a kind of wooden carriage, in which the bodies of the dead are borne to their grave. See BURIAL.

The word comes from the French *biere*, which ſignifies the ſame. It is called in Latin *feretrum*, *a ferendo*.

Among the Romans, the common *bier*, whereon the poorer ſort were carried, was called *ſandapila*; that uſed for the richer ſort, *lectica*, *lectica funebris*, ſometimes *lectus*. The former was only a ſort of wooden cheſt, *vilis arca*, which was burnt with the body; the latter was enriched and gilded for pomp. It was carried bare, or uncovered, when the perſon died a natural and eaſy death; when he was much disfigured or diſtorted, it was veiled or covered over.

BIER is more peculiarly uſed for that whereon the bodies of ſaints are placed in the church to reſt, and expoſed to the veneration of the devout.

BIFARIA *folia*, in *Botany*, are ſuch as point two ways.

BIFFA, in *Middle Age Writers*, a machine for caſting ſtones and darts, having a moveable counterpoiſe, which turned round its yard.

BIFID *leaf*, in *Botany*, a leaf cloven into two parts.

BIFOLIUM, in *Botany*; ſee TWYBLADE.

BIFRONS, a perſon double-fronted, or two-faced.

BIFRONS is more peculiarly an appellation of Janus, who was repreſented by the ancients with two faces, as being ſuppoſed to look both backwards and forwards: though other reaſons for it are recited by Plutarch. Sometimes he was painted with four faces, *quadrifons*, as reſpecting the four ſeaſons.

BIGA, a chariot for racing, drawn by two horſes a-breaſt.

The word ought rather to be written *bigæ*, in the plural; q. d. *bijugæ*, two horſes being joined by a *jugum*, or yoke.

Bigæ ſtand contradiſtinguiſhed from *trigæ*, *quadrigæ*, &c.

Bigæ are of very ancient ſtanding: all the heroes in Homer, Heſiod, Virgil, &c. fought in them.

The invention of *bigæ*, is attributed by Pliny to the Phrygians; by Iſidore, to Cyreſtenes of Sicyon, who firſt yoaked two horſes together.

Bigæ were the CHARIOTS firſt uſed in the CIRCENSIAN games; then *trigæ*, and afterwards *quadrigæ*.

The moon, night, and the morning, are by mythologiſts ſuppoſed to be carried in *bigæ*, the ſun in *quadrigæ*.

STATUES in *bigæ* were at firſt only allowed to the gods, then to conquerors in the Grecian games; under the Roman emperors, the like ſtatues, with *bigæ*, were decreed and granted to great and well-deſerving men, as a kind of half triumph, being erected in moſt public places of the city.

Figures of *bigæ* were alſo ſtruck on their coins, and are termed BIGATI.

The drivers of *bigæ* were called *bigarii*; a marble buſt of one Florus a *bigarius* is ſtill ſeen at Rome.

BIGA, or BIGATA, in *Writers of the Middle and Barbarous Age*, a cart with two wheels, drawn often with one horſe. It was more frequently called *birota*.

BIGAMY, a double marriage, or the poſſeſſion of two wives at the ſame time.

Among the ancient Romans, thoſe convicted of *bigamy* were branded with a note of ignominy; and, in France, they were anciently puniſhed with death. See POLYGAMY.

BIGAMY, in the *Canon Law*, is alſo where a perſon either marries two women ſucceſſively; or only marries one woman who had been married before. Each of which the canoniſts account impediments to be a clerk, or to hold a biſhopric without a diſpenſation: a point of diſcipline founded on that of St. Paul, *Let a biſhop be the huſband of one wife*, 1 Tim. chap. iii. ver. 2. Apoſt. Conſt. 17, 18.

Bigamy they make of two kinds: *real*, as where the party actually marries twice; and *interpretative*, where he marries a widow, or woman defiled before, which is eſteemed a kind of ſecond marriage.

The Romaniſts make a third kind of *bigamy*, *by interpretation*; as, when a perſon in holy orders, or that has taken on him ſome monaſtic order, marries.—This the biſhop can diſpenſe withal, at leaſt on ſome occaſions.

There is alſo a kind of *ſpiritual bigamy*; as, when a perſon holds two incompatible benefices, v. gr. two biſhoprics, two vicarages, two canonries *ſub eodem tecto*, &c.

BIGATI, in *Antiquity*, a kind of ancient Roman ſilver coins, on one ſide whereof was repreſented a *biga*, or chariot drawn by two horſes.

The *bigatus* was properly the Roman *denarius*, whoſe impreſſion, during the times of the commonwealth, was a chariot driven by Victory, and drawn either by two horſes, or four, according to which it was either denominated *bigatus*, or *quadrigatus*.

Bigati therefore were of different values, according to the ſpecies of *denarii*, &c.

Several of thoſe called conſular medals are alſo *bigati*.

In lieu of horſes, the chariot is repreſented on ſome *bigati*, as drawn by two deer, eſpecially in the medals of the family of Axſia; on thoſe of the family Crepereia, by two *hippopotami*, who draw, or rather bear Neptune on their tails.

BIGGEL, in *Natural Hiſtory*, a quadruped much about the colour and bigneſs of a rein-deer; its head is ſaid to be like that of a horſe; its main like that of an aſs, with black cloven feet, and two black horns on his head.

This animal is found in the Eaſt Indies, according to Mandelſloe, in Harris's Collection of Voyages.

BIGHT, in the *Sea-language*, denotes any part of a rope, as it is taken compaſſing, coiled up; or the double part of a rope, when it is folded in contradiſtinction to the end. It ſignifies alſo a ſmall bay between two points of land.

BIGNONIA, in *Botany*, Trumpet-*flower*.

BIGOT, a perſon fooliſhly obſtinate, or perverſely attached to an opinion.

The word comes from the German *bey*, and *Gott*, or the Engliſh *by-God*.

Camden relates, that the Normans were firſt called *Bigots*, on occaſion of their duke Rollo; who receiving Giſſa, daughter of king Charles, in marriage, and with her the inveſtiture of the dukedom, refuſed to kiſs the king's foot in token of ſubjection, unleſs he would hold it out for that purpoſe: and being urged to it by thoſe preſent, anſwered haſtily, *No by God*; whereupon the king, turning about, called him *Bigot*; which name paſſed from him to his people.

Bigot, in Italian *bigontia*, is uſed to denote a Venetian liquid meaſure, containing the fourth part of the *amphora*, or half the *boot*.

BIGOURNEAU, in *Natural Hiſtory*, a name given by Bellonius to that genus of *cochleæ*, called the ſemi-circular mouthed, or ſemi-lunar kind, including the NERITA.

BIJUGUM *folium*, in *Botany*, denotes a winged leaf, bearing two pair of *foliola*.

BIL, in *Ichthyography*, a name given in ſome parts of England to a particular ſpecies of cod-fiſh, called by Willughby *aſellus luſcus*. It is diſtinguiſhed from the cod by its ſmallneſs, by its being ſhorter and broader in its ſhape, by the paleneſs of its colour, and largeneſs of its ſcales; though it agrees with it, in having a beard under the chin.

BILANCIIS *deferendis*, a writ directed to a corporation, for the carrying of weights to ſuch a haven, there to weigh the wool, which perſons by our ancient laws were licenſed to tranſport.

BILANDER, in *Navigation*, a ſmall merchant-ſhip with two maſts; diſtinguiſhed from other veſſels of the ſame kind by the form of the main-ſail. Few veſſels are now rigged in the manner of *bilanders*; the name has been variouſly applied in different countries.

BILARIUS Porus, Bilary *pore*, or *hepatic duct*, a conſiderable appendage of the liver, formed from the concurrence of a multitude of ſmall ramifications ſpringing from the glands of the liver, which unite into ſeveral trunks equal in magnitude to the branches of the hepatic arteries; and accompany them branch for branch through the whole ſubſtance of the liver; being wrapped up in the ſame *capſula* with the *porta*. See *Tab. Anat.* (*Splanch.*) *fig.* 5. *litt. ff*.

Theſe branches are about the ſize of a wheat-ſtraw, the biggeſt large enough to admit the little finger; and are diſtinguiſhable from the *porta* by their contents, being always full of bile. Beſides the *capſula* common to theſe and the *porta*, each has a thick white coat proper to itſelf, like the muſculous coat of an artery.

On the concave ſide of the liver the ſeveral ramifications meet, and form one trunk, or channel, properly called the *bilary pore*, about the bigneſs of a gooſe quill, which deſcending about two inches, meets with the cyſtic duct, and together with it forms what we call the *ductus communis*; which deſcending in a right line, about four inches, diſcharges itſelf into the *duodenum*, by an oblique inſertion, oftentimes at the ſame aperture with the pancreatic duct.

The *porus bilarius* communicates with the gall-bladder, by a duct firſt deſcribed by Dr. Gliſſon, and afterwards by Blaſius and Perrault, who gave it the name of the *cyſt-hepatic duct*. Verheyen, in oxen, found two, three, or four of theſe *cyſt-hepatic ducts*; and the like has been obſerved in a dog, and a man.

BILATERAL Cognation, denotes kinſhip, or kindred, on both ſides; that of the father as well as mother.

Such is the relation of brothers, ſiſters. *Bilateral* ſtands contradiſtinguiſhed to *unilateral*.

BILBERRY, in *Botany*, Whortle-berry.

BILBOWS, in *Sea-phraſe*, a puniſhment anſwering to the STOCKS at land.

BILCOCK, in *Zoology*, a name given by ſome to the water-rail, a bird of the moor-hen kind, but ſmaller than the common moor-hen. See Rollus.

BILDGE, or Bilge *of a ſhip*, denotes the bottom of her floor; or the breadth of that part which ſhe reſts on, when ſhe is a-ground.

Bildge-*water*, is that which, by reaſon of the flatneſs of the ſhip's bottom, lies on her floor, and cannot go to the well of the pump.

The Dutch, whoſe ſhips are often of this form, uſe a ſort of pumps called *bildge-pumps*; or, as we call them, *burr-pumps*, to carry off the *bildge-water*.

When a ſhip ſtrikes on a rock, they alſo ſay, ſhe is *bildged*, or *buldged*.

BILE, Bilis, a yellow bitter juice, ſeparated from the blood in the liver, collected in the *porus bilarius*, and gall-bladder, and thence diſcharged by the common duct into the *duodenum*.

The word *bile* comes from the Latin *bilis*, which ſome derive further, from the Greek *βια*, *violence*; becauſe bilious people are inclined to anger: others derive it from the Latin *bullire*, *to boil*.

Bile is of two kinds; *hepatic*, and *cyſtic*.—The firſt, moſt properly called *bile*, is ſeparated immediately from the glands of the liver into the PORUS *bilarius*.—The ſecond, more properly called *gall*, is ſeparated likewiſe from the glands of the liver into the gall-bladder, by roots or ducts proper to itſelf. See Gall.

The *cyſtic bile* is thicker, of a deeper yellow, and bitter; though it has varied in colour and taſte in different ſubjects, and different circumſtances; is not evacuated continually, but only when its receptacle is replete; in which caſe, the contraction of the irritated fibres propels it into the *duodenum*.—The *hepatic bile* is greener, thinner, more mild and pellucid, reſembling lymph, ſubalcaline, and rather oily, and is continually ouſing out; being expelled by the ſole action of the neighbouring parts. The *cyſtic bile* reſiſts acids, and, mixed with other fluids, gives them the like property: it abſterges like ſoap, and renders oils capable of mixing with water; it reſolves and attenuates reſins, gums, and other tenacious bodies, rendering them homogeneal to itſelf. It is neither alcalious nor acid, but ſeems a concretion of oil, ſalt, and ſpirits diluted with water. By a chemical analyſis, Dr. Drake obſerves it affords ſome ſulphur, or oil, ſome volatile ſalt, a good deal of ſixt ſalt (in which particular it differs from all other animal liquors), and a moderate quantity of *caput mortuum*, or earth: the baſis is phlegm.

Dr. Maclurg obſerves, that the mixture of the mineral acids with the *bile* produces a fine green colour, which he attributes to the union of the phlogiſton of the *bile* with the acid: and that the action of the concentrated mineral acids upon the *bile*, whereby they change and decompoſe it, depends on their violent attraction for the principle of inflammability: and that the menſtruum which extracts the colour of the *bile*, extracts at the ſame time its bitterneſs; ſo that it no longer exhibits the phænomena depending on its phlogiſton. The vegetable acids do not decompoſe the *bile*, which, he ſuppoſes, is owing to their weaker attraction of the phlogiſton. As the brown colour of the *cyſtic bile* is reſtored by the addition of an alcali, he infers, that this colour depends on an alcaline nature acquired by the *bile* during its ſtagnation in the gall-bladder. He concludes alſo, that there is fixed air in the *bile*, becauſe the cauſtic alcali, diſſolving its coagulum, becomes mild, and capable of efferveſcence. From other experiments he infers, that the antiſeptic principle of the *bile* cannot reſide in the part to which it owes its coagulability, and which is exactly analogous to the lymph of the blood; but that it is probably connected with its bitterneſs, and that both are qualities of the colouring matter. Of all the animal fluids, Dr. Maclurg thinks, that the milk and the *bile* are moſt analogous to one another, and to the BLOOD. See Maclurg's Exp. on the Human Bile.

The principal uſe and effect of the *bile* is, by mixing with the chyle and *fæces*, to attenuate, reſolve, abſterge, and ſtimulate the *fibræ motrices* of the inteſtines; as alſo to mix together things very different, to bruiſe and blunt thoſe that are ſharp and ſaline, to divide thoſe that are coagulated, to open the paſſages for the chyle, to excite appetite, to act the part of a ferment, and to aſſimilate crude things to things concocted. Theſe effects the *cyſtic bile* has in a greater, the *hepatic* in a leſſer degree.

Dr. Quincy thinks the principal uſe of both ſorts of *bile* is to ſheathe and blunt the ACIDS of the chyle, entangling them with its ſulphur, ſo as to prevent their being ſufficiently diluted by the pancreatic juice to enter the lacteals: which ſeems confirmed by this; that, notwithſtanding the great quantity of acid ſalts in the aliment in the ſtomach, there are never any found in the chyle after it has paſſed the *duodenum*, and being impregnated with the *bile* continually ouſing out of the PORUS *bilarius*. See Acid, and Blood.

Borelli aſſerts, that part of the *bile* diſcharged into the inteſtines re-enters the meſeraic veins, and, mixing with the blood of the *vena porta*, is again percolated through the liver; and Boerhaave ſeems of the ſame opinion: on which footing the *bile* has its circulation, as well as the BLOOD.

Some will have the *cyſtic bile* brought to its receptacle three different ways, and that it is even compoſed of three different kinds of *bile*, whence its different properties. Though Boerhaave takes thoſe properties rather to reſult from its ſtagnating in the gall-bladder; and, with Malpighi, thinks the bitter part may probably become ſo in the glands between the coats of the gall-bladder, which are furniſhed from the cyſtic arteries; whence it proceeds bitter, and mixes with the reſt in the bladder.

The influence of *bile* upon the animal œconomy is allowed to be very great. By its fermentative quality, it promotes digeſtion; in which reſpect, it differs widely from vegetable bitters, which are retarders of fermentation. However, in one thing it agrees with them, viz. as a corrector of acidities.

Bile ſpeedily corrupts, but not to ſuch an high or offenſive degree as the blood or fibrous parts of the body. To this corruption of the *bile*, as one cauſe, Dr. Pringle attributes the paroxyſms in bilious fevers: nay, all bilious diſorders, as the *cholera morbus*, dyſentery, &c. are thought to be chiefly owing to a redundance or corruption of the *bile*. Hence, the reaſon why theſe diſorders are moſt frequent in hot countries, and in armies when much expoſed to the ſun, is, that the *bile*, if not more abundant, is in ſuch circumſtances more corrupted than uſual.

The *bile* is a juice of great importance, with regard to the good or ill habitude of the animal. Dr. Woodward has traced its effects throughout the body very minutely, and makes no ſcruple to aſcribe moſt of the diſeaſes thereof to ſome diſorder of the *bile*. This he takes to be the chief ſpring in the animal machine, and from this accounts for moſt of the phænomena of a body, whether healthy or diſeaſed: and yet the ancients generally took it to be no more than an excrement, for which they could not find any uſe.

Many of the moderns, from the ſmall quantity of *bile* ſecerned, have been led into a miſtake, that this ſecretion is not the ſole end of ſo conſiderable a *viſcus* as the liver.

Dr. Keill obſerves, that in a dog, whoſe common duct was near as big as that of a man, he gathered at the rate of about two drachms an hour; though, in a human body, there is reaſon to think the quantity ſecreted to be greater.

The *bile* is a part found in all animals; even pigeons, &c. which have no gall-bladder, yet have *bile*: their liver being found very bitter. Mr. Tauvry obſerves, that the *bile* becomes one of the principal cauſes of THIRST, by mixing with the ſalival juice.

Sometimes the *bile* from yellow becomes greeniſh, like verdegris, and frequently pale, like the yolks of eggs, and that without any other apparent cauſe than a little motion, a convulſion, or a violent paſſion of the mind. This occaſions many and terrible diſeaſes; as nauſeas, an abhorrence of food, anxiety, ſighing, cardialgias, wind, diarrhœas, dyſenteries, acute diſeaſes, fevers, and convulſions.

Sometimes it becomes black, and takes the name of *choler*: in this caſe, it ſometimes taſtes like a very ſharp vinegar; ſometimes like putrefied blood; gnawing, burning, diſſolving, conſuming, occaſioning inflammations, gangrenes, mortifications, violent pains, and terrible fermentations.

Of ATRA *bilis*, or *black bile*, Boerhaave diſtinguiſhes three kinds: firſt, the mildeſt, ariſing from the matter of the blood, put in too great a motion, which hence takes the name of *aduſt*: the ſecond is an aggravation of the firſt, ariſing from the ſame cauſes only heightened: the third is a corrupt, parched *bile*, which if it aroſe from a greeniſh or paliſh ſort, is ſtill worſe.

Too great an evacuation of the *bile*, either upwards or downwards, robs the chylefaction of its main inſtrument: hence it prevents digeſtion, ſecretion, excretion of the *fæces*, and produces an acid temperature, coldneſs, weakneſs, paleneſs, ſwoonings, &c. When the ſtomach is full, the *cyſtic bile* is more copiouſly diſcharged into the *duodenum*; when it is empty, the *hepatic bile* is more freely ſecerned in the gall-bladder. If the *bile*, when prepared, be prevented its diſcharge into the inteſtines, it produces a JAUNDICE, and an overflowing of the GALL.

Bile, *ſecretion of the.*—For the manner in which the *bile* is ſeparated in the liver, there are various opinions. Some maintain, that the pores of the ſecretory glandules of the liver have a certain configuration and magnitude, to which the particles of the *bile* floating in the blood being juſt anſwerable, both in bulk and figure, are admitted in, and all the reſt excluded. Others, with Sylvius and Liſter, not allowing any difference in the configuration, as knowing that the pores of all the veſſels are circular, and that particles of all kinds will be admitted, if ſmall enough, have recourſe to a ferment, which they ſuppoſe to reſide in the liver, by means whereof the particles of the blood, in their paſſage through the ſecretory ducts, aſſume the form of *bile*. But, as this is little elſe than begging the queſtion, others have recourſe to another hypotheſis; maintaining, that the fluids contained in the blood of the *vena porta*, while that enters the ſubſtance of the liver in its way to the extremities of the *vena cava*, indifferently apply to the apertures of the ſecretory tubes contiguous to the extreme branches of the *porta*, which are wide enough, and to the roots of the *cava*, which are not wide enough, to receive them; by which means, being ſeparated from the ſociety and the inteſtine motion of the other and eſſential part of the blood, and being no longer agitated by the vital action of the blood-veſſels, and becoming expoſed to the actions of the biliary veſſels, they conſtitute a new humour, diſtinct from the blood, called *bile*, &c. Dr. Keill accounts for the ſecretion of the *bile* from the ſtrong attraction between the particles whereof it is compoſed. He obſerves that the heart and liver being ſo near each other, were the cœliac artery to have carried all the blood to the liver, conſidering the velocity of the blood, ſo viſcid a ſecretion as the *bile* could never have been effected. Nature, therefore, forms a vein for the purpoſe; viz. the *porta*; and by it ſends the blood from the branches of the meſenteric and cœliac arteries to the liver; by which the blood is brought a great way about, paſſing through the inteſtines, ſtomach, ſpleen, and *pancreas*, before it arrives at the liver: thus its velocity is exceedingly diminiſhed, and the particles that are to form the *bile* have a ſufficient time to attract one another, and unite, before they come to their ſecerning veſſels. But, as if this diminution of velocity were not ſufficient for the purpoſe, nature has gone farther, having made the cavities of all the arteries increaſe as they divide: thus the ſum of the branches, ariſing from the *aorta*, is to the *aorta* itſelf, as 102740 to 100000. And yet, as if that proportion were too little for the preſent purpoſe, nature has here taken a further ſtep, and increaſed the branches ſpringing from the meſenteric artery in a greater ratio. Thus, in a body which he examined, he found the ſum of the branches more than double that of the trunk; and therefore the velocity of the blood, in the former, muſt be leſs than half that of the latter. He further ſhews, from a juſt calculation, that the time the blood now takes, in its paſſage from the *aorta* to the liver, is at leaſt twenty-ſix minutes: whereas, had an artery gone directly from the *aorta* to the liver, it would have paſſed in little more than half a ſecond; viz. 2437 times in the ſpace it now takes up in its paſſage. Whence it appears, that the blood was not in a ſtate fit to yield *bile*, had it gone directly from the *aorta* to the liver; and that a longer time, and more languid motion, was neceſſary, to have the bilious particles in a readineſs to be ſeparated. He adds, that did the humours exiſt in the glands the ſame as they are found after ſecretion, nature would not, on this occaſion, have been at ſo much expence to retard the blood's velocity: beſides, that the *bile* has another advantage from the uſe of the *porta*: for, by running through ſo many parts before it reaches the liver, it leaves behind it moſt of its *lympha*; by which means the particles being brought nearer each other, are, by their mutual attraction, ſooner united. But it has been objected, that this account is too ſyſtematical. See Gall, Secretion, &c.

Biliary *concretions*, found in the paſſages of the *bile*, or in the gall-bladder, commonly called gall-ſtones, are not of a cretaceous nature, but are merely *coagula* of the bile formed by an acid; which, being allowed to ſtagnate, acquire a ſtony hardneſs.

BILGE; ſee BILDGE.

BILIMBI, in *Natural Hiſtory*, the name of an Eaſt India tree, very famous throughout that part of the world for its uſes in medicine. European botaniſts have called it MALUS *Indica fructu pentagono*, or the India apple-tree, with the five-cornered fruit.

It ſeldom grows to above twelve feet high, and is not commonly wild, even in the Eaſt Indies, but is carefully cultivated in gardens, where it flowers all the year round. The juice of the root is drank as a cure for fevers. The leaves boiled, and made into a cataplaſm with rice, are famed in all ſorts of tumours, and the juice of the fruit is uſed in almoſt all external heats, dipping linen rags in it, and applying them to the parts. It is drank, mixed with arrack, to cure diarrhœas; and the dried leaves, mixed with betel leaves, and given in arrack, are ſaid to promote delivery. The fruit is pleaſant to the taſte, when fully ripe, and is commonly eaten; when ſmaller, and unripe, it makes a very pleaſant pickle.

BILINGUIS, in *Law*; ſee MEDIETAS *Linguæ*.

BILINGUIS properly denotes a perſon, who has two TONGUES in his mouth; an inſtance of which is given by Dolæus. It is alſo uſed for a perſon who ſpeaks two languages.

BILIOUS *complexion*; ſee CHOLERIC, COMPLEXION, TEMPERAMENT.

BILIOUS *colic*; ſee COLIC.

BILIOUS FEVER, a term uſed by medical writers to expreſs ſuch fevers as ariſe from an immediate effuſion of the bile. Theſe often ariſe from violent fits of anger in the patient. Of this nature are the *cholerica febris*, and *cauſus*.

Dr. Pringle, in his Obſervations on the Diſeaſes of the Army, remarks, that the *bilious* or putrid fever is epidemic in camps, eſpecially in low and marſhy countries, where the air being full of moiſt and putrid effluvia, tends to relax the fibres and promote putrefaction. As to the ſymptoms of the *bilious* fever, it always begins with chillneſs and laſſitude, pains of the head and bones, and a diſorder at the ſtomach. At night the fever runs high; the heat and thirſt are great; the tongue is parched; the head aches violently; the perſon gets no reſt, and often becomes delirious; but generally in the morning an imperfect ſweat brings on a remiſſion of all the ſymptoms. In the evening the paroxyſm returns, but without any cold fit, and is commonly worſe than the former: on the ſecond morning it remits as before. Theſe periods go on, daily, till the fever changes inſenſibly, either into a confirmed, or into an intermitting ſtate. Sometimes looſe ſtools carry off the fit, and ſupply the place of ſweats: however, though it reſembles an ague in many particulars, yet it is rare to meet with a real ague in the camp, unleſs the perſon has been ill of it before he took the field. The remiſſions uſually appear from the beginning, eſpecially if the patient has been plentifully blooded: but ſometimes there are no remiſſions for the laſt two or three days. Hæmorrhages of the noſe happen frequently in the height of the paroxyſm, and always bring on the remiſſion ſooner, and make it fuller. Vomiting or purging have the like effects. The fits are ſeldom preceded by ſhiverings, or any ſenſe of cold after the firſt attack; the pulſe is always full and quick during the paroxyſms, and in the remiſſions it ſtill indicates ſome degree of fever. The blood is florid, the *craſſamentum* is firm, in large quantity, and ſinks in the *ſerum*. Whilſt the weather continues warm, the *bilious* ſymptoms are moſt frequent, but as winter approaches, the INFLAMMATORY ones prevail.

The doctor enumerates other ſymptoms, as crudeneſs of the urine, *bilious* ſtools, coſtiveneſs, &c. and further obſerves, that the infantry are more liable to it than the cavalry.

As to the cure of the *camp-fever*, before it becomes continued, it depends upon the proper uſe of evacuations, the neutral ſalts, and the bark. Bleeding he judges indiſpenſible; which he would have repeated once or oftener, according to the urgency of the ſymptoms. After bleeding it will be neceſſary to give an emetic, the beſt time for doing which is in the remiſſion of the fever, and rather ſooner after a paroxyſm than before one. He adds, however, that vomits do harm when the ſtomach is anywiſe inflamed; in which caſe they ought never to be given. Ipecacuanha is the ſafeſt and eaſieſt, but antimonials make the moſt efficacious vomit. If the body remains coſtive, it is neceſſary to open it with ſome lenient phyſic; and eſpecially if the bowels are affected with pains, or a *teneſmus*. He likewiſe recommends ſalt of wormwood, lemon juice, *ſpiritus Mindereri*, and the bark; which laſt ought not to be given till the urine breaks, and the intermiſſions take place. Bleeding and purging are alſo neceſſary before the bark ought to be given: it anſwers beſt in ſubſtance adminiſtered in Rheniſh wine, after ſtanding a night in infuſion.

If, after remiſſions or intermiſſions, the diſeaſe changes into a continued fever, bleeding becomes neceſſary, unleſs other ſymptoms forbid it; but whether there be room for bleeding or no, bliſters are not only uſeful, but the beſt remedy. To theſe may be joined the neutral ſalts and diaphoretic powders. But, though a ſweat be the proper criſis, it ought never to be promoted by *theriaca*, or the like hot medicines; unleſs the pulſe ſhould ſink, and the *petechiæ* or other bad ſymptoms appear: in which caſe the warmer alexipharmics are neceſſary, as the diſeaſe has changed into a MALIGNANT FEVER. See *Malignant catarrhal* FEVER.

BILL, in *Huſbandry*, denotes an edge-tool, of the ax kind, with a hooked point, fitted to a handle, and uſed to lop boughs of trees, &c.—When ſhort, it is called an *hand-bill*; when long, an *hedge-bill*.

BILL, in *Commerce*, denotes a ſecurity for money under the hand and ſometimes ſeal of the debtor, without any condition, or forfeiture, in caſe of non-performance.—In which it is diſtinguiſhed from a bond or obligation.

It has been uſually defined a writing, wherein one man is bound to another to pay a ſum of money, on a day that is future, or preſently on demand, according to the agreement of the parties at the time when it is drawn, and the dealings between them.

BILL, in *Law*, denotes a declaration in writing, expreſſing a wrong, or grievance, which the complainant hath ſuffered by the party complained of; or elſe ſome offence committed by him againſt ſome law or ſtatute of the realm. This *bill* is commonly addreſſed to the lord chancellor, eſpecially for unconſcionable wrongs done ſometimes to others having juriſdiction, according as the law they are grounded on directs.—It contains the fact complained of, the damages ſuſtained, and the petition of proceſs againſt the defendant for redreſs.

BILL, in PARLIAMENT, denotes a paper containing propoſitions offered to the houſes, to be paſſed by them, and then to be preſented to the king to paſs into an act or law.

BILL *of attainder*; ſee ATTAINDER.

BILL *of appeal*; ſee APPEAL.

BILL *of* EXCHANGE, a ſhort note, or writing, ordering the payment of a ſum of money in one place, to ſome perſon aſſigned by the drawer, or remitter, in conſideration of the like value paid to him in another place. See REMITTANCE.

The whole eſtate and effects of merchants often conſiſt in *bills of exchange*.

A *bill of exchange* is an inſtrument ſo noble and excellent, that though it want thoſe formalities required by the common law; as ſeal, delivery, and witneſſes; and ſo cannot be deemed a ſpeciality; yet is it ſuperior to any bond or ſpeciality by the reſpect that is paid it, and the punctuality and preciſeneſs of the payment.

There is ſome diſpute about the nature and ſanction of a *bill of exchange*: ſome take it to be a contract of permutation, or exchange; but the more general opinion is, that it is a mere contract of buying and ſelling; that the money given the perſon who draws the bill is the price of ſale; and that paid at the appointed place, the thing bought and ſold.

Bills of exchange were unknown in the ancient Roman commerce, as well as juriſprudence. According to the common opinion, they are the invention of the Jews: who, being baniſhed France, for ſome enormous crimes charged on them, retired into Lombardy, about the twelfth century, and found means to withdraw their effects, which they had lodged in the hands of friends, by ſecret letters and *bills* conceived in ſhort preciſe terms, like the modern *bills of exchange*; and this, by the aſſiſtance of merchants and travellers.—The faction of the Gibellins, being expelled Italy by the Guelphs, retired to Amſterdam, and uſed the ſame means, for the recovery of their effects in Italy, as the Jews had done; hence the Dutch merchants took the hint of negociating *bills of exchange*; and ſoon ſpread the practice throughout all Europe.—The ſame Gibellins are ſaid to be the inventors of the *rechange*, on account of damages and intereſts, when *bills of exchange*, which they call *polizza di cambio*, are not paid, but returned on proteſt. See RE-EXCHANGE.

That which conſtitutes the form and eſſence of a *bill of exchange*, is, the ceſſion, or transferring of a ſum of money made by the drawer, to him on whoſe account it is drawn, to be received of his correſpondent in another place; which ceſſion, or transfer, is made, in the mercantile terms, for *value received*, i. e. for a like ſum given by the perſon for whoſe ſake the *bill* is drawn, to the drawer, in money, merchandize, or other effects.

There are therefore three things neceſſary to conſtitute a *bill of exchange*: 1ſt, That it be drawn in one city on another. 2dly, That there be three perſons concerned; the drawer, the preſenter, or the perſon for whom it is drawn, and the ACCEPTOR, or he on whom it is drawn. 3dly, That it make mention, that the value which the drawer has received, is either in *bills of exchange*, in money, merchandize, or other effects, which are to be expreſſed; otherwiſe it is no *bill of exchange*.

When a *bill of exchange* is expreſſed to be *value in myſelf*, it is not ſuppoſed the drawer has received the ſum; but the perſon for whom it is drawn, ſtands debtor to him for it.—When a *bill of exchange* bears, *for which ſum I promiſe to furniſh bills of exchange* to ſuch a place, the perſon for whom the *bill* is drawn may compel him to give the *bills*, or to return the money.

Bills of exchange may be divided into *inland* and *outland*. *Outland* or *foreign bills* are thoſe made for money taken up in ſome other country, and to be paid in England; or *vice verſa*.—*Inland bills* are thoſe made for money taken up in one part of the kingdom, and to be repaid in another.—By the ſtat. 9 and 10 Will. III. theſe latter are made equally binding with the former: and the method of proteſting ſuch *bills* is farther regulated by 3 and 4 Anne. See NOTE.

BILLS, *Lumbard*, are inſtruments of an uncommon kind and figure, uſed in Italy and Flanders, and of late alſo in France; conſiſting of a piece of parchment, cut to an acute angle about an inch broad at top, and terminating in a point at bottom; chiefly given, where private perſons are concerned in the fitting out a ſhip on any long voyage.

The manner is this: The party, who is deſirous to be concerned in the cargo or venture, carries his money to the merchant, who fits out the ſhip, where it is entered down in a regiſter; at the ſame time the merchant writes down on a piece of parchment, upwards of an inch broad, and ſeven or eight inches long, the name of the lender, and the ſum lent, which being cut diagonalwiſe, or from corner to corner, each party retains his half. On the return of the veſſel, the lender brings his moiety to the merchant, which being compared with the other, he receives his dividend accordingly. Much the ſame is practiſed in Holland by thoſe who lend money on pledges: the name of the borrower, and the ſum, are written on a like ſlip of parchment, which is cut in two, and half given to the borrower, and the other half ſtitched to the pledge; that, upon comparing them together again, the borrower may receive his goods on paying the money ſtipulated.

BILL, *to note a*. See NOTE.

BILL, *to proteſt a*. See PROTEST.

BILLS, *bank*, are notes or obligations ſigned on behalf of the company of the BANK, by one of their caſhiers, for value received. See NOTE.

BILL *of parcels*, an account of the particular ſorts and prices of goods bought, given by the ſeller to the buyer.

BILL *of lading*, an inſtrument ſigned by the maſter of a ſhip, acknowleging the receipt of a merchant's goods, and obliging himſelf to deliver them, at the place to which they are conſigned, in good condition.

Of ſuch *bills* there are uſually three: the *firſt*, the merchant keeps; the *ſecond* is ſent to the factor to whom the goods are conſigned; and the *third* is kept by the maſter of the ſhip.

BILL *of ſale* is when a perſon, wanting a ſum of money, delivers goods as a ſecurity to the lender, to whom he gives this *bill*, impowering him to ſell the ſaid goods, in caſe the ſum borrowed is not repaid, with intereſt, at the time appointed.

BILL *of ſtore*, a kind of licence granted at the cuſtom-houſe to merchants, to carry ſuch ſtores and proviſions as are neceſſary for their voyages, cuſtom-free.

BILL *of ſufferance*, a licence granted at the cuſtom-houſe to a merchant, to ſuffer him to trade from one Engliſh port to another, without paying cuſtom.

BILL *of entry*, an account of goods entered at the cuſtom-houſe, both inward and outward; wherein is expreſſed, the merchant importing or exporting, the quantity of goods, and the ſorts, and from whence imported, or to what place exported.

BILLS *of mortality* are weekly liſts compiled by the pariſh-clerks in and about London, containing the numbers of ſuch as die of each diſeaſe, as well as of thoſe that are born, every week. See MORTALITY.

BILL, in *Phyſiology*, is a cartilaginous ſubſtance covered with a ſkin or *cutis*, which forms the beak, or *roſtrum*, of a BIRD.

The *bill* does the office of teeth in ſome birds; alſo of weapons of offence. In the parrot kind it is hooked, and ſerves to climb, and catch hold of boughs. The upper *bill* of this bird is filled with rows of croſs bars; and the under *bill*, which is much ſhorter, ſhuts within the upper, and draws againſt the roof of the mouth; by which means a kind of maſtication is effected, before the meat paſſes into the craw. The PHOENICOPTER'S *bill* is a true *hyperbola*, pointed at the end like a ſword; and what is remarkable, the upper *bill* of this bird moves in eating, the lower being fixed, which is the contrary of what is found in all other kinds. The wood-pecker's *bill* is ſtrong, and ſharp enough to dig holes, and build in the heart of the hardeſt timber. See PHOENICOPTERUS and PICUS. Phil. Tranſ. Nº 211, p. 155. Nº 350, p. 509.

In the iſland of Fero, a fixed reward is given for the *bills* of ravenous birds: all watermen are obliged to bring a certain number yearly to the country courts, at the feaſt of St. Olaus; when they are thrown into a heap, and burnt in triumph. Plott gives divers inſtances of monſtrous irregularities in the *bills* of birds; particularly of a raven, whoſe mandibles croſſed each other, the lower chap turning upwards, and the upper downwards. Plott's Nat. Hiſt. Stafford. ch. vii. § 4.

BILL, *crow's*, among *Chemiſts*, the beginning of the fanciful proceſs of the philoſopher's ſtone, diſcovered by the blackneſs of the matter, called alſo the *crow's head*.

BILLA VERA, *the bill is true*. The grand jury indorſing a *bill* whereby any crime puniſhable in that court is preſented to them, with the words *billa vera*, ſignify thereby, that the preſenter has furniſhed his preſentment with probable evidence, and worthy of further conſideration; whereupon the party preſented is ſaid to ſtand *indicted* of the crime, and bound to make anſwer thereto, either by confeſſing or traverſing the indictment.

BILLARD, in *Ichthyology*, an Engliſh name for the young of the coal-fiſh, or rowling pollack, up to a certain ſize, as the cod to a certain ſize is called a *codling*. Willughby.

BILLES, in *Traffic*, a name given firſt by the French, and afterwards by other nations, to the maſſes of raw ſteel, or ſuch as has been tempered for ſale, and is ready to be wrought into tools, &c. This in working loſes its temper, but it recovers it again by plunging it into cold water.

BILLET, in *Heraldry*, a bearing, in form of a long ſquare. See *Tab. Herald. fig.* 9.

Billets are ſaid to be couched, or inverted, when their longeſt ſide is parallel to the top of the ſhield, and the ſhorteſt perpendicular.

They are ſuppoſed to repreſent pieces of cloth of gold or ſilver, longer than broad, placed at a diſtance by way of ornament, on cloaths, and afterwards tranſlated to their coat-armour; though Guillim takes the *billet* to repreſent a letter ſealed up.

A coat is ſaid to be *billetted*, when it is charged with *billets*; thus, he bears *argent-billette* a croſs engrailed gules by the name of *Heath*. Bloom ſays, the number of the *billets* muſt be expreſſed when they are not above ten.

BILLET, *Billette*, in the *French Cuſtoms*, a little ſign in form of a caſk, hung up at places where toll is to be paid, to advertiſe paſſengers and carriages, that before they advance farther, the dues are to be paid to the king, or the lord who is charged with the care of repairing the highways.

BILLETS for fuel, are to be three feet long, and the band twenty-four inches round.

BILLETING *of ſoldiers*, is the lodging or quartering them in the houſes of the inhabitants of a place.

BILLETINS. See BROTHERS *of Charity*.

BILLIARDS, an ingenious kind of game played with two ſmall ivory balls, on an oblong table, covered with green cloth, and placed exactly level, which balls are driven by ſticks, made on purpoſe, alternately againſt each other, with a view to puſh the paſſive ball into hazards, or holes, on the edges and corners, according to certain laws, or conditions of the game.

The word comes from the French *billard*, of *bille*, the ball made uſe of; and that from the Latin *pila*, a *ball*.

BILLON, BILLIO, in *Coinage*, a kind of baſe metal, either of gold or ſilver, in whoſe mixture copper predominates. The word is French, formed according to Menage, from the Latin *bulla*, or *bullo*, *bullion*.—We do not find it is naturalized among us; but the neceſſity we are frequently under of uſing it in the courſe of this work, required its being explained.

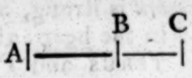
According to M. Boutteroue, *billon of gold* is any gold beneath ſtandard, or twenty-one carats; and *billon of ſilver*, all below ten penny-weights. But, according to others, and amongſt the reſt, M. Boizard, gold and ſilver beneath the ſtandard, as far as twelve carats, and ſix penny-weights, are properly baſe gold and ſilver, and all under thoſe, *billon of gold*, and *billon of ſilver*, in regard copper is the prevailing metal.

BILOCULAR, in *Botany*, a term applied to a CAPSULE having two cells.

BILUR, in *Natural Hiſtory*, a name given by many of the Arabian writers to a gem, which, though they often mention, yet they have no where given us a deſcription of. Some have imagined it the *onyx*, and others the *beryl*; but it appears more probably to have been a ſpecies of cryſtal; probably the pebble-cryſtal of the Eaſt Indies, which is conſiderably finer than the common ſprig-cryſtal,

tal, and is often ſold under the name of the white ſaphire; though conſiderably inferior, both in luſtre and hardneſs, to the true white ſaphire.

BIMEDIAL, in *Mathematics.* When two medial lines, as AB and BC, commenſurable only in power, and containing a rational rectangle, are compounded; the whole AC ſhall be irrational, with reſpect to either of the two, and is called a *firſt bimedial* line. Eucl. lib. x. prop. 38.



BINACLE. See BITTACLE.

BINARY *number*, that compoſed of two units. See NUMBER.

BINARY *arithmetic*, a method of computation, firſt propoſed by M. Leibnitz; wherein, in lieu of the ten figures in the common arithmetic, and the progreſſion from 10 to 10, he has only two figures, and uſes the ſimple progreſſion from two to two.

Joſ. Pelican of Prague has more largely explained the principles and practice of the *binary* arithmetic, in a book entitled, Arithmeticus perfectus, qui tria numerare neſcit. 1712.

All his characters uſed in this arithmetic are 0 and 1; and the cypher, here, multiplies every thing by 2, as in the common arithmetic by 10. Thus, 1 is one; 10, two; 11, three; 100, four; 101, five; 110, ſix; 111, ſeven; 1000, eight; 1001, nine; 1010, ten, &c. which is founded on the ſame principles with the common arithmetic.

Hence immediately appears the reaſon of the celebrated property of the duplicate geometrical proportion in whole numbers; viz. that one number of each degree being had, we may thence compoſe all the other whole numbers above the double of the higheſt degree. It being here, v. gr. as if one ſhould ſay, 111 is the ſum of 4, 2, and 1, which property may ſerve eſſayers to weigh all kinds of maſſes with a little weight; and may be uſed in coins, to give ſeveral values with ſmall pieces. This method of expreſſing numbers once eſtabliſhed, all the operations will be eaſy: in multiplication particularly, there will be no need for a table, or getting any thing by heart.

100	4
10	2
1	1
111	7

The author, however, does not recommend this method for common uſe, becauſe of the great number of figures required to expreſs a number; adding, that if the common progreſſion were from 12 to 12, or from 16 to 16, it would be ſtill more expeditious: but its uſe is in diſcovering the properties of numbers, in conſtructing tables, &c.

What makes the *binary* arithmetic the more remarkable is, that it appears to have been the ſame with that uſed 4000 years ago among the Chineſe, and left in *ænigma* by Fohi, the founder of their empire, as well as of their ſciences.

M. Lagni has propoſed a new ſyſtem of logarithms, on the plan of the *binary* arithmetic; which he finds ſhorter, more eaſy and natural, than the common ones.

BINARY *meaſure*, in *Muſic*, is that which is beaten equally; or where the time of riſing is equal to that of falling. See TIME and MEASURE.

BINATED *leaf*, in *Botany*, a digitate leaf, conſiſting of two *foliola*.

BIND-*weed*. See CONVOLVULUS, and BRYONY.

BIND-*weed, rough*. See SMILAX.

BIND-*weed, ſea*. See SOLDANEL.

BINDER-*ooze*, the weakeſt kind of *tan-ooze*. See TANNING.

BINDING *joiſts*, in *Architecture*, are thoſe joiſts in a floor, into which the trimmers of ſtair-caſes, or well-holes of the ſtairs, and chimney-ways, are framed: they ought to be ſtronger than common joiſts.

BINDING, in the *Art of Defence*, a method of ſecuring or croſſing the adverſary's ſword with a preſſure, accompanied with a ſpring from the wriſt. See BEATING.

Unleſs a man, by ſome kind of croſs, ſecure, as it were, or render his adverſary's ſword incapable to offend him during the time of his performing a leſſon upon him, it is impoſſible for him to be certain but that he may receive from his adverſary, either a fortuitious *contretemps*, or an exchanged thruſt, before the recovery of his body, or going off after a thruſt.

The great objection made by ſome people, particularly thoſe time-catchers, againſt the frequent uſe of *binding*, is, that when a man, in performing it, cleaves too much to his adverſary's ſword, he is liable to his adverſary's ſlipping of him, and conſequently of receiving either a plain thruſt, or one from a feint.

BINDING is a term in *Falconry*, which implies tiring, or when a hawk ſeizes.

BINDING *books*. See BOOK-*binding*.

BINN, *binna*, a ſort of cheſt or cupboard, wherein to lock up bread, meat, or other proviſions.

The word is alſo uſed for a place boarded up to put corn in.

BINN, or BIN. The peaſe and oatmeal, uſed at ſea, are apt to ſpoil in caſks. Dr. Hales propoſes to prevent this, by putting them into large *binns*, with falſe bottoms of hair clothes laid on bars, whereby freſh air may be blown upwards through them, at proper times, with ſmall VENTILATORS.

BINOCLE, or BINOCULAR *teleſcope*, from *binus, double*, and *oculus, eye*, that to which both the eyes may be applied, and conſequently the ſame object be obſerved at the ſame time by both.

It conſiſts of two tubes, with two ſets of glaſſes of the ſame power, and adjuſted to the ſame *axis*; and ſome have pretended that it repreſents objects much larger and clearer, than a ſingle, or MONOCULAR glaſs.

But this is only an illuſion, occaſioned by the ſtronger impreſſion, which two equal images alike illuminated make upon the eye. This method of conſtruction was invented by father Rheita, and brought into uſe by father Cherubin of Orleans. There are alſo microſcopes of the ſame kind, but very ſeldom uſed.

BINOMINAL, or BINOMIAL, from *bis, twice*, and *nomen, name*, in *Algebra*, a root conſiſting of two parts, or members, connected by the ſign +, or −.

Thus $a+b$ and $5-3$ are *binomials*, conſiſting of the ſums and difference of thoſe quantities; though the latter is uſually called RESIDUAL.

The powers of a *binomial* are found by a continual multiplication of it by itſelf, as often as unit is contained in the index of the power required. Thoſe of a *reſidual*, $a-b$, are obtained in the ſame manner, only with this difference in the reſult, that the terms in which the exponent of b is an odd number, will be negative.

If a ROOT have three parts, as $a+b+c$, it is called a TRINOMIAL; if more, a MULTINOMIAL.

BINOMIAL, *impoſſible*, in *Algebra*, is uſed for a *binomial*, one of the terms of which is an impoſſible quantity. Thus, $a+\sqrt{-bb}$, is an *impoſſible binomial*.

BINOMIAL *ſurd* is uſed for a *binomial*, the terms of which are ſurds; as $\sqrt{a}+\sqrt{b}$, or a^m+b^n, if m and n be fractions. The term *binomial ſurd*, is alſo applied to any quantity having a rational part and a ſurd part, as $25+\sqrt{968}$.

For the extraction of roots of *binomial ſurds*, ſee Newton's Arithmetica Univerſalis, and Mac Laurin's Algebra, p. 114—130.

BINOMIAL *curve* is uſed for a curve, the ordinate of which is expreſſed by a *binomial*. Thus if the ordinate of a curve be of this form $\overset{\theta}{x}+\overline{e+fx^{4}}^{\,\lambda}$, the curve is called a *binomial curve*. Stirling, Method. differ. p. 58.

BINOMIAL *theorem* is often uſed to ſignify Sir Iſaac Newton's theorem for raiſing a *binomial* to any power, or for extracting any ROOT of a *binomial*.

This *theorem* may be inveſtigated and explained in the following manner: whatever power of $a\mp b$ be required, it is obvious, from a continued multiplication of this quantity into itſelf, that the index of a in the firſt term is equal to the index of the power required; and that the indices of a decreaſe by the ſame difference, viz. unit, ſo as to become 0 in the laſt term; the quantity being $a^{0}=1$. Thoſe of b increaſe; in the firſt term it has 0 for its index, in the ſecond 1, &c. and in the laſt term its index is the ſame with that of a in the firſt; and the ſum of the indices of both quantities in every term is the ſame, or equal to the index of the power required. The coefficient for any term is eaſily found; that of the firſt term being unit, by multiplying the coefficient of the preceding term by the index of a in the ſame term, and dividing the product by the index of b in the given term, and continuing the operation, till the number of coefficients after the firſt be equal to the number of units in the index of the power required. Whence it appears that the coefficients increaſe, till the indices of the two quantities are equal, in a power denominated by an even number; and in a power denominated by an odd number thoſe of the two middle terms are the ſame; and then the remaining coefficients decreaſe in the ſame order. Thus, if $\overline{a\mp b}$ is to be raiſed to a power denoted by m, $\overline{a\mp b}|^{m}$ will be equal to $a^{m}\mp ma^{m-1}b+m\times\frac{m-1}{2}\times a^{m-2}b^{2}\mp m\times\frac{m-1}{2}\times\frac{m-2}{3}\times a^{m-3}b^{3}+m\times\frac{m-1}{2}\times\frac{m-2}{3}\times\frac{m-3}{4}\times a^{m-4}b^{4}$, &c. The ſame *theorem* may be eaſily applied to the *evolution* of powers, or the *extraction* of any root; the index in this caſe being a fraction whoſe denominator is equal to the index of the root required. E. gr. $\sqrt{a\mp b}=\overline{a\mp b}|^{\frac{1}{2}}=a^{\frac{1}{2}}\mp\frac{1}{2}\times a^{1-\frac{1}{2}}b+\frac{1}{2}\times\frac{\frac{1}{2}-1}{2}\times a^{\frac{1}{2}-2}b^{2}\mp\frac{1}{2}\times\frac{\frac{1}{2}-1}{2}\times\frac{\frac{1}{2}-2}{3}\times a^{\frac{1}{2}-3}b^{3}$, &c. $=a^{\frac{1}{2}}\mp\frac{1}{2}\times a^{-\frac{1}{2}}b+\frac{1}{2}\times-\frac{1}{4}\times$

$a^{-\frac{3}{2}}b^2 \mp \frac{1}{2}\times -\frac{1}{4}\times -\frac{1}{2}\times a^{-\frac{5}{2}}b^3$, &c. $= a^{\frac{1}{2}} \mp \frac{1}{2}a^{-\frac{1}{2}}b - \frac{1}{8}\times a^{-\frac{3}{2}}b^2 \mp \frac{1}{16}\times a^{-\frac{5}{2}}b^3$, &c. $= a^{\frac{1}{2}} \mp \frac{b}{2a^{\frac{1}{2}}} - \frac{b^2}{8a^{\frac{3}{2}}} \mp \frac{b^3}{16a^{\frac{5}{2}}}$, &c. See ROOT, REVERSION, SERIES, &c.

BINOMIUS, from *bis*, and *nomen*, *name*, in *Middle Age Writers*, denotes a perſon with two names.

Moſt Chriſtians anciently were *binomii*, as having had other names in their heathen ſtate, which they changed at their converſion. Beſides, it was an ancient cuſtom for parents to give names to their children immediately after they were born, and ſometimes other different ones afterwards at their baptiſm; one of which frequently became a *cognomen*, or ſurname. In reality, it was a conſtant practice to aſſume a new name at baptiſm, as the religious ſtill do in the Romiſh church, on their reception into the monaſtic ſtate; or the Jewiſh proſelytes at their circumciſion.

BIOCOLYTÆ, in the *Byzantine Empire*, an order of officers appointed to prevent the violences frequently committed by the ſoldiers.

The word is compounded of βια, *vis*, *violence*, and κωλυω, *I binder*; and ſhould rather be written *biacolytæ*.

The *biocolytæ* appear to have been much the ſame with the French archers of the Marſhalſea. They were ſuppreſſed by the emperor Juſtinian.

BIOGRAPHER, an author who writes the hiſtory, or life, of one or more perſons.—Such were Plutarch, Corn. Nepos, &c.

The word is formed from the Greek βιος, *life*; and γραφω, *ſcribo*, *I deſcribe*.

BIOGRAPHY, the art of deſcribing or writing lives.

Biography is a branch or ſpecies of hiſtory more entertaining, as well as more uſeful in many reſpects, than general hiſtory, as it repreſents great men more diſtinctly, unincumbered with a croud of other actors, and, deſcending into the detail of a man's actions and characters, gives more light into human nature, as well as excites us more to imitation. See an excellent paper on *biography* in the Idler, and in the Annual Regiſter, vol. i. p. 436. an. 1759.

BIOLYCHNIUM, a ſubſtantial fire, flame, or HEAT, which ſome phyſicians ſuppoſe actually lodged, or inherent in the heart, and remaining there as long as life laſts.

The word *biolychnium* is compounded of the Greek βιος, *life*, and λυχνος, *light*.

Some will have it to have been the human ſoul, others the animal ſpirits, and others the Deity, that did the office of a *biolychnium*, and was the ſpring of all the actions and motions of the body. See BLOOD, &c.

Caſp. Hoffman and Conringius have written treatiſes expreſs on the ancient doctrine of the lamp of light, or innate heat.

BIOLYCHNIUM is alſo a denomination of a peculiar kind of vital balſam, prepared from human blood; the proceſs of which is deſcribed by Beguinus. J. Ern. Burggravius has a treatiſe expreſs on it.

BIOTA, in *Zoology*, a name introduced by Dr. Hill for the POLYPE.

It is of a cylindric figure, but variable; the *tentacula* are arranged in a ſingle ſeries round the aperture of the mouth, at the extremity of the body. There are ſeveral ſpecies of this animal.

Linnæus calls this creature *hydra*, no doubt, from the reproduction or repullulation of the parts, when cut off; and this name, *biota*, is likewiſe given it on the ſame account, being derived from βιος, *life*.

BIOTHANATI, from βια, *violence*, and ϑανατος, *death*, in ſome *Medicinal Writers*, denotes thoſe who die a violent death.

The word is alſo written, and with more propriety, *biathanati*; ſometimes *biæothanti*.

In a more particular ſenſe, it denotes thoſe who kill themſelves, more properly called *autothanati*. See MURDER. In this ſenſe it is, that the word is uſed both by Greek and Latin writers. By the ancient diſcipline of the church, they were puniſhed by denying them burial, and refuſing all commemoration of them in the prayers and offices of the church.

BIOTHANATI, ſuppoſed by ſome to be derived from βιος, *life*, and ϑανατος, *death*, and alluding to the belief of a future life after death, was alſo a name of reproach given by the heathens to the primitive Chriſtians, for their conſtancy, and forwardneſs to lay down their lives in martyrdom.

BIOTHANATOS is alſo uſed in ſome writers of the barbarous age for wicked, damnable, or accurſed. Du-Cange.

BIOUAC, BIVOUAC, or BIOVAC, in the *Military Art*, a nightly guard performed by the whole army, when there is an apprehenſion of danger from the enemy.

The word is formed, by corruption, from the German *weywacht*, a *double watch* or *guard*.

BIPARTIENT, in *Arithmetic*, is a number that divides another into two equal parts without a remainder. Thus 2 is a *bipartient* to 4, &c.

BIPARTITE *leaf*, in *Botany*, ſignifies a leaf divided into two ſegments.

BIPARTITION ſignifies ſuch dividing.

BIPENNIS, in *Roman Antiquity*, a two-edged ax, uſed anciently by the Amazons in fight; as alſo by the ſeamen, to cut aſunder the ropes and cordage of the enemy's veſſels. The *bipennis* was a weapon chiefly of the oriental nations, made like a double ax, or two axes, joined back to back, with a ſhort handle. Some compare it to the figure of a pen, and ſuppoſe it hence to have acquired the name *bipennis*; the tube or barrel of the pen repreſenting the handle, and the point or nib the head. Modern writers uſually compare it to our HALBARD, or *partizan*; from which it differed in that it had no point, and that its ſhaft or handle was much ſhorter.

BIQUADRATE, or BIQUADRATIC, is the next POWER above the cube, or the ſquare multiplied by itſelf.

BIQUADRATIC *equation*, in *Algebra*, an equation raiſed to the fourth power; or where the unknown quantity of one of the terms has four dimenſions: thus $x^4 + ax^3 + bx^2 + cx + d = 0$ is a *biquadratic* equation. See EQUATION.

BIQUADRATIC *parabola*, in *Geometry*, a curve-line of the third order, having two infinite legs tending the ſame way. See PARABOLA.

BIQUADRATIC *power of any number*, is the fourth power, or ſquared ſquare of that number: thus 16 is the *biquadratic* power of 2; for 2 × 2 = 4, and 4 × 4 = 16.

BIQUADRATIC *root of any number*, is the ſquare root of the ſquare root of that number: thus the *biquadratic* root of 81 is 3; for the ſquare root of 81 is 9, and the ſquare root of 9 is 3.

BIQUALAR, in the *Cuſtoms of the Algerines*, a cook of the divan.

The janizaries, whom the Algerines call *oldachis*, after ſerving a certain term as common ſoldiers, are preferred to be *biqualars*, or cooks of the divan, which is the firſt ſtep towards arriving at higher preferment. *Biqualars* have the care of furniſhing the officers and commanders of the Algerine ſoldiery with meat and drink in the camp, in garriſon, &c. From *biqualars* they are made *odobachis*; that is, corporals of companies, or commanders of ſquadrons.

BIQUINTILE, an ASPECT of the planets, when they are 144 degrees diſtant from each other. It is thus called, becauſe they are diſtant from one another by *twice* the *fifth* part of 360 degrees.

BIRABETANE, in the *Botanical Writings of the Ancients*, a name given to *verbena*, or vervain, and to other herbs uſed in ſacrifices. It is only the word *hierobotane*, as altered by the Æolic manner of writing and ſpeaking it. *Hierobotane* is the common Greek name of vervain, and other ſacrificial herbs, and it is probable that the Latin name *verbena* came from the Æolic manner of ſpeaking this word. All thoſe herbs, which were laid upon the altars on ſolemn occaſions, ſuch as making of peace, and other ſolemn contracts, and were to be taken up by the contracting parties as part of the ceremony, were called by the Greeks *hierobotanæ*, that is, *ſacred plants*, and *verbenæ*; but as the plant we now particularly know by the name *verbena* was more frequent in uſe than any other on this occaſion, it was afterwards diſtinguiſhed by that name.

BIRAO, in *Botany*, the name given by the inhabitants of the Philippine iſlands to a plant more commonly known among botanical writers by the name TUGUS, and ſuppoſed by Camelli, who carefully obſerved it on the ſpot, to be the true AMOMUM of the ancient Greeks.

BIRCH-*tree*, *Betula*, in *Botany*, a genus of trees of the *monoecia tetrandria* claſs; the characters of which are theſe: it hath male and female flowers, at ſeparate diſtances on the ſame tree; the male flowers collected in a cylindrical catkin. The flower is compoſed of three equal florets, fixed to the empalement by a ſingle ſcale, having four ſmall ſtamina. The female flowers grow in a catkin, in the ſame manner as the male, which are heart-ſhaped. They have no viſible petals, but a ſhort oval germen. It hath no *pericarpium*, but the ſeeds are included in the ſcales of the catkin, which are oval and winged. There are four ſpecies.

The firſt is the common *birch*-tree, which is ſo well known as to need no deſcription. This is not much eſteemed for its wood, but however may be cultivated to advantage upon barren land, where better trees will not thrive; for there is no ground ſo bad but this tree will thrive in it; it will grow in moiſt ſpringy land, or in dry gravel or ſand, where there is little ſurface. So that upon ground which produced nothing but moſs, theſe trees have ſucceeded ſo well, as to be fit to cut in ten years after planting, when they have been ſold for near 10*l.* an acre ſtanding, and the after-produce has been conſiderably increaſed. Many woods near London, which were chiefly ſtocked with theſe trees, having been of late years grubbed up, the value of theſe plantations has advanced in proportion. Perſons therefore who are poſſeſſed of poor land, cannot employ it better than by planting it with theſe trees, eſpecially as the expence of doing it is not great.

The beſt method of cultivating this tree, is to procure young plants from the woods, where they grow naturally; but where no young plants are near, they may be raiſed from ſeeds, which ſhould be carefully gathered in autumn, as ſoon as the ſcales under which they are lodged begin to ripen, otherwiſe they will ſoon fall out and be loſt; and being ſmall, ſhould not be buried deep in the ground. Autumn is the beſt ſeaſon for ſowing them; and in a ſhady ſituation they will thrive better than when expoſed to the full ſun.

The ſeeds of *birch* are ſo diſpoſed for germination, that they will even grow on the body of the mother-tree when falling, and being incaſed on it, adhere ſo ſtrongly, as never to ſeparate from it; but increaſing yearly, form thoſe crouded buſhes, like birds neſts, often ſeen on *birch* trees.

If the plants take kindly to the ground, they will be fit to cut in about two years; after which they may be cut every ſeventh or eighth year, when deſigned for the broom-makers only; but when they are intended for hoops, they ſhould not be cut oftener than every twelfth year.

Broom-makers are conſtant cuſtomers for *birch*, in all places within twenty miles of London, or where it is near water carriage; in other parts the hoop-benders are the purchaſers. But the larger trees are often bought by the turners; and the wood is uſed for making ox-yokes, and other inſtruments of huſbandry. In ſome of the northern parts of Europe, the wood of this tree is greatly uſed for making carriages and wheels, being hard, and of long duration. In France it is generally uſed for making wooden ſhoes, and it is good fuel. In ſome places theſe trees are tapped in the ſpring, and the ſap drawn to make *birch*-wine, which has been recommended for the ſtone and gravel, as is alſo the ſap unfermented. In Sweden the houſes are covered with it, where it laſts many years. It frequently happens that the wood is entirely rotten, while the bark is perfectly ſound and good.

The piercing and bleeding of *birch* is performed thus: about the beginning of March, when the buds begin to be proud and turgid, and before they expand into leaves, with a chiſſel and a mallet cut a ſlit almoſt as deep as the pith, under ſome branch of a well-ſpreading *birch*; cut it oblique, and not long-ways, as a ſurgeon does a vein; and inſert a ſmall ſtone or chip, to keep the lips of the wound a little open; laſtly, to this orifice faſten a bottle, or other convenient veſſel, appendant, into which will extil a limpid and clear water, retaining an obſcure ſmack both of the taſte and odour of the tree. The wonder is, that, in the ſpace of twelve or fourteen days, as much juice will be gathered, as will outweigh the whole tree, body and roots. Phil. Tranſ. N° 43, p. 854. N° 44, p. 880. N° 46, p. 917 and 963.

The liquor or juice, thus procured, is uſed, in ſome northern countries, as a preſervative againſt the ſtone. Van Helmont extols a drink prepared with this juice, daucus-ſeeds, and brook-lime. Mr. Boyle tells us, he has ſeen extraordinary medicinal effects of the juice itſelf, even when the other remedies failed; ſo that he uſually provided a quantity of it every ſpring. He ſays, it may eaſily be preſerved, by pouring a little oil on the top of it, or by diſtillation; but that the beſt way is, to impregnate it with the fumes of ſulphur. Phil. Works abr. vol. i. p. 51. and vol. iii. p. 338.

The juice is uſed both to make wine of, and for brewing; being here employed in lieu of water, a barrel of malt will afford as much, and as good ale, as four with common water. Phil. Tranſ. N° 46, p. 963.

A great difference is found between the efficacy of that liquor which diſtils from the bold, or parts of the tree nearer to the root, and that which weeps out from the more ſublime branches; the former being more crude and watery, the latter purer, and more refined. Evel. Sylv. cap. 16. § 3. p. 71.

Birch-*tree of America*. See Mastic-*tree*.

Birch-*bark* being bituminous, and conſequently warm and emollient, is uſed in fumigations to correct a diſtempered air.

The inner ſilken bark was anciently uſed for writing-tables, before the invention of paper; though Ray rather aſſigns the office of paper to the cuticle, or outer ſkin, which peels off yearly. And with the outward, thicker, and coarſer part are houſes in Ruſſia, Poland, and other northern tracts, covered, inſtead of ſlates and tyle. Hiſt. Plant.

The Indians make pinnaces with white cedar; which they cover with large flakes of *birch*-bark, ſewing them with thread of ſpruſe-roots, and pitching them; as the ancient Britons did with the willow. Pliny ſpeaks of a bitumen actually procured from the *birch*-tree. Hiſt. Nat. lib. xvi. c. 18.

Birch, *fungus of*, an excreſcence growing on its trunk: it is aſtringent, and good againſt hæmorrhages; when boiled, beaten, and dried in an oven, it makes excellent ſpunk, or touchwood.

Birch-*leaves* are of uſe in the dropſy, itch, &c. either internally or externally applied.

Birch-*twigs* ſerve to make rods and brooms; ſmeered with bird-lime they are uſed by fowlers, to ſay nothing of the ancient faſces carried by lictors.

Birch-*wine* is made by fermenting the vernal juice: formerly it was in great repute againſt all nephritic diſorders; but is left out in the modern London practice.

The preparation of *birch*-wine is well and amply deſcribed in a book, intituled, Vinetum Britannicum. Phil. Tranſ. N° 123. p. 574.

BIRD, *Avis*, in *Natural Hiſtory*. The characters of this claſs of animals are, that they have a body covered with feathers, two legs, two wings, and a hard or bony bill; and that the females are oviparous.

Linnæus, from the conſideration of the different ſhapes and ſtructure of their beaks, has diſtributed *birds*, which form the ſecond claſs of animals, into ſix orders, viz. *accipitres*, *picæ*, *anſeres*, *grallæ*, *gallinæ*, and *paſſeres*, comprehending 921 known ſpecies. Syſtema Nat. ed. 13. tom. i.

The hiſtory and deſcription of *birds* make a particular branch of ſcience called *ornithology*.

Birds are variouſly divided and denominated by naturaliſts from the places of their abode, their food and manner of living, make of their bills, wings, feet, &c.

Birds are uſually divided into *terreſtrial* and *aquatic*.

Birds, *terreſtrial*, comprehending the *rapacious*, *pies*, the *gallinaceous*, the *columbine*, and the *paſſerine*, are ſubdivided into thoſe which have *crooked beaks* and *talons*; and thoſe whoſe beaks and claws are *ſtraiter*.

Of *birds* with *crooked beaks* and *talons*, ſome are carnivorous and rapacious, called *birds of prey*; others are frugivorous, called by the general name of *parrots*.

Of *birds of prey*, ſome prey in the day-time, and are called *diurnal*; others in the night, and are called *nocturnal birds*. *Diurnal birds of prey* are either of a *greater* or a *leſſer* ſize.—The *greater* are either of a more bold and generous nature, as the eagle-kind, or of a more cowardly and ſluggiſh, as the vulture.

Concerning the carnivorous or rapacious *birds*, it is obſerved, 1. That though Ariſtotle ſays they fly ſolitary, yet that holds not in all; ſeeing that vultures have been ſeen to fly in troops fifty or ſixty together.

2. That the females of the ravenous *birds* are bigger, ſtronger, and of greater courage, than the males; nature ſeeming to have been ſo provident, as to furniſh theſe females with ſuch advantages, upon the account that they muſt provide food not only for themſelves, but alſo for their young ones. Phil. Tranſ. N° 120. N° 483.

The *leſſer* diurnal *birds* of prey are either of a generous and docible, or of a cowardly, ſluggiſh, and untractable nature. The *generous* and *docible* are the hawk-kind, which are wont to be reclaimed and manned for fowling. Theſe by the falconers are diſtinguiſhed into *long-winged*, as the *falcon*, *lanner*, *ſacre*, *gerfalcon*, *keſtril*, &c. whoſe wings reach almoſt as far as the end of their train; and *ſhort-winged*, as the *goſs-hawk* and *ſparrow-hawk*, whoſe wings, when cloſed, fall much ſhort of the end of their trains.

The *cowardly* and *ſluggiſh* are neglected by our falconers, and ſo live at large.—Of theſe alſo there is a *greater* ſort, as the *buzzard-kind*; to which may be added, the *ring-tail* and *kite*; and a *leſſer*, as the *butcher-kind*, or *ſhrike*, about the bigneſs of a *blackbird*.

Of *birds* of prey with crooked beaks and talons, others are *nocturnal*, as the *owl-kind*, which prey by night; and theſe are either horned or eared, as the eagle-owl, horn-owl, &c. or without horns or ears, as the brown owl, white owl, grey owl, howlet, fern-owl, or goat-ſucker, &c.

Frugivorous land-*birds*, with crooked beaks and talons, are diſtinguiſhed into three ſorts, according to their bigneſs; the *greateſt* ſize being called *maccaws*, and *cockatoons*; the *middle-ſized*, and moſt common, *parrots*, and *poppinjays*; and the *leaſt* ſort, *parrakeets*: theſe all make uſe of their beak in climbing, and move the upper jaw.

Land-*birds*, which have their bills and claws more ſtrait, are diſtinguiſhed into three ſizes; the *greateſt* kind are; ſuch as by reaſon of the bulk of their bodies, and ſmallneſs of their wings, cannot fly at all; ſuch are the *oſtrich*, the *caſſowary*, and the *dodo*.

The *middle-ſized* are divided into ſuch as have either *large* and *long*, or *ſmaller* and *ſhorter bills*.

Of thoſe with large, thick, ſtrong, and long bills, ſome feed promiſcuouſly on fleſh, inſects, and fruits, as the *crow-kind*, which are wholly black; and the *pye-kind*, which are party-coloured, as the *magpye*, *jay*, &c. others feed on fiſh only, as the *king's-fiſher*; and others on inſects only, as the *wood-pecker*.

For thoſe which have a ſmaller and ſhorter bill, their fleſh is either white, as the poultry kind ; or blackiſh, as the *pigeon* and *thruſh-kind*.

The *leaſt-ſized* kind of *land-birds*, with ſtrait bills and claws, are called *ſmall birds*. Small *birds* are ſubdivided into thoſe with *ſlender bills*, as the *lark*, *ſwallow*, *martin*, &c. *thick and ſhort bills*, as the *bull-finch*, *houſe-ſparrow*, *linnet*, &c. thoſe with a hard protuberance on the upper chap or bill, as the *bunting*, *yellow hammer*, *reed-ſparrow*, &c.

Among *birds* which have ſtrait beaks and claws, Mr. Willughby obſerves, that the *caſſowary* (as well as the *pelican*) is without a tongue ; ſwallowing not only bits of iron, as the *oſtriches*, but alſo red-hot coals ; yet, not digeſting the iron, but voiding it whole, as the *oſtrich* alſo does.

Birds, *aquatic*, or *water-fowl*, comprehending the *cloven-footed*, the *fin-footed*, and *web-footed*, are diſtinguiſhed into ſuch as *walk* in the waters, and ſuch as *ſwim* in them.

Aquatics which *walk*, are all cloven-footed, and generally have long legs, and thoſe naked, or bare of feathers, a good way above the knee, that they may the more conveniently wade in waters.—Of theſe authors reckon two kinds ; a *greater* and a *leſſer*.—To the *greater* belong the *crane*, *jabiru*, &c.—The *leſſer* are either *piſcivorous*, as the *heron*, *ſpoon-bill*, *ſtork*, &c. or *mudſuckers*, and *inſectivorous*.

Of aquatic *birds*, ſome have *ſlender bills*, ſharp-pointed, as the greateſt *diver*, *gull*, *grey gull*, &c. others *toothed bills*, as the *gaſſander*, &c. others *broad bills*, as the *ſwan*, *hooper*, *gooſe*, *duck*, &c.

Of *inſectivorous* water-fowl, ſome have *very long* bills ; others *middle-ſized* ones, as the *ſea-pye*, and *red-ſhank* ; others *ſhort bills*, as the *lapwing* and *plover*.

Of thoſe with *long bills*, ſome have them crooked, as the *curlieu* and *wimbrel* ; and others ſtrait, as the *woodcock* and *godwit*.

Note, thoſe are reckoned ſhort bills, which exceed not an inch and a half ; middle-ſized bills, to two inches and an half ; and long bills above two inches and an half.

Of aquatics, which *ſwim* in the water, ſome are *fiſſipedes*, cloven-footed, as the *rail*, *plover*, &c. ſome are fin-footed, *pinnati*, as the *coot* and *grebe*, &c. but moſt are whole-footed, or web-footed, *palmipedes*.

Of theſe, ſome few have very long legs, as the *flammant*, the *avoſetta*, and *corrira* ; but the generality are ſhort-legged.

Of the *ſhort-legged*, *whole-footed aquatics*, ſome have but three toes on each foot, as the *penguin*, *razor-bill*, &c. but generally they have four toes on each foot, and theſe either all connected together by intervening membranes, as in the *pelican*, *ſoland-gooſe*, &c. or more uſually with the back-toe looſe.

This laſt kind are either *narrow-billed*, or *broad-billed*.—Thoſe with *narrow bills* have them either blunt or hooked at the tip, or ſharp-pointed and ſtraiter.

Of the former ſort ſome are ſerrate, as in the diver-kind ; and ſome not toothed, as in the *puffin*.

Of thoſe with ſharp-pointed and ſtraiter bills, ſome have long wings, as the *gull-kind*, and ſome ſhorter, as thoſe diving *birds* called *douckers*.

Thoſe with *broad bills* may be divided into the *gooſe-kind*, which are larger ; and the *duck-kind*, which are ſmaller ; and theſe latter into ſea-ducks, or river, and plaſh-ducks.

In flat-billed *birds*, as *ducks*, there are three pair of nerves, which come down between the eyes into the upper bill, whereby they are enabled to ſmell, and find out their food in the mire, water, and the like. The like has alſo been diſcovered in ſeveral round-billed *birds* ; but much ſmaller, and ſcarce diſcernible, except in the rook, where they are conſpicuous enough ; and it is remarkable that theſe, more than any other round-billed *birds*, ſeem to grope for their meat in cow-dung and the like. In the lower bill there are alſo nerves, which have much the ſame ſituation with thoſe in the flat-billed kind ; but very ſmall, and ſcarce diſcernible. Phil. Tranſ. N° 206. p. 990.

Moſt water-fowls have a ſhort tail ; and none of this kind have their feet diſpoſed like parrots and woodpeckers, which have two toes forward, and two backward ; whereas none of theſe have more than one back-toe, and ſome have none at all.

The ſtructure and œconomy of *birds* are, in many reſpects, different from thoſe of their fellow-biped man, and of their fellow-brutes the quadrupeds, having ſome parts which thoſe want, and being without others which they have, beſides great variations in the contrivance of parts which are common to both ; all wiſely adapted to their different conditions and manners of life.

Among the parts peculiar to *birds*, are firſt, the bill, which ſerves them both in lieu of lips and teeth ; wherewith the rapacious tear their meat, the granivorous crack their ſeeds, and ſeparating the pulp with the tongue, throw out the huſk. Drake's Anthrop. lib. i. cap. 14.

Secondly, a horny nictitating membrane, to draw over and cover their eyes, and ſave them from the annoyance of thorns and buſhes, much like that which frogs are furniſhed with, to ſecure their eyes from mud and dirt. See Derham's Phyſ. Theol. & Niewent. Rel. Philoſ. § 18.

To which may, thirdly, be added, feathers and wings for cloathing and flight.

The parts which phyſiologiſts have generally ſuppoſed not to be found in *birds* are, 1. Teeth and lips, as already mentioned. 2. Lacteal veſſels. But Mr. Hewſon obſerves, that the difficulty of diſcovering the lacteals of *birds* is owing to the tranſparency of the chyle which they contain, and the want of meſenteric glands. The lymphatic ſyſtem in *birds*, he ſays, may be divided, as it is in quadrupeds, into the branches, viz. the lacteals and lymphatics, and their trunk, or thoracic duct. The lacteals are the lymphatics of the inteſtines, and, like the other lymphatics, carry a tranſparent lymph ; and, inſtead of one thoracic duct, there are two, of which one goes to each jugular vein. The lymphatics in the necks of fowls were diſcovered by Mr. J. Hunter many years ago. We may infer from hence, that abſorption is not carried on even in *birds* by the common veins. See an account of the lymphatic ſyſtem in *birds* by Mr. Hewſon, Phil. Tranſ. vol. lviii. N° 34. 1768. 3. Kidneys, and a bladder of urine, which they can be without, as they have but little moiſture in their bodies, do but rarely drink, and this only to moiſten their food. 4. A *ſeptum tranſverſum*, the want of which is ſupplied by a peculiar diſpoſition of the lungs.

Laſtly, Pliny ſays they alſo want an *epiploon* ; but in two eagles, and other *birds* diſſected by the royal academiſts at Paris, there were membranes like *epiploons* found.

Some authors alſo ſpeak of ducts which paſs immediately from a ſort of kidneys to the extremity of the *rectum* of *birds*, whereby a white, liquid kind of excrement is diſcharged, being firſt mixed with the groſſer *fæces*. Gentzken's Phyſ. Hypoth. p. 2. cap. 5, &c.

Variations in the parts of *birds* from thoſe of men and quadrupeds, are, 1. In the ear, where the cavities and the drum are of a peculiar make. Phil. Tranſ. N° 199. The ears of *birds* differ much from thoſe of men or beaſts ; there is almoſt a direct paſſage from one ear to the other of *birds* ; ſo that prick but the ſmall membrane called the drum in either ear, and water poured in at the one ear will run out at the other. But this is not all : what is much more remarkable, they have no *cochlea* ; but, inſtead thereof, there is a ſmall twiſting paſſage that opens into a large cavity running betwixt two ſculls, and paſſes all round the head ; the upper ſcull is ſupported by many hundreds of ſmall thread-like pillars or fibres, which, as it is ſuppoſed, have another uſe alſo, to break the ſound from making any confuſed echo, and to make it one and diſtinct.

This paſſage, obſerved betwixt the two ſculls, is much larger in ſinging *birds* than in others that do not ſing ; ſo very remarkable, that any perſon that has but been ſhewn this, may eaſily judge by the head what *bird* is a ſinging *bird*, or has aptitude thereto, though he never ſaw the *bird* before, nor knew what *bird* it were. Phil. Tranſ. N° 206, p. 995.

2. In the diviſion of the *aorta*.

3. In the ſpinal marrow, which is divided into two in the middle of the back, with a ventricle between the two. Phil. Tranſ. N° 180, p. 374.

4. In the bones, which are all hollow and fiſtular, to make the body lighter and more buoyant. Niewent. Relig. Philoſ. cont. 22. § 12. p. 335, ſeq.

Both in the bones, and in the fleſhy parts, there are receptacles of air communicating with the lungs. Phil. Tranſ. vol. lxiv. N° 29.

5. In the heart, which has a fleſhy valve at the mouth of the *vena cava*. See Pitfield's Nat. Hiſt. of Anim.

6. In the lungs, which are ſtrongly conjoined to the back, for greater convenience of flight. Vater Phyſ. Exp. p. 806, &c.

7. In the ſtomach, of which *birds* have two or three, to ſupply the want of maſtication. See Grew's Comp. Anat. The digeſtion of *birds* is very ſtrong, eſpecially in *hens*, *ducks*, and *pigeons*, whoſe ſtomachs have been found to act even on glaſs bullets. Boyle's Phil. Works abr. tom. ii. p. 183.

8. In the legs and feet, which, in ſome ſpecies of *birds*, are made to hold or cling faſt by ; in others to wade in the mud without ſinking. Niewent. Relig. Phil. p. 341. The poſture and action of *birds* in ſtanding and walking, are ſhewn by Borelli to be very different from thoſe of man, though both be bipeds ; particularly as to contrivance, whereby *birds* are enabled to ſtand better on one foot. See Phil. Tranſ. N° 144, p. 63. N° 92, p. 6004.

9. In their tails, which are made to poiſe their bodies in flight. Ibid. ſect. 20. p. 342.

10. In the pectoral muſcles, which, in *birds*, are the ſtrongeſt of all, as ſerving for the motion of the wings, which, in long or ſwift flights, requires great ſtrength ;

whereas, in man, the crural muſcles are ſtrongeſt; ſo that, if he would fly, it muſt rather be by the action of his legs than his arms. Phil. Tranſ. N° 220.

Their whole ſtructure is admirably accommodated to flight, eſpecially that of the *pelican*, which, beſide all other *apparatus* for this purpoſe, has a quantity of air lodged in the *veſiculæ* of the ſkin, which it takes in at every inſpiration, and expels again at expiration, whereby its bulk is conſiderably enlarged, without any ſenſible increaſe of weight. Hiſt. Acad. Sc. an. 1693, p. 259, &c.

11. In the brain, which is different from that both of man and quadrupeds, being adapted rather to the exerciſe of the locomotive faculty, than for imagination and memory.

However, the ſagacity of *birds* in building, and placing their neſts out of the reach of enemies, and in avoiding noxious plants, is prodigious. It is ſaid they will not ſo much as touch or perch on ſuch plants, being warned of the danger by the ſmell or *effluvia* of the plant. Boyle's Phil. Works abr. tom. ii. p. 183, and p. 437.

12. In the bronchial ducts, which are extended to the very bottom of the cavity of the *abdomen*, that the air received into them, may the better fill and enlarge the *thorax*, whereby they are rendered much lighter, than if their bodies were ſolid, like other animals. Acad. des Sc. an. 1693. p. 259.

13. In the ovaries, which, in *birds*, are ſingle, and only furniſhed with ſingle tubes, whereby to convey the eggs to the *uterus*; the whole faſtened to their back. Acad. des Scienc. an. 1699, p. 36.

Many methods have been uſed by naturaliſts for preſerving dead *birds* from corruption, in their natural form and colour. Some have taken off the ſkin, with all the feathers upon it, from the body and thighs, leaving the legs and wings, and the whole neck with the bill, and filled it with ſome ſoft ſtuff, ſuch as hay, wool, or flax. Others have put them into veſſels full of ſpirit of wine, or ſtrong brandy; againſt which it has been objected that ſpirituous liquors change the colours of the feathers; but M. Reaumur concludes from many experiments, that this objection is groundleſs; and he has given ſeveral minute directions for preſerving and conveying them in this way. Others again, eſpecially in countries where ſpices are cheap, have embalmed dead *birds*: Reaumur obſerves, that powdered alum or lime will ſerve the ſame purpoſe. Another method, which has been ſometimes practiſed, is that of drying *birds* for preſervation in a heated oven. The ſame ingenious naturaliſt informs us, that quadrupeds, fiſhes, reptiles, and inſects, may be preſerved in the ſame manner with birds. Phil. Tranſ. vol. xlv. p. 304, &c. See farther on this ſubject, ibid. vol. lx. N° 16, and N° 26.

Birds, *feetleſs*, *apodes*, a fictitious denomination given by ſome of the ancients to the *birds* of paradiſe, from a miſtaken notion that they had no feet, and could not walk, but only fly.

Theſe were placed in contradiſtinction to the *oſtriches*, which could only walk, not fly.

Birds, *ſubterranean*, thoſe which reſide in caves and holes under ground; as ſome ſpecies of owls, batts, &c.

To this claſs may alſo be referred thoſe vaſt quantities of *ducks*, which break out of the caves adjoining to the Zirchnitzer ſea in time of thunder, in ſuch numbers as to cover the lake. Phil. Tranſ. N° 191, p. 420.

Birds, *ſinging*, are the *nightingale*, *blackbird*, *ſtarling*, *thruſh*, *linnet*, *lark*, *throſtle*, *Canary-bird*, *bullfinch*, *goldfinch*, &c. See ſome very curious experiments and obſervations on the ſinging of *birds*, Phil. Tranſ. vol. lxiii. part ii. N° 31. Their firſt ſound is called *chirp*, which is a ſingle ſound repeated at ſhort intervals; the next *call*, which is a repetition of one and the ſame note; and the third ſound is called *recording*, which a young *bird* continues to do for ten or eleven months, till he is able to execute every part of his ſong; and when he is perfect in his leſſon, he is ſaid to *ſing his ſong round*. Their notes are no more innate, than language in man; they all ſing in the ſame key. The honourable author, Daines Barrington, has there attempted to reduce their comparative merits to a ſcale; and to explain how they firſt came to have particular notes. See SONG *of Birds*.

Birds, *migratory*, the ſame with *birds* of PASSAGE, and MIGRATION. Phil. Tranſ. vol. lxii. N° 20.

Birds, *decoy*, thoſe trained up to call and allure others into the fowler's nets, ſnares, lime-twigs, or the like.

Birds, *meſſage*, *aves internunciæ*, thoſe employed to convey letters, or other diſpatches, either for the ſake of expedition or ſafety. See CARRIER-*pigeon*.

Bird, *mocking*, in Virginia, a *bird* which imitates the voices of men, and the notes of all other *birds*, by way of diſguiſe, and thus eludes and eſcapes the fowler. Trev. Dict. Univ. tom. iv. p. 264. See MOCK-*bird*.

We have one *mocking bird* in England, which is the *ſky*-LARK.

Bird, *humming*, the American *tomineius*, denominated from the noiſe it makes in flight. It is ſaid to be the ſmalleſt of the whole ſpecies of *birds*. See GUAINUMBI, and Phil. Tranſ. N° 200, p. 760.

Birds, *anomalous*. It is diſputed whether the BAT belong to the *bird* or quadruped kind. Later naturaliſts incline to the latter, and, notwithſtanding its wings, condemn it to be a mouſe.

The like difficulty has been raiſed with reſpect to the *barnacle*, *ſolan-gooſe*, or *macreuſe*. Some, notwithſtanding its feathers, maintain it to be a fiſh. What ſhall we then ſay of the *pinguin*, or *penguin*, an eaſtern *bird*, denominated from the iſland of that name, which walks erect like a man, has no feathers, nor flies, nor aſſociates with other *birds*; and which ſome will have to participate both of the human, the volatile, and the fiſhy kingdom. In reality, it is *animal bipes* and *implume*, and conſequently a man, on the terms of Plato's definition.

Macer, among the ancients, and Willughby and Ray among the moderns, have written expreſly on *birds*. This laſt author affirms, that the kinds of *birds* known and deſcribed, are about 500. Boyle has given pneumatical experiments on *birds in vacuo*. Phil. Tranſ. N° 100. p. 480, &c.

Preſcience, or knowledge of futurity, was ſuppoſed, among the ancients, a natural faculty of *birds*, owing, perhaps, to their nearer intercourſe with heaven, or their breathing a purer and more celeſtial air than other animals. Hence it was, that divination by *birds* obtained among the ancient Greeks and Romans, being performed by obſerving, and interpreting the flight, chirping, and feeding of divers birds. See AUGURY and AUSPICIUM.

Birds, with regard to augury and divination, were of divers kinds, viz.

Aves auſpicatæ, or *felices*, thoſe which naturally portended good: ſuch were the *dove*, *ſwan*, &c.

Aves inauſpicatæ, *diræ*, *ominoſæ*, thoſe which boded ſome evil or miſchief: ſuch were the *kite*, *raven*, *crow*, and *owl*, every where, except at Athens.

Admiſſiva, that which excites and encourages the conſulter to execute what he has in view.

Arciva or *arcula*, that which forbad a thing to be done; otherwiſe called *clivia*, *clamatoria*, and *prohibitoria*, *inebra*, and *inhiba*.

Incendiaria, that which gave omen of a fire, or other calamity; or which is ſeen carrying a fire-brand from the funeral-pile to a houſe.

Remora, that which ſtays, or delays an action.

Siniſtra, that on the left hand, denoted a happy or proſperous omen; and was alſo called *ſecunda*, *proſpera*.

Alites, thoſe which gave omens by their wings and flight.

Oſcines, thoſe by their ſinging or chirping.

Pulli, by their pecking.

Præpetes, thoſe which by their flight, or perching, gave happy omens.

Inferæ, or *inebræ*, thoſe which in like manner gave ill omens.

Bird, in *Falconry*, denotes a *hawk*, or FALCON.

Birds, *niais*, *aves nidulariæ*, thoſe taken while in the neſt.

Birds, *ramage*, *arborariæ aves*, thoſe only arrived at ſtrength ſufficient to fly from branch to branch.

Bird, *hagard*, that which has lived at liberty, and is thence more wild and untractable.

Bird *of the fiſt*, that which having been reclaimed, returns to, and perches on the hand, without the help of a lure.

Bird *of lure*, that which comes to the lure, and by that means to the hand.

Bird, *baſtard*, a *hawk*, for inſtance, bred of a *hawk* and a *lanier*. Or a *ſaker*, bred of a *ſaker* and a *lanier*.

Birds, *coward*, thoſe which only purſue their game for their own belly, and which are not to be reduced to juſt ſport. As *ravens*, *kites*, &c.

Birds, *ſtorm*. See PROCELLARIA.

Birds, in *Medicine*, are chiefly the *gooſe*, *duck*, *hen*, *peacock*, and *pigeon*; of which the fat, eggs, and dung, are in uſe. Sextus Placidus treats at large concerning remedies from *birds*.

Birds, conſidered as foods, are of a dry warm nature, as feeding chiefly on dry meats, and drinking little. They are ſuppoſed to abound much in ſalt and ſulphur; whence Kircher accounts for the bright colours of their feathers. Some have denied the exiſtence of any volatile ſalt in *birds*. Borrichius eſtabliſhes it.

The *peacock* has been called *avis medica*, or the *medicinal bird*, on account of its great efficacy in divers diſeaſes.

Birds, in *Huſbandry*, are to be guarded againſt as deſtructive. *Kites* and *hawks*, to chickens; *crows* and *pigeons*, to corn; *jays*, *ſparrows*, and other ſmall *birds*, to fruits, &c.

Writers in huſbandry preſcribe divers methods of ſcaring away, or deſtroying noxious *birds*. Some prevent *birds* from eating the ſeed when firſt ſown, by liming, and mixing it with ſoot.

Bird, in *Aſtronomy*, *avis Indica*. See Apus.

Bird *of Phœbus*, the *raven*, one of the ſouthern conſtellations. See Corvus.

Birds, in *Heraldry*, are figures frequently borne in arms.

Birds are eſteemed a more honourable bearing than fiſhes; and wild, ravenous *birds*, than tame ones. The terms *armed*, *cloſe*, *creſted*, *diſplayed*, *jeſſed*, *jowlopped*, *languid*, and *membered*, are applied to *birds*, which ſee.

Bird *of the wiſe*, among *Chemiſts*, is the philoſophical mercury; and, in general, ſublimations or ſubſtances ſpiritualized by the ſeparation of their terreſtrial part.

Bird, *golden*, the hermetic matter partly matured.

Bird, *green*, the philoſopher's ſtone, at the time when its green colour appears.

Bird-*call*, a little ſtick cleft at one end, in which is put a leaf of ſome plant, wherewith to counterfeit the cryer's call of ſeveral *birds*, and bring them to the net, or ſnare, or lime-twig, to be taken.

A laurel leaf fitted on the *bird-call*, counterfeits the voice of *lapwings*; a leek, that of *nightingales*, &c.

Birds, *Cyprian*, *aves Cypricæ*, or *aviculæ Cypriæ*, is a denomination given to a kind of odorous candles, made of the matter of troches, and burnt for the ſake of their fumes, called alſo, from their figure, *baculi*, or *ſticks*.

Bird *of Hermes*, *avis*, or *avicula Hermetica*. All chemiſts ſpeak much of that which flies in the night without wings.

Some will have the *avicula Hermetica* to be an univerſal ſalt prepared from dew.—It alſo denotes red-lead.

Bird *cherry*, in *Botany*. See Prunus.

Bird's *eye*, in *Botany*. See Pheasant's *eye*.

Bird's *foot*, *Ornithopus*, in *Botany*, a genus of the *diadelphia decandria* claſs. Its characters are theſe: the empalement of the flower is permanent, of one leaf, tubulous, and indented in five equal ſegments at the brim. The flower is of the butterfly kind, the ſtandard heart-ſhaped and entire, the wings oval, erect, and almoſt as large as the ſtandard; and the keel is ſmall and compreſſed. It has ten ſtamina, nine of which are joined, and one ſtanding ſeparate, terminated by ſingle ſummits. The germen is narrow, ſupporting a briſtly aſcending ſtyle, terminated by a punctured ſtigma. The germen becomes a taper incurved pod, having many joints connected together, which ſeparate when ripe, each containing one oblong ſeed. There are five ſpecies.

Bird, or *fowl-mead* graſs, a ſpecies of graſs, which has been lately cultivated with a particular attention. It is a fine, ſweet, ſilky graſs, with a durable verdure; throws out a great crop, and produces a large quantity of ſeed. One rood of ground yielded a hundred weight of ſeed, and a very large load of hay. It is moſt proper for upland meadow: the ſeed ſhould be left uncovered on the ground.

Bird's *neſt*, in *Botany*, a name uſed by ſome for the *daucus*, or carrot; by others for ophrys.

Bird's *neſt*, *purple*. See Orchis.

Birds-*neſts*, in *Cookery*, the neſts of a ſmall Indian ſwallow, very delicately taſted, and frequently mixed among ſoops.

On the ſea-coaſts of China, at certain ſeaſons of the year, there are ſeen vaſt numbers of theſe *birds*; they leave the inland country at their breeding time, and come to build in the rocks, and form their neſts out of a ſpumous matter, which they find on the ſhore, waſhed thither by the waves. They are of a hemiſpheric figure, and of the ſize of a gooſe's egg, and in ſubſtance much reſemble the *ichthyocolla*, or iſinglaſs. The Chineſe gather their neſts, and ſell them to all parts of the world; they diſſolve in broths, &c. and make a kind of jelly, of a very delicious flavour.

Bird's *pepper*. See Capsicum.

BIRDLIME, a viſcid ſubſtance, prepared various ways, and from various materials, for the catching of birds, mice, and other vermin.

The *birdlime*, ordinarily uſed among us, is made from holly-bark, boiled ten or twelve hours: when the green coat is ſeparated from the other, it is covered up a fortnight in a moiſt place, then pounded into a tough paſte, ſo that no fibres of the wood be left, and waſhed in a running ſtream till no motes appear, put up to ferment four or five days, ſkimmed as often as any thing ariſes, and laid up for uſe.—To uſe it, a third part of nut-oil, or any thin greaſe, is incorporated with it over the fire.

The miſletoe affords a juice, even ſuperior to that of the holly; and if a young ſhoot of the common elder be cut through, a ſtringy juice will draw out in threads, and follow the knife like *birdlime*, or the juice of holly. It ſeems in this tree to be lodged, not in the bark, but in certain veins juſt within the circle of the wood. The roots of all the hyacinths alſo afford a tough and ſtringy juice of the ſame kind, and ſo do the aſphodel, the Narciſſus, and the black bryony root, in a ſurpriſing quantity.

The *birdlime* brought from Damaſcus is ſuppoſed to be made of ſebeſtens, their kernels being frequently found in it; but this does not endure either froſt or wet.—That brought from Spain is of an ill ſmell; that of the Italians is made of the berries of miſleto heated, mixed with oil, as before; to make it bear the water, they add turpentine.—It is ſaid, the bark of our *viburnum*, or way-faring ſhrub, makes *birdlime* as good as the beſt.

Birdlime is a ſubſtance very apt to be congealed, and rendered unſerviceable by froſts; to prevent which, it is proper, at the cold ſeaſons, to incorporate ſome petroleum with it, before it is uſed. The method of uſing it is to make it hot, and to dip the ends of a bundle of rods in it; then to turn them about, and play them together till a ſufficient quantity is extended over them all. If ſtrings, or cords, are to be limed, they are to be dipped into the *birdlime*, while very hot. The cords may be put in cold, but the rods ſhould be warmed a little. Straws are to be limed, while the matter is very hot; a large bundle of them ſhould be put in at once, and worked about in it, till they are well beſmeared. When thus prepared, they ſhould be preſerved in a leather bag, till they are uſed.

When the twigs, or cords, are to be put in places ſubject to wet, the common *birdlime* is apt to have its force ſoon taken away. It is neceſſary, therefore, to have recourſe to a particular ſort, which, from its property of bearing water unhurt, is called *water birdlime*; and is prepared thus.

Take a pound of ſtrong and good *birdlime*, waſh it thoroughly in ſpring-water, till the hardneſs is entirely removed; and then beat it well, that the water may be ſeparated from it; then dry it well, and put it into an earthen pot; add to it, as much capon's greaſe as will make it run. Then add two ſpoonfuls of ſtrong vinegar, one ſpoonful of oil, and a ſmall quantity of Venice turpentine. Let the whole boil for ſome minutes over a moderate fire, ſtirring it all the time. Then take it off; and when there is occaſion to uſe it, warm it, and cover the ſticks well with it. This is the beſt ſort of *birdlime* for ſnipes, and other birds that love wet places.

M. Barrera, phyſician at Perpignon, has diſcovered an animal *birdlime*, prepared of the bolls of a ſort of caterpillars, by putrifying them in the earth, ſteeping them in water, and then pounding and mixing them with olive oil. Fontenel. Hiſt. Acad. Scienc. 1720, p. 12.

BIREMIS, from *bis*, *double*, and *remus*, *oar*, in *Antiquity*, a veſſel with one or more rows of oars, ranged, as ſome think, in two ſtages over each other; or a veſſel having two ranks or rows of oars placed over, and aſide of each other. But the particular fabric of theſe veſſels ſeems far from being a ſettled point among the learned.

The Roman *biremis* is the ſame with what the Greeks called δικροτα, and ſtands contradiſtinguiſhed from *triremis*, *quadriremis*, &c.

BIRETUM. See Birretum.

BIROTA, *Birotum*, from *bis* and *rota*, *wheel*, a kind of vehicle denominated from the two wheels whereon it moved.

The *birota*, by the conſtitution of Conſtantin, was drawn by three mules, and carried two hundred pound weight; by which it was diſtinguiſhed from the *rheda*, which carried a thouſand pounds, and was drawn by eight, and in winter by ten mules.

BIRRETUM, in *Writers of the Middle and Lower Ages*, a thin black cap, or cover for the head, made of linen fitted cloſe to the head, and pointed by a pyramid, anciently worn by prieſts, ſoldiers, doctors, &c. Du-Cange.

The word *birretum*, ſometimes written *birrettum* and *biretum*, is alſo applied to a cap or coif of a judge, or ſerjeant at law.

The *birretum* alſo denotes the cap worn by the novices in the Jeſuits order, formerly of a ſquare, now a round figure.

The *birret* was the ordinary cover of the head in France five hundred years ago. It took its denomination from *birrus* or *birrum*, the coat anciently uſed by eccleſiaſtics; with which the cap was then of a piece, and made part of it; ſo that the whole covered, not only the head, but the ſhoulders. Afterwards, when they began to retrench the lower part, ſtill retaining the upper, it was no longer called *birrus*, or *birrum*, but diminutively *birret*, or *birretum*.

BIRRUS, an ancient habit worn by the Chriſtians in Africa.

The word is alſo written *byrrus*, ſuppoſed to be formed from ϖυῤῥος, on account of its red colour.

Some will have the *birrus* an epiſcopal habit. Others extend it to all the clergy. Others, on juſter grounds, make it the common coat of all the Chriſtians in that quarter.

BIRTH, the natural excluſion of a perfect foetus from the womb by the *vagina*. See Delivery, &c.

BIRTH, *an immature*, is called an ABORTION.

BIRTH, *ſeven months*, *partus ſeptimeſtris*, that which happens on the hundred and eighth, or hundred and eighty-ſecond day after impregnation.

This phyſicians allow may not only be a living, but a vital *birth*; though it does not often prove long-lived. And the civil laws all own it as legitimate.

Hippocrates has written expreſly on the ſeven months birth, Περι ἑπταμηνȣ, in two books, the firſt of which, as now extant, is held ſpurious. The ſecond is commented on by Galen, Περι ἑπταμενων βρεφων.

A child born in the ſeventh month oftner lives than a child born in the eighth; perhaps becauſe the premature *birth* in the firſt caſe is owing to the ſtrength of the child, and in the ſecond to the weakneſs of the mother.

BIRTH, *eight months*, *partus octimeſtris*, ſeldom if ever produces a living, or lively child. An eight month's *birth* is always weak and ſickly, and ſcarce ever ſurvives the fortieth day.

BIRTHS, *præternatural*, are thoſe made by the way of the *anus*, navel, &c.

For the number of *births*, ſee MARRIAGE: under which the proportions of *births* to marriages, of *births* to burials, and of male-*births* to females, is computed.

BIRTH, *after*. See AFTER-*birth*.

BIRTH, or BIRTHING, among *Seamen*, denotes the due diſtance obſerved between ſhips lying at an anchor, or under ſail.—A convenient place a-board for a meſs to put their cheſts, ſleep, &c. is alſo called a *birth*.—There is uſually one of theſe in ſhips of war between every two guns.—And a proper place to moor a ſhip in is called by the ſame name, as is alſo the ſtation in which a ſhip rides at anchor.

BIRTH, *expoſition of*, among the *Ancients*, was where a new-born infant was expoſed or caſt away, and left to the mercy of the firſt-comer, who might either take and bring it up, or ſuffer it to periſh. See EXPOSING *of children*.

Ger. Nodt has a treatiſe expreſs on the ſubject. Julius Paulus, ſive de partu expoſitione & nece apud veteres Lugd. Bat. 1710, 4to.

BIRTH, *ſuppoſition of*, *partus ſuppoſitio*, in the *Civil Law*, is a crime, for which accuſation may be intented by thoſe who have intereſt therein, and is puniſhed with death, like the *crimen falſi*, or forgery.

BIRTH, *ſuppreſſion of*, *partus ſuppreſſio*, is the crime of a woman, who endeavours, by medicines, to deſtroy or hinder the *birth* of a child; or, after its being born, hides, expoſes, or even ſtrangles it.

BIRTH-*day*, the anniverſary return of the day whereon a perſon was born.

This anſwers to what the ancients called γενεθλιον, *genethlion*, *natalis dies*, *natalitius dies*, *natalitia*, and, in the middle age, *genetalius*.

The ancients made much of their religion to conſiſt in the celebration of *birth-days*, and took omens from thence of the felicity of the coming year. We meet with *birth-days* of the gods, emperors, great men, poets, and even private perſons. What is more, the *birth-days* of cities, as Rome and Conſtantinople, were celebrated with great pomp by the inhabitants. Virgil's *birth-day* was held very ſtrictly by the wits and poets who ſucceeded him. Pliny aſſures us, that Silius kept it with more ſolemnity than he did his own. Epiſt. lib. iii. Ep. 7.

The manner of celebrating *birth-days* was by a ſplendid dreſs; wearing a ſort of rings peculiar to that day; offering ſacrifices, the men to their Genius, of wine, frankincenſe; the women to Juno; giving ſuppers, and treating their friends and clients; who, in return, made them preſents, wrote and ſung their panegyrics, and offered vows and good wiſhes for the frequent happy returns of the ſame day.

The *birth-days* of emperors were alſo celebrated with public ſports, feaſts, vows, and medals, ſtruck on the occaſion.

But the ancients, it is to be obſerved, had other ſorts of *birth-days* beſides the days on which they were born. The day of their adoption was always reputed as a *birth-day*, and celebrated accordingly.

The emperor Adrian, we are told, obſerved three *birth-days*; viz. the day of his nativity, of his adoption, and his inauguration. Fabr. Bibl. Græc. tom. xii. lib. vi. cap. 6.

In thoſe times it was held, that men were not born only on thoſe days when they firſt came into the world, but on thoſe alſo when they arrived at the chief honours and command in the commonwealth, e. gr. the conſulate. Hence that of Cicero in his oration *Ad Quirites*, after his return from exile: *A parentibus id quod neceſſe erat, parvus ſum procreatus, a vobis natus ſum conſularis.*

Beſides, thoſe who returned from baniſhment, were alſo conſidered as being born again, *renati*, and ever after called the day of their return their *birth-day*. Thus Cicero to Atticus: *Diemque natalem reditus mei cura, ut in tuis ædibus amæniſſimis agam tecum, & cum meis.*

Cenſorinus has a treatiſe *de die natali*, addreſſed to Q. Cerellius, as a compliment on his *birth-day*.

BIRTH-*days of the ſaints and martyrs*, *natales ſanctorum*, denote the days of their deaths.

In reality, *natalis* among the ancients was not reſtrained to *birth-days*, but extended to all feaſt-days.

Hence it is we meet with *natalis ſolis*, *natalis calicis*, *natalis eccleſiæ*, *natalis reliquiarum*, &c.

BIRTH-*ſin*, the ſame with *original* SIN.

BIRTH-*wort*, in *Botany*, the Engliſh name of the plant ARISTOLOCHIA, a genus of the *gynandria hexandria* claſs. Its characters are theſe: the flower is of one leaf, which is unequal; the baſe is ſwelling and globular. It is afterward extended in a cylindrical tube, which ſpreads open at the brim, where the lower part is ſtretched out like a tongue. The oblong angular germen ſits under the flower, which afterwards turns to a large ſeed-veſſel, differing in form, which opens in ſix cells, filled with ſeeds, for the moſt part compreſſed. There are nine ſpecies, one of which is the ſnake-root, which is greatly uſed in medicine; theſe roots are brought over from Virginia and Carolina. There are ſome of theſe plants preſerved in the gardens of thoſe who are curious; but as they are ſometimes killed by froſt in winter, ſo they are not very common in the Engliſh gardens.

BIS, in *Botany*, a name given by ſome old writers to the NAPELLUS, or monks-hood; and by others to the CICUTA, or hemlock.

There is, however, another ſenſe of the word, very different from both theſe, in which it is uſed to expreſs an eſculent plant. The phraſe *bis al nil* is frequent among the Arabian writers; and as *al nil* ſignifies only of the river Nile, the whole name ſhould ſeem to expreſs the character of ſome poiſonous plant growing in the Nile. This, however, is by no means the ſenſe in which it is received; for we are told, that *bis al nil* ſignifies a bulbous root of a ſweet taſte, growing on the mountains about Damaſcus, and in other parts of Syria, and eaten in the ſpring by the people of the adjacent country.

BIS-*annual*, a name given by botaniſts to thoſe plants, which ordinarily do not flower till the ſecond year.

BISA, or BIZA, a coin in Pegu, current there for half a ducat. The denomination is alſo given to a kind of weight uſed in the ſame country, equivalent to two Venetian pounds five ounces, or to three pounds nine ounces of the ſmaller weight of that city.

BISACUTA, in *Middle Age Writers*, an ax with two edges, or which cuts either way; or a miſſive weapon, pointed at both ends.

Walſingham repreſents the *ſecuris biſacuta* as peculiar to the Scottiſh nation. See BATTLE-*ax*.

BISANT. See BESANT.

BISARCA, in *Botany*, a name uſed by ſome authors for the herb TARRAGON.

BISBÆA, a feaſt celebrated by the Meſſapii, after the pruning of their vines, to obtain of the gods that they might grow again the better.

The word is formed from βισβυ, uſed by ſome for a *vine*.

BISCAIAN *language* denotes the Cantabrian, or ancient language of Spain, being a branch of the Celtic, which firſt gave way to the Romanſe.

BISCIA, in *Zoology*, a name by which ſome have called the ACUS, or, as we call it in Engliſh, the tobacco-pipe fiſh, the needle-fiſh, or trumpet-fiſh.

BISCUIT. See BISKET.

BISCUTELLA, in *Botany*. See MUSTARD.

BISECTION. See BISSECTION.

BISELLIARII, or BISELLIARI, in *Antiquity*, thoſe who enjoyed the honour or privilege of the BISELLIUM.

The word occurs in ancient inſcription, CN. PLAETORIO VIVIRO AUGUSTALI BISELLIARIO. Gruter, Inſcr. p. 1099.

The *honor biſellii* appears to have been much the ſame with what in France is called *droit de fauteuil*; and the *biſelliarii* thoſe who, in public aſſemblies, enjoy this diſtinction of the *fauteuil*, while other perſons are obliged to ſtand, or ſit on benches, ſtools, or ordinary chairs. Scaliger, in his index to Gruter, miſtook the *biſelliarii* for artificers who made theſe ſeats.

BISELLIUM, from *bis* and *ſella*, a *chair*, in *Antiquity*, a kind of ſeat or chair, larger and richer than ordinary, big enough to hold two perſons, wherein to ſit in courts, theatres, and other public aſſemblies.

BISERRULA, in *Botany*, a genus of the *diadelphia decandria* claſs. We have no Engliſh name for this plant. Its characters are theſe: the flower is papilionaceous, having a large roundiſh ſtandard, whoſe edges are reflexed. The wings are oblong, and the keel is of the ſame length with the wings. It hath ten ſtamina, nine of which are joined, and the other ſingle; in the centre is ſituated an oblong compreſſed germen, which afterward becomes a flat, narrow pod, indented on both edges like the ſaw of a ſword-fiſh, having two cells filled with kidney-ſhaped ſeeds. We have but one ſpecies of this genus, which is an annual plant, growing naturally in Italy, Sicily, Spain, and the ſouth of France.

BISETÆ, from *bis* and *ſeta, briſtle*, in *Natural Hiſtory*, a term uſed to expreſs a genus of flies of the claſs of the SETICAUDÆ, diſtinguiſhed from the others by their having two hairs or briſtles growing out at the tail. There are many ſpecies of this genus, and they are uſually divided by authors into two principal kinds; ſuch as have ſharp ends, and ſuch as have blunt ones. There are ſeveral ſpecies of the former found in our hedges. See HENOTHRIX.

BISHOP, a prelate, or perſon conſecrated for the ſpiritual government and direction of a dioceſe.

The word comes from the Saxon *biſchop*, and that from the Greek επισκοπος, an *overſeer*, or *inſpector*; which was a title the Athenians gave to thoſe whom they ſent into the provinces ſubject to them, to ſee whether every thing were kept in order; and the Romans gave the ſame title to thoſe who were inſpectors and viſitors of the bread and proviſion. It appears from a letter of Cicero, that he himſelf had a biſhopric; being *epiſcopus Oræ & Campaniæ*.

A *biſhop* differs from an archbiſhop in this, that an archbiſhop with *biſhops* conſecrate a *biſhop*, as a *biſhop* with prieſts ordain a prieſt; that the archbiſhop viſits a province, as the *biſhop* a dioceſe; that the archbiſhop convocates a provincial ſynod, as the *biſhop* a dioceſan one; and that the archbiſhop has canonical authority over all the *biſhops* of his province, as the *biſhop* over the prieſts in his dioceſe.

It is a long time that *biſhops* have been diſtinguiſhed from mere prieſts or preſbyters; but whether that diſtinction be of divine or human right, whether it was ſettled in the apoſtolical age, or introduced ſince, is much controverted. On the one ſide ſtands the New Teſtament, wherein it is certain the names *biſhop* and prieſt are uſed indifferently: on the other ſide are tradition, the fathers, and the Apoſtolical Conſtitutions.

There appear no footſteps of any inſtitution of *biſhops*, diſtinct from prieſts, in the Scriptures; neither do the oppoſers thereof pretend to ſhew any mark of any other form of church-government therein: ſo that it may ſeem probable, the apoſtles did not ſettle any thing of this kind at all; but either left the ſpiritual œconomy in the hands of the preſbyters, or of thoſe together with the people.

Accordingly, new occaſions requiring new meaſures, in a little time the functions of the prieſthood were divided, and the prieſts diſtinguiſhed into degrees; the political part of religion being aſſigned principally to *biſhops*, and the evangelical to the prieſts, &c. Or rather, as ſome will have it, the functions of teaching and preaching were reſerved to the *biſhop*, and that of ordination ſuperadded; which was their principal diſtinction, and the mark of their ſovereignty in their dioceſe.

By the ancient diſcipline, *biſhops* were to be married once, and not to put away their wives on pretence of religion; but a ſecond marriage was a diſqualification for this order. If they lived chaſte, they were ranked as confeſſors.

Some *biſhops*, in the middle age, on account of their *regalia*, or temporalities, were obliged to a military ſervice called *hoſtis*, by which they were to lead their vaſſals into the field, and attend the king in his military expeditions. This Charlemagne excuſed, and even forbid: but the prohibition was little regarded; ſince we find the thing often practiſed afterwards. Du-Cange.

The election of *biſhops* was anciently placed in the clergy, and the people of the pariſh, province, or dioceſe; but afterwards, princes and magiſtrates, patriarchs and popes, uſurped the power. The election was to be within three months after the vacancy of the ſee; and the perſon to be choſen out of the clergy of that church. Formerly the *biſhop* claimed a ſhare in the election of an archbiſhop; but this was ſet aſide by the popes.

In England, during the Saxon times, all eccleſiaſtical dignities were conferred by the king in parliament. At length, however, after ſeveral conteſts, eſpecially between archbiſhop Anſelm and Henry I. in conſequence of a grant of king John, recognized in Magna Charta, and eſtabliſhed by ſtat. 25 Edw. III. ſtat. 6. § 3. *biſhops* were elected by the chapters of monks or canons, ſome ſhadow of which ſtill remains in the preſent method of diſpoſing of biſhopricks. But by ſtat. 25 Hen. VIII. cap. 20. the right of nomination was reſtored to the crown.

Ordinarily, at leaſt three *biſhops* are required in the ceremony of conſecrating a *biſhop*; but, in ſome caſes, a ſingle one might ſuffice. The Engliſh ſucceſſion of proteſtant *biſhops* ſtands on this laſt ground.

In England, the king being certified of the death of a *biſhop* by the dean and chapter, and his leave requeſted to elect another, the *conge d'elire* is ſent to them, with a letter miſſive, nominating the perſon whom he would have choſen. The election is to be within twelve days after the receipt of it, otherwiſe the king by letters patent appoints whom he pleaſes; and the chapter, in caſe of refuſing the perſon named by the king, incurs a *præmunire*.—After election, and its being accepted of by the *biſhop*, the king grants a mandate under the great ſeal for confirmation; which the archbiſhop conſigns to his vicar-general; conſiſting moſtly in a ſolemn citation of ſuch as have any objections to the *biſhop* elect, a declaration of their contumacy in not appearing, and an adminiſtration of the oaths of allegiance and ſupremacy, of ſimony, and canonical obedience. Sentence being read by the vicar-general, the *biſhop* is inſtalled in the province of Canterbury by the arch-deacon; the fact is recorded by a public notary; and the biſhop is inveſted with full powers to exerciſe all ſpiritual juriſdictions, though he cannot ſue for his temporalities till after conſecration.—Then follows the conſecration by the archbiſhop, or ſome other *biſhop* appointed by lawful commiſſions, and two aſſiſtant *biſhops*: the ceremony of which is much the ſame as in the Romiſh church, ſave that, having put on the epiſcopal robes, the archbiſhop and *biſhops* lay their hands on the new prelate's head, and conſecrate him with a certain form of words.

The proceſs of the tranſlation of a *biſhop* to another biſhopric only differs in this, that there is no conſecration.

The age of a *biſhop* is to be at leaſt thirty years; and, by the ancient diſcipline, none were to be choſen but thoſe who had paſſed through all the inferior orders; but, in ſome caſes of neceſſity, this was diſpenſed with, and deacons, nay laymen, were raiſed *per ſaltum* to the epiſcopal dignity.

The form of conſecrating a *biſhop* is different in different churches.—In the Greek church, the *biſhop* elect, being by the aſſiſtant *biſhops* preſented for conſecration, and the inſtrument of election put in his hand; after ſeveral prayers, (the firſt called *diaconicum*) demanding conſecration, makes profeſſion of his faith; after which he receives a benediction. He is then interrogated as to the belief of the Trinity; to which he anſwers by a *long profeſſion of faith*, and receives a ſecond benediction. Laſtly, he is aſked what he thinks of the *incarnation*; to which he anſwers in a *third profeſſion of faith*; which is followed by a third benediction: after which the conſecrator gives him the paſtoral ſtaff: then he is led up to the altar; where, after certain prayers, and three croſſes on his head, he receives the *pallium*, if he be an archbiſhop or patriarch; he then receives the kiſs of peace, of his *conſecrator* and two aſſiſtants; and, ſitting down, reads, prays, and gives the communion to his *conſecrator* and others.

In the Romiſh church, the *biſhop* elect being preſented by the elder aſſiſtant to the conſecrator, takes the oath: he is then examined as to his faith; and, after ſeveral prayers, the New Teſtament is drawn over his head, and he receives the chriſm or unction on his head. The paſtoral ſtaff, ring, and Goſpel, are then given him; and, after communion, the mitre is put on his head: each ceremony being accompanied with proper prayers, &c. the conſecration ends with Te Deum.

Theſe laſt mentioned ceremonies are laid aſide in the conſecration of Engliſh *biſhops*. Nevertheleſs, the book of conſecration, ſet forth in the time of Edward VI. and confirmed by act of parliament, in which ſome of them are enjoined, is declared to be the ſtandard for this purpoſe by the thirty-ſixth article.

The function of a *biſhop* in England may be conſidered as two-fold; viz. what belongs to his *order*, and what belongs to his *juriſdiction*.—To the *epiſcopal order* belong the ceremonies of dedication, confirmation, and ordination; to the *epiſcopal juriſdiction*, by the ſtatute-law, belong the licenſing of phyſicians, chirurgeons, and ſchoolmaſters, the uniting ſmall pariſhes (though this laſt privilege is now peculiar to the *biſhop* of Norwich), aſſiſting the civil magiſtrate in the execution of ſtatutes relating to eccleſiaſtical matters, and compelling the payment of tenths and ſubſidies due from the clergy.

By the common law, the *biſhop* is to certify the judges, touching legitimate and illegitimate births and marriages; and by that and the eccleſiaſtical law, he is to take care of the probate of wills, and granting adminiſtrations; to collate to benefices, grant inſtitutions on the preſentation of other patrons, command induction, order the collecting and preſerving the profits of vacant benefices for the uſe of the ſucceſſors, defend the liberties of the church, and viſit his dioceſe once in three years. To the *biſhop* alſo belong ſuſpenſion, deprivation, depoſition, degradation, and EXCOMMUNICATION.

The *biſhops* of England are all barons. Barons in a two-fold manner; viz. *feudal*, in regard of lands and baronies annexed to their biſhopricks; and by *writ*, as being ſummoned by writ to parliament.—They have the precedence of all other *barons*, and ſit in the upper houſe as *barons*.—They are twenty-four in number, beſides two archbiſhops.

With reſpect to the order of precedency among one another, the archbiſhop of Canterbury takes the lead; then the archbiſhop of York; next to him the *biſhop* of London, of Durham, and Wincheſter. The other *biſhops* follow according to the ſeniority of their conſecration; excepting only, that a *biſhop* being a privy-counſellor, takes place after the *biſhop* of Durham.

Biſhops have two ſpecial privileges next to regal; the firſt, that in their courts they ſit, and paſs ſentence, of themſelves, and by their own authority: the *biſhops* courts being not like other courts; but writs are ſent out in their own name, *teſte* the *biſhop*, not in the king's name, as is done in the king's courts.—The ſecond, that, like the king, they can depute their authority to another, as their ſuffragan, chancellor, commiſſary, &c.

They have alſo this advantage over lay-lords, that, in whatever Chriſtian country they are, their epiſcopal degree and dignity are acknowledged; and they may, *quatenus biſhops*, ordain, &c.

They have ſeveral immunities, as from arreſts, outlawries, diſtreſs, &c. liberty to hunt in the king's foreſts, &c. to have *certain tuns of wine duty-free*, &c. Their perſons may not be ſeized, as lay-peers may, upon contempt, but their temporalities alone. They may qualify as many chaplains as a duke, viz. ſix. But, as they have no right to be tried themſelves in the court of the lord-high ſteward, as peers, they ought not to be judges there.

By law, the crime of *epiſcopicide*, which a clergyman commits by killing his *biſhop*, is petty-treaſon.

In Denmark, there are ſix ſuperintendents, who take it very kindly to be called *biſhops*, and *my lords*.—They have no temporalities; keep no eccleſiaſtical courts; have no cathedrals, or prebends, &c. but are only *primi inter pares*, having the rank above the inferior clergy of the province, and inſpection over their doctrine and manners. They are allowed two or three pariſhes each. Their habit is common with that of the other miniſters.

In Sweden are an archbiſhop, and ten *biſhops*, with ſeven or eight ſuperintendents under them.—They have alſo eccleſiaſtical courts, &c

Bishop-*abbot*, *epiſcopus-abbas*, was an abbot inveſted with the epiſcopal order; of which we meet with ſeveral in the richer and more conſiderable monaſteries.

Bishop, *cardinal*, a *biſhop* in chief, or *in capite*.

St. Gregory ſometimes uſes the term for a proper *biſhop*.

Anciently there were alſo *biſhops*, who, by a peculiar privilege from the holy ſee, were ranked, and had a ſeat among the cardinals.

Bishop, *cathedral*, was alſo a title given to the proper *biſhops*, by way of diſtinction from the *chorepiſcopi*.

Bishops, *vague*, thoſe without any dioceſe, ſometimes attendant in camps, or in foreign countries, for the converſion of infidels.

The like *vague biſhops* were ſometimes alſo granted by popes to monaſteries, exempt from the juriſdiction of the dioceſan, where they performed all the epiſcopal functions. Du-Cange.

Bishop *in partibus infidelium*, he who is dignified with the title of a biſhopric, whoſe diſtrict or dioceſe is in the poſſeſſion of infidels or heretics.

By the canon law, a *biſhop in partibus* is qualified hereby to be a COADJUTOR of another *biſhop*.

The denomination took its riſe from the expulſion of the *biſhops* and clergy, out of the Holy Land by the Saracens; when flying into Italy for ſhelter, coadjutories were given them for their ſubſiſtence.

Bishop, *acephalous*, he who is immediately ſubject to the papal ſee, without any metropolitan over him.

Bishop-*elect* is he who has the king's nomination, with the ſanction of the chapter; but without conſecration.

Bishop-*deſigned*, *epiſcopus deſignatus*, denoted a COADJUTOR of a *biſhop*, who, in virtue of his office, is to ſucceed at the incumbent's death.

Bishops, *ſuffragan*, are coadjutors or aſſiſtants of dioceſan *biſhops*, authorized by commiſſion from him.

Bishops, *exempt*, thoſe freed from the juriſdiction of the metropolitan, and immediately ſubject to the ſee of Rome alone.

Bishop *of the palace*, *epiſcopus pallatii*, was probably the ſame with *biſhop* of the king's chapel, a title in the court of Bohemia. Du-Cange.

It was alſo a title given thoſe *biſhops*, who, by licence of the pope, dwelt in palaces of kings, to be in readineſs for ſpiritual ſervice and counſel in church-matters.

Bishop *of the prime ſee*, denoted a PRIMATE, otherwiſe denominated a *ſenior biſhop*.

Bishops, *commendatory*, or *biſhops in* COMMENDAM, are cardinals not of the order of *biſhops*, or other prelates, who yet hold biſhoprics *in commendam*.

The appellation had its origin during the reſidence of the papal ſee at Avignon, when ſcarce any cardinal, prieſt, or deacon, was created, who held not one, two, three, or more *biſhoprics in commendam*. Du-Cange.

Bishop, *univerſal*, or *catholic*, is a title given to the patriarch of Armenia.

Bishop *of the catholic or univerſal church*, a title ſometimes aſſumed by the popes.

Bishop *of biſhops*, was a title anciently given to the prelates of ſome of the greater and more honoured ſees, as Jeruſalem and Rome.

The firſt who had the title was James *biſhop* of Jeruſalem. Some will have the appellation to have been common to all *biſhops*.

Bishops, in the *Lutheran Church*, are thoſe more uſually called SUPERINTENDENTS.

The Calviniſts allow of no other *biſhops* beſides preſbyters; but the Lutherans make ſome diſtinction, and give a ſuperiority or pre-eminence over the reſt to their *biſhops*, *ſuperintendents*, or *overſeers*.

Bishop is alſo a quality ſometimes attributed to ſecular princes, in reſpect of their SUPREMACY or juriſdiction in matters belonging to religion.

In this ſenſe it is that the emperor Conſtantine, in a letter to the *biſhops* in his dominions, calls himſelf *common biſhop*, as being, in ſome reſpects, general *biſhop* of the whole Roman world.

Bishop *of the Jews*, the head of that people in England, choſen by themſelves, to whom they ſubmitted to be judged, and governed according to their law. Prideaux's Connect. part ii. lib. v. p. 478.

This officer, which ſubſiſted under our Norman kings, and was licenſed by them, anſwered to the ÆCHMALOTARCHS in Babylon, and the ALABARCHS in Egypt.

Bishops *at cheſs*, a kind of pieces, the third in rank, below queens, but above knights, diſtinguiſhed by their cloven heads.

In Latin writers of the middle age, the *biſhop* is called *alphinus*; and by the French *le fou*, the *fool* or *madman*. See CHESS.

Bishop, in *Zoology*, a little ſpotted beetle, commonly called the lady-cow, or lady-bird.

Bishops, *regionary*. See REGIONARY.

Bishop'*s Court*. See COURT.

Bishop'*s ſee*, or *ſeat*, originally denoted the throne or chair in the church where the *biſhop* ſat.

This was alſo denominated APSIS.

Bishop'*s ſee* alſo denotes the city or place where the reſidence of the *biſhop* is fixed.

Every *biſhop's ſee* was anciently called *ſedes apoſtolica*; though the appellation has ſince been reſtrained to the ſee of Rome.

Anciently *biſhops* ſeem to have had a right in England to ſit as judges in the hundred and county-courts. In after-times, they were forbid to ſit in ſecular courts, and had ſeparate courts erected for them; which proved an occaſion of much diſpute between the two juriſdictions. No church-tenant might be ſued in any court but the *biſhop's*. There are alſo traces of a ſeparate court of the *biſhops* much earlier, among our Saxon anceſtors, in the eighth century.

The regard borne to the character of *biſhops*, made them the common arbitrators even of ſecular cauſes: they had the cognizance of all cauſes concerning lands in *frank-almoign*; and for eccleſiaſtics, were judges even in capital cauſes.

Bishop'*s weed*, *Ammi*, in *Botany*, a genus belonging to the *pentandria digynia* claſs of Linnæus. Its characters are theſe: it is an umbelliferous plant, with difform flowers, each having five heart-ſhaped petals; they have five ſlender ſtamina, and two reflexed ſtyles, crowned with obtuſe ſtigmas; the germen becomes a ſmall, round, ſtriated fruit, compoſed of two ſeeds. There are two ſpecies.

Bishop, in *Ornithology*, is a name given to an excellent ſinging bird in Louiſiana. His ſong continues for the ſpace of a *miſerere*, in all which time he does not appear to breathe; he is then ſilent twice as long before he renews it; ſo that the alternative of ſong and reſt continues two hours.

BISHOPING, in *Horſemanſhip*, a term denoting the arts uſed by jockeys for making old horſes appear young, &c.

BISHOPRIC, the juriſdiction of a *biſhop*: or the diſtrict within which it is compriſed; called alſo *dioceſe*.

There are 24 *biſhoprics*, and two archbiſhoprics, in England and Wales.—To the *old* ones, ſubſiſting before the times of the Reformation, Henry VIII. by letters patent added five more *biſhoprics*; viz. thoſe of Cheſter, Gloceſter, Peterborough, Briſtol, and Oxford, ſtat. 34 & 35 H. VIII. cap. 17.

In Ireland, there are eighteen *biſhoprics*, and four archbiſhoprics; in Scotland none.

BISK, or **BISQUE**, in *Cookery*, a rich ſort of broth or ſoop, made of pigeons, chickens, force-meat, mutton-gravy, and other ingredients.

The word is French, formed, as ſome think, from *biſcocta*; becauſe the *biſque*, conſiſting of a diverſity of ingredients, needs ſeveral repeated coctions to bring it to perfection.

There is alſo a *demi-biſque*, made at a low expence, in which only half the ingredients are uſed; and a *biſque* of fiſh, made of carps, minced with their roes and lobſters.

BISKET, or **BISQUET**, uſually denotes a delicate kind of bread prepared by the confectioners, of fine flour, eggs, ſugar, and roſe of orange-water; or of flour, eggs, and ſugar, with aniſe-ſeeds and citron-peel; baked in the oven in tin or paper moulds.

The word comes from the Latin *bis*, *twice*; and the French *cuit*, *coctus*, q. d. *baked*.

We find divers ſorts of ſuch *biſkets*; as, ſeed-*biſket*, fruit-*biſket*, long-*biſket*, round-*biſket*, Naples-*biſket*, ſpunge-*biſket*, &c.

BISKET, *ſea*, is a ſort of bread much dried, by paſſing the oven twice, to make it keep for the ſervice of the ſea.—For long voyages they bake it four times, and prepare it ſix months before the embarkation. It will hold good a whole year.

To preſerve ſea-*biſkets* from inſects, Dr. Hales adviſes to make the fumes of burning brimſtone paſs through the caſks full of bread.

Biſket may be likewiſe preſerved a long time, by keeping it in caſks well calked, and lined with tin.

The ancients had their *biſket* prepared after the like manner, and for the like uſe as the moderns. The Greeks called it αρτον διπυρον, q. d. *bread put twice to the fire.* The Romans gave it the name of *panis nauticus*, or *capt.* Pliny denominates it *vetus aut nauticus panis tuſus atque iterum coctus.* By which it appears, that, after the firſt baking, they ground or pounded it down again for a ſecond. In ſome middle-age writers, it is called *paximas*, *paximus*, and *panis paximatus*.

Among the Romans, we alſo meet with a kind of land-*biſket* for the camp-ſervice, called *buccellatum*, ſometimes *expeditionalis annona*, which was baked much, both to make it lighter for carriage, and leſs liable to corrupt, the coction being continued till the bread was reduced one fourth of its former weight.

BISLINGUA, *double-tongue*, a name uſed by many authors for the narrow-leaved RUSCUS, or BUTCHERS-BROOM; called by many others the Alexandrian bay, or *laurus Alexandria*.

BISMILLAH, in the *Mahometan Cuſtoms*, a ſolemn form, viz. *in the name of the moſt merciful God*, conſtantly placed at the beginning of their books and writings in general, as a peculiar mark, or diſtinguiſhed characteriſtic, of their religion, it being counted an impiety to omit it.

The Jews, for the ſame purpoſe, make uſe of the form, *in the name of the Lord*, or, *in the name of the great God.* Sale.

BISMILLAH is alſo uſed among the Arabs, as a word of invitation to eat.

An Arab prince will frequently ſit down to eat in the ſtreet before his own door, and call all that paſs, even beggars, by this word, who do not fail to come and ſit down to eat with him; for the Arabs are great levellers, and ſet every body upon a footing with themſelves. Pococke's Egypt, &c. p. 483.

BISMUTH, a mineral body, of the ſemimetallic kind; by many ſuppoſed to be compoſed of the firſt matter of tin, while yet imperfect. It is found uſually in tin-mines, ſometimes alſo in ſilver-mines.

Its weight and colour diſcover it to be of a mercurial or metallic nature. In common menſtruums, it undergoes much the ſame alterations, and aſſumes much the ſame forms as lead. Quincy ſays, there is always ſome ſilver in it.

Its ſubſtance is hard, ponderous, and brittle, of a large grain, gloſſy, white, and ſhining.—It is alſo called TIN-*glaſs*; becauſe, when broken, it ſhews a vaſt number of little poliſhed *laminæ* like glaſs: it is alſo called MARCASITE, by way of excellence, becauſe ſurpaſſing all other marcaſites or ſemimetals in whiteneſs and beauty.

It appears to be compoſed of cubes, formed by the application of plates upon each other. Its colour is leſs white than that of the regulus of antimony, and has a reddiſh tinge, eſpecially when expoſed to the air. It is the heavieſt of the ſemimetals, and loſes in water about a ninth part of its weight. Like the other ſemimetals it is ſemi-volatile; when expoſed to the fire, flowers riſe from it, it is calcined, and converted into a litharge and glaſs nearly as lead is, and, like it, may be employed to the purification of gold and ſilver by cuppellation. It eaſily combines with ſulphur, and amalgamates with mercury, and unites with all metallic matters, excepting, according to Mr. Gellert, zinc, and arſenic; their affinities with it are, according to him, in the following order. Iron, copper, tin, lead, ſilver, and gold. *Biſmuth*, like iron, is ſaid to occupy, when fuſed, a leſs ſpace than when ſolid; it is fuſible with a heat of 460° degrees of Fahrenheit's thermometer; it greatly increaſes the fuſibility of ſome other metals; a ſmall portion of it increaſes the brightneſs, hardneſs, and ſonorouſneſs of tin, for making pewter, with which it is chiefly uſed; as it is alſo for ſoldering ſome metals, and for making printer's types; for ſoils for mirrors; for anatomical injections; for imitating ſilvering upon wood; and for rendering ſome metals fitter for being caſt into moulds.

Biſmuth is ſometimes found native, but that very rarely. Its moſt uſual appearance is in the ſtate of ore, into which it is reduced by its particles being penetrated by, and intimately mixed with, a ſulphur, and with a large quantity of arſenic, and with an earthy matter, which yields a blue colour, equal to the zaffer, or ſmalt produced from cobalt.

In the fuſion of this ore, the ſulphur and arſenic evaporate over the fire; and the reguline matter, being freed from its impriſoned ſtate, runs off from the earthy ſubſtance, which being left fixed behind, may, with the addition of flints, and a fixed alkali, be run into a fine blue, glaſſy matter, no way differing from the ſmalt of cobalt.

Native *biſmuth* is found in ſmall compact maſſes, of a pale lead colour on the outſide, and when broken, of a fine, glittering, ſilvery white, and compoſed of a multitude of foliaceous flakes or plates, laid evenly over one another, and diſpoſed in ſeveral irregular directions in the maſs.

It is ſubject to fewer variations in its ore than moſt other minerals; but it is ſometimes turned yellow by too great a proportion of ſulphur, and ſometimes is very deeply tinged with the matter of the common marcaſites, and, in this condition is often miſtaken for mere marcaſite, to the no ſmall loſs of the proprietor of the mine.

It is very common in Germany and England. The tin-mines in Cornwall afford great quantities of it; but it is not much known there.

Mr. Boyle mentions a medicine prepared from *biſmuth* by calcination, and the addition of ſpirit of vinegar and *cremor tartari*, which has been extolled in the dropſy. He alſo mentions a preparation of it with common ſublimate into a white powder, a few grains of which purge gently. Works abr. p. 501.

Its medicinal virtue is much the ſame with that of the droſs of lead, being ſeldom uſed except in external forms, as containing an arſenical ſalt, very dangerous to be taken inwardly; yet M. du Clos made a purgative of it, to be uſed in the dropſy. Add, that *biſmuth* being diſſolved in ſpirit of nitre, yields a fume, which, being precipitated with water, produces a white powder, called magiſtery of *biſmuth*, and Spaniſh white, found a good diaphoretic in acute caſes.

But its chief uſe among the ancients, as well as moderns, is as a coſmetic. Other menſtrua, and other precipitates, have been uſed for producing this powder; but by whatever means it is prepared, it retains a corroſive quality, and injures the complexion.

Sig. Poli, by repeated diſtillations of *biſmuth* with an equal quantity of corroſive ſublimate, procured a running mercury, and a fine powder, of the colour of pearl, which might be of uſe in counterfeiting the oriental pearls. Hiſt. Acad. Sc. 1713.

To the ſame purpoſe, Neumann ſays, that by expoſing a mixture of *biſmuth* and corroſive ſublimate to the fire in a retort, part of the quickſilver diſtilled, and was ſucceeded by a dark brown butter, which concocting, grew hard as a ſtone. By repeatedly rectifying the butter, it became clearer and browner, and harder; and an unctuous pearl-coloured matter remained after every diſtillation. Neumann's Works, p. 109.

Biſmuth bears a near affinity to ZINC.

Lemeri ſays, that if the ſolution of *biſmuth* be uſed as an ink to write with, the writing does not appear, but that it becomes very black, when moiſtened with the deliquiated liquor of the ſcoria of *regulus* of antimony. See INK *ſympathetic*.

There is alſo an *artificial biſmuth*, which is that ordinarily found in the ſhops, made by reducing tin into thin *laminæ*, or plates, and cementing them by a mixture of white tartar, ſalt-petre, and arſenic, ſtratified in a crucible over a naked fire. The ſame is alſo by ſome made of a mineral called ZINC, uſing lead inſtead of tin, and a little calamine.

BISMUTH-*graupen*, in *Mineralogy*, a name given by the Germans to a fixed earth contained in the ores of *biſmuth*, which ſerves to make *ſmalt*, as well as the earth of *cobalt*. After the *biſmuth* is melted from the ore, they take the *reſiduum*, or *graupen*, and mixing it with flints calcined and powdered, they run it into a fine blue glaſs, which is no way inferior to the common *ſmalt*.

The *biſmuth* ore is often mixed among the *cobalt*, and, in this caſe, the miners ſeparate them with all the care they can; but often they are not able to do it perfectly, and the two minerals bear the fire together; in which caſe, there ariſes ſome difficulty in the working; for the *biſmuth* mixing itſelf with ſome of the earth of the *cobalt*, in this caſe, ſubſides to the bottom of the veſſel in form of reddiſh *regulus*; but this is to be ſeparated by a ſecond operation, and the *regulus* obtained pure and white; and its own earth, together with that of the *cobalt*, are ſeparated from it, and wrought together into *ſmalt*.

BISNOW, or BISCHNOU, a ſect among the Indian BANIANS, or caſt of merchants.

The banian ſect conſiſts of two leſſer ones; that of *biſnow*, and that of *ſamarath*.

The followers of the former hold one God, whom they call *ram-ram*, and allow of no lieutenants or deputy-gods, as is done by thoſe of the ſect *ſamarath*; but they allow their god a wife, and have idols, which they dreſs up with gold chains, and collars of pearl and precious ſtones, and pay them worſhip, by ſinging hymns in their temples, and dancing before them to the ſound of flagelets and kettle-drums.

In this ſect, the wives do not burn themſelves after their huſbands death, as is practiſed by thoſe of the *ſamarath* ſect; but content themſelves with a perpetual widowhood.

BISOMUM, in *Antiquity*, a TOMB for two bodies, or the aſhes of two.

The word is compounded of *bis*, *twice*, and the Greek σωμα, *body*, or *aſhes of a body*. Some, with greater purity, write *diſomum*.

The ancients frequently buried two, three, or four bodies in the ſame ſepulchre, diſpoſed aſide of each other; for it was held an impiety to lay one a-top of another. Hence the ſepulchres of the primitive Chriſtians had the words *biſomi*, *triſomi*, *quadriſomi*, &c. inſcribed on them, to indicate the number of bodies depoſited in them. Du-Cange.

BISON, in *Natural Hiſtory*, the name of a ſpecies of wild-bull, which differs from all other ſpecies, by having a very ſhaggy mane, running down his neck quite to his ſhoulders, and a large hump on his back. In Mr. Ray's time, there was a bull of this kind kept in St. James's Park; but there was no account whence it was brought. This author ſuppoſes it to have been from Florida, where, according to Ambroſe Paré, there are bulls called *butrones* by the natives, which have horns of about a foot long, and a bunch in the middle of the back, like the camel. Thevet alſo mentions this creature; and Geſner deſcribes it under the name of the BOS CAMELITA.

BISQUET. See BISKET.

BISSACRAMENTALES, a denomination given by ſome Romiſh writers to proteſtants, on account of their only holding two ſacraments, viz. baptiſm and the ſupper.

BISSECTION, in *Geometry*, the diviſion of any quantity into two equal parts, otherwiſe called BIPARTITION. See DIVISION, &c.

BISSELÆON, in the *Materia Medica*, a name that is found in many works of the moſt ancient Greek and Roman writers, and uſed to expreſs the oil of pitch, or that fluid ſubſtance which ſwims at the ſurface of melted pitch, and was taken up by means of wool or cotton by the ancients, and uſed in many external diſorders.

The common name of this oil was *piſſelæum*; and this other name is only a corrupt way of ſpelling it. The old authors, in many other words as well as this, have changed the initial P into B.

BISSEXTIALIS, or BISSEXTIALIS *olla*, an ancient meaſure or veſſel, containing twelve ounces, or two SEXTARIES.

BISSEXTILE, or *Leap-year*, in *Chronology*, a YEAR conſiſting of 366 days, happening once each four years, by reaſon of the addition of a day in the month of February, to recover the ſix hours which the ſun ſpends in his courſe each year, beyond the 365 days ordinarily allowed for it.

The day thus added, is alſo called *biſſextile*; Cæſar having appointed it to be the day before the 24th of February, which among the Romans was the ſixth of the calends of March, and was reckoned twice.

By the ſtatute *de anno biſſextile*, 21 Hen. III. to prevent miſunderſtandings, the intercalary day, and that next before it, are to be accounted as one day.

The aſtronomers concerned in reforming the calendar, by order of pope Gregory XIII. in 1582, obſerving, that the *biſſextile* in four years added 44 minutes more than the ſun ſpent in returning to the ſame point of the zodiac; and computing that theſe ſupernumerary minutes in 133 years would form a day; to prevent any changes being thus inſenſibly introduced in the ſeaſons, directed, that, in the courſe of 400 years, there ſhould be three *biſſextiles* retrenched; ſo that every centeſſimal year, which, according to the Julian account, is *biſſextile*, or leap-year, is a common year, in the Gregorian account, unleſs the number of centuries can be divided by 4, without a remainder. Thus 1600 and 2000 are *biſſextile*; but 1700, 1800, and 1900, are common.

The Gregorian computation was received in moſt foreign countries ever ſince the reforming of the calendar; and by act of parliament paſſed anno 1751, it commenced in all the dominions under the crown of Great Britain, in the year following, ordering that the natural day following the ſecond of September, ſhould be accounted the fourteenth; omitting the intermediate eleven days of the common calendar.

BISTER. See BISTRE.

BISTI, a ſpecies of Perſian money, valued at ſixteen or eighteen French *deniers*. Some repreſent the *biſti* as an ancient ſilver coin: others, as Chardin, make it only a money of account, and call it DINAR BISTI.

BISTORT, or SNAKEWEED, *Polygonum*, in *Botany*, the name of a genus of the *octandria trigynia* claſs of plants, the characters of which are theſe: the flower is of the apetalous kind, conſiſting of a number of ſtamina, which ariſe from a cup, divided into ſeveral ſegments at the edge: the piſtil becomes afterwards a ſeed, uſually of a triangular figure, and contained in a capſule, which was before, the cup of the flower. See *Tab.* 1. *of Botany*, *Claſs* 15.

To this it is to be added, that the flowers are diſpoſed in ſpikes; and the roots are large and fleſhy, oddly twiſted or contorted, and furniſhed with a number of ſmall fibres, like hairs. There are alſo ſome ſpecies of *biſtort*, in which, beſide the common flowers and ſeeds, there are certain tubercles, which have their roots, and rudiments of leaves.

There are three different ſpecies of this plant which are found wild in England, but they are ſeldom planted in gardens, the common ſort only is uſed in medicine. Phil. Tranſ. vol. xlix. part ii. N° 112.

The common great *biſtort*, or *ſnakeweed*, flowers in May, and if the ſeaſon proves moiſt, will continue to produce new ſpikes of flowers until Auguſt: it may be propagated by planting the roots in a moiſt ſhady border, either in ſpring or autumn, which will ſoon furniſh a garden with plants, for it greatly increaſes by its creeping roots.

The root of *biſtort*, which is the only part that is uſed, is drying and binding; of ſervice in all kinds of fluxes and hæmorrhages, either from the bowels, or any other part; they help the incontinence of urine, and the making bloody water; they are alſo alexipharmic, and good in peſtilential fevers, reſiſt poiſon, and the bites and ſtings of venomous creatures.

BISTOURY, a kind of ſurgeon's cutting inſtrument, of the knife-kind; much uſed in making inciſions.—There are three kinds: the blade of the *firſt* turns backwards and forwards like a lancet for opening abſceſſes, and is ſometimes uſed inſtead of it.—The *ſtrait biſtoury* does not turn, but ſtands ſtrait in the handle like a common knife.—The *crooked biſtoury* is ſhaped like a half moon, the keen edge being on the inſide.

We have the deſcription of a *biſtoury*, and furrowed director, ſomewhat different from the common, by Mr. Monro, in the Medic. Eſſ. Edinb. vol. v. art. 41.

M. le Dran deſcribes a *biſtoury caché*, for more ſafely performing the operation of *herniæ*. The point of the *biſtoury* ſlides in the furrow of the director, to keep down the guts, and thereby prevent their being cut.

BISTRE, a compoſition made of the moſt gloſſy and higheſt burnt ſoot, pulverized, and paſſed through a fine ſieve, then baked in a little gum-water, and made into cakes.

The beſt is prepared from the ſoot of dry beech-wood, by grinding it with urine or water, into a ſmooth paſte, and then diluting it with more water; after the groſſer ſubſtance has ſubſided, the liquor is poured off into another veſſel, and left to ſettle three or four days; the fine matter that remains is *biſtre*. That which is good is tranſparent, when moiſtened with water, and of a warm, deep, brown colour.

Inſtead of this, ſome uſe the hatches of a pen, with a little Indian ink, others red chalk, others black lead, &c. See WASHING.

BIT, or BITT, an eſſential part of a bridle; its form and uſe well known; its parts and kinds various.

The kinds of *bits* are, 1. The muſroll, ſnaffle, or watering *bit*. 2. The cannon-mouth, jointed in the middle; preferred by Solleyſel to all others. 3. The cannon with a faſt mouth all of a piece, only kneed in the middle, to form a liberty or ſpace for the tongue; fit for horſes too ſenſible or ticklish, and liable to be continually bearing on the hand. 4. The cannon-mouth, with the liberty in form of a pigeon's neck; proper where a horſe has too large a tongue. 5. The cannon with a port, mouth, and an upſet, or mounting liberty, uſed where a horſe has a good mouth but large tongue. 6. The ſcatch-mouth, with an upſet; ruder, but more ſecure than a cannon-mouth. 7. The cannon-mouth with a liberty, after M. Pignatel's manner; proper for a horſe with a large tongue and round bars. 8. The maſticadour, or ſlavering *bit*. 9. The cat's foot *bit*. 10. The baſtonet *bit*, &c.

The ſeveral parts of a ſnaffle or curb-*bit* are—the mouth-piece, the cheeks and eyes, guard of the cheek, head of the cheeks, the port, the welts, the campanel, or curb and hook, the boſſes, the bolſters and rabbets, the water-chains, the ſide-bolts, bolts and rings, kirbles of the *bit* or curb, trench, top-roll, flap, and jeive.

To BIT *a horſe*, is to give him ſuch a bridle as is moſt proper for gaining his conſent to thoſe actions, which are required of him.

All *bits* ought to be proportioned to the mouth of the horſe, according as it is more or leſs cloven or wide; or more or leſs ſenſible and tender: alſo according as the tongue and lips are higher and flatter; and as the palate is more or leſs fleſhy.

BIT is alſo uſed for a little tool, fitted to a ſtock or handle, to bore withal.

In this ſenſe we ſay, the *bit* of a piercer, an AUGRE, or the like; meaning that iron part of thoſe tools, wherewith the holes are bored.

BIT *of a key* is that part fitted at right angles to the ſhank of the KEY, wherein the wards are made. See LOCK, &c.

BIT is alſo uſed, in *Commerce*, for a piece of coin current in Jamaica, and valued at 7*d*. ½.

BITS, or *bitts*, in a ſhip, are two great pieces of timber uſually placed abaft the manger in the ſhip's loof, through which the croſs-piece goes, their lower parts being faſtened to the rudders; and their middle parts, in great ſhips, bolted to two large beams, croſs the bows. Their uſe is to belay the cable to, when the ſhip rides at anchor.

The word ſeems formed from the French *bittes*, which ſignifies the ſame; unleſs we ſuppoſe that the French word is formed from ours.

In great ſtorms, to ſtrengthen the *bits*, and ſecure the bows, the cable is faſtened to the main-maſt.

BITS, *fore-jeer*, thoſe to which the fore-jeer is faſtened and belayed.

BITS, *fore-top-ſail-ſheet*, thoſe to which the fore-top-ſail-ſheet is belayed.

BITE is defined to be a ſolution of the continuity of a ſoft part, cauſed by the impreſſion of an animal's teeth.

For the poiſonous, or venomous *bites* of VIPERS, the RATTLE-SNAKE, MAD-DOGS, the TARANTULA, &c. See VIPERS, &c.

SNAKE-STONE, SNAKE-WEED, *terra melitenſis*, &c. are reputed ſpecifics againſt poiſonous *bites*.

The *bites* of ſpiders, at leaſt of ſome *ſpecies*, alſo appear to be poiſonous; which has perhaps been the occaſion of the common error, that this inſect is poiſonous, when eaten. See SPIDER.

Mr. Robie, a phyſician in New England, gives the hiſtory of a perſon bitten in the leg by a ſmall ſpider, accidentally incloſed in his ſtocking; it was followed by an acute, erratic pain; firſt in the leg, then in the groin, and ſucceſſively paſſing into the ſmall of the back, the thigh, and the head, attended with a numbneſs, &c. It was cured with *ſp. cor. cerv.* and *ſal. vol. corn. cerv.* with *vinum viperinum*, and onions or garlic applied to the wound. Phil. Tranſ. N° 382, p. 69.

Sig. Redi attributes the malignity of the *bite* of a VIPER, to a yellow juice lodged in a bag behind the gum, which is inſtilled through a ſlit in the teeth, into the wound. M. Bourdelot, and Charas, aſcribe it to the irritated bilious ſpirits, and breath of the enraged animal. Phil. Tranſ. N° 83.

In ſupport of which it is alledged, that the viper's lungs are full of bilious ſpirits, which exhale with its breath; and that there is an immediate duct in this creature, from the gall-bladder to the throat; by means of which, a quicker, and more copious infuſion of the bile, is made into the wound. But much of this may be juſtly doubted. Phil. Tranſ. N° 77. p. 3015.

The beſt remedy for it is ſucking the wound; a kind of cure, for which the ancient Marſi and Pſilli are celebrated.

The beſt cure for the *bite* of the rattle-ſnake is an actual cautery; e. gr. a hot burning coal held on the wound. Phil. Tranſ. N° 210.

The *bites* of divers creatures, when mad, are poiſonous, which at other times are not ſo, as of dogs, cats, men, &c. See HYDROPHOBIA, MAD-*dog*, MADNESS, MANIA, &c.

BITE is alſo applied, in a leſs proper ſenſe, to the impreſſion of other ſharp, or pungent bodies. Thus a file is ſaid to *bite* the metal; *aqua fortis bites*, or eats into copper. An anchor is alſo ſaid to *bite*, when it holds faſt in the ground.

BITERLOGH, or BITHERLAGE, the ancient Daniſh military, or camp law.

The word is compounded from *bithe*, *mulct*; and *lagh*, *law*; q. d. the law of *mulcts*, or *wites*.

Among the laws of the Danes, there are two peculiarly eminent; viz. the *bird ſtraa*, or *court-law*; and the *biterlage raett*, made by Canute the Great, about the year 1035. Of which an edition has been given by Reſenius.

BITHYNIARCHIA, a ſort of ſuperior prieſthood in the province of Bithynia, to which belongs the ſuperintendency of the ſacred games, and which gave an exemption to him poſſeſſed of it, called *bithyniarcha*, from the care of tutorage.

BITTACLE, or BINACLE, a ſquare box, or frame of timber, placed in the ſteerage of a ſhip, wherein the COMPASS is placed.

The word is formed, by contraction, from the French *habitacle*, a *ſmall habitation*, which ſignifies the ſame.

Large veſſels have two *bittacles*, a leſſer placed before the pilot, and a greater before the ſteerſman.

In the ſmaller veſſels, the *bittacle* is divided into three ſpaces or apartments; in large veſſels into five. One for the hour-glaſſes; another for the lamp, or light; another for the compaſs, &c.

Great care is to be taken in the diſpoſition, framing, &c. of the *bittacle*, that it ſtand true, and that it be not faſtened together with iron nails, but with wooden pins, becauſe the former would affect the compaſs.

BITTACUS, in *Natural Hiſtory*, a name given by Cteſias, and ſome others of the Greek authors, to the parrot.

The word *pſittacus* is ſo near this, that they are plainly only a corruption of one another. The Greeks called this bird indifferently *pſittacus*, and *ſittacus*, as they did the fine ointment *ſagda*, indifferently by that name, or *pſagda*, the *ps* being only one letter with them; and that, and the ſingle S, very frequently uſed at pleaſure for one another.

BITTER *almonds*. See ALMOND.

BITTER *apple*. See COLOCYNTHIS.

BITTER *gourd*. See COLOCYNTHIS.

BITTER *waters*. See WATER.

BITTER *wine*. See WINE.

BITTER *ſweet*, in *Botany*. See NIGHTSHADE.

BITTER *vetch*. See VETCH.

BITTER *wort*. See GENTIAN.

BITTERN, in *Zoology*, the name of a bird of the heron-kind, called by authors ARDEA *ſtellaris*; and by ſome *taurus*, *botaurus*, *butorius*, and *ocnus*: in Engliſh, the *butter-bump*, and *mire-drum*. It builds on the ground, and lays five or ſix eggs, which are roundiſh, and of a greeniſh white. When wounded, and going to be taken, it ſtrikes at the perſon's eye, and ought carefully to be guarded againſt.

BITTERN is alſo a name given to the brine ſwimming upon the firſt concreted ſalt in the ſalt-works; this liquor is ladled off, that the ſalt may be taken out of the veſſel, and is afterwards put in again, and affords more ſalt, which is to be ſeparated like the reſt, by lading off the liquor a ſecond time, and ſo on.

The *bittern*, according to Mr. Boyle, is a very ſaline, bitter, ſharp, pungent liquor, which drains off in the making of ſalt from ſea-water; or which remains in the pans, after the coagulation, and granulation of the purer, and more ſaline part, by boiling.

A *bittern* alſo runs, or oozes, from the heaps of foſſile ſalt at Limington, and Portſea in Hampſhire. Phil. Tranſ. N° 377. p. 348.

Bittern makes the *baſis* of *ſal catharticum amarum*, or EPSOM-SALT.

Bittern is the mother-ley of SEA-*ſalt*, or the liquor which remains after the purification and cryſtallization. It is employed in this country for making a purging bitter ſalt, which proves ſimilar in quality to the ſalt obtained from the Epſom waters, and is commonly ſold under its name. The *ley* is boiled down to a certain pitch, then filtered and inſpiſſated, the dry matter is calcined, rediſſolved, and cryſtallized. If the mother-ley be inſpiſſated and diſtilled with vitriolic additions, a ſpirit of ſalt is obtained. Neumann, p. 212.

BITTERNESS, a kind of ſavour or ſenſation, oppoſite to ſweetneſs.

According to Grew, *bitterneſs* is produced by a ſulphur well impregnated with a ſalt, either alcaline or acid, and ſhackled with earth.

Hence it is that the bittereſt plants uſually yield the greateſt quantity of lixivial ſalt; and that many diſtilled oils, digeſted with any ſtrong acid, acquire a bitter taſte. Add, that the leaves of all ſweet roots are bitter; the fig-tree, which bears a ſweet fruit, bleeds a bitter milk; and that the roots of plants, which bear a bitter ſtalk, are not bitter, but hot. That the earthy parts contribute conſiderably to the *bitterneſs* of bodies, appears hence, that moſt bodies of that kind are fixed; or, if they do emit fumes, do not loſe their bitter taſte therewith. Diſc. of Taſte of Plants, cap. iv. § 12.

Bitterneſs, Neumann obſerves, is extracted both by water and ſpirit; does not ariſe in diſtillation; is freed from its ſmell by boiling in water, and covered by acids. He has given the chemical hiſtory of *bitter* VEGETABLES. See his Works.

Mr. Boyle obſerves, that a ſubſtance bitter in the higheſt degree, may be divided into two ſubſtances, the one extremely ſour, and the other inſipid. This happens, when the cryſtals of ſilver are diſtilled by a heat ſufficient to drive away all the ſpirits from the ſilver. What remains is inſipid, and what riſes is highly acid. Works abr. vol. i. p. 541.

The extinguiſhing, or removing of *bitterneſs*, is called DULCIFYING, ſweetening, &c.

M. Bon has given methods of removing, or diſcharging the *bitterneſs* of olives and Indian cheſnuts. Mem. Acad. Sc. 1720. p. 600.

The *bitterneſs* of SEA-water has been ſuppoſed to ariſe from the diſſolution of the beds, or ſtrata of BITUMEN; as its ſaltneſs does from a diſſolution of the ſtrata of ſalt. Ibid. 1710. p. 33.

The qualities of *bitter* bodies are ſuppoſed to be dry, warm, aſtringent, and earthy.

According to Grew, all plants which are *bitter* and pungent, either on the tongue, or in the throat, are good cleanſers, e. gr. daiſy, anagallis, &c. The ſame author adds, that moſt purgative and emetic plants, which have any ſenſible taſte, are *bitter*; either ſimply, as colocynthis; or *bitter* and aſtringent, as aloes, &c.

Bitter things are generally reputed STOMACHIC; yet, according to Abercromby, they are naturally the reverſe, and hurtful to the ſtomach; and only become beneficial to it, where their aſtringency renders them proper. Phil. Tranſ. N° 171. p. 1026.

Bitters are ſaid to reſiſt putrefaction and moderate fermentation: hence appears their uſe in putrid diſorders. *Bitters* likewiſe correct acidities, and aſſiſt digeſtion, by bracing the fibres of the ſtomach.

BITTER *purging ſalt*, *ſal catharticum amarum*. See EPSOM *ſalt*.

BITTER *place*, *locus amarus*, a poor barren ſoil, by Pliny called *terra amara*, *ſive macra*.

BITTER, in the *Sea-language*, denotes a turn of the cable about the bitts, in order to its being veered out by little and little at pleaſure.

A ſhip is ſaid to be brought up to a *bitter*, when ſhe is ſtopped by her cable.

BITTER *end*, is that part of the cable which ſtays within board, wound about the bitts, when the ſhip is at anchor. When they would have that end bent to the anchor, they ſay, bend to the *bitter end*.

BITUMEN, in a general ſenſe, a fatty, tenacious, mineral juice, very inflammable; or a foſſil body, which readily takes fire, yields an oil, and is not ſoluble in water.

The origin of *bitumens* has not yet been aſcertained: ſome ſuppoſe that they belong to the mineral kingdom, and others that they proceed originally from vegetable ſubſtances. Macquer inclines to the latter opinion; though Dr. Lewis, the tranſlator of Neumann's works, diſtinguiſhes between mineral *bitumens* and vegetable reſins.

Naturaliſts diſtinguiſh three kinds of *bitumens*; *hard*, *ſoft*, and *liquid* or *oily*; each of which they ſubdivide into ſeveral ſpecies.

Among the *hard* or *ſolid bitumens* are ranked, yellow amber, ambergris, jet, aſphaltum, piſſaſphaltum, pit-coal, and ſulphurs.—The *ſoft* are maltha, *bitumen* of Calao, and of Surinam.—Laſtly, the naphtha of Italy, and petroleum, are ranked among the *liquid bitumens*.

Of *bitumens*, ſome again are foſſil, others are found floating on the ſurface of certain lakes, and others ſpring from the earth like fountains; as at Pitchford in Shropſhire, &c.—Some *bitumens* are ſo hard, that they are uſed in forges, inſtead of coals: others ſo glutinous, that they ſerve inſtead of cement, or mortar, in buildings; of which kind that was wherewith the famous walls of Babylon were built: and others ſo liquid, that they are burnt in lamps inſtead of oil.

The *bitumen* in moſt eſteem is that of Judea.

From the origin and inflammability of *bitumens*, it appears they bear a near affinity to ſulphurs, and are ſuppoſed both formed of the ſame principles or ingredients; only differing in this, that ſulphurs are harder and more brittle, *bitumens* more fatty and tenacious.

Bitumens are uſually divided into two ſpecies, *liquid* and *ſolid*. Though ſome diſtinguiſh three kinds, as before mentioned.

Dr. Woodward gives a different diviſion of the Engliſh *bitumens*, or bituminous foſſils. The firſt are thoſe of a more lax and coarſe conſtitution; and which, when wetted, yield a groſſer, or pitchy matter. Such are the *lapis piceus*, or pitch-ſtone, the *lapis ampelites*, *obſidianus* or canel, and the *lithanthrax* or coal. The ſecond is of a more denſe and fine conſtitution, and yields an oil: ſuch are the GAGATES, or jet; and SUCCINUM, or amber.

Bitumen is ſuppoſed the chief fuel of the ſubterranean fires.

Many have been fond of ſuppoſing all ſea-water to contain a large quantity of *bitumen*, and that it owes its bitterneſs to this admixture; but this ſeems erroneous, ſince we find that all ſea-water contains a large quantity of bitter purging ſalt of the nature of what is ſold in our ſhops, under the name of *Epſom ſalt*; and its bitterneſs is of the very ſame kind with the taſte of that ſalt.

That there are, however, *bitumens* mixed in ſeveral places with the water of the ſea, is very certain. Barbadoes tar is found floating on the ſea, being waſhed in great quantities from the rocks, and count Marſigli obſerved ſpiral filaments ariſing from the ſurface of the ſea Marmora, near Conſtantinople, which concreted into *bitumen*, exactly of the ſame kind with that he obſerved at Zant, flowing from the ſides of a bituminous mountain.

On ſome of the coaſts of Italy they ſkim off a kind of liquid *bitumen*, or petroleum, from the ſurface of the ſea. Some think that ambergris is a *bitumen* of the ſea, and many travellers tell us of a fatty ſubſtance on the ſurface of it, that gives light in the night. Theſe various ſubſtances may impart various properties to the ſea-water, in ſuch parts where they are found to abound, and they may be common in many places, but they are certainly not found in all, nor is *bitumen* a neceſſary ingredient in ſea-water. Count Marſigli has indeed proved, that a ſpirit diſtils from the moſt common of all *bitumens*. Pit-coal will gave water a bitter taſte, but ſea-water is not yet proved to be impregnated with ſuch a ſpirit. On the contrary, when diſtilled, it has no bitter taſte; therefore marine waters are not impregnated with ſuch a volatile ſpirit, but evidently owe their *bitterneſs* to a fixed principle; and it is very certain, that pit-coal cannot give this taſte, ſince the waters which iſſue out from among the ſtrata of ſea-coal are never found to be bitter, though often ſtrongly impregnated with iron.

All *bitumens* have this good quality in their burning, that they will do without a wick. Dr. Plott therefore conjectures, that the famous ſepulchral LAMPS of the ancients were contrived of theſe *bitumens*, particularly of the liquid kind, becauſe any thing that would require a wick, would be liable to its choaking up, and being deſtroyed.

BITUMEN, in a more particular ſenſe, is reſtrained to the ASPHALTOS, otherwiſe called *bitumen Judaicum*.

BITUMEN *Barbadenſe*; ſee BARBADOES *tar*.

BITUMEN *Hybleanum*, in *Mineralogy*, a name given by Boccone and others to a peculiar ſpecies of bituminous foſſil, which is flexile while in the earth, a property very ſingular in a foſſil not of the talcy kind, as this evidently is not. It is a ſtony ſubſtance, ſmelling like the common *bitumens*, and compoſed of a very great number of thin plates, laid evenly and regularly on one another. It has its name from the place where it is found, which is the Hyblæan mountains of Sicily, near Milelli, neighbouring upon the town of Auguſta and the ancient Megara. When burnt in a candle, the bituminous ſmell is perceived very ſtrong; and the ſtone, though when firſt taken up it be flexible like paper, yet in time hardens, and becomes brittle like other foſſils of that lax conſiſtence. There are found whole hillocks covered with it. This does not prevent their bearing plants and herbage, the roots of the graſs, &c. inſinuating themſelves between the *laminæ* of this ſtone, and getting good nouriſhment there. Phil. Tranſ. N° 100.

BITUMINOUS, ſomething that relates to, or partakes of the nature and qualities of BITUMEN.

All *bituminous* bodies are offenſive to the head. Their ſmell or ſtench makes the EPILEPSY diſcover itſelf.

BIVALVE, or BIVALVULAR, a term uſed by the writers of natural hiſtory, for ſuch ſhell-fiſh as have two ſhells, e. gr. cockles, muſcles, oyſters, &c. which are ſaid to be of the *bivalvular* kind.

Theſe are a leſs numerous claſs than the *univalves*, and have been arranged by an accurate French writer under ſix genera. Theſe are, 1. The OISTERS. 2. The CHAMÆ. 3. The MYTULI, or MUSCLES. 4. The CARDIFORM ſhells. 5. The PECTINES, or ſcallops.

And, 6. The SOLENS, or razor-ſhells. For the characters and ſpecies of each of theſe, ſee their ſeveral heads, OISTERS, &c.

See a deſcription of *bivalve* inſects by Mr. Muller, in the Phil. Tranſ. vol. lxi. part i. Nº 29.

BIVALVE is alſo applied to the *ſiliquæ*, or ſeed-pods, of ſuch plants as open their whole length to diſcharge their ſeeds. Such are peas, beans, &c. which the botaniſts ſay, have *bivalve* or *bivalvular ſiliquæ*.

BIVENTER, from *bis*, and *venter*, *belly*; in *Anatomy*, a denomination given to the ſixth muſcle of the lower jaw; being the laſt of thoſe ſerving to depreſs or open it: thus called, as having two bellies for its two extremities, and a tendon in the middle.—See *Tab. Anat.* (*Myol.*) *fig.* 2. *n.* 2.

The *biventer* or *digaſtricus* has its origin from a ſciſſure between the occipital bone and the maſtoidal *apophyſis*; whence paſſing its tendon through a hole in the *ſtyl-hyoideus*, and an annular ligament of the *os hyoides*, there ariſe ſome fibres, which join its ſecond belly: hence, growing fleſhy, and returning upwards, it is inſerted into the middle of the inferior part of the lower jaw.—By this contrivance it is enabled to draw the jaw downwards.

BIUMBRES, from *bis*, *double*, and *umbra*, *ſhadow*; in *Geography*, an appellation given to the inhabitants of the torrid zone, becauſe, at two different ſeaſons of the year, their ſhadows are projected two different ways.

The *biumbre* are the ſame with thoſe otherwiſe denominated AMPHISCII.

BIXA, in *Botany*, a genus of the *polyandria monogynia* claſs; ANOTTA, by the French called ROUCOU. Its characters are theſe: the flower hath a double ſeries of petals, the outer conſiſting of five, which are large, the inner of the ſame number and ſhape, but narrower. It hath a great number of briſtly STAMINA: in the centre is ſituated an oval *germen*, which afterward becomes an oval heart-ſhaped capſule, covered with ſharp briſtles, opening with two valves, with one cell, and filled with angular ſeeds. We have but one ſpecies of this genus; which muſt be conſtantly kept in a bark ſtove, or they will not thrive in England.

BIZARRE, Fr. denoting *capricious*, &c. a term uſed among *Floriſts* for a particular kind of carnation, which has its flowers ſtriped or variegated with three or four colours.

BIZE, in *Zoology*, a name by which ſome call the PELAMYS, a ſea-fiſh, of the ſhape of the tunny, and reſembling the young brood of that fiſh; but diſtinguiſhable by its wanting ſcales in moſt parts of its body.

BIZOCHI, or BISOCHI, a ſect or branch of religious minorites, condemned by ſeveral popes.

The *Bizochi* were alſo called *fratricelli*, or *fratres de paupere vita*; ſometimes *Bichini*, or *Bicchini*, and BEGUINS. The name is formed from *biſaccus*, on account of a double budget or wallet wherewith they begged their living. See BEGHARDI.

BIZZARRO, or *con* BIZZARIA, in the *Italian Muſic*, ſignifies *with capricious changes*; ſometimes faſt, at others ſlow, ſoft, ſtrong, &c. at the fancy of the compoſer.

BLACK, ſomething opake and porous, that imbibes all the light falling on it, reflects none, and therefore exhibits no colour. See BLACKNESS.

There are various kinds of *blacks*, which paſs in commerce; viz. *blue black*, *dyers black*, *painters black*, *German black*, *ivory black*, *Spaniſh black*, *lamp black*, *Indian black*, &c.

Bodies of a *black* colour are found more inflammable, becauſe the rays of light falling on them are not reflected outwards, but enter the body, and are often reflected and refracted within it, till they be ſtifled and loſt. They are alſo found lighter, *cæteris paribus*, than white bodies, being more porous. It may be added, that cloaths dyed of this colour wear out faſter than thoſe of any other, becauſe their ſubſtance is more penetrated and corroded by the vitriol neceſſary to ſtrike their dye, than other bodies are by the galls and alum which ſuffice for them.

The inflammability of *black* bodies, and their diſpoſition to conceive heat, beyond thoſe of other colours, is eaſily evinced. Some appeal to the experiment of a white and a *black* glove worn in the ſame ſun; the conſequence will be, a very ſenſibly greater degree of heat in the one hand than the other. Others allege the phænomena of burning-glaſſes, by which *black* bodies are always found to kindle ſooneſt. Mr. Boyle gives other proofs ſtill more obvious: he took a large tile, and having whited over one half of its ſuperficies, and blacked the other, expoſed it to the ſummer ſun; where having let it lie a convenient time, he found, that whilſt the whited part remained ſtill cool, the *black* part was grown very hot. For farther ſatisfaction, the ſame author has ſometimes left on the ſurface of the tile a part retaining its native red, and expoſing all to the ſun, has found the latter to have contracted a heat in compariſon of the white part, but inferior to that of the *black*.

So alſo on his expoſing two pieces of ſilk, one white, the other *black*, in the ſame window to the ſun, he often found the latter conſiderably heated, when the former has remained cool. It is obſervable likewiſe, that rooms hung with *black* are not only darker, but warmer than others Boyle's Works abridg. tom. i. p. 144. and tom ii. p. 36.

To all which may be added, that a virtuoſo of unſuſpected credit aſſured Mr. Boyle, that in a hot climate, he had, by carefully blackening the ſhells of eggs, and expoſing them to the ſun, ſeen them thereby well roaſted in a ſhort time.

Dr. Watſon of Cambridge covered the bulb of a thermometer with a *black* coating of Indian ink; in conſequence of which, the mercury roſe ten degrees. Phil. Tranſ. vol. lxiii. part i. p. 40.

Black cloaths heat more, and dry ſooner in the ſun than white cloaths. *Black* is a bad colour for cloaths in hot climates; but a fit colour for the linings of ladies ſummer hats. Dr. Franklin's Experiments, Obſervations, &c. 5th edit. p. 483, & ſeq He obſerves alſo, ibid. p. 3 2, that a chimney painted *black*, when expoſed to the ſun, will draw more ſtrongly.

BLACK, in matters of dreſs, is the diſtinguiſhing habit of church-men and mourners.

Some will have it, that the common people among the Romans were cloathed in *black*; whence the denomination given them of *turba pullata*.

BLACK, in *Heraldry*, is properly called SABLE.

BLACK, in the *Manege*.—A horſe of a deep, ſhining, and lively *black* is called a *black-more*, or *coal-black*. Horſes *black* all over are commonly reckoned dull and melancholy; but a white foot, or ſtar in the forehead, gives them a degree of ſprightlineſs. The Spaniſh gravity is ſaid to be beſt pleaſed with thoſe entirely *black*.

BLACK, *blue*, is the coal of ſome kind of wood, or other vegetable matter: the beſt ſort is ſaid to be made of vine-ſtalks and tendrils.

BLACK, *bone*, is made of the bones of bullocks, cows, &c. well burnt and ground. To be good, it muſt be ſoft and friable, of a gloſſy caſt. It is in conſiderable uſe, though inferior in goodneſs to *ivory black*.

The invention of *bone* or *ivory black* is attributed to Apelles. Plin. Hiſt. Nat. lib. xxxv. cap. 5.

BLACK, *dyers*, is one of the five ſimple and mother colours uſed in DYING; and given differently, according to the different quality and value of the ſtuffs to be dyed.

Green vitriol ſtrikes a *black* colour with vegetable aſtringents, and hence it is the baſis of the *black* dye for cloth, leather, hats, &c. And as ſolutions of iron with galls, &c. produce the ſame colour, a method is derived from hence of diſtinguiſhing the minuteſt portions of iron in mineral waters, &c. Neumann.

For broad cloaths, fine ratines, and druggets, &c. they uſe woad and indigo; the goodneſs of the colour conſiſts in there not being above ſix pounds of indigo to a ball of woad, when the latter begins to caſt its blue flower; and, in its not being heated for uſe above twice.—Thus blued, the ſtuff is boiled with alum, or tartar, then maddered; and, laſtly, the *black* given with galls, copperas, and ſumac.—To bind it, and prevent its ſmearing in uſe, the ſtuffs are to be well ſcoured in the fulling-mill, when white, and well waſhed afterwards.

For ſtuffs of leſs value, it is ſufficient they be well blued with woad, and *blacked* with galls and copperas: but no ſtuff can be regularly dyed from white into *black*, without paſſing through the intermediate blue.

Yet there is a colour called *coal black*, or *Jeſuit's black*, prepared of the ſame ingredients as the former, and ſufficient of itſelf without the blue dye. Here the drugs are diſſolved in water that had boiled four hours, and ſtood to cool till the hand would bear it; then the ſtuff is dipped in it, and again taken out ſix or eight times. Some even prefer this *black* to the other.—This method of dying *black* is ſaid to have been invented by the Jeſuits, and to have been practiſed in their houſes, where they retained numbers of dyers.

By 23 El. c. 9. nothing of the nature of cloth ſhall be maddered for a *black*, except it be firſt grounded with woad only, or with woad and anele [blue ind.] unleſs the madder be put in with ſumac or galls; on pain of forfeiting the value of the thing dyed: provided it ſhall be lawful to dye any manner of *gall black*, and *ſumac black* [*plain black*] wherein no madder ſhall be uſed.

Logwood ſtrikes a *black* with chalybeate ſolutions, and is employed with thoſe liquors for ſtaining wood *black*, as picture-frames, &c. With the addition of galls, it is uſed for dying cloth and hats *black*. Neumann's Works, p. 385. This *black* colour is not permanent, though beautiful, any more than the natural violet dye of the LOG-*wood*.

BLACK, *earth*, is a kind of coal found in the ground, which, well pounded, is uſed by painters in freſco.

There is alſo a kind of BLACK made of ſilver and lead, uſed to fill up the ſtrokes and cavities of things engraved.

BLACK, *German* or *Frankfort*, is made of the lees of wine burnt, then waſhed in water, and ground in mills for that purpoſe, together with ivory or peach-ſtones burnt. This *black* makes the principal ingredient in the rolling-preſs-printers INK. It is ordinarily brought from Frankfort, Mentz, or Straſbourg, either in lumps or powder. That made in France is more valued than that of Germany.

BLACK, *harts*, that which remains in the retort after extracting the ſpirit, ſalt, and oil of hartſhorn. This reſidue being ground up with water, makes a *black* not much inferior to that of ivory.

BLACK, *ivory*, is made of ivory burnt or charred, ordinarily between two crucibles well luted; which, being thus rendered perfectly *black*, and in ſcales, is ground in water, and made into troches, or little cakes, uſed by the painters; as alſo by the jewellers to blacken the bottom or ground of the collets, wherein they ſet diamonds to give them their teint or foil. Some recommend ſoaking the chips or ſhaving of ivory in hot linſeed oil, before it is charred.

There are particular machines and contrivances for burning the *ivory* for theſe purpoſes, by which the colour is rendered more beautiful than that of the coal which remains in the diſtillation. Neumann.

The goodneſs of *ivory black* may be perceived by its fulneſs, without a blue caſt; and by the fineneſs of the powder.

BLACK, *lamp*, or *Lam* BLACK, originally perhaps the ſoot collected from lamps, is generally prepared by melting and purifying reſin or pitch in iron veſſels; then ſetting fire to it under a chimney, or other place made for the purpoſe lined a-top with ſheep ſkins, or thick linen cloth, to receive the vapour or ſmoke, which is the *black*: in which manner they prepare vaſt quantities of it at Paris. In England it is ordinarily prepared from the reſinous and fatty parts of woods, burnt under a kind of tent, which receives it; but the greateſt part is brought from Sweden and Norway, where it is frequently obtained not from pure reſin or pitch, but from the dregs, and pieces of the bark of the tree, ſeparated in preparing them. The droſs left on ſtraining the reſin is burnt for *lamp black*, in a low oven, from which the ſmoke is conveyed by a long paſſage into a ſquare chamber, having an aperture in the top, upon which is faſtened a large ſack. The ſoot concretes partly in the ſack, and partly in the chamber and canal.

It is uſed on various occaſions, particularly in the printers INK; for which it is mixed with oils of turpentine and linſeed, all boiled together.

It muſt be obſerved, that this *black* takes fire very readily, and when on fire, is very difficultly extinguiſhed: the beſt method of putting it out is with wet linen, hay, or ſtraw; for water alone will not do it.

There is a finer and brighter kind of *lamp* or *candle black* procured from the fumes of a lamp or candle, gathered by a proper receptacle placed in manner of a canopy over the luminary, and wiped or bruſhed off; but it is not procured in quantity ſufficient for ordinary uſe.

A glaſs tube cloſely filled with *lamp black* has been found to conduct a conſiderable charge of electricity inſtantaneouſly, and with ſcarce any exploſion. But a coating of this ſubſtance mixed with tar or oil is a perfect nonconductor, and has proved a preſervative from lightning, by repelling the electric matter from thoſe parts of the maſts of ſhips which have been covered with it.

BLACK, *ſoot*, or *chimney*, is a poor colour; but ready for painting *black* draperies in oil. See SOOT.

BLACK, *Spaniſh*, ſo called, becauſe firſt invented by the Spaniards, and moſt of it bought from them; is no other than burnt cork uſed in various works, particularly among painters.

BLACK, *Indian*; ſee *Indian* INK.

BLACK, *curriers*, ſignifies a teint or dye laid on tanned leather; of which there are uſually two; the firſt made of galls, alegre, and old iron; the ſecond of galls, copperas, and gum Arabic. See CURRYING.

BLACK *act*; the ſtatute of 9 Geo. I. c. 22. is commonly called the Waltham *black act*, becauſe it was occaſioned by the devaſtations committed near Waltham in Eſſex, by perſons in diſguiſe, or with their faces *blacked*. By this ſtatute it is enacted, that perſons hunting armed and diſguiſed, and killing or ſtealing deer, or robbing warrens, or ſtealing fiſh out of any river, &c. or any perſons unlawfully hunting in his majeſty's foreſts, &c. or breaking down the head of any fiſh-pond, or killing, &c. of cattle, or cutting down trees, or ſetting fire to houſe, barn, or wood, or ſhooting at any perſon, or ſending letters, either anonymous or ſigned with a fictitious name, demanding money, &c. or reſcuing ſuch offenders, are guilty of felony, without benefit of clergy. This act is made perpetual by 31 Geo. II. c. 42. See farther 6 Geo. II. c. 37. and 27 Geo. II. c. 15. Blackſtone's Comm. vol. iv. p. 144. 208. 232. 244.

BLACK-*berry*, in *Botany*, a ſpecies of the RASP-*berry*.

BLACK-*bird*, *merula*, in *Ornithology*, a bird of the TURDUS or thruſh kind, of which there are ſeveral ſpecies. 1. The common kind, well known in our hedges. 2. The kind called the PASSER *ſolitarius*, or ſolitary ſparrow. 3. The *cæruleus*, of which there are two kinds. 4. The Braſilian *black-bird*, remarkable for the ſhortneſs and crookedneſs of its beak, and for its remarkably beautiful colours. Its tail and wings are black, and the reſt of its body of a fine beautiful deep red. Its legs and feet are black, or of a browniſh grey. Its wing-feathers alſo have ſome ſlight variegations of red. 5. The MERULA *roſea*, or roſe-coloured *black-bird*; this is ſmaller than the common kind, and its back, breaſt, and wings are of a pale red or damaſk roſe-colour. Its wings and tail black. 6. The red-breaſted Indian *black-bird*, called by the Braſilians JACAPU. 7. The *merula torquata*, or ring AMZELL. Beſide theſe there is the MERULA *montana*, or common AMZELL: and the MERULA *bicolor*: and two other birds, called MERULA *congeneres*, deſcribed by Aldrovandus, but not now known. See *Tab. of Birds*, Nº 29, 30.

The muſic of the *black-bird* is not its only valuable quality; for it is a very delicate bird for the table. It builds its neſt in woods, very early in the ſpring, often in March, while the ſnow is on the ground. It generally chooſes the ſtumps of trees, or thick hedges, for the place. The outſide of the neſt is made of dry graſs, ſticks, and the fibres of roots of trees: the inſide is lined with clay, and formed ſo round, that art cannot mend it. They build three or four times in the year, and even oftener than that, if their neſts are taken early from them. The young ones may be eaſily raiſed with any kind of meat. It ſings three or four months in the year: the note is loud, and not very agreeable; but may be much improved by teaching.

BLACK-*books*, a name given to thoſe which treat of NECROMANCY, or, as ſome call it, NIGROMANCY.

The BLACK-*book* of the Engliſh monaſteries was a detail of the ſcandalous enormities practiſed in religious houſes, compiled by order of the viſitors under king Henry VIII. to blacken them, and thus haſten their diſſolution.

BLACK-*canons*, a name given to the regular canons of St. Auguſtine, who wore a *black* mantle over their ſurplice, by way of diſtinction from the *Præmonſtratenſes*.

BLACK-*cap*, in *Zoology*, a name given by the common people of many counties of England to the PEWIT, a bird of the gull-kind.

BLACK-*cap* is alſo the common Engliſh name for the *parus paluſtris*, or marſh-TITMOUSE.

BLACK-*cap*, or *motacilla atricapilla* of Linnæus, is one of the ſmalleſt birds: the crown of the head in the male is black, but in the female of a dull duſt-colour; and they are thus diſtinguiſhed. This is a bird of paſſage. It ſings finely, with a full, ſweet, deep, loud, wild pipe: its ſtrains are ſhort, and motions deſultory. Its notes are ſuperior to thoſe of any of our feathered warblers, the nightingale excepted: and it is therefore called in Norfolk the mock-nightingale.

BLACK-*chalk*; ſee CHALK.

BLACK-*diver*, in *Zoology*, a name given by many to a ſpecies of duck very common about the coaſts of Lancaſhire, Yorkſhire, and ſome other counties, and called more generally the SCOTER. It is all over *black*.

BLACK-*ears*, or black-eared cat; ſee SIGAH *guſh*.

BLACK-*earth*, *terra nigra*, denotes the natural mould or loam. See SOIL, &c.

BLACK-*eunuchs*, in the cuſtoms of Eaſtern nations, are Ethiopians caſtrated, to whom their princes commonly commit the care of their women. See EUNUCH.

BLACK-*eye*, *hypoſphagma*, in *Medicine*, a ſuffuſion of blood on the *tunica adnata* turning livid, occaſioned by a blow. See ECCHYMOSIS.

BLACK-*eye* is alſo a name given to the GERM in BEANS, which the Romans called HILUM.

BLACK-*fryers*, a name given to the DOMINICAN order, called alſo *Predicants* and *Preaching fryers*; in France, *Jacobins*.

BLACK-*game*, in *Zoology*, a common Engliſh name for the *urogallus* or *tetrao minor*, called alſo the GROUSE.

BLACK-*glaſs*; ſee GLASS.

BLACK-*graſs*, a ſpecies of American graſs, growing in meadows which border on tide-rivers, well ſupplied alſo with freſh water; for a mixture both of freſh and ſalt water ſeems to be neceſſary for its prolific vegetation. Its ſeeds are ſmall, like thoſe of tobacco; its colour a deep green; and it affords from three to four tons of hay by the acre. This kind of graſs thrives beſt on a clay or ſtrong loam; nor is the vicinity of ſalt water abſolutely neceſſary. The ſeeds have been lately brought over into England, and diſtributed for trial in proper ſoils.

Black-*jack*, or Blend, is a mineral called alſo *falſe* galena, and blinde, &c.

Black-*land*, in *Agriculture*, a term by which the huſbandmen denote a particular ſort of clayey ſoil, which, however, they know more by its other properties than by its colour, which is rarely any thing like a true *black*, and often but a pale grey. This, however pale when dry, always blackens by means of rains; and when ploughed up at theſe ſeaſons, it ſticks to the plough-ſhares, and the more it is wrought, the muddier and duſkier-coloured it appears. This ſort of ſoil always contains a large quantity of ſand, and uſually a great number of ſmall white ſtones.

Black-*lead*; ſee Lead.

Black-*leather*, is that which has paſſed the curriers hands, where, from the ruſſet as it was left by the tanners, it is become *black*, by having been ſcored and rubbed three times on the grain-ſide with copperas-water.

Black-*legs*, a name given in Leiceſterſhire to a diſeaſe frequent among calves and ſheep. It is a kind of jelly which ſettles in their legs, and often in the neck, between the ſkin and fleſh.

Black-*mail*, a certain rate of money, corn, cattle, or other matter, anciently paid by the inhabitants of towns in Weſtmorland, Cumberland, Northumberland, and Durham, to divers perſons inhabiting on or near the borders, being men of name, and allied with others in thoſe parts, known to be great robbers and ſpoil-takers; in order to be by them freed and protected from any pillage. Prohibited by 43 El. c. 13.

The origin of this word is much conteſted, yet there is ground to hold the word *black* to be here a corruption of *blank* or white, and conſequently to ſignify a rent paid in a ſmall copper coin called *blanks*. This may receive ſome light from a phraſe ſtill uſed in Picardy, where ſpeaking of a perſon who has not a ſingle halfpenny, they ſay, *il n' a pas une blanque maille*.

Black-*monks*, a denomination given to the Benedictins, called in Latin *nigri monachi*, or *nigromonachi*; ſometimes *ordo nigrorum*, the order of *blacks*.

Black-*oats*; ſee Oats.

Black-*proceſſion*, in *Eccleſiaſtical Writers*, that which is made in *black* habits, and with *black* enſigns and ornaments. See Procession.

Anciently at Malta there was a *black-proceſſion* every Friday, where the whole clergy walked with their faces covered with a *black* veil.

Black-*rents*, the ſame with black-*mail*, ſuppoſed to be rents formerly paid in proviſions and fleſh, not in ſpecie.

Black-*rod*.—*Gentleman-uſher of the* Black-*rod*, is the chief gentleman-uſher to the king, called in the black-book, *Lator virgæ nigræ, & haſtiarius*; and elſewhere, *virgæ bajulus*.

His duty is to bear the rod before the king at the feaſt of St. George at Windſor; he has alſo the keeping of the chapter-houſe door, when a chapter of the order of the garter is ſitting; and, in time of parliament, attends the houſe of peers. His badge is a *black-rod*, with a lion in gold a-top. This rod has the authority of a mace: and to his cuſtody all peers queſtioned for any crime are firſt committed.

Black-*row grains*, a ſpecies of iron-ſtone or ore found in the mines about Dudley in Staffordſhire.

Black-*ſands*; ſee Sands.

Black *ſealing-wax*; ſee Wax.

Black-*ſheep*, in the *Oriental Hiſtory*, the enſign or ſtandard of a race of Turkmans ſettled in Armenia and Meſopotamia; hence called the *dynaſty of the black-ſheep*.

Black-*ſtains*; ſee Staining.

Black-*ſtones* and gems, according to Dr. Woodward, owe their colour to a mixture of tin in their compoſition.

Black-*ſtrakes*, a range of planks immediately above the wales in a ſhip's ſide: they are always covered with a mixture of tar and lamp-*black*.

Black-*thorn*, in *Botany*, a ſpecies of the *prunus*. See Plum-*tree*.

Black-*tin*, in *Mineralogy*, a denomination given to the tin-ore when dreſſed, ſtamped, and waſhed ready for the blowing-houſe, or to be melted into metal. Phil. Tranſ. N° 69. p. 2110.

It is prepared into this ſtate by means of beating and waſhing; and when it has paſſed through ſeveral buddles or waſhing-troughs, it is taken up in form of a black powder, like fine ſand, called *black*-tin.

Black-*varniſh*; ſee Varnish.

Black *vegetable juice*; ſee Anacardium.

Black-*whytlof*, in our old writers, bread of a middle fineneſs betwixt white and brown, called in ſome parts *ravel-bread*.

In religious houſes, it was the bread made for ordinary gueſts, and diſtinguiſhed from their houſehold loaf, or *panis conventualis*, which was pure manchet, or white bread.

Black-*work*, iron wrought by the black-ſmith; thus called by way of oppoſition to that wrought by white-ſmiths.

Black *of charcoal*; ſee Charcoal.

Black *Book of the Exchequer*, *Eagle*, *Hellebore*, *Money*, *Order*, *Star*; ſee the ſeveral ſubſtantives.

BLACKING is ſometimes uſed for a factitious black, as lamp-black, ſhoe-black, &c. A mixture of ivory or lamp-black with linſeed oil, makes the common oil *blacking*. For a ſhining *blacking*, ſmall-beer or water is uſed inſtead of oil, in the proportion of about a pint to an ounce of the ivory-black, with the addition of half an ounce of brown ſugar, and as much gum Arabic. The white of an egg, ſubſtituted for the gum, makes the black more ſhining; but is ſuppoſed to hurt the leather, and make it apt to crack.

BLACKNESS, the quality of a black body; or a colour ariſing from ſuch a texture and ſituation of the ſuperficial parts of the body, as does, as it were, deaden, or rather abſorb, the light falling on it, without reflecting any, or very little of it, to the eye.

In which ſenſe, *blackneſs* ſtands directly oppoſed to *whiteneſs*; which conſiſts in ſuch a texture of parts, as indifferently reflects all the rays thrown upon it, of what colour ſoever they be.

Deſcartes, ſays Dr. Prieſtley, though miſtaken with reſpect to the nature of light and colours, yet diſtinguiſhes juſtly between *black* and *white*, obſerving, that *black* ſuffocates and extinguiſhes the light that falls upon it; but that *white* reflects them. This, adds the hiſtorian of philoſophy, is the firſt diſtinct account I have met with of this ſenſible hypotheſis. Hiſt. of Viſion, p. 127 and 143, &c.

Sir Iſaac Newton, in his Optics, ſhews, that for the production of *black* colours, the corpuſcles muſt be leſs than thoſe which exhibit any other colours; becauſe, where the ſizes of the component particles are greater, there is too much light reflected to conſtitute this colour: but, if there be a little leſs than is requiſite to reflect the white, and very faint blue of the firſt order, they will reflect ſo little light, as to appear intenſely black; and yet may, perhaps, reflect it variouſly to and fro within them ſo long, till it happen to be ſtifled and loſt; by which means they will appear *black* in all poſitions of the eye, without any tranſparency.

And from hence it appears, why fire, and putrefaction, by dividing the particles of ſubſtances, turn them black: why ſmall quantities of *black* ſubſtances impart their colours very freely, and intenſely, to other ſubſtances, to which they are applied; the minute particles of theſe, by reaſon of their very great number, eaſily overſpreading the groſs particles of others. Hence alſo appears, why glaſs, ground very elaborately with ſand, on a copper plate, till it be well poliſhed, makes the ſand, together with what by rubbing is worn off from the glaſs and copper, become very black; and why black ſubſtances do, ſooneſt of all others, become hot in the ſun's light, and burn (which effect may proceed partly from the multitude of refractions in a little room, and partly from the eaſy commotion of ſuch very ſmall particles): alſo, why blacks are uſually a little inclined towards a bluiſh colour; for, that they are ſo, may be ſeen by illuminating white paper with light reflecting from black ſubſtances, where the paper will uſually appear of a bluiſh white; and the reaſon is, that black borders on the obſcure blue of the firſt order of colours; and therefore reflects more rays of that colour than of any other.

BLACKS, *Negroes*: a people, ſo called from the colour of their ſkin.—For the reaſon of their colour, and the commerce of them, ſee Negro.

Blacks, is alſo a name given to an aſſociation of diſorderly, and ill-deſigning perſons, formerly herding chiefly about Waltham in Eſſex, who deſtroyed deer, robbed fiſh-ponds, ruined timber, &c.—See Black *act*.

BLADDER, in *Anatomy*, a thin expanded membranous body, found in ſeveral parts of an animal, ſerving as a receptacle of ſome juice, or of ſome liquid excrement; from whence it takes various denominations, as *urine-bladder*, *gall-bladder*, &c.

Bladder, by way of eminence, is a large veſſel, which ſerves as a receptacle of the urine of animals, after its ſecretion from the blood in the kidneys.

This is ſometimes alſo called, by way of diſtinction, the *urinary bladder*, *veſica urinaria*.

The *bladder* is ſituated in the *pelvis* of the *abdomen*; in men immediately on the *rectum*; in women, on the *vagina uteri*: its figure in quadrupeds reſembles a pear, with the baſis upwards; but in human bodies the lower part is almoſt on a level with the upper; and its orifice, or neck, placed ſideways, while the *fundus*, or bottom, which in a human bladder is very broad, reſts either on the *rectum*, or the *vagina uteri*.—It is faſtened to the navel by the *urachus* degenerated into a ligament, its ſides to the umbilical arteries, and its neck to the *inteſtinum rectum* in women.

The *bladder* is compoſed of three coats; the firſt a covering of the *peritonæum*; the ſecond conſiſts of muſcular fibres, which run irregularly ſeveral ways; and the third, which is full of wrinkles for facilitating its dilatation, is both glandulous and nervous.—Its glands ſeparate a viſcous and ſlimy matter, which defends the *bladder* from the acrimony of the ſalts in the urine. Around its neck there goes a ſmall muſcle, called *ſphincter veſicæ*, which contracts the orifice of the *bladder*, to prevent the urine from dripping involuntarily, or till it thruſt open the paſſage, by the contraction of the ſecond coat of the *bladder*, which is therefore called *detruſor urinæ*.

Though the urinary *bladder* be naturally ſingle, yet there have been inſtances of nature's varying from herſelf in this particular. The *bladder* of the famous Caſaubon, upon diſſecting his body after his death, was found to be double; and, in the Philoſophical Tranſactions, we have an account of a triple *bladder* found in the body of a gentleman, who had long been ill, and no one could gueſs the cauſe.

As to the figure and ſituation of the human *bladder*, Mr. Weitbrecht has given a better deſcription of them than is to be met with in the common ſyſtems. Vid. Med. Eſſ. Edinb. Phil. Tranſ. N° 280. p. 1211.

The diſeaſes to which the *bladder* is ſubject are ulcers, wounds, deſcents or ruptures, preternatural contents, particularly ſtones and gravel, *ſchirrhus*, palſies, inflammations of its neck, &c. To theſe diſeaſes may be added incontinence of urine.

The internal membrane of the *bladder* has been known to come away with the urine, without any great danger. Mr. Rohault gives an account, in the Memoirs of the Academy of Sciences, of a patient he had, who, after a very violent ſtoppage of urine, voided with ſome pain a piece of a membrane of an inch ſquare. Three or four days afterwards, the patient felt ſomething again obſtruct the paſſage; and as it came nearer the end of the *urethra*, he at length took hold of it, and drew out a larger piece of the ſame ſort of membrane. Some time after this, in ſtraining violently in diſcharging his urine, he voided three other ſuch pieces, which together, according to Mr. Rohault's judgment, could not make leſs than two thirds of the internal membrane of the whole *bladder*; and in effect it was plain, that, in the courſe of the diſeaſe, the whole internal membrane had gradually detached itſelf from the external one, and made its way out by the *urethra*. After the whole was thus diſcharged, the urine found no ſtoppage; and it is evident, that what had before ſtopped its paſſage, was no other than the pieces of this membrane falling before, or blocking up the *urethra*. The pieces of the membrane, when examined, appeared to have all their blood-veſſels in their natural ſize; and the urine, in the whole courſe of the diſeaſe, having never been tinged with blood, is a proof, that the membrane detached itſelf naturally, not by violence. The patient, after this, was wholly cured of his complaint; but had a ſmall incontinence of urine attending him, which was plainly owing to the ſphincter's having been weakened, by being, as well as the *bladder*, diveſted of its membranes. Mem. Acad. Scienc. 1714.

The operations performed on the *bladder* are chiefly ſection, and extraction of the ſtone; to which may be added injection, dilatation, the application of lithontriptics, diuretics, &c. Phil. Tranſ. N° 236. p. 15, ſeq. where Hippocrates's aphoriſm, that the ſections of the *bladder* are always mortal, is defended; and the beſt method of extracting the STONE out of the *bladder*, eſpecially in women, is ſhewn to be by a gradual dilatation of the *urethra*. See alſo Hiſt. Acad. Scienc. ann. 1720. p. 33. where the great impediments to the diſſolution of the STONE in the *bladder* by lithontriptics, are repreſented to be the medicine's not continuing long enough in the *bladder*, and its being altered by the urine.

The urinary *bladders* of brutes are differently contrived from the human *bladder*, and from each other, according to the ſtructure, œconomy, and manners of living of each creature.

Birds are uſually ſaid to be without *bladders*, as being without urine; yet does not this hold univerſally; ſince, in an oſtrich diſſected by the French academy, a *bladder* was found ſituate at the extremity of the *rectum*, big enough to hold both fiſts, and in it eight ounces of urine.

Many have alſo denied a *bladder* of urine to fiſhes; but the more exact obſervers find this part in all, at leaſt, the greater part of the fiſhy kind. Phil. Tranſ. N° 178. Tortoiſes, Ariſtotle obſerves, have large *bladders*, and they need ſuch; ſince being covered with a thick ſhell, and having no pores or perſpirative veſſels whereby to carry off their moiſture, it is retained within them, and accumulated in the *bladder* of urine.

In the lion, the *bladder* is ſmall, as is the kidney; for that creature rarely drinks; inſomuch that Albertus affirms the female does not ſuckle her young, as having no milk.

Bladders, when below a certain magnitude, are more uſually denominated by the diminutive veſicles, *veſiculæ*. Of theſe we meet with many ſorts both in the animal and vegetable world; ſome natural, as in the lungs, eſpecially of frogs, and as ſome alſo imagine, in the muſcles; others morbid or preternatural, as the *hydatides*, and thoſe obſervable in the itch. Naturaliſts have alſo diſcovered *bladders* in the *thorax* and *abdomen* of birds, as well as others in the belly of fiſhes, called *air-bladders* and *ſwims*.

Vegetable *bladders* are found every-where, in the ſtructure of the bark, the fruit, pith, and *parenchyma*, or pulp; beſides thoſe morbid ones raiſed on the ſurface of leaves by the puncture of inſects.

BLADDER, *ſwimming*; ſee AIR-*bladder*.

BLADDERS, *oil*, in the anatomy of plants; ſee OIL-*bladders*.

BLADDER-*puceron*; ſee PUCERON.

BLADDER-*nut*, *ſtaphylæa*, in *Botany*, a genus of the *pentandria trigynia* claſs. Its characters are theſe: the empalement is concave, coloured, and ſo large as to encloſe the flower, which has five oblong erect petals, and a pitcher-ſhaped concave *nectarium*, at the bottom of the flower, with five oblong erect ſtyles terminated by ſingle ſummits, and a thick *germen* divided in three parts, ſupporting three ſtyles to which there are obtuſe ſtigmas contiguous. The *germen* afterward becomes two hard almoſt globular ſeeds, included in three bladders, joined by a longitudinal ſeam, with an acute point, opening within. There are two ſpecies; the *bladder-nut* with winged leaves; and, the *bladder-nut* with trifoliate leaves, or three-leaved Virginian *bladder-nut*. See *Tab.* I. *of Botany*, *Claſs* 21.

The firſt makes a pretty variety, when intermixed with others; though the flowers are not very beautiful. The nuts of this tree being hard and ſmooth, are ſtrung for beads by the Roman catholics in ſome countries; and the children of the poor inhabitants eat the nuts, though they have a diſagreeable taſte.

It is ſaid that from the ſeeds is expreſſed an oil having a reſolvent virtue.

BLADDER-*nut*, *African*; ſee ROYENA.

BLADDER-*nut*, *laurel-leaved*; ſee HOLLY.

BLADDER-*ſena*; ſee SENA.

BLADE, in *Botany*, that part of the flower, or florid attire of a plant, which ariſes out of the concave of the ſheath, and, at the top, uſually divides into two parts, which are covered with globules of the ſame nature as thoſe of the *apices*, but not ſo copious.

The *blade* runs through the hollow of the ſheath and baſe, and is faſtened to the convex of the ſeed-caſe, having its head and ſides beſet with globules, which, through a glaſs, appear like turnip-ſeeds, and which, in ſome plants, grow cloſe to the *blade*, and in others adhere to it by little pedicles, or foot-ſtalks. Theſe globules, as the *blade* ſprings up from within the ſheath, are ſtill rubbed off, and ſo ſtand like a powder on both. In ſome plants, as knap-weed, they ſeem alſo to grow on the inſide of the ſheath, as appears on ſplitting it with a pin. The head of a *blade* is divided uſually into two; but ſometimes, as in the cichory, into three parts, which, by degrees, curl outward, like ſcorpion-graſs. Grew's Anat. of Plants, lib. i. c. 5. § 20. lib. iv. c. 4. § 5.

BLADE, in *Anatomy*; ſee SHOULDER-*blade*.

BLADE, in *Commerce*, a thin, ſlender piece of metal, either forged by the hammer, or run and caſt in moulds, to be afterwards ſharpened to a point, edge, or the like. Sword-*blades* are made by the armourers, knife-*blades* by the cutlers, &c.

The Engliſh and Damaſcus *blades* are moſt eſteemed. Among the French, thoſe of Vienne in Dauphiny have the preference.

The conditions of a good *blade* of a ſmall ſword are, that it be light and tough, apter to bend than break. When it will ſtand in the bend, it is called *a poor man's blade*.

BLADE *of a chiſſel*, is the iron or ſteel part, as diſtinguiſhed from the wooden handle.

BLADE *of mace*, or cinnamon, among apothecaries, are little ſlips or ſlices of thoſe barks.

BLADE *of an oar*, is the flat part, which is plunged into the water in rowing. On the length of this does the force and effect of the oar, in a great meaſure, depend.

Blade *of a ſaw*, the thin part wherein the teeth are cut, which, to be good, muſt be ſtiff, yet bend equally into a regular bow all the way, without yielding more in one place than another.

Blade-*mill*, is that contrived for grinding iron tools, as ſithes, reaping-hooks, axes, chiſſels, and the like, to a bright edge.

BLADUM, in *Middle Age Writers*, is taken for all ſort of ſtanding corn in the blade and ear. The word is alſo written *blatum*, *blava*, and *blavium*.

In our old charters, the word *bladum* included the whole product of the ground, fruit, corn, flax, graſs, &c. and whatever was oppoſed to living creatures.

The word *bladum* was ſometimes alſo applied to all ſorts of grain or corn threſhed on the floor: *tria quarteria frumenti, tria quarteria avenarum, & unum quarterium fabarum, erunt quieti de ſolutione prædicti bladi in perpetuum.*

But the word was more peculiarly appropriated to bread-corn, or wheat, called in French *blé*.

Thus the knights Templars are ſaid to have granted to ſir Wido de Meriton's wife *duas ſummas bladi*. Kennet's Paroch. Ant. and Du-Cange.

BLÆRIA, in *Botany*, a genus of the *tetandria monogynia* claſs of plants.

BLÆSUS, among *Medicinal Writers*, the ſame with *balbus*.

Dr. Holder calls the letters F and Th *bleſe*, on account of the difficulty multitudes find of pronouncing them. Elem. Speech, p. 52.

The word is alſo uſed to denote an irregularity in the figure of the limbs, eſpecially the legs, when bent outwards.

BLAIN, a diſtemper incident to beaſts, conſiſting in a bladder growing on the root of the tongue againſt the wind-pipe, which at length ſwelling, ſtops the breath.

It comes by great chafing, and heating of the ſtomach; whereby, as ſome judge, it ſtill grows, and increaſes by more heat.

It is perceived, by the beaſt's gaping, holding out his tongue, and foaming at the mouth: to cure it, caſt the beaſt, take forth his tongue, and then ſlitting the bladder, waſh it gently with vinegar and a little ſalt.

BLAISE, a military order inſtituted by the kings of Armenia, in honour of St. Blaiſe, anciently biſhop of Sebaſta in that country, the patron ſaint of that nation.

Juſtinian calls them *knights of St. Blaiſe and St. Mary*, and places them not only in Armenia, but in Paleſtine.

They made a particular vow to defend the religion of the church of Rome, and followed the rule of St. Baſil.

The preciſe year of the inſtitution of the *knights of St. Blaiſe* is not known; but they appear to have commenced about the ſame time with the knights Templars, and Hoſpitallers; to the former of which they bore a near affinity, the regulars being the ſame in both.

BLAKEA, in *Botany*, a genus of the claſs of *dodecandria monogynia*.

BLANC; ſee Blank.

Blanc-*manger*, Fr. q. d. *white food*, is a preparation of diſſolved iſinglaſs, milk, ſugar, cinnamon, &c. boiled into a thick conſiſtence, and garniſhed for the table with blanched almonds. It is cooling and ſtrengthening.

Blancs *manteaux*, a name originally given to the *Servites*, or ſervants of the Bleſſed Virgin, on account of their white cloaks; but ſince applied to divers ſorts of religious, who have ſucceſſively inhabited the houſe of the *Servites*, and now to the Benedictines at Paris, though habited in black.

BLANCA, in *Medicine*, denotes a lenitive compoſition, formerly much in uſe; ſo called either from its white colour, or becauſe of its purging white, i. e. phlegmatic humours. There were three ſorts; a great, middle, and leaſt *blanca*.

Blanca *mulierum*, among the *Chemiſts*, ſignifies ceruss.

BLANCARDS, a name given to certain linen cloth, thus called, becauſe the thread uſed to weave them, has been half blanched or bleached before it was uſed. They are manufactured in Normandy, particularly in the places which are in the diſtrict, or under the juriſdiction of Pont-Audemer, Bernay, and Liſieux.

BLANCH *fermé*, or Blank *farm*, a *white farm*, that is, where the rent was to be paid in ſilver, not in cattle.

In ancient times, the crown rents were many times reſerved to be paid in *libris albis*, called *blanch firmes*: in which caſe the buyer was holden *dealbare firmam*; viz. his baſe money or coin, worſe than ſtandard, was melted down in the exchequer, and reduced to the fineneſs of ſtandard ſilver; or inſtead thereof he paid to the king 12*d*. in the pound, by way of addition. Lowndes on Coin, p. 5.

BLANCHE *carte*; ſee Carte.

BLANCHERS, a name given to mechanics employed in blanching, i. e. the art or manner of bleaching or whitening.

BLANCHING, in *Gardening*, is an operation performed on certain ſallads, roots, &c. as of celery, and endives, to render them fairer and fitter for the table. See Apium, and Endive.

Blanching alſo denotes the operation of covering iron plates with a thin coat or cruſt of tin. See Latten.

Blanching *of copper* for ſale, in imitation of ſilver; or mixing blanched copper with ſilver; or expoſing the ſame to ſale; or any malleable compoſition or mixture of metals or minerals heavier than ſilver, and which looks, and touches, and wears like gold, but is manifeſtly worſe than ſtandard, is made felony, 8 and 9 W. III. &c. 26.

Blanching *of wax*; ſee Wax.

Blanching, in *Coinage*, the operation of preparing the pieces before ſtriking, to give them the requiſite luſtre and brightneſs.

The *blanching*, as now practiſed, is performed by nealing or heating the pieces in a kind of pan or ſhovel, with a wood-fire, in manner of a reverberatory furnace, ſo that the flame paſſes over the ſhovel. The pieces being ſufficiently heated, and cooled again, are put ſucceſſively to boil in two copper pans, wherein are *aqua fortis*, common ſalt, and tartar of Montpellier; when they have been well-drained of this firſt water in a copper ſieve, they throw ſand and freſh water over them; and when dry, they are well-rubbed.

The ancient method of *blanching* was, by putting the pieces, after heating, in a large veſſel of common water, and ſome ounces of *aqua fortis*; but in different proportions for gold and ſilver.—The method is now diſuſed, partly by reaſon of its expenſiveneſs, and partly becauſe it diminiſhes the weight of the metal.

BLANK, or Blanc, in a general ſenſe, ſignifies white; and Blancus, or Blanca, is more particularly uſed for a kind of white, or ſilver money, of baſe alloy, coined by Henry V. in thoſe parts of France then ſubject to England, valued at 8*d*. ſterling. They were forbidden by his ſucceſſor to be current in this realm. In ſome ancient charters they are called *ſolidi blanci*, *white ſhillings*.

Blank alſo denotes a ſmall copper coin, formerly current in France, at the rate of five deniers Tournois.

They had alſo great *blanks*, or pieces of three *blanks*, and others of ſix, in reſpect whereof the ſingle ſort were called little *blanks*; but of late they are all become only monies of account.

Blank, or Blank-*ticket*, in lotteries, that to which no prize is allotted.

The French have a game, under the denomination *blanque*, anſwering to our lottery.

Blank, in *Coinage*, a plate, or piece of gold, or ſilver, cut and ſhaped for a coin, but not yet ſtamped. See Coining.

Blank, in *Zoology*, a name given by authors to a ſpecies of the cod-fiſh, called *gelbe*, *kolmulen*, and *aſellus flaveſcens*.

Blank-*bar*, in *Law*, is uſed for the ſame with what we call a *common bar*, and is the name of a *plea in bar*, which in an action of treſpaſs is put in to oblige the plaintiff to aſſign the certain place, where the treſpaſs was committed.

Blanks, in judicial proceedings, certain void ſpaces ſometimes left by miſtake. A blank (if ſomething material be omitted) in a declaration, abates the ſame: and ſuch a *blank* is a good cauſe of demurrer.

Blank-*verſe*; ſee Verse, and Rhyme.

Blank, *point*; ſee Point *blank*.

BLANKET, in *Commerce*, a warm woolly ſort of ſtuff, light and looſe woven; chiefly uſed in bedding.

The manufacture of *blankets* is chiefly confined to Witney in Oxfordſhire, where it is advanced to that height, that no other place comes near it. Some attribute a great part of the excellency of the Witney *blankets* to the abſterſive, nitrous water of the river Windruſh, wherewith they are ſcoured; others rather think they owe it to a peculiar way of looſe ſpinning, which the people have thereabouts. Be this as it will, the place has engroſſed almoſt the whole trade of the nation for this commodity; inſomuch, that the wool fit for it centers here, from the furthermoſt parts of the kingdom. Plott, Hiſt. Oxf. chap. 9. § 163.

Blankets are made of felt-wool, i. e. wool from off ſheep-ſkins, which they divide into ſeveral ſorts.

Of the head wool, and bay wool, they make *blankets* of twelve, eleven, and ten quarters broad; of the ordinary and middle ſort, *blankets* of eight and ſeven quarters broad; of the beſt tail wool, *blankets* of ſix quarters broad, commonly called *cuts*, ſerving for ſeamen's hammocks. See Hykes.

BLANKET, *toſſing in a*, a ludicrous kind of puniſhment, of which we find mention in the ancients, under the denomination *ſagatio*. Martial deſcribes it graphically enough. *Ibis ad excuſſo, miſſus ad aſtra, ſago.*

A late writer repreſents it as one of Otho's imperial delights. But this is turning the tables; that emperor's diverſion, as related by Suetonius, was not to be the ſubject, but the agent in the affair; it being his practice to ſtroll out in dark nights, and where he met with a helpleſs, or drunken man, to give him the diſcipline of the *blanket*.

BLANQUILLE, a ſmall ſilver coin, equivalent to about 1½*d.* ſterling, current in Morocco, and on the coaſts of Barbary.

BLAPSIGONIA, a kind of diſeaſe, or defect in bees, when they neglect, or fail to produce young, being wholly employed in making honey.

The word is Greek, compounded of *βλαπτω*, *I hurt*, and *γονη*, *brood* or *iſſue*.

BLARE, a ſmall copper coin, containing a little mixture of ſilver, ſtruck at Bern, and valued at much the ſame with the RATZE in other places.

BLAS, a novel term, in the Helmontian philoſophy, denoting the local, and alterative motion of the ſtars; from whoſe influence proceed changes of weather, ſeaſons, ſtorms, and the like.

In imitation of this *blas ſtellarum*, the ſame author framed another in animals, either natural, whereby each *viſcus* is framed, according to the model of its particular; or voluntary, which is directed to motion by the will.

BLASIA, in *Botany*, the name of a genus of plants belonging to the claſs of *cryptogamia algarum*, approaching to the nature of the *lichens*; the characters of which are theſe: the male flower has a cup compoſed of one leaf, which is oval at the baſe, ſomewhat cylindric in the middle, and expanded and truncated at the top; in this are contained a number of looſe granules, which ſeem to perform the office of *apices*, and contain the *farina fœcundans*. The female flower has ſcarce any cup, but produces a ſingle roundiſh fruit, uſually immerſed in the leaves; in this are contained certain round bodies, which appear to be ſeeds. Linnæus is much in doubt, whether theſe flowers are not to be underſtood a contrary way, and ſeems to ſuſpect, that what are called female flowers are really male ones; and what are called male, female.

BLASPHEMY, *blaſphemia*, or *blaſphemium*, in *Middle Age Writers*, denotes ſimply the blaming, or condemning of a perſon, or thing.

The word is Greek, *βλασφημια*, from *βλαπτω*, *lædo*.

Among the Greeks, *to blaſpheme*, was to uſe words of evil omen, or that portended ſomething ill, which the ancients were careful to avoid, ſubſtituting in lieu of them other words of ſofter and gentler import, ſometimes the very reverſe of the proper ones.

BLASPHEMY is more peculiarly reſtrained to evil or reproachful words ſpoken of the Deity. Auguſtin ſays, *Jam vulgo blaſphemia non accipitur niſi mala verba de Deo dicere.*

According to Lindwood, *blaſphemy* is an injury offered to God, by denying that which is due and belonging to him; or attributing to him what is not agreeable to his nature.

By the Moſaic law, *blaſphemy* was puniſhed with death. Levit. chap. xxiv. ver. 13—16. As alſo by the civil law. Novel. 77. In Spain, Naples, France, and Italy, the pains of death are not now inflicted. In the empire, either amputation, or death, is made the puniſhment of this crime.

By the canon law, *blaſphemy* was puniſhed only by a ſolemn penance; and by cuſtom, either by a pecuniary or corporal puniſhment. By the Engliſh laws, *blaſphemies* of God, as denying his being, or providence, and all contumelious reproaches of Jeſus Chriſt, &c. are offences by the common law, and puniſhable by fine, impriſonment, and pillory. And, by the ſtatute law, he that denies one of the perſons in the Trinity, or aſſerts there are more than one, or denies Chriſtianity to be true, for the firſt offence, is rendered incapable of any office; for the ſecond, adjudged incapable of ſuing, being executor or guardian, receiving any gift or legacy, and to be impriſoned for three years. 9 and 10 W. III. c. 32.

According to the law of Scotland, the puniſhment of *blaſphemy* is death. The firſt ſpecies thereof conſiſts in railing at, or curſing God, and here the ſingle act conſtitutes the crime. The ſecond conſiſts in denying the exiſtence of the Supreme Being, or any of the perſons of the Trinity; and therein obſtinately perſevering to the laſt. For reiterated denial does not fully conſtitute the crime, becauſe the ſtat. of Charles II. 1661, admits of repentance before conviction, as a complete expiation. This ſtatute of 1661, is ratified by a ſtatute of king William, whereby the calling in queſtion the exiſtence of God, or of any of the perſons of the Trinity, or the authority of Scripture, or the Divine Providence, is made penal. For the firſt offence, impriſonment, till ſatisfaction given by public repentance in ſack-cloth. For the ſecond, a fine of a year's valued rent of the real eſtate, and twentieth part of the perſonal eſtate. And the trial in both theſe caſes is competent to inferior judges. The trial of the third offence is death, to be tried only by the juſtices.

BLASPHEMY *againſt the Holy Ghoſt*. Divines are not agreed with reſpect to the nature of the crime thus denominated, Matthew, chap. xii. ver. 31. and the grounds of the extreme guilt aſcribed to it. Dr. Tillotſon maintains, that it conſiſted in maliciouſly attributing the miraculous operations which Chriſt performed by the power of the Holy Ghoſt to the devil. Vol. ii. ſerm. xvii. But Dr. Whitby, with greater probability, refers it to the diſpenſation of the Holy Ghoſt, which commenced after our Lord's reſurrection and aſcenſion; and thoſe were guilty of the crime, who perſiſted in their unbelief and blaſphemed the Holy Ghoſt, repreſenting him as an evil ſpirit. The crime was unpardonable, becauſe it implied a wilful oppoſition to the laſt and moſt powerful evidence which God would vouchſafe to mankind, and precluded the poſſibility of a recovery to faith and repentance. Whitby's Fourth Appendix to the Goſpel of St. Matthew, in his Paraphraſe, vol. i. p. 268.

BLAST, *flatus*, in the *Military Art*, a ſudden compreſſion of the air, cauſed by the diſcharge of the bullet out of a great gun.

The *blaſt* ſometimes throws down part of the embraſures of the wall.

BLAST is alſo applied, in a more general ſenſe, to any forcible ſtream of wind, or air; excited by the mouth, bellows, or the like.

BLAST is alſo uſed in *Agriculture* and *Gardening*, for what is otherwiſe called a BLIGHT.

Blaſts differ from MILDEWS, *rubigines*.

The SMUT of corn is a ſpecies of *blaſt*.

Blaſts, or *blaſtings*, are by ſome ſuppoſed owing to cold; by others, to the want of a due ſupply of ſap; by others, to aſcending fumes of the earth; by others, to ſharp winds and froſts, immediately ſucceeding rains. Phil. Tranſ. Nº 44.

That ſpecies called *uredines*, or *fire-blaſts*, is ſuppoſed by Mr. Hales owing to the ſolar rays reflected from, or condenſed in the clouds, or even collected by the denſe ſteams in hop-gardens, and other places. Ibid. Nº 399.

The effect of them is to wither, ſhrivel, ſcorch, turn black, and, as it were, burn up the leaves, bloſſoms, and fruits of trees, ſhrubs, herbs, graſs, corn, even for whole tracts of ground.

Phyſicians alſo ſpeak of a kind of *blaſts* affecting human bodies, and cauſing ERYSIPELAS, PALSIES, &c.

BLASTS, among *Miners*; ſee DAMPS.

BLASTED, ſomething ſtruck with a BLAST.

Among the Romans, places *blaſted* with lightning were to be conſecrated to Jupiter, under the name of BIDENTALIA, and PUTEALIA.

It was alſo a ceremonial of religion to burn *blaſted* bodies in the fire.

BLASTING, among *Miners*, a term for the tearing up rocks, which they find in their way, by gun-powder. The method of doing which is this; they make a long hole, like the hollow of a large gun-barrel, in the rock they would ſplit; this they fill with gun-powder, then they firmly ſtop up the mouth of the hole with clay, except a touch-hole, at which they leave a match to fire it. A ſmall quantity of powder does great things this way.

BLASTOLOGY, from βλαστος, *bud*, and λεγω, *I gather*; the regular and ſtated pruning of VINES.

BLASTUM *moſylitum*, in the *Materia Medica*, a term uſed by ſome writers to expreſs the *caſſia lignea*, or caſſia bark, when not peeled off from the branches, but kept with the wood within it; this was a common way of collecting and preſerving, not only this bark, but the cinnamon, and many others.

BLATTA, in *Natural Hiſtory*, a genus of inſects of the order of *hemiptera* in the Linnæan ſyſtem, the characters of which are, that the head is inclined, the *antennæ* are ſetaceous, the wings are membranaceous, the *thorax* is flat, orbiculated, and marginated, the feet are formed for running, and there are two ſmall horns above the tail. There are ſeveral ſpecies.

It is likewiſe the name of a ſpecies of beetle, called by Columna SCARABÆUS *teſtudinatus*.

BLATTA, in *Middle Age Writers*, denotes a purple in the wool or ſilk, dyed with the liquor of the fiſh of the BLATTA.

This was otherwiſe denominated *blatta ſerica*, or *blatto ſericum*; whence alſo *blattiarius*, uſed in ancient writers for a dyer in purple.

BLATTA, according to ſome writers, was alſo uſed for the KERMES inſect; and, according to others, for the purple-worm. But both of theſe acceptations are ſuſpicious.

We know that it was anciently uſed for a kind of moth, or fly, whoſe fat was reputed excellent for the ears. See BOOK-*worm*.

BLATTA, *byzantina*, in *Phyſiology* and *Pharmacy*, a teſtaceous body, being the *operculum*, or lid of a turbinated ſhell, whoſe fiſh yields a purple dye.

The *blatta* differs from the lid of the *buccinum*, or *purpura*, in figure; the firſt being oblong, the latter round: but in the ſhops they are ordinarily confounded, and ſold for each other. The *blatta byzantina* is alſo confounded by apothecaries with the UNGUIS ODORATUS, from which it ought to be diſtinguiſhed, as belonging to another kind of ſhell-fiſh.

Dr. Liſter takes the *blatta byzantina* to have ſucceeded the UNGUIS ODORATUS, and to have been brought into the ſhops in its place. In Dioſcorides's time, the beſt was brought from the Red ſea, viz. the paleſt and fatteſt; the blacker and leſs from Babylon, or the Perſian gulph: but, it ſeems, latter times took up with thoſe found about Conſtantinople; whence the preſent ſhop-*blatta* had its name.

The name *blatta* ſeems to have been given to this *operculum* from the colour; as being of a dark hair-colour, as the common *blatta piſtinaria*, or *bakehouſe beetle*, ſo frequent in London, is.

The *blatta byzantina*, when exhibited internally, renders the body ſoluble, ſoftens the ſpleen, and diſcuſſes peccant humours. When uſed externally, by way of fumigation, it reſtores epileptic patients, and women-labouring under a ſtrangulation of the *uterus*. In other diſorders its effects are the ſame with thoſe of moſt other teſtaceous ſubſtances.

BLATTARIA, in *Botany*; ſee MULLEIN.

BLAZE, in the *Manege*; ſee STAR.

BLAZING-*ſtar*; ſee COMET.

BLAZON, or BLAZONRY, in *Heraldry*, the art of deciphering the arms of noble houſes; or of naming all the parts in their proper and particular terms.

Various etymologies are given of the word *blazon*: the moſt probable is that which derives it from the German *blaeſen*, *to blow a horn*; it being the cuſtom of thoſe who preſented themſelves at the liſts in the ancient tournaments to blow a horn, to notify their coming. After this the heralds ſounded their trumpets, and then *blazoned* the arms of thoſe who preſented themſelves; deſcribed them aloud, and ſometimes expatiated on the praiſes, and high exploits, of the perſons who bore them.

There is this difference between *arms* and *blazon*; that the firſt are the device or figures borne on the coat, or ſhield; and *blazon*, the deſcription thereof in words.

The rules of *blazon* are, 1. To name the metal or colour of the field firſt: as, *or*, *argent*, or *gules*, &c. 2. To name the manner of the diviſion of the eſcutcheon by line, whether downright or bendwiſe, and alſo the difference of the line, whether it be indented, ingrailed, &c. in the next place. 3. Then to name the charge that is on the field. 4. Having thus expreſſed the field, the diviſion, and the charge, if there be more parts of the field occupied by the charge than one, you are to name the principal part of the field firſt. 5. If there be more than one kind of charge in a field, that in the chief part is to be named firſt. 6. To uſe no iteration or repetition of words, in *blazoning* a coat, eſpecially of any of theſe four words, *of*, *or*, *and*, *with*. 7. The three forms of *blazon* are by metals and colours, by precious ſtones, and by the celeſtial planets: the firſt for private gentlemen; the ſecond for perſons ennobled with titles, as dukes, earls, &c. and the third for emperors, kings, and princes. Though this variety of form is rejected by the French, from whom we had our heraldry, and by all other nations, who uſe none but metals and colours for all degrees. 8. That metal upon metal, and colour upon colour, is falſe heraldry: which admits of no exception, except in the arms of Jeruſalem, which are, argent, a croſs potent between four croſlets, or.—Add, that when lions ſtand upright in a coat, they are called *rampant*; when walking forward, *paſſant*; when they look you in the face, *paſſant guardant*: in other poſtures they have other terms, as *ſaliant regardant*, &c. Wolves and bears are termed after the manner of lions; griffons (inſtead of *rampant* and *ſaliant*) are termed *ſegreant*; lions, griffons, and eagles, are alſo ſaid to be *langued* and *armed*; ſwans, *membred*; hawks, *jeſſed* and *belled*; cocks, *armed*, *creſſed*, and *jowlped*: that is, when the tongues, bills, and claws of ſuch creatures are found of different colours from the body.—When an animal proceeds from the bottom of the ordinary, it is termed *iſſuant*; when over ſome ordinary, *jeſſant*; and if it proceed from the middle of any ordinary, or common charge, *naiſſant*.

BLEA, in vegetables, is that part of a tree, which lies immediately under the bark, and between that and the hard wood, and is the firſt progreſs of the alteration of the bark into wood by the natural growth and ſtrengthening of the fibres.

While the *blea* remains yet ſoft, and retains ſomething of the nature of bark, it may maintain a feeble vegetation; but when it is grown abſolutely hard and woody, it can contribute nothing to the growth of the tree. The vegetation of the young branches of trees is the moſt lively and vigorous, and the only one that goes as far as the flowers and fruit, becauſe theſe branches are little elſe but bark.

BLEACHING, or BLANCHING, the art of whitening linens, ſtuffs, ſilks, and other matters.

BLEACHING *of ſilk*.—While it is yet raw, it is put into a thin linen bag, and thrown into a veſſel of boiling river-water, wherein ſoap has been diſſolved, then boiled two or three hours, and the bag being turned ſeveral times, it is taken out, beaten and waſhed in cold water, ſlightly wrung out, and thrown into a veſſel of cold water, mixed with ſoap and a little indigo: the indigo gives it the bluiſh caſt always obſerved in white ſilks. After taking it out of the ſecond veſſel, it is wrung out, and all the water and ſoap expreſſed, ſhook out to untwiſt and ſeparate the thread, and hung up in the air, in a kind of ſtove made on purpoſe, wherein is burnt ſulphur; the vapour whereof gives the laſt degree of whiteneſs to the ſilk.

BLEACHING *or ſcouring of woollen ſtuff*.—There are three ways of whitening woollens; the firſt with water and ſoap; the ſecond with vapour of ſulphur; the third with chalk, indigo, and vapour of ſulphur.

For the firſt, the ſtuffs being taken from the fulling-mill, are put into ſoaped water a little warm, and worked afreſh by force of arms over a bench, which finiſhes the whitening the fulling-mill had begun; and laſtly, waſhed out in clear water and dried; this is called *the natural way of bleaching*.

In the ſecond method, they begin with waſhing the ſtuff in river-water: it is then laid to dry on poles, and, when half dry, ſpread out in a kind of ſtove well cloſed, wherein is burnt ſulphur; the vapour whereof diffuſing itſelf, ſticks by little and little over all the ſtuff, and gives it a fine whitening: this is commonly called *bleaching by the flower*.

In the third method, after the ſtuffs have been waſhed, they are thrown into cold water impregnated with chalk and indigo; after they have been well agitated here, they are waſhed afreſh in clear water, half dried on poles, and ſpread in a ſtove to receive the vapour of the ſulphur: which finiſhes the operation. This is not eſteemed the beſt method of *bleaching*, though agreeable enough to the ſight.

It may be here obſerved, that when a ſtuff has once received the ſteam of ſulphur, it will ſcarce receive any beautiful dye but black or blue.

BLEACHING *of hollands or fine linens*.—After taking them from the loom, they are ſteeped a day in fair water, waſhed out and cleared of their filth, and thrown into a bucking-tub filled with a cold *lixivium*, or lie of wood-aſhes and water. When taken out of the lie, they are waſhed in clear water, ſpread in a meadow, and watered, from time to time, with water from little dikes, or canals, along the ground, by means of ſcoops, or hollow peels of wood, called by the Dutch, who pretend to be the inventors of them, *gieters*. After lying a certain time on the ground, they are paſſed through a new lie, poured on hot, and again waſhed in clear water, and laid a ſecond time on the ground, and every thing repeated as before; then paſſed through a ſoft gentle lie, to diſpoſe them to reſume the ſoftneſs which the other harſher lies have taken from them, waſhed in clear water, ſoaped with black ſoap, and that ſoap again waſhed out in clear water: they are then ſteeped in cow's milk, the cream being firſt ſkimmed off, which finiſhes their whitening and ſcouring, gives them a ſoftneſs, and makes them caſt a little knap: when taken out of the milk, they are waſhed in clear water for the laſt time. After all this proceſs, they give the linen its firſt blue, by paſſing it through a water wherein a little ſtarch, and ſmalt, or Dutch *lapis lazuli*, have been ſteeped.—Laſtly, the proper ſtiffneſs and luſtre is given with ſtarch, pale ſmalt, and gums, the quantity and quality whereof may be adjuſted according to occaſion.

In fine weather, the whole proceſs of *bleaching* is completed in a month's time; in bad weather it takes up ſix weeks, or more.

In ſome parts of France, ARUM, or WAKE-*robin*, is uſed in *bleaching*, being ſuppoſed by its corroſive quality to diſſolve unctuoſities, and make the linen white. It was uſed alſo for STARCH before the diſcovery of that from wheat; and was ſaid to cauſe a ſoreneſs of the hands hardly relievable by ointments. Neumann.

BLEACHING *of coarſe linens.* They are taken from the loom, and laid in wooden frames, full of cold water; where, by means of wooden hammers, worked by a water-mill, they are beat, ſo as to waſh and purge them of their filth; then ſpread on the ground, where the dew, which they receive for eight days, takes off more of their impurity; then put into a kind of wooden tubs or pans, with a hot lie over them. Thus lixiviated, they are again purged in the mill, laid afreſh on the ground, and after eight days more, paſſed through a ſecond lie, and all things repeated, till ſuch time as they have acquired their juſt degree of whiteneſs.

The proceſs of *bleaching* in Scotland differs in ſome particulars from that above deſcribed, and uſed in France, &c. The following is an abſtract. The linens are folded up, in diſtinct pieces, depoſited in a wooden veſſel, and covered with warm water, or equal parts of water and lie: a wooden cover is laid over them to preſs them down: when the fermentation begins, bubbles of air riſe to the ſurface of the liquor, and there form a kind of pellicle or ſcum; when this begins to ſubſide, which generally happens in the ſpace of thirty-ſix or forty-eight hours, the linen is taken out, well rinſed, waſhed in a mill, and ſpread on a field to dry. As ſoon as it is thoroughly dry, it is fit for bucking. For this purpoſe a mother-lie is prepared of 30lb. of blue, and as much white pearl aſhes, 200lb. of Marcoſt aſhes, or 300lb. of caſhub, and 300lb. of Muſcovy aſhes, all well pounded, and boiled for a quarter of an hour in a large copper, containing about 126 Scots gallons of water. This liquor is left to ſettle, and is then uſed for preparing the bucking-lie: two gallons of this, with 2lb. of ſoft ſoap, are mixed with thirty-eight gallons of water: this lie, made blood-warm, is poured on the linens, previouſly diſpoſed in a large wooden veſſel: after a ſhort interval, the liquor is drawn off and heated again to a greater degree, and poured on the linen as before; which proceſs is repeated ſeveral times, till at laſt the lie is thrown on boiling hot. When this is done, the linens are ſpread on the graſs, and watered ſeveral times in the courſe of forty-eight hours: this proceſs of bucking and watering is repeated from ten to ſixteen times or more, and the lie is gradually made ſtronger from the firſt to the middle bucking, and weakened in the ſame manner to the laſt. The next operation is that of ſouring, which is performed by pouring ſuch a quantity of butter milk or ſour milk, or inſtead of this, ſour liquor made with bran or rye-meal and water, as is ſufficient to cover and well-moiſten the linen, which is put in rows into a large veſſel, and kept down by a lid full of holes, and prevented from riſing. A fermentation takes place in this part of the proceſs, which laſts five or ſix days, and when the ſcum formed by the aſcending air-bubbles begins to ſubſide, the linen ſhould be taken out, rinſed, mill-waſhed, and then waſhed with ſoap and water. Theſe ſeveral operations are repeated in ſucceſſion, till the linen is ſufficiently whitened; after which it is blued, ſtarched, and dried. In *bleaching* coarſe cloths, boiling is uſed inſtead of bucking; and they are ſoured with warm water and bran.

Inſtead of the acid of milk, Dr. Home recommends for this purpoſe water acidulated with ſpirit of vitriol, in the proportion of half an ounce, or at moſt three quarters of an ounce to a gallon. This proceſs is much quicker than the other, requiring only as many hours as the other requires days. Home's Exper. on Bleaching.

The method uſed for *bleaching* coarſe cloths in Scotland, is like that practiſed in Ireland for both fine and coarſe. Perſons appointed by the truſtees for improving the hempen and flaxen manufactures in Scotland, may enter into any bleach-yard, back-houſe, &c. and ſearch all rooms, and the boilers therein, and view the lees, and refuſe and dregs thereof, to ſee whether there have been any lime, pigeons-dung, or ſoap-dregs, uſed in the *bleaching* of linen cloth or yarn, contrary to the ſtatute, 13 Geo. I. c. 26. § 16.

Lime, or pigeons-dung, are not to be uſed in *bleaching* and whitening of linen, 10 Ann, c. 21.

Lime-water prohibited in *bleaching* is made either of ſhell-lime, or of ſtone-lime; the former is ſtronger than the latter, and more powerful on the human *calculus*; and Dr. Home diſcovered by experiment, that it was likewiſe more efficacious in *bleaching* linen. It whitens more, but weakens more, and extracts more out of the cloth. He concluded from his experiments, that it ought to be conſidered as the moſt expeditious, but at the ſame time as the moſt dangerous material for *bleaching* yet known. In the courſe of his experiments, this remarkable phænomenon occurred, that though LIME and LIME-*water* preſerve many animal ſubſtances in a ſound ſtate; yet mixed with alcalies, it produced a lie corroſive with reſpect to animals; but the effects on linen were juſt the reverſe, LIME-*water* was corroſive, and alcalies in proportion to their quantity weakened its corroſive power; inſomuch that he judged that a mixture of one part of lime with four of pure alcali, might be ſafely uſed in *bleaching*.

For BLEACHING *of hair*, ſee HAIR.

For BLEACHING *of wax*, ſee WAX.

BLEAK, in *Ichthyology*, a name given by us to the fiſh called by authors the ALBURNUS and *albula*. According to the new ſyſtem of Artedi, it is a ſpecies of the CYPRINUS. The French call it the ABLETTE.

BLEB, a ſmall bliſter or BUBBLE.

Naturaliſts have obſerved ſmall purple *blebs* on all the plants of the *hypericum* kind. Phil. Tranſ. Nº 274.

Thick pieces of glaſs, fit for large optic glaſſes, are rarely to be had without *blebs*. Ibid. Nº 4.

BLECTINUM, in *Botany*, a genus of plants of the claſs of the *cryptogamia filices*; the fructifications of which are diſpoſed in parallel lines on the ſides of the leaves.

BLEEDING, PHLEBOTOMY, an operation in chirurgery; being the opening of a vein with a lancet, for the evacuation of corrupt, or redundant blood.

Some phyſicians extol *bleeding* as the ſureſt, and moſt efficacious ſpecies of evacuants. Yet it was very rare among the ancients, however frequent among the moderns.—Oſtenſius obſerves, that at Rome perſons of quality are not allowed to be let blood, even in the moſt dangerous diſeaſes, without leave from the pope.

The *hippopotamus* is ſaid to have firſt taught men the uſe of *bleeding*: for that animal, being overcharged with blood, rubs itſelf againſt a pointed bulruſh, and opens a vein; till finding its plenitude diſcharged, it welters in the mire to ſtanch the blood again.

Bleeding is a ſpecies of evacuation of the utmoſt importance in medicine; an idea of its effects, with the reaſon of its uſe, may be conceived from what follows.

It is evident the blood thrown out of the heart, while it ſtrikes upon the antecedent blood, and drives it forwards, transfers to it part of its own motion, and it is therefore ſo much retarded in its own motion. Hence, if blood be drawn out of the baſilic vein of the right arm; the ſucceeding blood, or that carried by the axillary artery, or right ſubclavian, will be leſs hindered in its motion, than it was before that vein was opened: for part of the blood being taken away by the opening of that vein, there remains behind a leſſer quantity in the axillary vein, or leſs is contained between the farther extremity of the axillary artery and the heart, than was before: therefore the blood being let out by the vein, the remainder in the artery will be leſs impeded in its motion than before.

Hence the blood of that artery which communicates with the vein that is opened, will flow with a greater velocity after the aperture is made than before. Conſequently, while the blood is flowing out of the vein in the arm, that thrown out of the heart into the *aorta*, will find leſs reſiſtance in the aſcending trunk, than in the deſcending; and will therefore flow faſter in the aſcending, than in the deſcending trunk: and thence too it will find leſs reſiſtance in the right ſubclavian artery than in the left.

Laſtly, it hence appears, that the blood being let out of a vein in the right arm, the remaining blood in the right axillary artery runs with a greater velocity into the artery of that arm that is contiguous to it, than through the thoracic artery, or the right ſcapulary, which is likewiſe contiguous to it; becauſe, when the blood is not ſuppoſed to be drawn out from any vein correſponding to the thoracic artery, or into which this diſcharges itſelf, there is proportionably a greater impediment to the motion of the blood in the thoracic artery, than in that of the arm. But becauſe the velocity of the blood in the ſubclavian artery, or the right axillary, is greater than in the left; the velocity in the right thoracic will alſo be greater than in the left thoracic artery. Hence it is manifeſt, that the blood being let out of a vein in the right arm; the greateſt velocity of the remaining blood will be in the artery of that arm, becauſe it immediately empties its blood into the vein that is opened; and the next greateſt velocity will be in the thoracic artery, or ſcapulary of the ſame ſide, going out from the axillary artery. But the velocity of the blood will be far leſs in the brachial, axillary, and thoracic artery on the left and oppoſite ſide; and leaſt of all in the arteries ariſing from the deſcending trunk of the *aorta*.

On this view it may eaſily be gathered, what is to be done in the ſeveral circumſtances of blood-letting: for inſtance, if we would prevent the increaſe of any humour from the blood ſtagnating in the left leg, or bring it about, that as little blood as poſſible ſhould flow to that leg in any given ſpace of time; firſt, blood is to be taken from the arm or leg of the right ſide: becauſe this is truly making what is called a *revulſion*.

Again, if blood be drawn away on the ſame ſide, and from ſome vein that receives the blood from a branch of that trunk which tranſmits it to the ſwelled part; it will occaſion a greater derivation of blood to that limb for a few moments: and this is all that can make any difference between the different parts from which the blood is drawn.

As to what relates to the whole habit; in all lentors and viſcidities, if there be a due ſtrength and elaſticity remaining in the ſolids, PHLEBOTOMY will make the remaining blood circulate the faſter, and become thinner and warmer; but in a *plethora*, from a debauch, or too large quantities of ſpirituous nouriſhment, or from a diminution of perſpiration, where the blood yet retains its natural fluxility, PHLEBOTOMY will make the remaining maſs circulate ſlower, and become cooler.

In the former caſe, a diminution of the reſiſtance in the blood-veſſels, will increaſe the contractile powers of thoſe veſſels, and make them beat faſter, and circulate their contents with greater velocity; but in the latter caſe a diminution of the quantity of a ſpirituous blood will leſſen the quantity of ſpirit ſecreted in the brain, the conſequence of which will be, that the heart and arteries will not contract ſo often nor ſo ſtrongly as before, and therefore the blood will move ſlower, and become cooler. And on theſe things depend the whole doctrine of blood-letting.

Bleeding, according to Dr. Pringle, is the moſt indiſpenſible of all remedies in inflammatory diſeaſes; to the delaying of which too long, or not repeating it, are chiefly owing the bad conſequences of colds, as dangerous fevers, rheumatiſms, and conſumptions. He obſerves farther, that, in general, young practitioners are apt to be too ſparing in letting blood, by which means many lives are loſt: for a ſurgeon may be aſſured a ſoldier will never complain of a cough, or pains with inflammatory ſymptoms, wherein *bleeding* is not neceſſary; and from the ſizineſs of the blood, and continuance of the complaints, he is to judge of the neceſſity of repeating it, which, in caſe of a ſtitch, or difficult breathing, is never to be delayed. In inflammatory caſes, from twelve to fifteen ounces may be taken for the firſt *bleeding*, and ſomewhat leſs for all the reſt; and when it is neceſſary to exceed this quantity, it may be proper to follow Celſus's rule, in minding the colour of the blood whilſt it flows, and when it is of a blackiſh caſt, which is always the caſe in difficult breathing and great inflammations, to let it run till it becomes more florid. In all caſes where plentiful *bleeding* is indicated, it is beſt to do it in bed, to prevent fainting; and we may obſerve, that a perſon will bear the loſs of a much greater quantity of blood if the ſtream is ſmall, than by a large orifice, which ſome have thought neceſſary for making a more ſpeedy revulſion.

Bleeding is highly neceſſary in the *phrenitis*, *ophthalmia*, quinſey, rheumatiſm, cough, hectic fits, and, in general, in all inflammatory caſes. See Pringle's Obſervations on the Diſeaſes of the Army, *paſſim*.

It is to be obſerved, however, that, in malignant and putrid diſorders *bleeding* frequently renders them more malignant; it is therefore to be omitted, or at leaſt not repeated unleſs there appear evident marks of inflammation. See MALIGNANT *fever*, BILIOUS *fever*, DYSENTERY, &c.

As to the method of the operation, the puncture ſhould neither be too ſmall nor too large. Different ſurgeons open the vein in three different directions: ſome make the orifice in a ſtraight line with the courſe of the vein; others tranſverſely; but moſt make it obliquely: and if the patient is to be blooded in the left arm, the ſurgeon ſhould be able to uſe his left hand, inſtead of his right.

If the blood ſtops after a ſmall time, looſen the BANDAGE a little, to give way to more blood's deſcending by the artery, and it will bleed freſhly again; and if the orifice be obſtructed by too great a tenſion of the ſkin, or an intruſion of the *membrana adipoſa*, the piece of fat ſhould be returned by preſſing with the finger, or a bit of ſponge, and the ſkin relaxed by bending the arm; and, laſtly, if the orifice be obſtructed by thick grumous blood, that impediment may be removed by wiping with a ſponge dipped in warm water.

When a ſufficient quantity of blood is diſcharged, the ligature muſt be immediately taken off, and the ſkin about the orifice gently ſtroaked or preſſed together by the two fore-fingers of the left hand; by which means, the lips of the divided vein are cloſed: then the ſmaller of the two compreſſes is to be applied, firſt letting what little blood there may be between the orifice and the vein be diſcharged; the larger compreſs ſhould then be laid on the ſmaller, and preſſed ſlightly down with the thumb: then wiping the blood from the arm, the bandage is to be applied. Some wet the compreſſes in vinegar, water, or ſpirit of wine; but it is not neceſſary, and they ſit eaſieſt when applied dry.

In *bleeding* it ſometimes happens that an artery is opened either inſtead of, or together with, the vein: an accident of this kind is attended with the utmoſt danger. An artery is known to be wounded when the blood ſpins out very forcibly from the orifice, and that by ſtarts or leaps, not in an even ſtream, and extends itſelf in a greater arch from the orifice to the baſon. The colour of the blood from an artery is alſo much more florid than from a vein; to which add, that, on preſſing the finger on the veſſel below the orifice, the blood ſtarts out more violently than before; and ſtops, or at leaſt abates, on preſſing above the orifice; quite the contrary of what happens on the opening a vein.

In an accident of this kind, the ſurgeon ſhould have preſence of mind not to betray the caſe, by his fears, to the patient, or attendants: he ſhould obſerve whether the blood flows freely from the orifice, or whether it inſinuates itſelf in any conſiderable quantity between the integuments. If the firſt is the caſe, he muſt take a large quantity of blood away, even till the patient faints, perſuading the attendants that the heat of the blood requires it; and while the patient is in his fainting fits, as the flux then ceaſes, he may commodiouſly dreſs and bind up the wound; and by this precaution hinder a freſh hæmorrhage or an aneuriſm. The ſurgeon muſt place ſome ſmall piece of money between the folds of the firſt compreſs; and on this place two, three, or more compreſſes, each larger than the other: and then, bending the *cubitus*, apply two bandages in this manner, as after bleeding in the vein, only a little tighter; and lay a thick, long, and narrow compreſs over the artery, from the *cubitus* to the *axilla*: and the patient muſt be warned to wear his arm in a ſling, pinned to his cloaths, for a fortnight, and refrain from all uſe of it.

If the blood from the wounded artery is found to inſinuate itſelf between the integuments, the orifice muſt be immediately compreſſed, and tied up as before directed; and the arm often inſpected, to ſee whether a bleeding within the integuments does not yet continue. The patient muſt be frequently bled in the other arm, and, if a large quantity of blood ſhould be lodged from the wounded artery under the integuments, it will be neceſſary to open the integuments to diſcharge it.

It is too common an accident to find a nerve or tendon punctured in *bleeding*; and this is generally known to be the caſe by the patient's making a ſevere outcry at the time; and eſpecially if he complains afterwards of acute pains, and the limb begins to ſwell and be inflamed, convulſed, ſtiff, and extended as in the cramp: which ſymptoms, if not timely relieved, threaten convulſions of the whole body, a gangrene of the part, and even death in a ſhort time.

The beſt method to be taken in theſe accidents is, to firſt bathe the part with a mixture of oil of turpentine and ſpirit of wine, and then inveſt the whole arm with the diachalciteos plaſter, melted down in oil of vinegar and roſes, retaining it on by the expulſive bandage; which, beginning upon the hand, aſcends gradually by ſpiral turns to the top of the ſhoulder; by which means the impulſe of the blood on the part is not only much abated, but alſo the pain and inflammation much diminiſhed: and, laſtly, the following cataplaſm ſhould be applied to the arm, to complete the cure: take of flour of barley and of bitter vetch, of each two ounces; chamomile flowers and melilot flowers, of each two handfuls; freſh butter, an ounce and half: boil theſe into a cataplaſm with ſoap ſuds, and apply them to the arm till the pain and other bad ſymptoms are removed. Heiſter.

BLEEDING *in the hand*.—There are two principal veins in the hand, which are ſometimes opened to bleed the patient: the one is the *ſalvatella*, which runs on the outſide of the back of the hand towards the little finger. This was called *ſplenica* by the ancients, and they eſteemed the opening it particularly ſerviceable in melancholy, and diſeaſes of the ſpleen. The other is the *cephalica*, which runs betwixt the thumb and fore-finger, and was ſo denominated from an opinion, that the *bleeding* from it was particularly ſerviceable in diſeaſes of the head; but theſe opinions were all without foundation; and though the patient is bled more difficultly and ſlowly in theſe veins, the effect is the ſame as if bled in the arm. It is ſometimes, however, neceſſary for a ſurgeon to open them, either at the particular deſire of the patient, or when the veins of the arm are very obſcurely ſituated, or lie deep, while theſe lie fair and conſpicuous.

When any one is to be blooded in the hand, it muſt firſt be held for a conſiderable time in warm water, and well rubbed there with the other hand, in order to make the ſmall veins become turgid and conſpicuous; then a ligature is to be fixed on the wriſt, that the veins may continue thus diſtended, and wiping the hand dry with a napkin, an orifice is to be made in the moſt convenient part of the vein, as in *bleeding* in the arm. If the blood does not flow freely from the orifice, the hand muſt be again plunged into warm water, and kept there, till the quantity taken away is judged ſufficient; then the hand is to be wiped dry, and the orifice covered with a compreſs, defended by a proper BANDAGE. Heiſter.

Bleeding *in the head.*—Many phyſicians have been of opinion, that *bleeding* from the veins of the forehead and temples is more expeditious in giving relief in diſorders of the head, than the like diſcharge by veins more remote from the part affected. There ſeems, however, to be but little foundation for this, and that the *bleeding* by the jugular vein would much more expeditiouſly anſwer the end propoſed. If the ſurgeon, however, is called upon to perform this operation, he muſt firſt draw a handkerchief or neck-cloth as tight round the neck as can be conveniently borne, that by compreſſing the jugular vein, thoſe branches of it may become more turgid and conſpicuous. The vein being opened, the patient muſt hold down his head, that the blood may not trickle down into his eyes or mouth, when the ſtream does not ſpin out with ſufficient force. If the blood does not ſtop of itſelf, after a ſufficient quantity is diſcharged, you muſt compreſs the orifice with a finger, and, after wiping the forehead and face, apply a compreſs or two, with the proper bandage.

Bleeding *in the eyes.*—There are ſeveral ways of performing this operation, but the beſt ſeems to be this. The patient being ſeated on a chair, and his head held in a proper poſture, a tranſverſe inciſion is to be made, with a fine lancet, upon the turgid ſmall veins in the corners of the eye, ſo as to open them or cut them quite aſunder. The eye-lids muſt be held apart with one hand, whilſt the veins are opened with the other; and ſome uſe a pair of fine ſciſſars for this purpoſe, inſtead of a lancet, and others elevate the veins with a crooked needle before they divide them: but in this operation the better way would be to make the needles with edges, that when the veins were thus elevated, they might divide them without the help of any other inſtrument. When the inciſion is made, the diſcharge of blood muſt be promoted by means of fomentation, with a ſpunge dipped in warm water; and if the diſcharge is not ſufficient, the inciſion may be repeated two or three times: but few patients can be brought to ſuffer this, and there is no practiſing it at all upon infants, becauſe they will not keep the eye ſteady. Heiſter.

Bleeding *in the neck.*—It has been a very ancient practice to bleed in the external jugular veins of the neck for moſt inflammatory diſorders of the adjacent parts. The accumulated blood and humours may certainly be thus diſcharged from the parts, and the operation is no way difficult or dangerous; ſince the jugular veins run on each ſide the neck from the head to the clavicles, juſt under the ſkin. They are very large, and eaſily opened; but a ſtricture is firſt to be made on the lower part of the neck with a handkerchief, or the like ligature. The beſt method of raiſing this vein is, however, by a looſe ligature thrown over the neck, which the patient, or an aſſiſtant, may pull downward over the breaſt; and by this means the jugular veins will be compreſſed on each ſide, and become turgid, without occluding the *trachea*, or obſtructing perſpiration. When the veins are thus made turgid, whichever of them lies the faireſt, may be ſecured by the finger for inciſion, if the diſorder affects the whole head; but if only one ſide be affected, it is beſt to open the jugular on that ſide.

When the proper quantity of blood is taken, cloſe the orifice, and apply a proper compreſs and bandage. The common fear of this vein's *bleeding* afterwards is ill-grounded, and there ſeldom is any difficulty of ſtopping the blood. The patient commonly faints away in *bleeding*; but this occaſions no harm. Heiſter.

Bleeding *in the ranulæ.*—It is often found of ſervice in quinſies and other inflammatory diſorders of the neck, to bleed in two ſmall veins, which run under the tip or end of the tongue, eſpecially if a larger vein has been before opened in the neck or arm. To bleed in theſe veins, a ſtricture muſt be made upon the neck; the *apex* of the tongue muſt be then elevated with the left hand, while with the other the veins are both opened, firſt one, and then the other, by the lancet. When they have bled ſufficiently, remove the ſtricture from the neck, on which the *bleeding* uſually ſtops of itſelf; but, if it does not, let the patient take a little vinegar, or red wine, in his mouth, or elſe apply a bit of vitriol, or alum, or a compreſs dipped in ſome ſtyptic liquor, till the hæmorrhage ceaſes. But there is no need of being too buſy with theſe topics; for the blood never flows violently, or long, without them; and if there be not a good quantity of blood diſcharged by theſe veins on the occaſions for which they are uſually opened, the operation is of no uſe. Heiſter.

The bramins never bleed, but, in lieu thereof, faſt.

Bleeding *at an artery* is called ARTERIOTOMY.

Bleeding *by meaſure*, is where account is taken of the quantity as it flows from the vein, in order to put a ſtop to the flux when the requiſite portion is had.

Bleeding *at large*, where the flux is continued without regard to the quantity, till ſuch time as ſome expected effect is perceived. This method is ſometimes uſed in caſes of apoplexies, comata, &c.

Bleeding *of a corpſe, cruentatio cadaveris*, is a phænomenon ſaid to have frequently happened in the bodies of perſons murdered, which, on the touch, or even approach of the murderer, began to bleed at the noſe, ears, and other parts; ſo as formerly to be admitted in England, and ſtill allowed in ſome other parts, as a ſort of detection of the criminal, and proof of the fact. Phil. Tranſ. N° 77. p. 3012. But this kind of evidence derives its weight merely from ſuperſtition and credulity.

Numerous inſtances of theſe poſthumous hæmorrhages are given by Webſter, Lemnius, Libavius, and eſpecially Horſtius, who has a diſcourſe expreſs on the point, under this title, De Cruentatione Cadaverum.

Bleeding is alſo applied, in a leſs proper ſenſe, to a flux of SAP out of the wounded veſſels of plants, either ſpontaneouſly at certain ſeaſons, or by art, and the help of inciſion.

BLEMISH, a term in *Hunting*, uſed when the hounds, or beagles, finding where the chaſe has been, make a proffer to enter, but return.

BLEMMYES, or **Blemyes**, among the *Ancient Geographers*, a fabulous ſort of people, ſuppoſed without heads; having eyes and mouths on their breaſts; ſaid to have inhabited part of Æthiopia.

Bochart derives the word *Blemmyes* from בלי, which implies a *negation*, and מוח, *brain:* in which ſenſe the *Blemmyes* ſhould have been people without brains.

BLENCH, a ſort of tenure of land; as to hold land in *blench* is by payment of a ſugar-loaf, a couple of capons, a beaver-hat, &c. if the ſame be demanded in the name of *blench*, i. e. *nomine albæ firmæ*.

BLEND, **Blende**, or **Black-*Jack***, is a mineral called alſo *falſe galena*. See BLIND.

Blend-*metal iron*, a coarſe ſort of iron from the Staffordſhire mines, uſed for making nails and heavy ware; in ſome places alſo for horſe-ſhoes.

Blend-*water*, a diſtemper incident to black cattle, and comes ſeveral ways, 1. From blood. 2. From the yellows, which is a ringleader of all diſeaſes. And, 3. From change of ground; for being hard, it is apt to breed this evil, which if not remedied in ſix days, will be paſt help.

BLENNA, **Blena**, βλεννα, μυξα, κορυζα, in Hippocrates, is a thick phlegm and mucus flowing from the brain through the noſtrils, and ſhewing ſigns of a beginning concoction; as Galen explains him in ſeveral parts of his works.

BLENNIUS, in *Ichthyology*, the name of a genus of fiſh of the general order of the ACANTHOPTERYGII, according to the diſtribution of Artedi, and of the *jugulares* in the Linnæan ſyſtem. The name is derived from the word βλεννα, which ſignifies a tough and mucous matter, ſuch as that which the body of this fiſh is covered with. The characters of this genus are, that the membrane of the gills has ſix bones; the fore-part of the head is very ſlanting; the body is prickly; and the belly-fins have two bones. Of this genus there are ſeveral ſpecies, as the creſted *blennius*, or *galerita*, with a triangular lobe red at the edges, and ſituated between the eyes, and a cuticular creſt running tranſverſely over the head; the *gattorugine*, or *blennius*, with two little fins at the eyes, and twenty-three bones in the *pinna ani*; the *gunnellus Cornubenſium*, *liparis*, or *butter-fiſh*, with about ten black ſpots, and a white border on each ſide of the back-fin; the *pholis*, or ſmooth-headed *blennius*, called in Cornwall *mulgranoc*, and *bul-card*; the viviparous *blennius*, &c. But the name *blennius*, and *blennus*, is uſually appropriated to that with a furrow between the eyes, and a large beautiful ſpot, black in the middle, and edged with white, in the back-fin; and on this account called in Engliſh the *butterfly-fiſh*. It is common in the Mediterranean, and is ſold in Venice and elſewhere for the FABER. The fleſh is very ſoft. See *Tab. of Fiſh*, N° 16. Willughby, p. 131.

Blennus is alſo a name given by ſome authors, particularly Schonfeldt, to the SYNGNATHUS *corpore hexagono, cauda pinnata*; the ACUS of Ariſtotle; and *acus ſecunda* of other writers; called alſo by Geſner and Bellonius, TYPHLE *marina.* It is a name uſed alſo by ſome for the tobacco-pipe fiſh.

BLESENSIS *bolus, bole of Blois,* in the *Materia Medica,* a very valuable medicinal earth dug about Saumur, Blois, and Bourgoyne in France, and ſeeming to poſſeſs all the virtues of the Armenian bole of Galen, which it alſo much reſembles in external appearance.

It is a very valuable medicine in fluxes and many other caſes, and might be had in any quantities, at a ſmall price; but the common red French bole, or a counterfeit of it, or the ſubſtance called BOLE *Armenic,* is generally ſold for it.

BLESTRISMUS, from βληστριζω, *I toſs,* derived from βαλλω; in the *Ancient Phyſic,* a continual toſſing and inquietude of the body, occaſioned by a tumultuary effervеſcence of the blood, eſpecially in acute fevers.

BLETA *alba,* an epithet given by ſome to the milky urine voided in ſome diſorders of the kidneys, ranked by Paracelſus among the cauſes of the *phthiſis.*

BLETUS, βλητος, from βαλλω, *I ſtrike*; in the *Ancient Phyſic,* a perſon whoſe ſide, by reaſon of ſome internal inflammation, as a pleuriſy or peripneumony, turns black or livid-ſpotted, chiefly preſently after death.

BLEW-CAP, an Engliſh name for a peculiar ſpecies of fiſh of the ſalmon-kind, diſtinguiſhed by a broad blue ſpot on the head, from whence they have their name. Theſe ſeem not to breed with us; but appear in our rivers only at certain ſeaſons, when there have been very violent north winds. This fiſh is ſeldom found ſingle; ſo that the fiſhermen rejoice at the taking one of them, expecting a large ſhoal of them near.

BLEYME, in *Farriery,* an inflammation in a horſe's hoof, occaſioned by blood putrified in the inner part of the coffin towards the heel, between the ſole and the coffin-bone. Some write the word corruptly *bleyne.* It is originally French, *bleime,* which ſignifies the ſame.

There are three ſorts of *bleymes*; the firſt bred in ſpoiled wrinkled feet with narrow heels, are uſually ſeated in the inward or weakeſt quarter: the ſecond, beſides the uſual ſymptoms of the firſt, infects the griſtle, and muſt be extirpated, as in the cure of a quitter-bone: the third is occaſioned by ſmall ſtones and gravel between the ſhoe and the ſole.—For a cure, they pare the foot, let out the matter, if any, and dreſs the ſore, like the prick of a nail.

BLICEA, in *Ichthyology,* the name of a ſmall fiſh of the harengiform kind, caught in the German and other ſeas, and ſuppoſed by many to be the ſame with what in England we call the ſprat, which to ſome ſeems to be no other than a young herring.

It is likewiſe the name of a freſh-water fiſh of the *malacoſtomous,* or, as we call it in Engliſh, the leather-mouthed kind, ſeeming to be the ſame with the more common kind of *carcaſſius.* It is alſo the name of an Eaſt Indian fiſh, which might be more properly called *harengus minor Indicus,* or the ſmall Indian herring. It is of the ſhape of the herring; but ſomewhat broader and thinner, and is of the ſame colour. Its tail alſo is forked; but its head is of an odd figure, its eyes and the end of its ſnout being extremely large. This fiſh ſwims uſually in vaſt ſhoals, and is caught principally on the coaſt of Malabar. It is a well-taſted fiſh; but has not at all the taſte of the herring. It takes ſalt, which ſcarce any other of the Eaſt Indian fiſh will do, and is therefore very much valued, and ſent into all the neighbouring parts of the country in pickle. There is alſo another very conſiderable uſe it is put to by the natives, which is the manuring the lands whereon they ſow their rice: they uſe this fiſh, which is caught in prodigious plenty, inſtead of dung on this occaſion. Willughby and Ray.

BLIEGG, in *Ichthyology,* a name given by the Germans to the fiſh we call the BLEAKE, and authors in general the ALBULA and ALBURNA.

BLIGHT, in *Huſbandry,* a diſeaſe incident to plants, and affecting them variouſly; the whole plant ſometimes periſhing by it, and ſometimes only the leaves and bloſſoms, which will be ſcorched and ſhriveled up, the reſt remaining green and flouriſhing.

This diſorder ſeldom happens but upon the blowing of ſharp eaſterly winds, which are moſt frequent with us about March; whence that month proves, of all others, the moſt fatal to plants.—From this circumſtance, ſome imagine the colds that then reign, being exaſperated by the eaſtern winds, effect *blights*; but Mr. Bradley furniſhes a more plauſible account: for on this principle, it were hard to ſay why one plant, or one part of a plant, ſhould be *blighted* more than another. He obſerves then, that caterpillars and other inſects generally attend thoſe winds; and that they infect ſome one kind of tree more than another, and even ſome particular branch more than others; and thence infers, either that the eggs of thoſe inſects, or the inſects themſelves, are brought to us by the eaſterly winds; or that the temperature of the air, when the eaſtern winds blow, is neceſſary to hatch thoſe creatures, ſuppoſing the eggs to have been already laid on the infected parts. Now each of theſe cauſes ſeems to have its effect: thoſe *blights* attended with large worms, or caterpillars, ſeem hatched by the eaſtern winds; and thoſe others, which only produce the ſmall inſects, that occaſion the curling of the leaves of trees, may proceed from ſwarms of them, either ready hatched, or in the egg, brought with the wind.

The coldneſs of thoſe winds he ſhews to be no objection againſt their being fitted to hatch inſects; different inſects requiring vaſtly different degrees of heat. To this he adds, that every inſect has its proper plant, or tribe of plants, which it naturally requires for its nouriſhment, and will feed on no other; and in which, therefore, it lays its eggs: it is no wonder then, that one kind of tree ſhould be infected, and all the reſt eſcape. That wind, v. gr. which brings or hatches the caterpillars on the apple-tree, will not infect the pear, plum, or cherry; becauſe, were the ſhoals of inſects natural to the apple to light on thoſe other trees mentioned, they would either want their proper matrix to hatch in; or, were they ready hatched, would periſh for want of proper food. So that it is morally impoſſible all kinds of plants ſhould be *blighted* at the ſame time, unleſs the eggs of every kind of inſect natural to each tree could be brought at one time with the wind; or, that an eaſterly wind could contain in it, at once, as many different degrees of cold, or heat, as would be required to hatch and maintain each different claſs of inſects. Nor is it any objection, that in *blights* there are not frequently any animals immediately perceivable. By the microſcope, we diſcover animalcules a million of times leſs than the ſmalleſt which come under ordinary notice; theſe, the gentleſt air may be conceived capable of blowing from place to place; ſo that it is no wonder if they be brought to us from the remoteſt regions, eſpecially the north-eaſt part of Great Tartary, &c. where the cold is intenſe enough to give them life; and from whence there is not ſea enough, by the warmth and ſaltneſs of whoſe vapours they might be ſuffocated. Thoſe brought from the north-eaſt parts of America are probably deſtroyed by paſſing the vaſt Atlantic ocean, which may be the reaſon why the north-weſt wind is not ſo infectious.

But that *blights* are frequently no more than an inward weakneſs or diſtemper in trees, evidently appears, if we conſider how often it happens, that trees againſt the ſame wall, expoſed to the ſame aſpect, and equally enjoying the advantages of ſun and air, with every other circumſtance which might render them equally healthy, are often obſerved to differ greatly in ſtrength and vigour; and as often do we obſerve the weak trees to be continually *blighted,* when the vigorous ones in the ſame ſituation eſcape. Dr. Hales aſcribes *blights* to the obſtruction of perſpiration in bloſſoms and leaves, occaſioned by a continued dry eaſterly wind, without ſhowers or dew; in conſequence of which the perſpirable matter becomes glutinous, and adheres to the ſurfaces of leaves, hereby affording a proper nutriment for inſects, which prey on the leaves and tender branches of fruit-trees, when the *blight* happens, though they are not the firſt cauſe of it.

To prevent *blights,* the more knowing among country-people, while the eaſterly winds blow, uſed to guard againſt them by burning heaps of weeds, chaff, and other combuſtibles, on the wind-ſide of their orchards, that the ſmoke may either poiſon the inſects, or their eggs, as they paſs along. It may be added, that theſe fires are often made with good ſucceſs, to deſtroy the caterpillars, even after they are hatched, and have begun to devour the trees.—Another method of preſerving trees from *blights* is, by ſprinkling tobacco-duſt, or pepper-duſt, or waſhing the leaves with water wherein tobacco-ſtalks have been infuſed; which, it is ſaid, is preſent death to all inſects, and animalcules.—Another is by pulling off the leaves when withered, and cutting off the ſmaller branches, when they produce crooked and unnatural ſhoots. Dr. Hales recommends waſhing and ſprinkling the trees occaſionally with fair water: and if their ſhoots ſeem to be much infected, waſhing them with a woollen cloth, ſo that their perſpiration may not be obſtructed.

But there is another ſort of *blight,* againſt which it is more difficult to guard fruit-trees; that is, occaſioned by ſharp, pinching, froſty mornings, which often happen at the time when the trees are in flower, or while the fruit is very young, and occaſion the bloſſoms or fruit to drop off; and ſometimes the tender parts of the ſhoots and leaves are greatly injured thereby. The only method yet found out to prevent this miſchief is, by carefully covering the walls, either with mats, canvas, &c. which being faſtened ſo as not to be diſturbed with the wind, and ſuffered to remain on during the night, are to be taken off every day, if the weather permits.

Another ſort of *blight*, which ſometimes happens in April or May, and which is often very deſtructive to orchards and open plantations, and againſt which we know of no remedy, is what is called a *fire-blaſt*, which in a few hours hath not only deſtroyed the fruit and leaves, but many times parts of the trees, and ſometimes whole ones have been killed by it. This more frequently happens in cloſe plantations, where the ſtagnating vapours from the earth, and the plentiful perſpirations from the trees, are pent in, for want of a free air to diſſipate and diſpel them; than in thoſe planted at a greater diſtance, or ſurrounded with hills or woods. See RUST.

Corn is liable to *blights*, like other ſorts of grain.

BLIGHT *of corn* is called SMUT.

BLIKE, in *Ichthyology*, a name given by ſome to an anadromous fiſh, ſomewhat reſembling our river chub, and called by Geſner *capito anadromus*; but more generally known by the name of ZERTA, or the ZERTE.

BLIND.—*Pore* or *Pur*-BLIND, denotes only a great degree of ſhort-ſightedneſs. Phil. Tranſ. Nº 37. p. 731.

BLIND, *Moon*, is uſed in ſpeaking of horſes, which, according to the vulgar, but very abſurd opinion, loſe their ſight only under certain ſtates of the moon, and ſee at every other time. This diſeaſe is the forerunner of cataracts, and generally ends in total blindneſs.

In ſome caſes of this diſtemper, a thin viſcid corroſive water runs from the diſeaſed eye, more or leſs in proportion to the degree in which the eye and eye-lids are ſwelled and inflamed. In other caſes, the diſeaſed eye diſcharges no humour; but looks thick and troubled; and the horſe ſees little or very indiſtinctly. The cauſes of this diſtemper are various: it ſometimes proceeds from a natural defection of the eyes, and often from ſome accidental malady. When the humour attaches one eye without changing to the other, there is hope of a cure; at leaſt of preſerving one eye. But when the eyes look depreſſed, and gradually decay, total blindneſs commonly enſues. If the eyes are full and inflamed, bleeding is proper; but if they appear ſunk and periſhing, it is often pernicious. In the former caſe, when the eyes diſcharge a ſharp water, they ſhould be waſhed twice a day with a ſtrong tincture of roſes, made by ſteeping two drams of roſe-buds in half a pint of boiling water, and diſſolving half a dram of ſugar of lead in the quantity of four ounces of it. If the matter digeſts, two drams of honey ſhould be added to the above quantity. At the ſame time purges ſhould likewiſe be adminiſtered twice a week. Lenitive electary and cream of tartar, of each four ounces; Glauber's purging ſalts, three ounces; the ſolutive ſyrup of roſes, two ounces, mixed with white wine and water, or warm water-gruel, are very proper for this purpoſe. Cutting out the haw is alſo an operation which is uſually performed on *moon-blind* horſes. Gibſon.

BLIND is alſo uſed for occult, or imperceptible. Hence *blind* rampart, *cæcum vallum*, among the ancients, was that beſet with ſharp ſtakes, concealed by graſs or leaves growing over them.

BLIND *teſtimonies*, *cæca teſtimonia*, thoſe given by abſent perſons in writing.

BLIND is alſo uſed in ſpeaking of bodies without apertures. Hence,

BLIND *wall*, *cæcus paries*, that without windows. In a like ſenſe we meet with *blind* chamber, *cæcum cubiculum*.

BLIND is alſo uſed in ſpeaking of veſſels which are not perforated.

In this ſenſe, the chemiſts ſay a *blind* alembic. A tube is ſaid to be *blind*, when it is cloſed a-top.

Some anatomiſts alſo call the third cavity of the ear CÆCUM, as having no iſſue; but it is more uſually denominated LABYRINTH.

BLIND *granado*, that which does not light or take fire.

BLIND, in *Ichthyology*, a local name for a fiſh, called by authors the ASELLUS *luſcus*, and more univerſally in Engliſh the *bib*. It is a fiſh of the cod-kind, but never growing to any great ſize. The word *blind* is uſed in Cornwall.

BLIND, or BLINDE, among *Mineraliſts*, a ſpecies of lead-MARCASITE, by our miners called *mock-ore*, *mock-lead*, and *wild-lead*, &c.

Blinde is a mineral maſs, flaky, gloſſy, and breaking in angles, much like the potters lead-ore, only of a colour more duſky, and approaching to black. In it are veins of a yellow ſhining MARCASITE, with a little white ſpar, and on one ſide a greeniſh æruginous matter. On a trial by the fire, it yielded very little copper, leſs lead, and no tin. It is very obſtinate, ſeveral attempts having been made with the alcaline fluxes to run it, in vain.

The German mineraliſts call it BLENDE, whence our denomination *blinde*. It anſwers to what in Agricola is called GALENA *inanis*. It uſually lies immediately over the veins of lead-ore, in the mines which produce it, for it is not found in all. When the miners ſee this, they know the vein of ore is very near.

BLIND *faith*; ſee FAITH.

BLIND *gut*; ſee COECUM.

BLIND-*worm*; ſee SLOW-*worm*.

BLINDS, or BLINDES, in the *Military Art*, denote every thing ſerving to cover the beſiegers from the enemy, as wool-packs, earth-baſkets, ſand-bags, and the like.

Blinds are ſometimes only canvas ſtretched to take away the ſight of the enemy; ſometimes they are planks ſet up, properly called mantlets; others are of baſkets, others of barrels.

BLINDS more peculiarly denote wooden frames of four pieces, round or flat, two of which are ſix feet long, and pointed at the ends, and the others three or four feet, which ſerve as ſpars to faſten the two firſt together. They are fixed upright in the ground, againſt the ſides of the ſaps, to ſuſtain the earth, and to faſten faſcines on the upper part, or to cover the ſaps, and to lay faſcines over them, to ſecure the troops from ſtones and granades. They are chiefly uſed, where the trenches are carried on in the face of the place, in a right line, ſo as the enemy might ſcour them with their guns from the walls. See *Tab. of Fortification, fig.* 1.

BLIND is ſometimes alſo uſed for ORILLON.

BLINDING, a ſpecies of corporal puniſhment anciently inflicted on thieves, adulterers, perjurers, and others; and from which the ancient Chriſtians were not exempt. Sometimes lime and vinegar, or barely ſcalding vinegar, was poured into the eyes, till their balls were conſumed; ſometimes a rope was twiſted round the head till the eyes ſtarted out. Solin. Polyhiſt. c. 4. Lamprid. in Alex. Sev. c. 17. Val. Max. lib. vi. c. 5. Lactant. de Mort. Perſec. c. 36.

In the middle age, they changed total *blindneſs* for a great darkneſs, or diminution of ſight, which they produced by holding a red-hot iron diſh or baſon before the eyes, till their humours were dried, and their coats ſhrivelled up.

The inhabitants of the city Apollonia executed it on their watch, whom they found aſleep. Democritus, according to Plutarch, Cicero, and A. Gellius, put out his own eyes, that he might be leſs diſturbed in his mental contemplations, when thus freed from the diſtraction of the objects of ſight. Herodot. lib. vi. c. 92. Aul. Gell. Noct. Att. lib. x. c. 71. Cicero Tuſc. Qu. 5.

BLINDING, *obcæcatio*, in the *Black Art*, denotes a ſpecies of NECROMANCY, whereby a viſible body may be concealed, or hidden by an inviſible power.

BLINDING *of a caſemate*, ſignifies erecting a battery againſt it, in order to diſmount its cannon, and render them uſeleſs.

BLINDNESS, a privation of the ſenſe of ſight, ariſing from a total depravation of its organs, or an involuntary obſtruction of their functions.

Blindneſs is of divers kinds. Natural *blindneſs* is that happening according to the ordinary courſe of things; thus that of certain inſects formed without eyes, though it is not eaſy to fix which theſe are, ſince divers animals have been erroneouſly ſuppoſed ſo, on account of their ſmallneſs or imperceptibility; as the CÆCILIA, commonly called the blind-worm, the mole, &c.

Præternatural, or morbid *blindneſs*, is that owing to diſeaſe or accident.

Total *blindneſs*, is that wherein all ſight or perception, even of light, is wanting, as is the caſe of thoſe who are ſaid to be *ſtone-blind*.

A *blind* man by the civil law cannot make a teſtament, except under certain modifications; but in every caſe he is diſabled from being a witneſs to a teſtament, on account of his *blindneſs*.

Partial *blindneſs*, is that wherein ſome faint glimmering is left, as is always the caſe in people who have ripe cataracts, who are never ſo blind, but they can diſcern day from night; and, for the moſt part, in a ſtrong light, diſtinguiſh black, white, and ſcarlet, though they cannot perceive the ſhape of any thing. The reaſon is, that the light by which thoſe perceptions are made, being let in obliquely through the aqueous humour, or the anterior ſurface of the cryſtalline (by which the rays cannot be brought into a focus upon the *retina*), they can diſcern in no other manner, than a ſound eye can through a glaſs of broken jelly, where a great variety of ſurfaces ſo differently refract the light, that the ſeveral diſtinct pencils of rays cannot be collected by the eye into their proper foci; wherefore the ſhape of an object in ſuch a caſe cannot be at all diſcerned, though the colour may. Phil. Tranſ. Nº 402. p. 447.

Perpetual *blindneſs*, is that which remains alike under all the diverſity of ſeaſons, times, ages, &c.

Tranſient *blindneſs*, is that which gives way of itſelf in due time, as that of whelps, which continues for ſeveral days, ſometimes nine, rarely twelve, after they are littered.

The Nogais Tartars, according to father Du Ban the Jeſuit, who lived among them, are born *blind*, and open not their eyes, till ſeveral days.

Periodical *blindneſs*, is that which comes and goes by turns, according to the ſeaſon of the moon, time of day, and the like. Phil. Tranſ. N° 233. p. 728.

Diurnal *blindneſs*, is called *hemera copia*.

Nocturnal *blindneſs*, called alſo *nyctalopia*, that which enſues on the ſetting of the ſun in perſons who ſee perfectly in the day, but become quite blind as ſoon as night comes on. Brigg, in Phil. Tranſ. N° 159. p. 560, where an inſtance of it is given. See a ſingular caſe of this kind, related by Dr. Samuel Pye, in the Medic. Obſerv. and Inquir. vol. i. p. 111. See alſo the Col. Acad. tom. vi. p. 507.

The cauſes of *blindneſs* are either ordinary, as a decay of the optic nerve (an inſtance whereof we have in the Academy of Sciences, where, upon opening the eye of a perſon long blind, the optic nerve was found extremely ſhrunk and decayed, and having no medulla in it); or ſome external violence, vicious conformation, growth of a cataract, *gutta ſerena*, ſmall-pox, or the like. Hiſt. Acad. Scienc. ann. 1713 and 1721.

Extraordinary cauſes of *blindneſs* are malignant ſtenches, poiſonous juices dropped into the eye, baneful vermin, long confinement in the dark, or the like.

The ducks which breed under ground, and break out into the Zirchnitzer ſea in Carniola after all great ſtorms, are blind at their firſt eruption; but, in ſome time, come to their ſight.

The author of the Embaſſy of D. Garcias de Silva Figueroa into Perſia tells us, that in ſeveral parts of that kingdom are found vaſt numbers of blind people of all ages, ſexes, and conditions; by reaſon of a ſpecies of little flies which prick the eyes and lips, and enter the noſtrils, carrying certain *blindneſs* with them when they light on the eyes.

The miſeries of *blindneſs* are feelingly painted by Milton, and may be alſo partly gueſſed at by the extaſies into which perſons have fallen on their recovery from it. Mr. Boyle mentions a gentleman, who having been blind, and brought to ſight at eighteen, was very near going diſtracted with the joy. See a remarkable caſe of this kind, Tatler, N° 55. vol. i. Parad. Loſt, lib. iii. init. Boyle's Works abr. tom. i. p. 4.

We find various recompenſes for *blindneſs*, or ſubſtitutes for the uſe of the eyes, in the wonderful ſagacity of many blind perſons recited by Zahnius in his *Oculus Artificialis*, and others. In ſome, the defect has been ſupplied by a moſt excellent gift of remembering what they had ſeen; others, by a delicate noſe, or the ſenſe of ſmelling; others, by an exquiſite touch, or ſenſe of feeling, which they have had in ſuch perfection, that, as it has been ſaid of ſome, they learned to hear with their eyes; it may be ſaid of theſe, that they taught themſelves to ſee with their hands.

Some have been enabled to perform all ſorts of curious and ſubtile works in the niceſt and moſt dextrous manner. Aldrovandus ſpeaks of a ſculptor, who became *blind* at twenty years of age, and yet ten years after made a perfect marble ſtatue of Coſmo II. de Medicis; and another of clay like Urban VIII. Bartholin tells us of a *blind* ſculptor in Denmark, who diſtinguiſhed perfectly well, by mere touch, not only all kinds of wood, but all the colours; and F. Grimaldi gives an inſtance of the like kind; beſide the *blind* organiſt lately living in Paris, who is ſaid to have done the ſame.

The moſt extraordinary of all is a blind guide, who, according to the report of good writers, uſed to conduct the merchants through the ſands and deſarts of Arabia. James Bernoulli contrived a method of teaching blind perſons to write. Leo Afr. Deſcr. Afr. lib. vi. p. 246. Caſaub. Treat. of Enthuſ. chap. ii. p. 45. Fonten. Elog. des Acad. p. 114.

Yet have not blind perſons any idea of viſible objects, though they can diſtinguiſh them by the touch: thus the gentleman couched by Mr. Cheſelden, though he knew the colours aſunder in a good light during his blind ſtate; yet when he ſaw them after couching, the faint ideas he had of them before, were not ſufficient for him to know them by afterwards. Phil. Tranſ. N° 403. p. 447.

It was even a conſiderable time before he could remember which was the cat, and which the dog, though often informed, without feeling them. All, that he had no idea of diſtance; but thought that all the objects he ſaw touched his eyes, as what he felt did his ſkin.

Blindness, in *Farriery*, is a diſeaſe incident to horſes, eſpecially thoſe of an iron-grey or dapple-grey colour, when ridden too hard, or backed too young. Phil. Tranſ. N° 37.

It may be diſcovered by the walk or ſtep, which, in a blind horſe, is always uncertain and unequal, becauſe he dares not ſet down his feet boldly when led in one's hand; though, if the ſame horſe be mounted by an expert horſeman, and the horſe of himſelf be mettled, the fear of the ſpur will make him go more freely; ſo that his *blindneſs* can hardly be perceived. Another mark whereby a horſe may be known to have loſt his ſight, is, that upon hearing any body enter the ſtable, he will prick up his ears, and move them backwards and forwards, as miſtruſting every thing, and being in continual alarm by the leaſt noiſe.

D. Lower firſt ſhewed the cauſe of the ordinary *blindneſs* in horſes, which is a ſpongy excreſcence, growing in one, ſometimes in two or three places of the *uvea*, which being at length overgrown, covers the pupil when the horſe is brought into the light, though in a dark ſtable it dilates again.

BLINKS, in *Botany*; ſee Montia.

Blinks, among *Ancient Sportſmen*, denoted boughs broken down from trees, and thrown in the way where deer are likely to paſs, to hinder their running, or rather to mark which way a deer runs, in order to guide the hunter.

BLINKING *of beer*, in Lincolnſhire, ſignifies letting the wort ſtand for ſome time in the vat, till it hath acquired ſome degree of acidity, in order to diſpoſe it to fine, and be the ſooner ready for drinking.

BLISSOM, among *Huſbandmen*, corruptly called *bloſſom*, is the act of a ram when coupling with an ewe.

BLISTER, in the *Animal Oeconomy*, denotes a thin bladder raiſed on the ſkin, and full of a watery or other humour.

Bliſters are ſymptoms uſually enſuing on burns, ſcalds, and cauſtic matters applied to the ſkin.

It is diſputed among ſurgeons, whether *bliſters*, in caſe of burns, are to be opened, or not. Some adviſe it, to prevent further ulcerations underneath; others, unleſs they be large, diſſuade it, as creating the patient needleſs pain.

Blister, Epispastic, or Vesicatory, an external medicine, ſerving to raiſe a bliſter; whence alſo it is itſelf, though improperly, called a *bliſter*.

Of *bliſters* there are ſome which act very gently, and others with great violence.

Bliſters are unguents, cataplaſms, or plaſters made of ſharp, irritating medicaments, which have a faculty of drawing the humours from within, outwards; inflaming and ulcerating the ſkin, and raiſing *veſicæ*, or bladders; whence their denomination, *veſicatory*.

We have *veſicatories* made of CANTHARIDES, of EUPHORBIUM, FIGS, SUBLIMATE OF MERCURY, LAPIS INFERNALIS, MUSTARD, ANACARDIUM, SQUILLS, BRIONY, VINEGAR, PEPPER, LEAVEN, *leſſer* SPURGE, &c. which are incorporated and made up with honey, gum, reſins, &c. to bring them to the conſiſtence required.

Bliſtering chiefly takes place in the dropſy, delirious and feveriſh diſorders, apoplexies, pleuriſies, and the like. Some alſo preſcribe it in the *hydrocephalus*, *ophthalmia*, ſuffocative catarrhs, *cephalæa*, &c. Some ſay, that *bliſtering* is generally found hurtful in dropſies.

In the Phil. Tranſ. vol. l. part ii. N° 75. an. 1758, there is a paper by Dr. Whytt, containing caſes of the remarkable effects of *bliſters* in leſſening the quickneſs of the pulſe in coughs, attended with infarction of the lungs, and fever. See alſo ſeveral papers concerning *bliſters* in the Lond. Medic. Obſerv. &c. vol. ii. p. 311. ibid. p. 382. and vol. iii. p. 102. where they are recommended as efficacious in curing an incontinence of urine.

The operation and effect of *bliſters* in curing fevers, are by ſome reſolved into the pain which they excite; by others, into the ingreſs of the particles of the CANTHARIDES into the blood; by others, into the quantity of hot, ſharp, and ſalt lymph diſcharged; by others, into the condenſation of the blood, and ſtoppage of the rarefaction, whereby the ſpirits are diſpoſed to be plentifully ſeparated. Dr. Cockburn, who refutes all theſe ſyſtems, accounts for it from the CANTHARIDES wounding the nerves or canals whereby the ſpirits are conveyed to the heart; Dr. Morgan from the ſubtile, hot, active ſalts of the flies, ſtrongly attracted by the *ſerum*, and carried with it through the ſeveral glands and ſecretory ducts of the body, where they act by diſſolving, attenuating, and rarefying the viſcid coheſions of the lymph and *ſerum*, and ſtimulating the nervous coats of the veſſels, whereby they are induced to throw off their ſtagnating viſcidities, and reſtore the free drain of the lymph from the arteries to the veins; and at the ſame time, by ſcouring and cleanſing the expurgatory glands, bring on critical ſweats and urines. Phil. Tranſ. N° 252. p. 173.

Dr. Morgan endeavours to diſcard the method of dreſſing *bliſters*, by which nothing is gained, but the plaguing and tormenting the patient, and depriving him of the benefit of a much greater diſcharge, which would be at leaſt three to one, were the ſame plaſter left on for four or five days, or as long as it will draw off any thing; and then, when it has done running, taking it off and applying a plaſter of melilot, or rather of diachylum, once, for all, till the part is quite well and healed. Indeed, when a *bliſter* is firſt raiſed, if it doth not break and run of itſelf, it may be proper to raiſe the lower end of the plaſter a little, to ſnip the bladder, and let out the water; but if the ſurgeon has made the plaſter ſtrong enough, this is commonly done of itſelf, without help. It is uſually objected, that a ſtrong epiſpaſtic left on five or ſix days, muſt deeply corrode the fleſh under it, and thereby endanger a mortification. But this, according to the author laſt cited, is ſo far from being true, that, on the contrary, it prevents the worſt accidents uſually happening in *bliſtering*, which are what they call *ſloughs*, or deep ſtrong incruſtations of a ſharp ſalt and adheſive matter, covering the whole ſurface of the fleſh where the plaſter had been applied. Now, this is always occaſioned by an unſeaſonable removal of the epiſpaſtic, while the humour is in full flow, and ſtrongly feeding to the part; and the humour, thus ſuddenly checked and thrown back for want of a ſufficient drain, forms this ſlough. Morg. Mech. Pract. of Phyſ. p. 176.

BLISTERING, in *Farriery*, is uſed in caſes of ſtrains and ſhrunk ſinews in horſes, as ſome maintain, with good effect; but others ſay, with none.

BLITE, *ſtrawberry ſpinage*, *blitum*, in *Botany*, a genus of the *monandria digynia* claſs of plants; the characters of which are theſe: the flower hath no petals, but one briſtly ſtamen, of the length of the empalement. In the centre is ſituated an oval pointed germen; the empalement afterward becomes an oval compreſſed capſule, including one globular compreſſed ſeed, of the ſize of the capſule. There are two ſpecies.

Blite is eſteemed cooling and emollient, and therefore good in dyſenteries and ſpitting of blood.

BLOATED *fiſh* or *herring*, in our *Statutes*, are thoſe which are half-dried. Vid. Stat. ann. 18 Car. II. c. 2.

Bloated herrings are made by ſteeping them in a peculiar brine, and then hanging them in a chimney to dry.

BLOATING, a puffing up or inflation of the exterior habit of the body, lodged chiefly in the adipoſe cells. It is the ſame with what phyſicians call an *emphyſema*.

BLOCK is uſed for a piece of marble, as it comes out of the quarry, before it has aſſumed any form from the hand of a workman.

Block, in the *Mechanic Arts*, a large piece of ſolid wood, whereon to faſten work, or to faſhion it; ſtrength and ſtability being the requiſite properties.

In this ſenſe, we ſay a chopping *block*; a ſugar-finer's *block*; a ſmith's *block*, on which his anvil is faſtened; an executioner's *block*, on which the criminal's head is laid to be ſtruck off.

Block, *mounting*; ſee Anabathra.

Block, among *Cutters in Wood*, is a form made of peartree, box, or other hard and cloſe-grained wood, free from knots, on which they cut their figures in relievo with knives, chiſſels, &c.

The like *blocks* are in uſe for card-making; and from the ſame, firſt aroſe the modern art of printing. Phil. Tranſ. N° 310. p. 2398.

Block, among *Bowlers*, the mark which is aimed at, being a ſmall-ſized bowl laid on the green for this purpoſe; it is called alſo the *jack*.

Block, in *Falconry*, denotes the perch whereon a bird of prey is kept. This is to be covered with cloth.

Blocks, in *Sea-language*, are pieces of wood belonging to ſhips, in which the ſhivers of pullies are placed, and wherein the running-ropes go. Of theſe, ſome are ſingle, ſome double; and ſome have three, four, or five ſhivers in them. They are named and diſtinguiſhed by the ropes they carry, and the uſes they ſerve for. See *Tab. Ship*.

The *cat-block* is employed to draw the anchor up the cathead.

The *clue-garnet blocks* ſerve to draw the clues or lower corners of the courſes up to the yard, and are faſtened to the clues of thoſe ſails.

The *fiſh-block* is hung in a notch at the end of the davit, ſerving to haul up the flooks of the anchor to the ſhip's bow.

The *ſnatch-block* is a large *block* with a ſhiver in it, and a notch cut through one of its cheeks, for the more ready receiving a rope, ſince, by means of this notch, the middle part of the rope may be reeved into the *block*, without paſſing it endwiſe. It is commonly faſtened with a ſtrap about the main-maſt cloſe to the upper-deck, and is chiefly uſed for the fall of the winding tackle, which is reeved into this *block*, and then brought to the capſtan.

The *top-block* is uſed to hoiſt up or lower down the topmaſt, and is hooked in an eye-bolt driven into the cap.

Block and block is a phraſe uſed, when on hauling on any tackle, haulyard, or the like, to which two *blocks* belong, the two meet and touch; ſo that they can haul no farther.

Block, *voyal*; ſee Voyal.

Blocks, *wind-tackle*; ſee Wind.

Block-*wood*, is a name ſometimes given in our laws to logwood. 23 Eliz. c. 9.

BLOCKADE, a ſort of siege of a place, intended to be taken by famine; wherein all the paſſages, and avenues, are ſeized, and ſhut up, ſo that no ſupplies of proviſion can be brought in.

It comes from the German *blochus*, or *blockhauſe*, *a bulwark*, or *houſe of wood*; or from the Gauliſh *blocal*, *barricade:* though others derive it from the Latin *buculare*, *to ſtop a paſſage*.

A *blockade* is no regular siege; inaſmuch as there are no trenches or attacks. *Blockades* are formed by the cavalry.

The word *blockade* is ſometimes alſo uſed in ſpeaking of the beginning of a siege, when forces are ſent to ſeize the principal avenues where the beſiegers intend to fix their quarters.

There are two ways of forming *blockades*. The firſt is ſimply by fortifying or ſeiſing poſts at ſome diſtance from the place, chiefly on the banks of rivers both above and below, and on the great roads and inlets, where bodies of foot and horſe are placed, communicating with each other, till the diſtreſs of the place, for want of neceſſaries, occaſions deſertions of the garriſon, and murmurings or inſurrections of the townſmen, whereby the governor is frequently forced to capitulate.

The other ſort is made nearer the place, by lines of circumvallation, wherein an army is poſted, being chiefly uſed when, after a battle, the vanquiſhed party have ſhut themſelves up in ſome town ill provided, and thereby capable of being ſtarved in a ſhort time.

BLOCK-*battery*, in the *Military Art*, denotes a wooden battery on four wheels, moveable from place to place, whereby to fire *en barbe*, or over the parapet; ſometimes alſo uſed in galleries and caſemates, where room is wanted.

Block-*houſe*, a kind of wooden fort or battery, either mounted on rollers, or on a veſſel, and ſerving either on the water, or in counter-ſcarps and counter-approaches.

The name is ſometimes alſo given to a brick or ſtone fort built on a bridge, or the brink of a river, ſerving not only for its defence, but for the command of the river both above and below. Such was that noted *block-houſe* anciently on the bridge of Dreſden, ſince demoliſhed on enlarging the bridge.

BLOCKING, in *Middle Age Writers*, denotes a kind of burial uſed for perſons dying excommunicated.

Blockings, *circular*, in *Architecture*, are baſes to the dome, repreſented in *Tab. of Archit. fig.* 40. (QQQ); which by their apparent ſolidity ſeem to ſtrengthen the dome, and at the ſame time taking from its height, add a peculiar graceſulneſs to its appearance.

Blockings, *ſquare*, are repreſented at S, *fig.* 40. in *Tab. Archit.* Theſe, when enriched with baſe and cap, obtain the appellation of pedestals.

Blocking-*courſe*; ſee Course.

BLOCKY, among *Jewellers*, a name given to a diamond when its ſides are too upright, by its table and collet being larger than they ought to be.

BLOIS, *bole of*; ſee Blesensis *bolus*.

BLOMARY, or **Bloomary**, the firſt forge in an ironwork, through which the metal paſſes after it is melted out of the ore. See Iron. They are alſo called *blomary-hearths*.

BLOOD, a warm, red liquor in moſt animals, circulating, by means of arteries and veins, through every part of the body, during their life, and the common ſource whence all the neceſſary and ſuperfluous animal liquids are derived.

Blood, *microſcopically examined*.—By the microſcope, the *blood* appears to conſiſt of little red globules, ſwimming in an aqueous liquor, ſuppoſed to be the *cruor* and *ſerum* that appear diſtinct when let out. Mr. Lewenhoeck computes theſe globules to be twenty-five thouſand times ſmaller than the ſmalleſt grains of ſand; and Dr. Jurin makes them ſtill leſs. Upon an accurate menſuration, he found the diameter of one, equal to $\frac{1}{3240}$ of an inch, or leſs than $\frac{1}{324}$ of an ordinary hair of the head.

Blood makes a very common object for microſcopical obſervations. The method of examining it is this: take a ſmall drop of warm *blood* immediately from the vein, with the nib of a pen, or hair-pencil, and ſpread it as thin as poſſible on a plate of glaſs; and applying this to the microſcope with the ſecond, or firſt magnifier, the globules will all be ſeen very diſtinctly, and a little practice will enable us to form a judgment on the alterations that may happen in the ſize, figure, or colour of them. If a little warm water be applied to the *blood*, the globules will be divided, and many of them break into a number of ſmaller globules. If warm milk be added inſtead of water, the larger globules will be ſeen very diſtinct; but the ſmaller will be blended with, and loſt in the milk, which is itſelf no other than a congeries of ſuch globules.

Late writers have induſtriouſly purſued the examination of the globules of the *blood*; and found divers orders of them: thoſe large ones viſible to the eye conſtitute the *globules of the firſt order*; each of which, according to Lewenhoeck, is compoſed of ſix ſmaller ſpheres, cluſtered together in a very regular way; and that ſo nicely, in a perfect globule, that the compoſition comes to be imperceptible. But ſometimes the ſame perſon has ſeen a red globule looſening and breaking into theſe compounding ſpherules; and ſometimes has had the good fortune to perceive theſe running together, and beginning the compoſition of a new red globule. Theſe ſmaller ſpherules are called *globules of the ſecond order*. But Lewenhoeck did not ſtop here; he ſaw in the chyle and *blood* a great many particles ſix times leſs than theſe globules of the ſecond order, and thirty-ſix times leſs than the great red globules. So that the globules of the ſecond order are to be looked on as compounded of theſe ſmaller ones; which therefore are juſtly to be reckoned as another claſs, or *globules of the third order*. Further, he finds innumerable *blood*-veſſels in the body, of ſuch ſmallneſs, that none of thoſe hitherto mentioned globules could paſs through them; ſo that it ſeems neceſſary to ſuppoſe inferior claſſes of *globules of the fourth, fifth, ſixth, &c. orders*. He even ſaw veſſels, the wideneſs of which was leſs than the eighth part of the diameter of a red globule; ſo that the particles paſſing through them, ſhould be upwards of five hundred times leſs than ſuch globules, and conſequently ſmaller than thoſe of the fourth order. Beſides, upon a careful examination, he could perceive ſtill ſmaller veſſels, narrower than the tenth part of the diameter of a red globule, and conſequently not capable of tranſmitting ſpherules greater, than if a red globule were broken into a thouſand parts. On the whole then, the globules of the firſt order are made up of ſix globules of the ſecond, theſe of ſix of the third, theſe of ſix of the fourth, theſe of ſix of the fifth order, and ſo on. And accordingly we find the globules of the higher orders may be broken down into their compounded particles. That the *blood*, in ſome caſes, might be turned into *ſerum*, was obſerved by Ariſtotle. Nor did ſuch a change of the *blood* eſcape the obſervation of the accurate Dr. Harvey. Phil. Tranſ. Nº 102. Nº 106. Nº 109. Nº 165. Nº 263. Nº 380. Med. Eſſ. Edinb. tom. ii. *paſſim*.

Dr. Martine has alſo given us ſome computations of the diameters, magnitudes, weights, &c. of the globules of the *blood*. The doctor's computation of the diameter of a red globule, agrees with Lewenhoeck's and Dr. Jurin's, being about $\frac{1}{1938}$ of an inch.

The *blood*, as already obſerved, is compoſed of globules of different orders and magnitudes. The diameters of thoſe of the tenth order are eſtimated at leſs than $\frac{1}{4000000}$ of an inch.

The particles of *blood* have, ever ſince the time of Lewenhoeck, been generally deemed ſpherical, and therefore called globules; though ſome accurate obſervers have at different times expreſſed their doubts concerning their figure. Lewenhoeck acknowleges, that in fiſh and in the *amphibia* they are flat and elliptical; but thoſe of the human blood, and of the blood of quadrupeds, have generally been reckoned ſpherical. Father de la Torrè, by obſerving them with glaſs ſpherules of a very conſiderable magnifying power, was led to apprehend, that they were flat and annular: Mr. Hewſon has proſecuted the inquiry both into their ſize and ſhape; and he concludes, that ſo far from being of the ſame ſize in all animals, as ſome have ſuppoſed, they differ much in this reſpect; and that this difference bears no regular proportion to the ſize of the animal to which they belong; thoſe of an ox's *blood* not being ſo large as thoſe of the human *blood*, and thoſe of a porpoiſe not being larger than thoſe of ſmaller fiſh: nor are they all of the ſame ſize in the ſame animal. With reſpect to their figure, he obſerves, that they are flat in all animals, the human ſubject not excepted; that a dark ſpot may be ſeen in the middle of one of theſe particles, which F. de la Torrè ſuppoſed to be a perforation, but which Mr. Hewſon ſuppoſes to be a ſolid particle contained in a flat veſicle, and filling only the middle of it, whilſt the edges of this veſicle are hollow, and either empty, or filled with a ſubtile fluid. He ſuppoſes farther, that they are ſolid particles, and not fluid, as has been commonly believed: and he adds, that the uſe of thoſe ſalts which enter into the compoſition of the *blood*, is probably to preſerve the red veſicles in their flat form. See an account of the experiments on which theſe concluſions are founded, in the Phil. Tranſ. vol. lxiii. part ii. p. 303.

Blood, *analyſis of the*.—The *blood*, while in its veſſels, appears to the naked eye uniform and homogeneous; but, when let out and cold, it ſeparates ſpontaneouſly into two different parts: the one red and fibrous, which coheres into a maſs, and is called the *cruor*; the other thin and tranſparent, which retains its fluidity when cold, and, being ſuppoſed ſpecifically heavier than the other, ſuſtains and bears it up, and is called the *ſerum*. The proportion of the *ſerum* to the *cruor*, Dr. Drake makes at a medium, as one and a half to one: but Mr. Boyle, more accurately, makes the *ſerum* $\frac{13}{15}$ of the whole *blood*; and Dr. Jurin, $\frac{15}{17}$ of the whole weight, or $\frac{3}{4}$ of the bulk.

Boerhaave extends the proportion of the *ſerum* of *blood* to $\frac{5}{6}$ parts of the whole maſs; yet Dr. Morgan ſcruples not to depart from this, and makes the *cruor* and *ſerum* equal to each other. Indeed in cold, and ſufficiently coagulated *blood*, the tough *craſſamentum*, and its ſurrounding fluid, *ſerum*, are ordinarily found to the eye pretty nearly equal to one another.

If the red part of the *blood* bears too great a proportion to the *ſerum*, which is the caſe of athletic perſons, and others who do not take a ſufficient quantity of drink with their meat, the fault may be corrected by leſſening the meat, or by increaſing their drink. Dr. Bryan Robinſon tells us of a young man, who, not having for a conſiderable time drank with his meat, had a very florid complexion, and ſcorbutic eruption all over his body, which indicated too great a proportion of the red part of the *blood* to the *ſerum*; he was freed from his diſorder by drinking with his meat, without any farther remedy.

In the beginning of fevers, the proportion of the red part of the *blood* to the *ſerum* is greater, and at the end of them leſs, than it is in health. The change of this proportion is owing to perſons under this diſorder living wholly on drink and liquid nouriſhment. And bodies loaded with ſerous moiſture, an argument of too ſmall a proportion of the red part of the *blood* to the *ſerum*, have been freed from their load, by abſtaining wholly from drink.

There are other cauſes beſides the bare quantities of meat and drink, which vary the proportion of the red part of the *blood* to the *ſerum*; for this proportion is greater in country people than in citizens, in perſons who uſe exerciſe than in perſons who are inactive, and in perſons who live upon fleſh meats, and fermented liquors, than in perſons who live upon vegetables and water. In ſhort, this proportion is increaſed by things which dry the body, and ſtrengthen the fibres; and leſſened by things of a contrary nature.

Too great a proportion of the red part of the *blood* to the *ſerum*, renders bodies ſubject to inflammatory fevers on taking cold.

When extravaſated *blood* is left to itſelf, the red globules run forcibly together, and ſqueeze out the intervening *ſerum* in ſome animals with a greater, in others with a leſs force; which is a proof, that theſe globules are endowed with an attractive power. This force in deer's *blood* is ſo weak, that it ſcarcely coagulates into a firm *craſſamentum*. On the contrary, in ſome great and ſtrong beaſts, it becomes a tough, and almoſt indiſſoluble maſs; ſo that the *blood* of bulls was frequently drank by the ancients, as a moſt effectual poiſon.

Mr. Le Cat thinks, that the *blood* is detained in its fluid ſtate by a cauſtic fluid, and that this forms the red globules. But then it needs the aſſiſtance of the animal fluid, which is the principle that preſerves all from corruption, and to which we owe our ſenſation and motion. See Coagulation, Craſſamentum, and Sensitive *fluid*.

The *blood* is found to conſiſt chiefly of phlegm, as the baſis or vehicle; of volatile ſalts; of oil, which, by ſome nice examiners, has been found of two kinds; and of *caput mortuum*, or earth, which, though it may conſiſt of divers ſubſtances, eſſentially different from each other, yields only a little fixed ſalt.—From the beſt experiments of this kind it appears, that in ſeven ounces of human *blood*, there are five ounces two drachms of phlegm, three drachms of a ſubtile ſpirituous oil, a ſmall quantity of a thicker oil, two drachms of ſalt, and about two of earth.

The *blood*, and other parts of animals, all contain more or leſs of an acid; and this ſeems wholly owing to the effects of their organs of digeſtion upon the aliments they take in, which, in fine, become aſſimilated to, and make part of their fluids and ſolids.

It might be ſuppoſed, that this acid, however, ſhould be only found in ſuch animals as eat vegetables, not in ſuch as feed on other creatures; but this doubt will vaniſh when we conſider, that the carnivorous animals ſwallow theſe acids, at leaſt, at ſecond-hand, in the fleſh of thoſe animals which had fed on vegetables. This, though a very fair way of reaſoning, did not content Mr. Homberg, but he tried the facts themſelves by a number of experiments; convinced by which, that in carnivorous and fructivorous animals, and in ſuch as eat vegetables alone, the acids of thoſe vegetables remained acids in the parts of the animal, Mr. Homberg tried the ſame experiments on the fleſh and *blood* of creatures that eat only fleſh, as well as on thoſe which eat indiſcriminately every ſort of food, and the event proved the ſame in all. All contained a red acid liquor, which had the properties before deſcribed, and in which the alkali and acid were ſo blended together, that they deſtroyed not one another, but each was ready to exert itſelf on occaſion. Mem. Acad. Scienc. 1712.

Dr. Jurin adds, that the *ſerum*, upon a chemical analyſis, exhibits a great deal of phlegm, and of the other principles a ſmall quantity; and, on the contrary, the *cruor* yields leſs phlegm, but the other principles much more copiouſly than the *ſerum*. From which data he concludes, that the globules conſiſt of ſome phlegm united with the oil and ſalts, and a ſmall quantity of earth; but in what proportion, and how, and in what parts they are formed, &c. is not determined. Indeed, it muſt be conſidered, that the principles which the chemiſts thus produce ſeparate, may poſſibly be much altered by the fire. Thus, it is paſt doubt, the oils drawn from the *blood* by fire, are vaſtly different from the natural oil, which circulates with the *blood*. To which may be added, that the *caput mortuum* remaining after diſtillation, may, poſſibly, be a new production, which had no exiſtence under any form reſembling that in the *blood*.

The *origin* of the *blood* is in the chyle, which, paſſing the lacteals, is delivered into the ſubclavian; where, mixing with the *blood*, they proceed together to the right ventricle of the heart; and there, being yet more intimately mixed, they circulate together through the whole body: till, after ſeveral circulations, and ſecretions at the ſeveral ſtrainers of the body, they are aſſimilated, ſo as to make one uniform compound maſs, which appears to be nothing elſe but chyle altered by the artifice of nature, and exalted into *blood*; there being no appearance of any thing extraneous mixed with the liquor circulating in the *blood*-veſſels, but chyle; excepting what had been before ſeparated from it, for ſome particular purpoſes, which being once ſerved, it is returned to it again: unleſs, perhaps, it may receive ſome portion of air in the lungs.

That there is *air mixed* in the *blood*, and circulating with it, is paſt doubt; but, whether any more than was at firſt contained in the food whereof the chyle is formed, is a queſtion not yet decided. The principal arguments urged for it are, the neceſſity of reſpiration; which may be accounted for on another principle: and the florid colour the *blood* receives in the lungs, and firſt ſhews in the *vena pulmonalis*; which is countenanced by an experiment made with the red grumous part of the *blood* after coagulation on *blood*-letting; for, upon turning the under-ſurface, which was before black, upwards, and expoſing it to the air, by its contact therewith it acquires a florid colour, like that of the *blood* in the *vena pulmonalis*. But this effect others account for from the extraordinary agitation and comminution of the *blood* in the lungs. Dr. Lower has confuted this notion, by obſerving, that the attrition of the *blood* is greater in the muſcles, from which, however, it always returns black.

Indeed, Dr. Keil, Bohnius, Bernoulli, and ſome other mathematic phyſiologiſts, go farther. Mr. Boyle having examined the ſpecific gravity of *blood*, and found that of the *ſerum* to be greater than that of *blood*, in the proportion of 1190 to 1040, i. e. nearly as 8 to 7, it followed, that the *cruor*, or *blood*-globules, were ſpecifically lighter than the *ſerum*, and that in a conſiderable degree; which was further confirmed by the globules being ſuſtained in the *ſerum*, both while circulating, and when let out.—Hence it was conjectured, that theſe globules were nothing elſe but thin veſicles filled with a ſubtile aerial ſubſtance: and this opinion was confirmed from its being obſerved, in viewing the circulation by a microſcope, that a *blood*-globule, in paſſing through a very narrow veſſel, would change its ſhape from a globular, to an oval form, and would again recover its former figure, as ſoon as it was got through its narrow paſſage; which appearance was naturally enough aſcribed to the elaſticity of the included air: and, from this conjecture, were accounted for, a great number of the phænomena of the animal œconomy, particularly Dr. Keil's theory of muſcular motion.

But this principle Dr. Jurin has examined, and appears to have overthrown. He made ſeveral experiments, in ſome of which the *cruor* before ſuſpended at the ſurface of the *ſerum*, immediately ſunk, when its adheſion to the ſides of the porringer was cut off, and it was removed to another veſſel of *ſerum*. In others, where the *cruor*, buoyed up in the *ſerum*, even without any adheſion to the ſides of the glaſs, and merely by the bubbles of air adhering to its ſurface, upon being included in a receiver, and exhauſting the air, ſo that the bubbles burſt, would ſink: whence he concludes the globular part of the *blood* to be heavier than the ſerous: and, from other experiments, he aſcertains the proportion of the gravity of *blood* to that of *ſerum*, to be as 1054 to 1030; whence the quantity of the globules being before fixed at $\frac{1}{4}$ of the whole, the preciſe gravity of the globules beyond that of the *ſerum* is eaſily determined.—The *blood*-globules therefore are not veſicles filled with air, or any other fluid ſubſtance lighter than *ſerum*: which is further confirmed from this, that *blood*-globules are not found to dilate, or undergo any alteration, in an exhauſted receiver, when viewed through a microſcope; whereas, were they filled with any elaſtic fluid, they would either burſt, or at leaſt dilate into 70 or 80 times the ſpace.

As to the *heat* of the *blood*, authors are exceedingly divided about the cauſe thereof: the ancients aſcribe it to a vital flame, or innate heat lodged in the heart, and thence communicated to the *blood*. Dr. Willis imagines a kind of accenſion in the *blood*; and thinks its heat reſults from its being, as it were, ſet on fire, and perſevering in that ſtate. Dr. Henſhaw ſolves it from an ebullition conſequent on the mixture of two fluids, ſo diſſimilar as the chyle and *blood*. Others have recourſe to the chemical principles of alcali and acid; others to the mutual action of the principles, or component parts of the *blood*, by means whereof an inteſtine motion, and by that means an inteſtine heat, or incaleſcence, is effected.

Dr. Drake, with more reaſon, attributes the heat of the *blood* to the ſpring of the air incloſed together with it in the veſſels: for, air being incloſed in the *blood*-veſſels, will endeavour to expand itſelf; and, conſequently, if it have force enough, will drive outwards the parts of the body that incloſe it; by which means it cauſes the *blood* to beat againſt the ſides of the veſſels; which, having muſculous, contractile coats, do in their turns compreſs it again, and ſo cauſe a reciprocal æſtus in the *blood*, greater than the mere circulatory motion could; whence the parts of the ſolids, or containing veſſels, being put into a conſtant agitation, a heat is produced in both, which they mutually impart to each other. See ATTRITION, &c.

Laſtly, Dr. Boerhaave accounts for the heat of the *blood* from the action of the heart, and the re-action of the *aorta*: for, the *blood*, driven by the heart obliquely againſt the ſides of the *aorta*, preſſes them, and ſpends almoſt its whole *momentum* againſt the curvity thereof, and is, by the figure and elaſticity of this veſſel, preſſed back again. Every moment of time, therefore, each particle of *blood* acquires a new motion, a new *niſus*, and rotation: hence follows a perpetual attrition, attenuation, rubbing off of angles, and a ſimilitude and homogeneity of all the parts; and hence the maſs derives its fluidity, heat, diviſion into particles accommodated to all veſſels, preſſure into the lateral tubes, &c.

Nor is the cauſe of the *redneſs* of the *blood* leſs obſcure: the chemiſts account for it from the exaltation of its ſulphur; others from the mixture of ſaline and ſubacid juices with ſulphureous ones; and others from the colour of the heart. The French philoſophers attribute this redneſs to the ſmallneſs of the ſize, and roundneſs of the figure, of the particles that compoſe the *cruor*; notwithſtanding that red, being the colour of all others leaſt refrangible, and the globular figure of all others the moſt refrangible, that figure ſeems, of all others, leaſt apt to produce this colour. Others aſcribe the colour of the *blood* to the impregnation of the air in the lungs; for, that air is diſpoſed to produce ſuch an effect, appears from the experiment above.

But others, more reſerved, extend this effect of the air no further than to account for the difference of redneſs between the venal and arterial *blood*; ſuppoſing, that after its colour has been heightened, and rendered more florid, by the mixture of the air in the lungs, it retains it pretty well in the arteries; but that, circulating in the body, and carried through the veins, the air tranſpires, by degrees, through the pores of the veſſels, and leaves the liquor of a paler dye.

There is now little doubt that the redneſs of the *blood* is owing to its contact with air: M. Cigna of Turin found, by putting a little oil on a quantity of *blood*, that it remained black throughout; but that when he took away the red part, and expoſed to the air the lower *laminæ* which were black, they alſo became ſucceſſively red, till the whole maſs acquired that colour. Beccaria, at his requeſt, expoſed *blood in vacuo*, and found that it always continued black; but when he brought it into contact with the air, it became red.

M. Cigna, in his firſt Memoir, publiſhed in the Miſcellanea Taurinenſia, expreſſes his opinion, that the air which is introduced into the *blood* by means of the chyle, contributes to preſerve its redneſs: but in a ſecond Memoir on the ſame ſubject, he doubts whether the change of colour takes place in the lungs; and if it does, he inclines to aſcribe it to the evaporation from the *blood* in the lungs. The ingenious Mr. Hewſon is fully convinced, that the air in the lungs is the immediate cauſe of this change of colour; and to this purpoſe he obſerves, that he has diſtinctly ſeen the *blood* of a more florid red in the left auricle of the heart, than it was in the right: and though ſome have attributed the effect to nitre abſorbed from the air, he conſiders this as a mere hypotheſis, adding rather too haſtily, that air contains no nitre; and that moſt of the neutral ſalts produce the ſame effect in ſome degree.

Dr. Prieſtley, who has purſued his inquiries on the ſubject of reſpiration with very conſiderable ſucceſs, apprehends, that the air we breathe may be ſo far decompoſed, as to communicate a nitrous quality to the *blood*, in its paſſage through the lungs; and this opinion is confirmed by his analyſis of atmoſpherical air, which he has proved to conſiſt of earth and ſpirit of nitre. He has farther demonſtrated, by the moſt accurate and concluſive experiments, that the florid red colour of the *blood* is owing to the effect which the air has upon it; for the blackeſt parts of the *craſſamentum* of coagulated *blood*, ſeparated from the *ſerum*, aſſumed a florid red colour in common air; and the colour was more florid, and the change produced in leſs time in dephlogiſticated air, which is purer and more fit for reſpiration than common air: on the contrary, the brigheſt red *blood* became black in any kind of air, that was unfit for reſpiration, as in fixed air, inflammable air, nitrous air, or phlogiſticated air; but upon expoſing the *blood*, which became black in the phlogiſticated air, to common or dephlogiſticated air, it regained its red colour: and the ſame pieces became alternately black and red by being transferred from phlogiſticated to dephlogiſticated air; and *vice verſâ.* The *blood*, in theſe experiments, he ſays, muſt have parted with its phlogiſton to the common air or dephlogiſticated air; and have imbibed it and have become ſaturated with it, when expoſed to phlogiſticated, nitrous, inflammable, or fixed air. There are, however, he acknowleges, other cauſes to which the blackneſs of the *blood* may ſometimes be owing, beſides its acquiring phlogiſton: nor can it be expected, that, when *blood* has become black without having received phlogiſton *ab extrà*, it will generally recover its florid colour by being expoſed to the air.

Dr. Prieſtley proceeded to examine, whether the quality of the air, to which pieces of *blood* had been expoſed, and in which their colour was changed, was at all affected or altered, during the operation. In this experiment he made uſe of dephlogiſticated air, as its quality is more ſuſceptible of alteration than common air; and he found, that a piece of *craſſamentum*, about the ſize of a walnut, put into the quantity of about five ounce meaſures of this air, and changed about ten or twelve times in the ſpace of twenty-four hours, ſo depraved the air, that a mixture of one meaſure of this, and two of nitrous air, which, at the beginning of the experiment, occupied the ſpace of no more than half a meaſure, afterwards occupied the ſpace of a meaſure and a half. See Air, *nitrous.* Whence he infers, that the black *blood* muſt have communicated phlogiſton to the air; and that its change of colour from black to a florid red, muſt have been occaſioned by the ſeparation of phlogiſton from it. He afterwards ſatisfied himſelf, that *blood* has likewiſe a power of taking phlogiſton from air; for by expoſing *blood* of a very beautiful florid colour to nitrous and to inflammable air, both were conſiderably diminiſhed by the proceſs. And he concludes, upon the whole, that the air becomes phlogiſticated in paſſing through the lungs, by means of the *blood.* Dr. Prieſtley anticipates an objection, which may be urged againſt this concluſion; viz. that the *blood* never comes into actual contact with the air in the lungs, but is ſeparated from it, according to Dr. Hales, at the diſtance of no more than a thouſandth part of an inch; and that the red globules remain in a large quantity of *ſerum*, which is a fluid of a very different nature. In order to reſolve this difficulty, he put a large quantity of black *blood* into a bladder, moiſtened with a little *ſerum*, and tying it very cloſe, hung it in a free expoſure to the air; and the next day he found, that all the lower ſurface of the *blood*, which had been ſeparated from the common air by the intervention of the bladder, and a ſmall quantity of *ſerum*, had acquired a coating of a florid red colour, as thick, in his opinion, as it would have acquired, had it been expoſed to the open air. He alſo found, that a deep covering of *ſerum* did not obſtruct the mutual action of the *blood* and air any more than the bladder had done. From both experiments he infers, that the change of colour cannot be owing, as M. Cigna imagined, to evaporation: nor is the change of colour in the laſt experiment owing to the *ſerum*, but to the air; for two equal portions of black *blood* were put into equal cups, containing equal quantities of *ſerum*, covering them to the depth of half an inch; one cup was expoſed to the open air, and the other placed in an exhauſted receiver; the *blood* in the former preſently acquired a florid colour, but the other continued after twelve hours as black as at firſt.

Dr. Prieſtley infers, from another experiment, that the moſt florid *blood* contains a conſiderable quantity of phlogiſton; and he obſerves, that there is a great difference in the conſtitution of *blood*, with reſpect to its property of being affected by the air. See on this curious ſubject, Hewſon's Experimental Inquiry into the Properties of Blood, or Phil. Tranſ. vol. lx. p. 368, &c. Prieſtley's Exp. and Obſ. on Air, vol. iii. p. 55. or Phil. Tranſ. vol. lxvi. p. 226, &c.

Boerhaave accounts for the colour of the *blood* from the ſame cauſe as for its heat; viz. from the action of the heart, and re-action of the ſides of the *aorta.* Borelli, to aſcertain the cauſe of the redneſs, took a parcel of the *cruor*, after it had ſeparated itſelf as far as ſpontaneouſly it would from the *ſerum*, and, waſhing it frequently in water, found it ſeparable into a viſcous, ſlippery ſubſtance, conſiſting of white or colourleſs fibres (which roſe to the ſurface of the water, and there gathered into a ſkim, or coherent pellicle of a reticular texture), and a deep red powder, which precipitated pretty plentifully to the bottom. Hence it appears, that the red colour of the *blood* is imparted to it by red tinging particles, as in the common caſe of dyers. By examining the red precipitate apart, and finding which of the elements it conſiſted chiefly of, a man who would reaſon about the colour of the *blood* from principles of the chemiſts, might carry that matter nearer an iſſue.

However, this red colour, though generally found in all terreſtrial animals, is not yet abſolutely neceſſary and eſſential; there being whole ſpecies which have their circulating liquor, or *blood*, white and limpid: to which Dr. Drake adds an inſtance of a pure white *blood*, like milk, which he let out of the median vein of a man, and which, when cold, did not ſeparate into a *craſſamentum*, as the red uſually does; nor yield a ſkim or cream, or turn ſour upon keeping, as milk does. Dr. Beal gives us another inſtance of the like kind; and Dr. Lower adds a third, of a perſon who bled ſo long at the noſe, till at laſt the broth he drank flowed, little altered, that way, as *blood.*

Blood, *changes and diſorders of the.*—From the principles, or conſtituent parts of the *blood* above recited, variouſly combined and diſtributed by the circulatory motion impreſſed by the heart, and by the oſcillatory expanſive motion of the interſperſed air, and the re-action of the contractile veſſels, flow all the properties and operations of the *blood.* From this mixture of elements, and their lax compoſition, it becomes ſuſceptible of various alterations and impreſſions; the principal whereof are, *coagulation*, which uſually attends it out of the body, ſometimes in it, and ſcarce ever without an artificial procurement, but always mortal: and *diſſolution*, which is juſt oppoſite to the former, and conſiſts in ſuch a comminution of the fibrous parts of the *blood*, as indiſpoſes it for a ſeparation of the *cruor* from the *ſerum.* This is frequently the conſequence of malignant and peſtilential fevers, &c. and is likewiſe occaſioned by ſome kinds of poiſons.

Theſe two contrary affections of the *blood*, Dr. Drake aſcribes to the oppoſite kinds of ſalts, acids, and volatile alcalies. For though, adds he, in a human body, no ſincere acid is found, nor could it, indeed, be conſiſtent with life; yet it may, and does often, enter the *blood*, ſo compounded as to bridle the volatile, alcalious ſalt of the *blood*, and ſo hinder the due attenuation and mixture of the ſeveral parts; as is the caſe in a *diabetes*, and perhaps in a *chloroſis*, where the *blood* is thick and torpid: on the other hand, where the alcalious ſalts are too redundant, the *blood* is rendered too thin and fluid, ſo that the difference of its conſtituent parts is loſt.

Another affection frequent in the *blood* is, a too great abundance of oils, or oily particles, by means whereof the active parts of the *blood* are too much clogged, and thoſe parts which ſhould be ſecreted, for peculiar uſes in the body, are detained; and perhaps the ſolids, through which it paſſes, too much lubricated, their tone vitiated, ſhrunk, relaxed, &c. whence the ſluggiſhneſs and inactivity of very fat people.

The contrary affection to this is, the defect of oil in the *blood*; which, being, as it were, its balſam, lines and preſerves the parts from being fretted and corroded by the ſalts, whoſe *ſpicula* or edges are, as it were, ſheathed in this ſoft balſamic matter, and their attrition againſt the ſolid parts prevented: this ſtate of the *blood* is uſually attended with a general atrophy, and a fretting and corroſion of ſome particular parts; whence ſerous defluxions, apoſthumations, and ulcers, eſpecially in the lungs, whoſe tender veſiculous ſubſtance is more eaſily annoyed than any other, by the acrimony of the ſaline *ſerum*. See CATARRH, CORPULENCY, &c.

There are other affections of the *blood*, reſulting from its inordinate temperature and mixture, with regard to the earthy parts; the conſequences of which are, the ſtone, &c. and others that do not originally ſpring from any dyſcraſy, or undue mixture of the elements, but from an alteration in its motion; ſuch as an augmentation or diminution of its progreſſive motion, or the like changes in its inteſtine motion; whence ſupernatural fermentations are induced.—The occaſions here may be various; ſometimes fevers, and other diſorders occaſioned by ſurfeits, debauches, catching cold, violent exerciſe, &c. whence atonias; at other times ſome latent malignity of the air, whence epidemical diſeaſes.

To which may be added divers other morbific conſtitutions depending on the different ſtates and diſpoſitions of the *blood*, in reſpect of quantity, velocity, fluidity, denſity, ſeroſity, &c. An exceſs in the quantity of *blood* conſtitutes what we call a *plenitude*, or *plethora*; a defect or want of a competent quantity, a *leiphæmia*.

The ſymptoms of exceſs or defect, of an over-repletion or depletion, in the *blood*-veſſels, are obvious; but caution muſt be uſed not to miſtake every occaſional fluſhing or tide of the *blood* to the head for a general *plethora* of the *blood*-veſſels, ſuch tides and fluſhings being very common in caſes where there is yet no *blood* to ſpare.

The *æquilibrium* of the *blood* is an uniform and proportional diffuſion of it through all the parts of the body.

Any conſiderable *ſtimulus*, it is known, will drive the *blood* in large quantities to the ſtimulated part, which muſt neceſſarily break the *æquilibrium* and uniformity of its circulation; whence congeſtions, ſtagnations, concretions, &c. of the *blood*; and hence it is, that a great part of regular practice conſiſts in driving, revulſing, diſcuſſing, and variouſly directing and determining the *blood*, in order to recover its *æquilibrium*.

The *æquilibrium* of the *blood* againſt any occaſional affluxes and refluxes of this fluid, is preſerved or reſtored, either by raiſing and diffuſing it when too weak and languid by cardiacs; as ſaffron, opium, Virginia ſnake-root, &c. or by depreſſing and repelling it when too much raiſed and diffuſed; which is done by the abſorbents, coolers, purgatives, acids of all ſorts, eſpecially apples.

The morbific exceſs or defect of the *blood's velocity* is as remarkable as that of its quantity; but this cannot be judged from the natural ſtate of the pulſe in health, which is different in different conſtitutions. The ordinary number of pulſations in a minute is from 70 to 80 under a ſtate of waking and moderate heat, and from 80 to 96 during the time of ſleep.

The too great *heat* and *viſcidity* of the *blood* is one of its moſt generally prevailing morbific conſtitutions, eſpecially in a country as ours, abounding with all the temptations to, and proviſions for, eaſe and luxury. This ſtate of the *blood* is brought on generally by drinking too freely hot, ſpirituous, inflammable liquors, and feeding plentifully on things, which contain a large proportion of volatile oily ſalts; as fleſh-meats half-boiled or roaſted, eaten in their bloody gravy, and all hot, ſpicy, and high-ſeaſoned broths, ſauces, and the like. The *blood* being by theſe over-heated and rarefied, the *ſerum* is, in conſequence, thickened into a ſort of jelly, by which means it is rendered unfit for motion, coheres too ſtrongly with the *craſſamentum*, and paſſes but ſlowly through the lymphatics and ſecretory glands. In this ſtate, the thicker and more viſcid parts of the *ſerum*, lodging on the lymphatics and receptacles of the glands, gradually obſtruct or fill them up. From which obſtruction and diminiſhed or intercepted circulation of the animal fluids, the heat and viſcidity of the *blood* ſtill increaſes, till the vital flame, raiſed too high, produces a fever. This ſtate of the *blood*, and its ſymptoms, are aggravated by a ſedentary life, or the want of due motion and exerciſe; for while the natural motion of the muſcular *fibrillæ* is either not at all, or but little promoted by voluntary action, the glands, and their receptacles, muſt be the ſooner ſtuffed up, and the circulation of the lymph, that powerful means by which nature continually cools and dilutes the *blood*, ſooner be ſuſpended.

The *blood* is cooled, diluted, and attenuated by temperance, exerciſe, the uſe of water as beverage, and otherwiſe, and by deobſtruents, eſpecially mercury, in the gentler preparations of it; as *æthiops* or cinnabar given in moderate doſes, ſo as not ſenſibly to affect the ſtomach, nor excite ſalivation, for a long time.

As to the greater or leſs degree of fluidity and viſcidity of the *blood*, it is manifeſt, that this humour may either have its parts too intimately divided and attenuated, or, on the contrary, there may be too cloſe a coheſion between its parts, ſo as to render the maſs too thick and viſcous. The firſt of theſe ſtates diſpoſes the *blood* to a too quick, eaſy, and rapid motion, and ſometimes diſſolves and fuſes it to ſuch a degree, that the globules or *craſſamentum* paſſes, together with the *ſerum*, through the glandular ſtrainers, and occaſions bloody ſecretions; as in malignant and peſtilential fevers, bloody ſweats, and other preternatural hæmorrhages. The latter or viſcid ſtate renders the *blood* unapt for motion, and diſpoſes it to ſtick and lodge in the capillaries and lymphatics. Phil. Tranſ. N° 44. p. 891.

The *ſpecific gravity* of the *blood*, or the various degrees of its rarefaction and condenſation, depend on the degrees of heat; as the natural heat either riſes too high, or ſinks too low, the *blood* will, of conſequence, be either too much rarefied, or too much condenſed. In the former caſe, where the *blood* is overheated and rarefied, the expanſive force of the elementary fire and air contained in the maſs, prevails over the corpuſcular attraction; and then, by the coagulating power of heat upon the *ſerum*, and its too intimate mixture and coheſion with the *craſſamentum*, the lymph, which ſhould form the ſecretions, cannot be ſeparated, but the *ſerum* is, as it were, abſorbed in the *craſſamentum*; in conſequence of which, the ſecretions muſt be diminiſhed, or quite ſuſpended, and a fever enſue, more or leſs inflammatory, according to the degrees of heat in the *blood*, and the conſequent ſuſpenſion or interruption of the lymphatic ſecretions. See FEVER and BUFF.

On the other hand, where the *blood* is immoderately cooled and condenſed, the corpuſcular attraction prevailing over the expanſive force, the *ſerum* will be over-thinned and diluted, and conſequently ſeparated too faſt, and thrown off too plentifully on the glands and lymphatics; ſo that if the urinary drains happen to be obſtructed, a ſurcharge of *ſerum* muſt enſue, and in conſequence of this a dropſy: and in caſe the fluid parts of the urine paſs freely enough, and only the groſſer recrements, ſalts, and *ſabula*, or fine ſands, be kept back, theſe being thrown on the ſeveral organs, will produce the ſymptoms of the ſcurvy.

In order to aſcertain the colour of the different parts of corrupted *blood*, Dr. Pringle made the following experiment. He took a freſh quantity without any inflammatory cruſt, and divided it into the *craſſamentum*, the *ſerum* with a few red globules in it, and the pure *ſerum*. The phials containing theſe ſeveral liquors were put into a furnace, where they ſtood ſome days, till they became thoroughly putrid.

The *craſſamentum* was changed from a deep crimſon to a dark livid colour; ſo that when any portion of it was diluted with water, it appeared of a tawney hue. Of the ſame colour was the *ſerum* in which the red globules remained. But the pure *ſerum*, after becoming turbid, dropped a white purulent ſediment, and changed into a faint olive green.

From this experiment he concludes, that the *ichor* of *ſordes*, and that of dyſentery fluxes, conſiſts of the *ſerum* tinged with a ſmall quantity of red blood putrefied; and that when the ſerous veſſels are of a tawney caſt, we are not to refer that colour to inflammation, but to a ſudden ſolution of ſome of the red globules mixed with the *ſerum*.

A few drops of this putrid *craſſamentum* were mixed with the recent urine of a healthy perſon, which they immediately changed into a flame-coloured water, common in fevers and in the ſcurvy. After ſtanding an hour or two, the ſame gathered a cloud, reſembling what is ſeen in the crude urine of perſons in acute diſtempers.

As to a green *ſerum*, it is perhaps never to be ſeen in the veſſels of a living body, ſince it is not to be ſuppoſed that a perſon could ſurvive ſo great a change of the *blood*. In foul ulcers, indeed, and in other ſores, where the *ſerum* is left to ſtagnate long, the matter is found of a greeniſh colour, and is then always acrimonious. But the effects of a green *ſerum* are, in no caſe, to be ſo much dreaded as in the caſe of an *aſcites*, where it is collected in ſo large a quantity: of which we had, ſome time ſince, almoſt a fatal inſtance in Mr. Cox, ſurgeon at Peterborough; who, upon tapping a woman but a few hours after death, was ſo affected with the poiſonous ſteams of a green *ſerum*, that he was preſently ſeized with a peſtilential fever, and narrowly eſcaped with his life.

In regard to the ſediment which the *ſerum* dropped on becoming turbid, and which reſembled well digeſted matter, the doctor thinks it a terreſtrial ſubſtance, intended for the nouriſhment or reparation of the ſolids; in which opinion he was the more confirmed by obſerving a like ſediment in the urine of men in perfect health: and therefore concludes that the *pus*, or digeſted matter of ſores, is nothing but this ſubſtance ſeparated from the *ſerum* of blood. And hence it is that all large ulcers are extremely weakening, from the great expence of *blood* in furniſhing this ſubſtance. Hence alſo it is, that iſſues are of more conſequence for making drains, than one would expect from the viſible evacuation: as near as the doctor could gueſs, an ounce of *ſerum*, after ſtanding ſome days, not furniſhing more of this matter than what might be produced in the daily diſcharge of a large pea-iſſue, or from a ſeton.

There are frequent inſtances of the tawney colour of the *ſerum*, the reſolution of the *craſſamentum*, and even of the offenſive ſmell of *blood* recently drawn. And, indeed, if we reflect how putreſcent *blood* is in a heat equal to that of the human body, we may be convinced, that no ſooner is the perſpiration by the lungs impeded, than a corruption begins in the whole maſs; which, if not timely prevented, brings on ſome putrid diſeaſe. If the acrimony is great and ſudden, a fever or flux will enſue; but if the accumulation is ſo ſlow that the body grows habituated to the putrefaction, a ſcurvy prevails. This is the caſe in long voyages, on board unventilated ſhips; in marſhy countries; and, in a leſſer degree, in all northerly climates, in moiſt ſituations.

Blood, *thickneſs of the*, is alſo a preternatural concretion, following on a *plethora*, or diminution of its motion, from which ſtagnations and other diſorders draw their riſe. This is either general throughout the whole body; or ſpecial, confined to ſome particular part; as in hypochondriac and hyſteric caſes, where the *blood*, by reaſon of the ſlowneſs of its progreſſion, acquires a *lentor* in the region of the *abdomen*. To the ſame cauſe are alſo owing polypuſes, apoplexies, pleuriſies, infarctions of the *viſcera*, palpitations of the heart, ſuppreſſions of the menſes, &c.

Blood, *ſolubility of the*, is that tendency in the *ſerum* and *craſſamentum*, by which they are diſpoſed to ſeparate and diſengage from each other, when the *blood* comes to cool, and ſtand in a baſon. When *blood* is taken off, it muſt frequently ſtand a long time at reſt, and in a cold place, before its principles can diſunite, ſo as to effect a perfect ſeparation of the *ſerum* from the *craſſamentum*; and yet at laſt, when the ſeparation is made, there may be a ſufficient quantity of *ſerum*, and perhaps a greater proportion than ordinary; whereas, at other times, this ſeparation ſhall be quickly made, and the ſolution effected after a ſhort time of ſtanding in a warmer air. Phil. Tranſ. Nº 44. p. 89.

The red part of the *blood* is readily ſoluble in water, but not in *ſerum*, nor in a ſaturated ſolution of neutral ſalts. See an account of ſome experiments on the *blood* by Dr. Lewis, in Neumann's Works, p. 551. n.

Blood, *ſweetening*, *purifying*, *or cleanſing the*, are terms which ſeem to have ariſen from a miſtake, as if the *blood* were an impure fluid, or capable of receiving impurities with the chyle; which ſeems to be overturned by the extreme fineneſs of the orifices of the lacteals, which will hardly allow any thing impure to paſs.

Blood, *excretions or evacuations of the*, are either ſpontaneous, as in the hæmorrhoids, *hæmoptoe*, hæmorrhages at the noſe, the *lochia*, and menſtrual flux; or artificially produced by medicines, emmenagogues, venæſections, ſcarifications, leeches, &c.

The want of due evacuations of the *blood* produces plethoras. In hypochondriacal caſes, the natural excretions by the *anus*, menſtrual flux, &c. are by all means to be promoted, as the ſureſt means of cure.

Blood, *transfuſion of it*. See TRANSFUSION.

Blood, *injecting liquors into it*. See INJECTION.

Blood, *ſpitting of*.—Spirit of plantain-juice, comfrey-roots, and fine ſugar, are recommended by Mr. Boyle as an approved remedy againſt ſpitting and vomiting of *blood*.

TAR-WATER is ſaid to be a very good remedy in this caſe.

Blood, *orgaſm of the*, denotes an extraordinary *efflatus* or ebullition, obſerved in fevers, phrenzies, *hæmoptoes*, palpitations of the heart, and even by ſome ſuppoſed in cephalalgias, ſcurvies, arthritic pains, &c. It is to be compoſed or allayed by calmers, nitroſe preparations, &c. rather than by opiates.

Blood, *cooling of the*, recommended by lord Bacon as a means of longevity, is to be effected by clyſters, baths, unctions, refrigerating decoctions applied to the belly, &c. Some have vainly imagined the chief office of reſpiration to be, to cool the kindled *blood*, and prevent too great a deflagration. See RESPIRATION.

Blood, *depuration of*. See SECRETION.

Blood, *flux of*, is called an HÆMORRHAGE. The periodical ones of women, MENSES. Thoſe after child-birth, LOCHIA. That ordinarily happening on the firſt coition, is by ſome called and conſidered as the teſt of virginity.

In the Philoſophical Tranſactions we have ſeveral very uncommon inſtances of ſpontaneous hæmorrhages or effuſions of *blood*; particularly of a child that bled at the noſe, ears, and hind part of the head, for three days; from that to the ſixth, ſhe ſweat blood from the head; on the ſixth, bled at the head, ſhoulders, and waiſt; and for three days more continued to bleed at the toes, bend of the arms, joints of the fingers of each hand, and at the fingers ends, till ſhe died: after her death were found, in the places whence the *blood* iſſued, little holes like the prickings of a needle.

About the matter of nutrition, or the ſource whence the nouriſhment is derived, great conteſts have ariſen among phyſicians and anatomiſts; ſome contending for a nutritious juice conveyed through the lungs; ſome ſetting up the lymph, others the chyle, ſome the *ſerum* of the *blood*, ſome the *cruor*, as the univerſal *ſuccus alibilis*, &c. However, all theſe, except they who bring the nutriment through the nerves, make the *blood* the vehicle, that conveys the alimentary parts through the body, whatever they be, and whenceſoever derived: but perhaps it was on the ſcore of its heterogeneity, or compoſition of different elements, that they did not make itſelf the nutritious fluid, without reſtraining that faculty to ſome particular parts of it. But Dr. Drake makes no ſcruple to ſay, that the *blood*, in its largeſt acceptation, as conſiſting of all the parts before deſcribed, is ſimple and homogeneous enough for the purpoſes of nutrition; and that every part thereof contributes ſomething, either materially or inſtrumentally, to the augmentation, or reparation, of the parts through which it paſſes. See NUTRITION.

For the manner in which the *blood* is formed, and how the chyle is aſſimilated into *blood*, ſee SANGUIFICATION.

Blood, *the quantity of*, in a human body, has been variouſly eſtimated by various authors: Dr. Lower computes it in an ordinary man, at about twenty pounds; Dr. Moulin by obſerving the proportion of the weight of ſeveral animals to their *blood*, eſtimates it at about $\frac{1}{20}$ of the weight of the whole man, which may amount to eight or ten pounds. Dr. Keill, from a calculation founded on the proportion of the coats to the diameters of the veſſels, ſhews, that in a body weighing 160 pounds, 100 pounds thereof are *blood*; but then under *blood* he includes the juices of the lympheducts, nerves, and other veſſels which are ſecreted from it.

In reality, it is very difficult to determine the quantity of *blood* in the body. Bleeding to death, the method uſed by Dr. Moulin and others, can never give the eſtimate of its true quantity; becauſe no animal can bleed longer than while the great artery is full, the continuance of which will be longer or ſhorter as the wounded artery is ſmaller or greater; and the *aorta* muſt always be the firſt veſſel that empties. The moſt certain way, in Dr. Keill's opinion, is, by finding what proportion the cavities of the veſſels, of which the whole body is compoſed, bear to the thickneſs of the coat. This, in the veins and arteries, may be exactly found; but, in the other veſſels, we only know the quantity of fluid they contain, by carefully evaporating as much as poſſible.

Some think it probable, that at leaſt two-thirds of the quantity of *blood* contained in an animal body, is continually paſſing the capillaries and ſmall veſſels in the glandular and muſcular parts, which can never be drawn off by any quick diſcharge from cutting the large veſſels; ſince, in that caſe, the larger veſſels being emptied much faſter than they can be ſupplied again from the capillaries, a defect of *blood* will ſoon enſue at the heart, upon which the animal falls into convulſions, and the circulation ſtops, while far the greater part of the *blood* muſt be ſuppoſed ſtagnating in the ſmaller and remoter veſſels.

Blood, *for the ſtanching of*, ſee STYPTIC.

Blood, *circulation of the*, denotes a natural motion of the *blood* in every living animal; whereby that fluid is alternately conveyed from the heart to all the parts of the body, by the arteries, and returned from the ſame parts to the heart by the veins.

The *circulation of the blood* has been generally allowed to have been firſt diſcovered in England, in the year 1628, by Harvey, a phyſician of our own country; though there are ſeveral authors who diſpute it with him.

Janſſon ab Almeloveen, in a treatiſe of New Inventions, printed in 1684, quotes ſeveral paſſages from Hippocrates, to prove that the *circulation* was known to him. Wallæus, ep. ad Barthol. pretends, it was known not only to Hippocrates, but alſo to Plato and Ariſtotle.—It is added, that the Chineſe phyſicians taught it 400 years, before it was ſpoke of in Europe.

Some go back as far as Solomon, and imagine they ſee ſome traces of it in Eccleſiaſtes, chap. xii.—Bern. Genga, in an Italian treatiſe of Anatomy, quotes ſeveral paſſages from Realdus Columbus, and And. Cæſalpinus, whereby by he endeavours to prove that they admitted a *circulation*, long enough before Harvey.

He adds, that Fra. Paolo Sarpi, the famous Venetian, from a conſideration of the ſtructure of the valves of the veins, and other experiments, concluded a *circulation*. See alſo Dutens's Recherches ſur l'Origine des Decouvertes attribuées aux Modernes. Paris. 1766.

Leonicenus adds, that F. Paolo durſt not make known his diſcovery, for fear of the inquiſition; that he therefore only communicated the ſecret to Fab. ab Aquapendente; who, after his death, depoſited the book he had compoſed on it in the library of S. Mark; where it lay hid a long time, till Aquapendente diſcovered the ſecret to Harvey, who then ſtudied under him at Padua; and who, upon his return to England, a country of liberty, publiſhed it as his own.—But much of this is fable.

Sir Geo. Ent has ſhewn that Father Paul received the firſt notice of the circulation of the *blood* from Harvey's book on the ſubject, which was carried to Venice by the embaſſador of the republic at the court of England, who ſhewed it to F. Paul, by whom ſome extracts were made from it, which coming afterwards into the hands of his heirs, gave riſe to an opinion in ſeveral perſons that he was the author of the papers and of the invention.

Servetus firſt announced the *minor circuitus*, or the leſſer *circulation* of the *blood* through the lungs, but the *major circuitus* was undoubtedly the diſcovery of Harvey. Many of the ancients had ſome knowlege of the *motion* of the *blood*; but they were ignorant of its regular *circulation*.

The *circulation* of the *blood* is evinced, from the following conſiderations.—1. All the *blood* of a living animal, upon wounding any one of the larger arteries, is, in a little time, evacuated, and that with a conſiderable force: as appears from the operation of butchers, &c.

Hence, it follows, that the *blood* has a paſſage from every part of the animal body into every artery: and if the whole maſs of *blood* be found to move on this occaſion, it is evident it muſt have moved before.

2. The great quantity of *blood* driven out of the heart into the arteries at every pulſe, makes a *circulation* neceſſary; ſince, without it, an infinitely greater ſtock of *blood* muſt be ſuppoſed in the body of a man, than any obſervation or experiment will allow of.

For though the ancients, who knew not this *circulation*, imagined that only a drop or two was expelled at each *ſyſtole*; which they were neceſſitated to ſuppoſe, to avoid the too great diſtenſion of the arteries, from a more conſiderable influx: yet it is certain, and even demonſtrable, that there muſt needs be an ounce, or more, driven into them at each time; and yet ſome compute that there are five or ſix thouſand pulſations in an hour.

3. Any of the arteries, being tied with a thread, ſwell, and beat, between the bandage and the heart; but they grow flaccid between the bandage and the extremities of the body. If now the artery be cut between the bandage and the heart, blood ſtreams out, even to death: if it be cut between the bandage and the extremities of the body, the quantity of *blood* it yields is very ſmall.

The vital *blood*, therefore, flows through the arteries; and its courſe is from the heart towards the extremes of the body: and this it does in every point of the body, internal and external; ſtill out of a wider part into a narrower; out of the trunk into the branches. And it is on this principle alone, that all the *blood* may be derived into any artery, and evacuated at it.

4. Any one of the larger veins being bound up with a thread, ſwells between the extremes of the body and the bandage, but without beating; and between the bandage and the heart it becomes flaccid.

If opened in the former part, it bleeds largely; if in the latter, it ſcarce bleeds at all. The *blood*, therefore, flows briſkly from every part of the body into this vein; and its courſe is from the extremes of the body towards the heart; from the narrower parts of the vein towards the wider parts; from the branches to the trunk.

From the whole, it is evident, that all the arteries of the body are continually bringing the *blood* from the left part of the heart, through the trunks of the arteries, into the branches; and from thoſe to all parts of the body, internal and external: and on the contrary, that all the veins, excepting the *porta*, are perpetually bringing back the *blood* from the extreme parts into the ſmaller branches; from thoſe it paſſes into the larger, at length into the trunks, and thence into the *cava*; and through the *ſinus venoſus*, or trunk of that vein (which ends in the cavity of the right auricle) into the heart.

The *blood* being arrived here, its motion, or *circulation*, is continued as follows.

The auricles of the heart being large hollow muſcles, are furniſhed with a double ſeries of ſtrong fibres proceeding with a contrary direction to two oppoſite tendons, the one adhering to the right ventricle, the other to the *ſinus venoſus*; as alſo with innumerable veins and arteries; by the contractile force of theſe auricles, the *blood* will be vigorouſly expreſſed, and drove into the right ventricle; which, upon this contraction, is rendered flaccid, empty, and diſpoſed to admit it.

If now the right ventricle, thus full of *blood*, by the contraction of its fibres preſs the *blood* towards the aperture again, the venous *blood* at the ſame time pouring in, will drive it back again into the cavity, and mix it more intimately; till riſing up againſt the *parietes*, it raiſes the *valvulæ tricuſpides*, which are ſo connected to the fleſhy columns extended on the oppoſite ſide, as that when laid quite down they cannot cloſe the *parietes* of the right ventricle: theſe it thruſts towards the right auricle, till being there joined, they ſtop the paſſage very cloſely, and prevent any return.

By the ſame means, the ſame *blood* riſes up into the three ſemilunar valves, placed in the extremity of the other mouth, and lying open to the pulmonary artery: theſe it ſhuts cloſe againſt the ſides of the artery, and leaves a paſſage into the artery alone. The venous *blood* therefore, that is, the *blood* of the whole body, continually moves out of the *ſinus*, or trunk of the *vena cava*, through the right auricle, and right ventricle, into the pulmonary artery, in a continued and forcible ſtream.

The *blood* carried by this artery into the lungs, and diſtributed by its branches through the whole ſubſtance thereof, is firſt admitted into the extremities of the pulmonary vein, called *arteria venoſa*; whence paſſing into four large veſſels, which unite together, it is brought to the left *ſinus venoſus*, or trunk of the pulmonary vein; by the force of whoſe muſculous ſtructure it is driven into the left ventricle, which, on this occaſion, is relaxed, and by that means prepared to receive it.

Hence, as before, it is driven into the left ventricle, which is relaxed by the ſame means; and the *valvulæ mitrales* opening, admit it into the left ventricle, and hinder its reflux into the pulmonary vein.

From hence it is forced into the *aorta*; at whoſe orifice there are three ſemilunar valves, which alſo prevent a reflux by cloſing the ſame.

And thus is *circulation* effected; all the *blood* ſent into the lungs, and received into the *arteria venoſa*, *ſinus venoſus*, left auricle and ventricle, being here continually propelled into the *aorta*, whoſe ramifications are ſpread throughout all the reſt of the body, with a violent motion.

This motion, in living animals, is attended with the following *phænomena*.

1. Both the venous ſinuſes are filled, and grow turgid at the ſame time. 2. Both auricles grow flaccid at the ſame time, and both are filled at the ſame time, with *blood* impelled by the contractile force of its correſpondent muſcular venous ſinus. 3. Each ventricle contracts, and empties itſelf of *blood* at the ſame time; and the two great arteries are filled and dilated at the ſame time. 4. As ſoon as the *blood*, by this contraction, is expelled, both ventricles being empty, the heart grows longer and broader; and conſequently more flaccid and capacious. 5. Upon which, the muſcular fibres of both venous ſinuſes contract, and expreſs the *blood* contained in them into the ventricles of the heart. 6. In the mean time, the venous ſinuſes are again filled, as before; and the auricles, &c. return into their former habitude. 7. And this alternation continues till the animal begins to languiſh, under the approach of death; at which time the auricles and venous ſinuſes make ſeveral palpitations, for one contraction of the ventricle.

Thus is all the *blood*, in its return from every point of the body, internal and external, and from every point of the heart and its auricles, impelled into the right ventricle; out of that into the lungs; thence into the left ventricle; and thence through the whole extent of the body; and thence again is brought back to the heart.

As to the manner of the *blood's* paſſing out of the arteries into the veins, in order to its being returned to the heart, there are two opinions.

In the firſt, the veins and arteries are ſuppoſed to open into each other, or to be continued from each other, by ANASTOMASES, or inoſculations of their extremities.

In the latter, the extreme capillary arteries are ſuppoſed to let out their *blood* into the pores of the ſubſtances of the parts; on whoſe nutrition part is ſpent, and the reſt is received in at the mouths of the capillary veins.

Each of theſe opinions muſt be allowed to have its reaſon: for without the firſt, it were difficult to account for ſo quick a return of the *blood* to the heart, as in effect we find; beſides, that in ſome of the larger veſſels, there is a confeſſed anaſtomaſis, v. g. in the ſplenic artery with the ſplenic vein, &c. whence authors conclude the ſame contrivance to hold in the leſſer veſſels; even in the ſmalleſt twigs in the extreme parts of the body, though not diſcovered by the eye; nature being ordinarily found very uniform, and conſiſtent with herſelf.

Riolanus, however, who will allow of no *circulation* but by anaſtomaſes, allows of none, neither, but by the larger veſſels.

The reaſon of the latter opinion is deduced hence, that if part of the arterial *blood* did not ooze out into the ſubſtance of the parts, they could not be nouriſhed thereby: for the *blood*, while contained in the veſſels, may indeed convey warmth thereto, but no nutriment; the very veſſels themſelves being not nouriſhed by the fluid running in their cavity, but by capillaries paſſing their coats.

If then the *blood* be driven out of the veſſels in a greater quantity than is required for NUTRITION, the redundancy muſt be imbibed by the capillary veins.

M. Leewenhoeck ſeemed to have put this matter out of doubt by his microſcopes, with which he diſcovered the inoſculations, or continuations of the extremities of the veins and arteries in fiſhes, frogs, &c. See ANASTOMASIS.

But doubts ariſing, whether the veins and arteries in human bodies and quadrupeds were of ſimilar ſtructure, Mr. Cowper made experiments, which evinced the inoſculations in the *omentum* of a cat, and alſo in the meſentery of a dog. He found, that the extremities of the veſſels are not equally leſſened, in the inoſculations in different animals.

In the tail of the tadpole, he frequently obſerved ſeveral communications between the veins and the arteries; through each of which two globules of *blood* might paſs together. In young fiſh, particularly *grigs*, the communicant branch is ſo ſmall, that one globule of *blood* can ſcarce paſs in the ſpace of three ſeconds.

The tail of a newt, or water-lizard, affords alſo a very entertaining proſpect of the *circulation* of the *blood* through almoſt numberleſs ſmall veſſels; but no object ſhews it ſo agreeably as one of theſe animals while ſo young as not to be above an inch long; for then the whole body is ſo very tranſparent, that the *circulation* may be ſeen in every part of it, as well as in the tail; and, in theſe objects, nothing is more beautiful than the courſe of the *blood* into the toes, and back again, where it may be traced all the way with great eaſe. Near the head there are alſo found three ſmall fins, which afford a very delightful proſpect: theſe are all divided like the leaves of polypody, and, in every one of the branches of theſe, the *blood* may be very accurately traced, running to the end through the artery, and there returning back again by a vein of the ſame ſize, and laid in the ſame direction; and as the veſſels are very numerous and large in this part, and the third or fourth magnifyer may be uſed, there are ſometimes ſeen thirty or forty channels of the running *blood* at once; and this the more as the globules of *blood* in the newt are large, and are fewer in number, in proportion to the quantity of *ſerum*, than in any other animal, and their figure, as they are protruded through the veſſels, changes in a very ſurpriſing manner.

In a *fœtus*, the *apparatus* for the *circulation* is ſomewhat different from that above deſcribed.—The *ſeptum*, which ſeparates the two auricles of the heart, is pierced through with an aperture, called the FORAMEN *ovale*; and the trunk of the pulmonary artery, a little after it has left the heart, ſends out a tube in the deſcending aorta, called the *communicating canal*.

The *fœtus* being born, the *foramen ovale* cloſes, by degrees, and the canal of communication dries up, and becomes a ſimple ligament. Though in ſome inſtances it has been known to remain open.

This mechaniſm once known, it was eaſy to perceive its uſe.—For while the *fœtus* is incloſed in the *uterus*, it receives no air, but that little furniſhed it by the umbilical vein: its lungs, therefore, cannot ſwell and ſubſide as they do after the birth, and after the free admiſſion of the air. They continue almoſt at reſt, and without any motion; their veſſels are, as it were, full of themſelves, and do not allow the *blood* to circulate, either in abundance, or with eaſe.

Nature, therefore, has excuſed the lungs from the paſſage of the greateſt part of the *blood*; and has contrived the *foramen ovale*, by which part of the *blood* of the *vena cava*, received into the right auricle, paſſes into the left auricle, as the mouth of the pulmonary veins; and by this means it is found as far in its journey as if it had paſſed the lungs.

But this is not all: for the *blood* of the *cava*, which, miſſing the *foramen ovale*, paſſes from the right auricle into the right ventricle; being ſtill in too great quantity to paſs by the lungs, whither it is driven through the pulmonary artery; is, partly, intercepted in the way by the communicant canal, and poured immediately into the deſcending aorta.

This is the doctrine of Harvey, Lower, and moſt other anatomiſts; but M. Mery, of the Royal Academy, has made an innovation in it.

He aſſigns another uſe for the *foramen ovale*; and maintains, that the whole maſs of *blood* brought from the *cava* to the right ventricle, paſſes, as in adults, into the pulmonary artery; whence part of it is conveyed by the communicant canal into the aorta; and the reſt brought from the lungs by the pulmonary vein into the left auricle, where it is divided into two parts; the one paſſing through the *foramen ovale* into the right ventricle, without circulating through the aorta, and the reſt of the body; the other part puſhed, as in adults, by the contraction of the left ventricle, into the aorta, and the whole body of the *fœtus*.

The whole queſtion, then, turns upon this, viz. whether the *blood* paſs through the *foramen ovale* from the right to the left ventricle, or from the left to the right?

M. Du Verney aſſerts the ancient opinion, againſt M. Mery; and maintains, that the *foramen ovale* has a valve ſo diſpoſed, as to be opened by the *blood* driving into the right ventricle; but ſhut the more firmly, by its puſhing towards the left. But M. Mery denies the exiſtence of any ſuch valve.

Again, in an adult, the aorta, being to receive all the *blood* of the pulmonary artery, is found of the ſame bigneſs. In a *fœtus*, the two arteries are to receive unequal quantities, which of the two ſyſtems ſoever be followed. According to the common opinion, the aorta, receiving more *blood* than the pulmonary, ſhould be bigger: according to the opinion of M. Mery, the pulmonary artery ſhould be the bigger, as being eſteemed to receive a greater quantity of *blood*.

To judge of the two ſyſtems, therefore, it ſhould ſeem, there needed nothing but to determine which of the two veſſels were biggeſt in a *fœtus*.

M. Mery always found the pulmonary artery half as big again as the aorta; and, on the other hand, M. Tauvry, who ſeconded M. Du Verney, produces caſes where the pulmonary is leſs than the aorta: the facts on both ſides being examined by the French Royal Academy.

M. Tauvry adds, that though the pulmonary artery ſhould be greater than the aorta, yet this does not prove, that more *blood* paſſes the firſt than the ſecond; ſince it may be accounted for from the *blood's* preſſing more ſlowly towards the lungs, which it finds ſome difficulty to penetrate, and accordingly ſwells, and is driven back.

M. Littre, upon diſſecting an adult, in whom the *foramen ovale* was ſtill open, and meaſuring the capacities of the veſſels on each ſide, declares for M. Mery.

As to the force of the *circulation* in the *fœtus*, anatomiſts are again divided.—The popular opinion is, that, during geſtation, the arteries of the *uterus* convey their *blood* into the *placenta*, which is nouriſhed by it, and that the ſurplus is conveyed into the roots of the umbilical vein, which makes part of the navel-ſtring: thence it is carried to the liver of the *fœtus*, where it enters the *vena cava*, and is thence conveyed to the right ventricle of the heart, and diſtributed as before.

Again, the *blood*, brought from the iliac arteries of the *fœtus*, enters the navel-ſtring by the umbilical arteries; then paſſes into the *placenta*, where it is reſumed by the veins of the *uterus*, which carry it back again to the mother; and perhaps, alſo, by the roots of the umbilical vein, which mix it afreſh with the *blood* of the mother.

According to this ſyſtem, therefore, it is the *blood* of the mother that ſupplies the child; which is here only regarded as a diſtinct member, or part, of her frame.

The beating of her heart ſends to it a portion of her *blood*; and ſo much of the impulſe is preſerved, as ſuffices to maintain that languid *circulation* which a *fœtus* enjoys; and, in all probability, gives that feeble pulſation obſerved in the heart.

Other anatomiſts maintain, that the *fœtus* is only ſupplied with chyle from the glands of the *uterus*; which is further elaborated, and turned into *blood*, in the veſſels of the *fœtus*; and *circulates* therein, without any further communication with the mother.—Theſe allow of no reciprocal *circulation*, excepting between the *placenta* and the *fœtus*.

But the former opinion ſeems beſt ſupported: for the *placenta*, being ſeparated from the *uterus*, during the time of geſtation, neither yields any chyle, nor any other thing but *blood*. Beſides, M. Mery has ſhewn, that the *uterus* has no glands to furniſh any chyle.

Two other obſervations of the ſame author, confirm the popular ſyſtem: the inner ſurface of the *uterus* is lined with veins; and the outer ſurface of the *placenta* is not lined with any membrane: now as it is by theſe two ſurfaces that the two ſeem, in ſome meaſure, glued together, it looks as if they were only left without membranes, for an immediate communication between their blood-veſſels.

Add to theſe a fact, whereof M. Mery was an eye-witneſs: a woman, big with child, was killed by a fall; in the cavity of her belly were found ſeven or eight pints of *blood*; all the *blood*-veſſels being emptied: the child, too, was found dead; but without the leaſt appearance of any wound, or contuſion; all its *blood*-veſſels being empty of *blood*, like thoſe of the mother. The body of the *placenta* ſtill adhered to the whole inner ſurface of the *uterus*; nor was there any extravaſated *blood* there.

Now the *blood* here had no other way to diſcharge itſelf, but by the veins of the *uterus*: whence it follows, that thoſe veins bring back to the mother the *blood* of the *fœtus*; which, alone, eſtabliſhes the whole ſyſtem. If the *circulation* were only from the *fœtus* to the *placenta*, and not alſo to the mother, the dead child would have had all its *blood*.

Upon the whole, the *blood* in the lungs of the *fœtus* has none of the advantages of *air*, or reſpiration; which yet being neceſſary, nature, it is ſuppoſed, takes care that it receives a portion of air, mixed together with its mother's *blood*, and tranſmitted to it by the umbilical veſſels, to be diffuſed through the body.

This is confirmed hence; that, by conſtringing the navel-ſtring very tight, the child dies like a man ſtrangled: which appears to be owing to nothing but the want of air. Add to this, that as ſoon as the mother ceaſes to reſpire, the *fœtus* expires.

As to the velocity of the circulating *blood*, and the time wherein a *circulation* is completed, ſeveral computations have been made. By Dr. Keill's account, the *blood* is driven out of the heart into the aorta, with a velocity which would carry it 52 feet in a minute; but this velocity is continually abated in the progreſs of the *blood* through the numerous ſections, or branches, of the arteries; ſo that before it arrives at the extremities of the body, its motion is infinitely diminiſhed.

But Dr. Jurin ſhews, that in any two arteries tranſmitting equal quantities of *blood*, the *momentum* of the *blood* is greater in the artery more remote from the heart than in that nearer; and that its *momentum* is greater in all the capillary arteries together, than in the aorta; and that the *momentum* of the *blood* is greater in any of the veins than in the artery correſponding to it; and therefore greater in the *vena cava* than in the aorta. Laſtly, he ſhews, that the *momentum* of the *blood* in the *vena cava* is equal to that of the quantity of *blood* thrown out into the aorta at each ſyſtole, whoſe velocity is ſuch as would paſs the whole length of the arteries and veins in the interval of time between two pulſes, and that the abſolute *momentum* of the *blood* in the *cava*, without any regard to the reſiſtance, is equal to the *momentum* of the weight of thirty pounds paſſing over the ſpace of an inch in a ſecond. He ſuppoſes the motion of the *blood* to be equable, which in reality it is not.

Dr. Keill, upon a moderate *ratio* of the branches of the arteries to the trunks, ſhews, that the greateſt velocity of the *blood* is to the leaſt, in a greater proportion than that of 10000,00000,00000,00000,00000,00000,00000, 00000 to 1.

The ſpace of time wherein the whole maſs of *blood* may ordinarily circulate, is variouſly determined.—Some of the lateſt writers ſtate it thus: ſuppoſing the heart to make 2000 pulſes in an hour, and that at every pulſe there is expelled an ounce of *blood*; as the whole maſs is not ordinarily computed to exceed 24 pounds, it muſt be circulated ſeven or eight times over, in the ſpace of an hour. See HEART.

The *impetus*, occaſioning the *circulation*, is great enough in ſome animals to raiſe the *blood* ſix, ſeven, or eight feet high from the orifice it ſpins out at; which, however, is far exceeded by that of the ſap of a vine in bleeding-time, which will ſometimes riſe upwards of forty feet high. Phil. Tranſ. Nº 398. p. 274.

The heat and motion of the *blood* are always greater from a greater activity in the ſoul, in the day than in the night; and they are likewiſe ever greater from the food taken in the day-time, for the pulſe is always quicker after eating than before it; after a full meal, than after a ſpare one; and after a meal of drier and ſtronger food, than after a meal of food that is moiſter and weaker.

BLOOD, *vitality and aſcenſion of the*.—Dr. Willis endeavours to ſhew that the *blood* being animate, this animation or life depends on its being kindled; inaſmuch as the common affections of fire and flame belong to the *blood*, though this vital flame doth not appear to ſight, becauſe its form is ſubordinate to another ſuperior form, viz. the ſoul of the animal. Phil. Tranſ. Nº 57. p. 1178. See BIOLYCHNIUM.

BLOOD, *inflammability of the*.—Mr. Boyle having held a piece of human *blood*, dried till it was almoſt pulverable, in the flame of a candle, found it would take fire, and afford a flame much like that which excited it, burning with a crackling noiſe, and here and there melting. But this inflammability much better appeared, when putting together four or five thoroughly kindled coals, he laid on them a piece of dried *blood* of the bigneſs of a ſmall nutmeg; for this yielded a large and very yellow flame, and if it were ſeaſonably and warily blown from time to time, as the *effluvia* degenerated into ſmoak, it would long continue to yield clear and yellow flames. The ſame author having cauſed ſome *blood* to be dried till it was reducible to fine powder, took part of the powder, which had paſſed a fine ſearce, and caſting it on the flame of a good candle, the grains, in their quick paſſage through it, took fire; and the powder flaſhed not without noiſe, as if it had been roſin.

BLOOD, *uſes of the*, are either in the animal œconomy, or in medicine, religion, diet, arts, manufactures, &c.

In the animal œconomy, the *blood* ſerves as the ſource or fund from which all the humours of the body are ſecreted, whether neceſſary for nutrition, digeſtion, muſcular motion, ſenſation, or the like. Some alſo make it the principle of life and heat. And others hold it to do the office of a *pondus* in the alternate motion of the heart. Phil. Tranſ. Nº 281.

Dr. Prieſtley has ſhewn, that one great uſe of the *blood* muſt be to diſcharge the phlogiſton with which the animal ſyſtem abounds; imbibing it in the courſe of its circulation, and imparting it to the air, with which it is nearly brought into contact, in the lungs; the air thus acting as the great menſtruum for this purpoſe. Exp. and Obſ. on Air, vol. iii. p. 71.

BLOOD, *mechanical and commercial uſes of*, are chiefly in agriculture, where it is found an excellent manure for fruit-trees; among lapidaries, among whom, it is pretended, rabbits *blood* will ſoften glaſs and flint; and goats *blood* diſſolves diamonds; in building, boards are ſometimes rubbed with *blood* to turn them brown. Some alſo pretend it has anciently been uſed in the mortar of old walls.

Blood is the baſis of that noble colour, called by painters PRUSSIAN BLUE; and it is to vitriol, that is, to iron diſſolved, and formed into a ſalt, that it owes its change into that colour.

On this principle, Mr. Brown, an excellent chemiſt among us, tried the effect of ſolutions of other metals mixed with *blood*, the reſult of which may be a *baſis* for many valuable diſcoveries. The *blood*, in all theſe experiments, was prepared into a *lixivium*, in the ſame manner as in the making the PRUSSIAN BLUE, that is, by calcining it with an equal weight of ſalt of tartar, and then diſſolving it in boiling water.

This *lixivium* of *blood* being poured into a ſolution of ſilver in *aqua fortis*, produces a *coagulum* of a pure fleſh-colour. The like *lixivium* made with fleſh inſtead of *blood*, produces, in this caſe, a white *coagulum*; and ſimple oil of tartar being uſed in the ſame experiment, by way of compariſon with theſe *lixivia*, afforded a much whiter ſediment. Spirit of ſalt being added ſeverally to all the three mixtures, the bloom of the fleſh-colour was taken off in the firſt; but it ſuffered no other change. In the ſecond, the *coagulum* was tinged a little blue; and in the third, the whiteneſs was evidently improved. The bluiſh tinge in the ſecond caſe, is not wholly to be attributed to the fleſh, but perhaps might be owing to an alloy of copper in the ſilver, from which it is ſeldom entirely freed.

The ſame liquors were made uſe of to form a precipitate from corroſive ſublimate of mercury diſſolved in water, the conſequence of which was, that the *lixivium* with the *blood* produced a pure yellow; that with fleſh, an orange colour; and the ſimple oil of tartar, a dingy red. The addition of ſpirit of ſalt afterwards to theſe made ſome very odd alterations; for the firſt changed its yellow into an orange colour; and the ſecond, its orange colour to a blue; while the third became without any colour. The blue colour in the *lixivium* with the fleſh, when mixed with this ſolution, may be accounted for from the vitriol in this preparation; but it is not ſo eaſy to ſay, why the ſame vitriol ſhould not have produced alſo a blue in a *lixivium* with *blood*.

Copper, when diſſolved in *aqua fortis*, makes the water of a green colour; and, on pouring to this the two *lixivia* of *blood*, and of fleſh, the *coagula* are much alike; that is, they are white, tinged with green; but, on adding ſpirit of ſalt to them, they become of a colour not unlike that of copper before the ſolution. Oil of tartar gives a pale green ſolution, and the ſpirit of ſalt clears up the liquor, and reſtores it to its former colour.

Biſmuth diſſolved in *aqua fortis*, and mixed with a *lixivium* of *blood*, produces a milky *coagulum*, which, after a ſmall time ſtanding, with the addition of ſome ſpirit of ſalt, becomes of a pale blue. The *lixivia* of fleſh, and of crude ſalt of tartar, produced both white *coagula*, which the ſpirit of ſalt made no alteration in. From theſe experiments it appears, that not any of theſe metallic bodies would produce a fine blue colour, with the *lixivium* of the *blood*; but a ſolution of iron anſwers all the experiments that are made with the ſolution of vitriol, and produces as fine a blue colour, as that made in the common way. Phil. Tranſ. N° 381. p. 25.

Blood, *medicinal uſes of*.—We find a great number of theſe enumerated by ancient and modern writers; but moſt of them, we doubt, on falſe and inſufficient grounds.

Blood, *eating of*.—This practice appears to have been prohibited to Noah, which prohibition was renewed by Moſes, and obſerved by the Jews, principally with a view to the uſe of ſacrifices in divine worſhip, and as a token of reſpect to the altar, at which the *blood* of every victim was preſented before God. The prohibition was repeated by the apoſtles at the council of Jeruſalem, confirmed and defended by all the fathers, except St. Auguſtin, and the univerſal practice, both of the eaſtern and weſtern church, till his time; and, in many churches, even of the weſt, much longer, as low as the middle of the tenth, ſome ſay the eleventh century. The queſtion is, whether the apoſtolical precept to abſtain from *blood*, be to be conſidered as only temporal and occaſional, a ſort of accommodation to the weakneſs of the Jewiſh converts; or perpetual, founded on moral principles, and conſequently ſtill obligatory.

The former opinion ſeems the more probable: though the advocates of the latter urge, that *blood* is prohibited, becauſe it tends to make men ſavage; that the prohibition is joined with that of fornication, which is an immorality; and that God has enjoined abſtinence from *blood* on all Chriſtians, in order to manifeſt his ſupreme power over all their enjoyments.

Blood, *religious uſes of*.—Among the ancients, *blood* was uſed for the ſealing and ratifying covenants and alliances, which was done by the contracting parties drinking a little of each other's *blood*; for appeaſing the *manes* of the dead, in order to which *blood* was offered on their tombs, as part of the funeral ceremony. Thus we read, that twelve youths were ſacrificed at the funeral of Patroclus; and eight at that of Pallas. Homer Il. φ ver. 27. Virgil Æn. lib. x. ver. 518.

The *blood* of victims was the portion of the gods, both among Jews and heathens; and accordingly was poured, or ſprinkled on the altars in oblation to them.

Some have aſſerted, that the Romans offered human *blood* to appeaſe their deities, which is denied by others.

The prieſts made another uſe of *blood*, viz. for divination: the ſtreaming of *blood* from the earth, fire, and the like, was held a prodigy, or omen of evil.

The Roman prieſts were not unacquainted with the uſe of *blood* in miracles; they had their fluxes of *blood* from images, ready to ſerve a turn; witneſs that ſaid to have ſtreamed from the ſtatue of Minerva at Modena, before the battle at that place. But in this their ſucceſſors have gone beyond them. How many relations in eccleſiaſtical writers of madonas, crucifixes, and wafers bleeding! At leaſt the liquefaction of the *blood* of St. Januarius at Naples, repeated annually for ſo many ages, ſeems to tranſcend by far, all the frauds of the Grecian or Roman prieſthood. But the chemiſts are got into the ſecret, and we find M. Neumann at Berlin performed the miracle of the liquefaction of dried *blood*, with all the circumſtances of the Neapolitan experiment.

Blood, in the *Romiſh Church*, is uſed in ſpeaking of the wine in the EUCHARIST; which they ſuppoſe miraculouſly converted, by the prieſt's conſecration, into the real *blood* of Chriſt. See TRANSUBSTANTIATION, &c.

Blood is alſo uſed abuſively for the SAP of plants; as having much the ſame office in the vegetable, as the other in the animal œconomy.

In a ſenſe, not unlike this, wine is ſometimes alſo denominated the *blood of the grape*.

Blood is alſo applied, in *Pharmacy*, to certain vegetable juices, tears, &c. as DRAGONS *blood*, a ſort of eaſtern gum.

Blood, *dragon's*, *ſanguis draconis*, is alſo uſed by the Arabs for the juice of the ANCHUSA.

Blood, *ſatyrion*, a ruddy liquor produced from the roots of *ſatyrium*, baked with bread; and liquified, as it were, into *blood*, by a long digeſtion.

Blood, in *Chemiſtry* and *Alchemy*, is a denomination given to ſeveral artificial compoſitions, chiefly on account of their red colour.

Blood is more peculiarly uſed by the alchemiſts for the tincture of a thing.

In which ſenſe we meet with *blood of mercury*, denoting the tincture of it; *dragons blood*, denoting the tincture of ANTIMONY.

Blood, or *ſanguis veri ruffi*, denotes the ſulphur of MARCASITE.

Blood is alſo uſed, in *Middle Age Writers*, for ſupreme juriſdiction, exerciſed by the lord of the fee, in caſes where *blood* is ſpilt.

This is alſo called *judgment of blood*, *juſtice of blood*, ſometimes *cognizance of blood*.

Blood, *avenger of*, among the Jews, was the next of kin to the perſon murdered, who was to proſecute the murderer.

Eccleſiaſtical judges retire, when judgment is to be given in *caſes of blood*, becauſe the church is ſuppoſed to abhor *blood*: it condemns no perſon to death; and its members become irregular, or diſabled from their functions, by the effuſion of *blood*.

Blood *of Chriſt* is the denomination of a military order inſtituted at Mantua in 1608, by Vinc. Gonzagua IV. Its device was, *Domine probaſti me*; or, *Nihil hoc triſte recepto*.

Hermant ſpeaks of this order, and obſerves that it took its name from ſome drops of the *blood of Chriſt* ſaid to have been preſerved in the cathedral church of Mantua.

The number of knights was reſtrained to twenty, beſides the grand maſter; the office whereof was annexed to himſelf, and his ſucceſſors.

Blood, in *Farriery*, denotes a diſtemper in cattle's backs, which makes them in going draw their heads aſide, or after them: the cure is by ſlitting the length of two joints under the tail, and thus letting the beaſt bleed plentifully. If he bleed too much, the farriers knit his tail next the body, and then bind ſalt and nettles bruiſed on the part.

Blood-*running itch*, is a ſpecies of itch in a horſe, proceeding from an inflammation of the *blood* by over heating, hard riding, or other ſore labour; which, getting between the ſkin and fleſh, makes the beaſt rub and bite himſelf; and, if let alone, ſometimes turns to a grievous mange, highly infectious to all nigh him.

Blood, *field of*, in Syriac *aceldama*, was a field purchaſed by the Jews, with the thirty pieces of ſilver, which had been given to Judas for betraying his maſter, and which he had reſtored.

It ſtill ſerves for a burial-ground, in which all pilgrims, who die in their pilgrimage at Jeruſalem, are interred.

Blood-*flower*, *Hæmanthus*, in *Botany*, a genus of the *hexandria monogynia* claſs: its characters are theſe: the flower has a permanent empalement of ſix leaves, ſhaped like an umbel. It hath one erect petal, cut into ſix parts; and ſix awl-ſhaped ſtamina, which are inſerted in the petal. The germen is ſituated under the flower, and afterward becomes a roundiſh berry with three cells, each containing one triangular ſeed. There are four ſpecies.

The ſeaſon for tranſplanting the bulbs of this plant is in May or June, when the leaves are decayed; they may be kept out of the earth at this ſeaſon three or four months, but it is more adviſeable to plant them ſooner, as they always flower the ſtronger for it. Their ſoil is half a fine hazel-earth, and half old rotten dung; in September they muſt be removed into a moderate ſtove, and watered gently at times. They flower in the depth of winter.

Blood-*hound*. See HOUND.

Blood-*letting*. See BLEEDING.

Blood *of the philoſophers*, in the *Hermetic Art*, denotes a mercurial ſpirit, inherent in all metals, but chiefly in gold and ſilver.

Blood, *precious*, a denomination given to a reformed congregation of Bernardine nuns at Paris, firſt eſtabliſhed under that name in 1661.

Blood, *princes of the*, in France, are thoſe deſcended from the *blood* royal.

Blood, *ſalamander's*, ſignifies the redneſs remaining in the receiver, after diſtilling the ſpirit of nitre.

Blood-*ſhotten*, a diſtemper of the eyes, wherein the blood-veſſels are greatly diſtended, ſo as to make the eyes appear red. See OPHTHALMIA.

Blood-*ſtone*. See HÆMATITES and SANGUINE.

Blood *of ſulphur*, *ſanguis ſulphuris*, is a preparation of liver of ſulphur, ground with oil of tartar *per deliquium*, then digeſted with dulcified ſpirit of nitre. It is reputed a good pectoral and diuretic, but rarely preſcribed.

Blood-*veſſels*, in *Anatomy*, uſually include only the veins and arteries; though, in a larger ſenſe, all the veſſels in the body; as the nerves, lymphatics, &c. to the very hair, may be comprehended under the denomination.

Mr. Boyle obſerved an actual *blood*-veſſel, and full of red *blood* in the middle of a NERVE.

In the PLICA POLONICA, each hair is ſenſibly a *blood*-veſſel; and, when cut, will bleed like a ſmall vein. Boyle's Phil. Works abr. tom. i. p. 173. 449.

Blood-*ſnake*. See *Blood*-SNAKE.

Blood-*wite*, in *Ancient Law Writers*, ſignifies *blood*, and a cuſtomary amercement paid as a compoſition for the ſhedding or drawing of *blood*.

The word is alſo written *blodwite*, *blodwita*, *blodwyta*, *bloodwit*, *blodwit*, *bloudwit*, and *bluidweit*.

It is formed from the ancient Saxon *blud*, *blood*, and *vite*, or *wite*, a *fine* or *penalty*.

The word alſo denotes an exemption from this penalty, granted by the king to certain perſons and communities, as a ſpecial favour.

King Henry II. granted to all tenants within the honour of Wallingford—*Ut quieti ſint de hidagio* & blodwite & *bredwite.*

Blood-*wood*, *Hæmatoxylon*. See Log-*wood*.

Blood-*wort*, in *Botany*. See Sanguinaria and Dock.

Blood, *corruption of*, in *Law*. See Corruption *of Blood*.

Blood, *inheritable*, denotes ſuch a regular deſcent, as gives a perſon legal right to inherit the eſtate of an anceſtor. See Attainder, Escheat, Inheritance, &c.

Blood *royal*, is applied to the regular deſcendants of the royal family.

Blood, *whole* and *half*; a kinſman of the *whole blood* is he that is derived from the ſame couple of anceſtors; whereas a perſon of *half blood* deſcends from either of them ſingly by a ſecond marriage. Blackſt. Com. vol. ii. p. 227.

BLOODY *crime*, *ſanguineum crimen*, in *Writers of the Middle and Barbarous Age*, that which is puniſhed with the *blood*, or life of the offender.

Bloody *hand*, one of the four kinds of treſpaſſes in the king's foreſt, by which the offender being taken with his hands or other part bloody, is judged to have killed the deer, though he be not found either hunting or chaſing.

Bloody *heel-cock*. See Heeler.

Bloody *rains*. See Rain.

Bloody *ſweat*. Many inſtances of this are recorded, in which it has been owing to bodily diſorder, or extreme mental agitation and agony. See particularly Ariſtotle's Hiſt. Animal. lib. iii. cap. 19. apud Oper. tom. ii. Thuanus Hiſt. Temp. &c. lib. ii. apud Oper. tom. i. Melanges d'Hiſtoire & de Literature, &c. par M. V. Marville, tom. iii. p. 149. Acta Phyſico-Med. Norimbergæ, vol. i. p. 84. and vol. viii. p. 428.

Bloody *flux*. See Flux and Dysentery.

Bloody *urine*, a diſorder wherein the urine comes away mixed with blood, in greater or leſs quantity.

The blood here voided uſually comes from the kidneys, though ſometimes from the bladder or ureters.—It is ſometimes occaſioned by violent motion, or a fall on the back, cauſing a rupture of ſome of the blood-veſſels of the urinary parts: ſometimes it ſucceeds ſudden ſuppreſſions of the hæmorrhoids or *menſes*. The ſtone, eſpecially in the kidneys, will alſo occaſion frequent paroxyſms of this diſeaſe: and *cantharides* taken internally, or even applied externally without acids, will ſometimes have the ſame effect.—Bloody urine is a terrible ſymptom in the ſmall-pox, and malignant fevers; though on ſome occaſions it has proved critical, and carried off the diſtemper.

BLOOM, in the *Iron Works*, a term uſed by the miners for a four ſquare maſs of hammered iron, of about two foot long, and three quarters of a hundred weight, made from part of a ſow of caſt iron. The *bloom*, however, is not yet become iron fit for the ſmith's uſe, but muſt undergo many hammerings, and be firſt made what they call the ancony.

Bloom, *half*, a round maſs of metal, which comes out of the finery of an iron-*work*. See Blomary.

BLOSSOM, in a general ſenſe, denotes the flower of any plant.

In a more proper ſenſe, the word is reſtrained to the flowers of trees, which they put forth in the ſpring, as the forerunners of their fruit, otherwiſe called their *bloom*.

The office of the *bloſſom* is partly to protect, and partly to draw nouriſhment to the embryo fruit, or ſeed. Phil. Tranſ. N° 399. p. 329.

As eſſential as *bloſſoms* may ſeem to be to fruits, being, according to Malpighi, both the *uterus*, and the egg, or *fœtus* of the plant; yet we are told of trees bearing fruit without *bloſſoms*, as was done by the maple-tree in New England, mentioned by Mr. Dudley, and is always done by the polonic tree in China, which, according to Kircher's relation, produces its fruit immediately from the ſtock, without the intervention of any *bloſſoms*. Phil. Tranſ. N° 117. N° 385. p. 199. N° 26. p. 486.

In ſome plants the male and female parts of generation are remote from each other; e. gr. in the *gourd*, *pumkin*, *melon*, *cucumber*, and all of that race; to which may be added the nut bearing, and perhaps moſt bearing trees, which have all *bloſſoms* diſtinctly, male and female, on the ſame plant.

The *male bloſſoms*, called alſo catkins, may be diſtinguiſhed from the others, in that they have not any piſtil, or rudiment of fruit about them, but have only a large thrum, covered with duſt in their middle.

The *female bloſſom* has a piſtil within the *petala*, or flower-leaves, and the rudiment of their fruit is always apparent at the bottom of the flower before it opens.

Some ſorts of willows appear to change their ſex every year, and produce only male *bloſſoms*, or catkins, one year; and the year following ſtrings of female *bloſſoms*, which, if they happen to be near enough ſome flowering male, will produce ſeed, not much unlike thoſe of an *apocinum*.

Blossom is alſo uſed in the *Manege* for the colour of a horſe, which has his hair white, but intermixed all over with ſorrel and bay hairs, called alſo *peach-coloured*.

Horſes of this colour generally are hard and inſenſible, both in the mouth and the flanks; ſo that they are little valued; beſides they are apt to turn blind.

Blossom, in reſpect of ſheep. See Blissom.

BLOTED *china ware*, a name given by ſome to a ſort of china that is loaded with colours in an irregular manner. This pleaſes ſome people, but it is a defective ſort of ware, the large blotches of colours having been only laid on to cover the blemiſhes or faults in the firſt baking.

BLOTTING *paper*, a ſpecies of *paper* made without ſize or ſtiffening, ſerving to imbibe the wet ink in books of accounts, and prevent its ſetting off, or blotting the oppoſite page.

Blotting *book*, a ſort of minute book, or memorandum book, uſed by ſome merchants, for making imperfect entries in a preſent hurry, which are to be copied out fairer and fuller at night into the journal.

BLOW, in a general ſenſe, denotes a ſtroke given either with the hand, a weapon or inſtrument.

In fencing, *blows* differ from thruſts, as the former are given by ſtriking, the latter by puſhing.

We ſay to give, to return, to parry a *blow*. See Parrying.

Blows on the ſword make a ſpecies of purſuit, called beating.

Blow, *blind*, *ictus orbus* or *cæcus*, is that which does not appear, or is not attended with effuſion of blood; in contradiſtinction from that followed by a wound, diſcolouring, *tumor*, or the like, called *ictus apertus* or *apparens*, an open *blow*.

In the ancient laws, we find *blows* for remembrance, given to make perſons remember ſome tranſaction, and enable them to become better witneſſes of it in future times.

Blow, *military*, *alapa militaris*, that given with the ſword on the neck or ſhoulder of a candidate for knighthood, in the ceremony of dubbing him.

The cuſtom ſeems to have taken its riſe from the ancient ceremony of manumiſſion.

In giving the *blow*, the prince uſed this form: *eſto bonus miles*; upon which the party roſe a complete knight, and qualified to bear arms in his own right. Sometimes a double or even triple *blow* was given, called *trinapercuſſio.*

Blows, in *Common Law*. See Battery.

Blows and contuſions on the head, and about the *larynx*, are dangerous; thoſe in the epigaſtric region, eſpecially about the *ſcrobiculus cordis*, are frequently mortal.

Blows, *fly*, the *ova* of flies depoſited on fleſh, or other bodies proper for hatching them.

Blow-*pipe*, among jewellers and other artificers, is a glaſs-tube, of a length and thickneſs at diſcretion, wherewith they quicken the flame of their lamp, by blowing through it with their mouth. It is uſed in works of quicker diſpatch, which do not need the bellows, for concentrating flame and various uſes.

Though the wind blown out at a ſmall bent tube of glaſs, called a *blow-pipe*, ſeems not to have any great celerity, in compariſon of the parts of flame, and is itſelf of little force; yet, when the flame of a lamp or candle is directed by it, ſo as to beat upon a body at a convenient diſtance, it may be made to melt ſilver, or even copper itſelf, which yet may be kept, for many hours, unmelted in a red-hot crucible, or the flame of the lamp or candle unaſſiſted by the blaſt.

The enamellers have alſo tubes of divers ſizes, wherewith to *blow* their enamel, anſwering to the ſame purpoſe as the *ponteglio*, or *blow-pipe*, of glaſſmen.

BLOWER, *ſouffleur*, an appellation of contempt ſometimes given to an alchemist.

In the French king's kitchen, there was anciently an officer under the denomination of *ſufflator*, or *fire-blower*. The Roman mint-men were diſtinguiſhed by the appellation of *blowers* of gold, ſilver, and braſs, &c. *flatores auri*, *argenti*.

Blower, among dealers in horſes, a term uſed for ſuch horſes as wheeze much, without wanting wind. See Wheezing.

BLOWING *of glaſs*, one of the methods of forming the divers kinds of works in the glaſs manufacture.—It is performed by dipping the end of an iron ponteglo, or blowing-pipe, in the melted glaſs, and *blowing* through it with the mouth, according to the circumſtances of the glaſs to be blown.

Blowing *machines.* See Bellows.

Blowing, in *Medicine.* One method of adminiſtering medicines is by inflation, or *blowing* them into the part by a tube: thus it is they ſometimes convey powders into the eye, and ſometimes up the noſe, for the cure of a Polypus.

Blowing, *exſufflatio*, was alſo a ceremony in the ancient adminiſtration of baptiſm, whereby the *catechumen*, upon rehearſing the renunciation, *blew* three blaſts with his mouth, to ſignify that he rejected or caſt the devil abſolutely off.

Something like this is ſtill retained in the Ruſſian church. In the ſacramentary of St. Gregory, the prieſt who adminiſters baptiſm, is enjoined to *blow* thrice on the child's face, making the ſign of the croſs with his head, and pronouncing the words *exi ab eo ſatan.* Juſtin Martyr, Tertullian, St. Cyril, and St. Auguſtin, ſpeak of this ceremony as uſed in their times.

Blowing *of tin*, the running or melting the ore, after firſt burning it in a kiln, to deſtroy the mundic. Phil. Tranſ. N° 69. p. 2111, ſeq. See Tin.

Blowing *of a fire-arm*, is when the touch-hole is gulled, ſo that the powder will flame out.

Blowing is alſo uſed in ſpeaking of the natural motion or courſe of the wind.

In the ſea-language, the wind is ſaid to *blow home*, or *blow through*, when it does not ceaſe, or grow leſs, till it comes paſt the place where the ſpeaker is. To *blow through* is ſometimes alſo uſed to denote, that the wind will be ſo great as to *blow* aſunder the ſails. When a wind increaſes ſo much that they cannot bear any top-ſails, they ſay, they were *blown into their courſes*, i. e. they could only have out the ſails ſo called. To expreſs an extraordinary great wind, they ſometimes ſay, it will *blow the ſail* out of the bolt-ropes.

Blowing is alſo uſed in ſpeaking of the force and effect of kindled Gun-*powder*, on bodies which happen to be over it.

In this ſenſe we ſay to *blow* up a houſe. Engineers at ſieges make Mines wherewith to *blow* up walls, baſtions, and other defences.

Powder-mills are apt to *blow* up by the iron-gudgeon's growing hot, and ſetting fire to the powder-duſt flying about.

Blowing, among *Gardeners*, denotes the action of flowers, whereby they open and diſplay their leaves.

In which ſenſe, *blowing* amounts to much the ſame with Flowering and Bloſſoming.

Blowing *of a flower*, among *Floriſts*, an artificial proceſs, in order to bring a flower to diſplay itſelf with greater perfection and beauty than it would arrive to in the natural way of *blowing*. The uſual method is thus: about April, when the flower-ſtems begin to put forth or *ſpindle*, as the gardeners call it, they place by each flower a ſtraight ſtick four feet long, and tie the ſpindles to it as they ſhoot. As ſoon as the flower-buds appear, they leave only one of the largeſt on each flower-ſtem to bloſſom. About ten days before the flowers open themſelves, the round podded kinds will begin to crack their huſks on one ſide, when the careful gardener, with a fine needle, ſplits or opens the huſk on the oppoſite ſide to the natural fraction; and about three or four days before the complete opening of the flower, cuts off with a pair of ſciſſars the points on the top of the flower-pod, and ſupplies the vacancies or openings on each ſide the huſk with two ſmall pieces of vellum, or oil-cloth, ſlipped in between the flower-leaves and the inſide of the huſk; by ſuch means, the bloſſom will diſplay its parts equally on all ſides, and be of a regular figure. Beſides this care, when the bloſſom begins to ſhew its colours, they uſe to ſhade it from the extreme heat of the ſun with a trencher-like board, or other device of the like nature, faſtened to the ſtick which ſupports it; for the flowers, as well as fruits, grow larger in the ſhade, and ripen and decay ſooneſt in the ſun.

In *Heraldry*, a *fleur-de-lys* is ſaid to be *blown*, *eſpanoui*, when its leaves are opened, ſo that buds appear among the *fleurons*. The arms of the city of Florence are *argent*, a *fleur-de-lys blown, gules.*

Blowing-*ſnake*, in *Zoology*, a name given by the people of Virginia to a ſpecies of ſerpent much reſembling the European viper, but conſiderably larger, and very remarkable for its inflating and extending the ſurface of its head before it bites. Its wound is very fatal.

BLOWN-*red*, in the manufacture of porcelane. See Red.

BLUBBER, in *Phyſiology* and *Trade*, the fat which inveſts the bodies of all large cetaceous fiſh, ſerving to furniſh an oil.

The *blubber* is properly the *adeps* of the animal: it lies immediately under the ſkin, and over the muſcular fleſh. In the porpoiſe, it is firm and full of fibres, and inveſts the body about an inch thick. In the whale, its thickneſs is ordinarily ſix inches; but, about the under lip, it is found two or three feet thick. The whole quantity yielded by one of theſe animals ordinarily amounts to forty or fifty, ſometimes to eighty or more, hundred weight. Phil. Tranſ. N° 77. p. 2275.

The uſe of *blubber* to the animal ſeems to be partly to poiſe the body, and render it equiponderant to the water; partly to keep off the water at ſome diſtance from the blood, the immediate contact whereof would be apt to chill it; and partly alſo for the ſame uſe that cloaths ſerve us, to keep the fiſh warm, by reflecting or reverberating the hot ſteams of the body, and ſo redoubling the heat; ſince all fat bodies are, by experience, found leſs ſenſible of the impreſſions of cold than lean ones.

Its uſe in trade and manufactures is to furniſh train-oil, which it does by boiling down. Formerly this was performed aſhore in the countries where the whales were caught; but of late the fiſhers do not go aſhore, they bring the *blubber* home ſtowed in caſks, and boil it down there.

Blubber-*livers.*—The livers of cods, which having been barrelled, yield ſpontaneouſly a conſiderable quantity of oil, which being ſkimmed off, the reſidue are called *blubber-livers*, to be boiled down for more oil.

Blubber, *ſea*, a denomination given by our navigators to the Urtica Marina, or ſea-nettle. Phil. Tranſ. N° 349.

BLUE, one of the primitive colours of the rays of light.

Anciently, *blue* was the ſymbol of the ſea; for which reaſon, in the Circenſian games the combatants who repreſented the ſea were clad in *blue*; and thoſe who had diſtinguiſhed themſelves by any notable exploit at ſea, were rewarded with a *blue* enſign.

Mr. Boyle has given us the following method of making tranſparent *blue*, nearly equal to ultramarine. The principal ingredient of this beautiful colour is the *cyanus*, or *blue* corn-bottle-flower, which abounds almoſt in every corn-field, and may eaſily be had during four of the ſummer months. It may be gathered by children about the verges of corn fields, without doing any damage to the corn.

This flower has two *blues* in it, one of a pale colour in the large outer leaves; and the other of a deeper *blue*, that lies in the middle of the flower. Both theſe will do, being ſeparated from the buttons or caſes in which they grow; but the deep *blue* leaves in the middle produce much the beſt colour: this may be obſerved by rubbing the leaves while they are freſh upon a piece of writing paper, ſo hard as to expreſs the juice, which will yield an excellent colour, that by the experience of two or three years has not been found to fade.

A ſufficient quantity of theſe middle leaves being procured, let the juice be preſſed from them; to which a little alum being added, will give a laſting tranſparent *blue*, ſcarcely inferior in brightneſs to ultramarine.

It is very probable, that if the chives of theſe flowers were cured in the ſame manner with ſaffron, they would produce a much greater body of colour, from which a tincture might be drawn with more eaſe than when preſſed freſh from the field.

Mr. Boyle alſo recommends another fine *blue*, produced from the *blue* leaves of rue, beaten in a ſtone mortar with a wooden peſtle, and then put in water for fourteen days or more, waſhing them every day until they are rotten. Theſe beaten up at laſt, water and all, until they become a pulp, and then dried in the ſun, will make a fine *blue* for ſhading.

Blue *aſhes*, *Cendre bleu*, and by corruption from the French, *Sanders blue.*—Theſe are very much uſed in water colours, and ſome are very lively; but in oil they grow dull and greeniſh, being ſomewhat of the nature of verdigriſe; and the more oil is put to them, the weaker they become. They are found in the form of a ſoft ſtone, in places where there are copper mines, and water only is made uſe of in levigating them, to reduce them to a fine powder. This kind of *blue* ought to be uſed in works to be ſeen by candle light, as in ſcene painting; for though a great deal of white be mixed with it, it appears very beautiful, notwithſtanding it has a greeniſh caſt; quite contrary to enamel, which looks bright by day, and dull by candle light.

Some of theſe *blue aſhes* look as beautiful as ultramarine, but by mixing them with a little oil, the difference is eaſily diſcovered: for whereas ultramarine becomes much higher on being mixed with oil, theſe acquire no body of colour from the mixture.

There is nothing to be found in the ſhops under this name but common *verditer*, or ſome ſpecies of it. See Verditer.

Blue *bice*, is a colour of good brightneſs, next to *Pruſſian blue*; it is alſo a colour of a body, and flows well from the pencil. See Bice.

Blue, *azure*, in *Chemiſtry*.—This colour may be drawn from ſilver: but Boyle and Henckel juſtly obſerve, that this happens only according to the proportion of copper found mixed in this metal. The following is the ſhorteſt proceſs for making it. Diſſolve ſal gem, ſalt of tartar, and roche alum, in the ſtrongeſt double diſtilled vinegar; ſuſpend over the vinegar ſo prepared, thin plates of ſilver; and bury the veſſel in the huſks of grapes. Every three days remove the plates, and wipe off the *blue* which will be formed on them. Otherwiſe, put *laminæ* of ſilver as thin as paper into a pint of the ſtrongeſt vinegar, add to it two ounces of *ſal ammoniac* well pulveriſed; put this into a glazed earthen pot carefully ſtopped; bury this in horſe-dung for fifteen or twenty days, at the end of which time you will find the plates covered with a fine *azure blue*.

Blue, *dyers*, is one of their ſimple or mother colours, uſed in the compoſition of others: it is given chiefly with woad, and indigo. Some dyers heighten their *blue*, by adding madder, braſil, and other woods. The way of brightening *blues* is by paſſing the ſtuff, when dyed and well waſhed, through luke-warm water; or, which is much better, by working and fulling the dyed ſtuff with melted ſoap, and then ſcouring it well.—*Blues* are dyed immediately from the whites, without any other preparation than ſcouring. See Dying.

Blue and yellow compoſe green when blended together. Hellot ſuſpects that ſuch a *blue fecula* as is procured from INDIGO and WOAD is procurable from many other vegetables. He ſuppoſes the natural greens of vegetables to be compounded in like manner of thoſe two colours, *blue* and yellow; and that the *blue* is oftentimes the moſt permanent, ſo as to remain entire after the putrefaction or deſtruction of the yellow. The theory is ſpecious, and perhaps juſt. Neumann.

Blue *black*. See Black.

Blue *enamel*. See *Azure* Enamel.

Blue, *Flanders*, is a colour ſeldom uſed but in landſcapes, as being apt to turn green. The French call it *cendre verte*, or green aſhes.

Blue *for painting or ſtaining glaſs*. See Glass.

Blue *Japan*. See Japanning.

Blue *Indigo*. See Indigo.

Blue *Litmus*, or *Lacmus*. See Litmus.

Blue, *painters*, is made differently, according to the different kinds of paintings. In limning, freſco, and miniature, they uſe indifferently ultramarine, *blue* aſhes, and ſmalt; theſe are the natural *blues*, excepting the laſt, which is partly natural, partly artificial. See each under its proper head.

In oil and miniature they uſe indigo, *blue* bice, *blue* verditer, *lapis armenus*, ſmalt, and litmus; alſo a counterfeit ultramarine.

Enamellers and painters on glaſs have *blues* peculiar to themſelves; each preparing them after their own manner. See Enamelling, *Painting on* Glass, and Neumann's Chem. Works, by Dr. Lewis.

Blue, *Pruſſian*, or *Berlin* Blue, is a modern invention, conſiderably in uſe among painters, though inferior to the ultramarine *blue*. It was diſcovered by accident, about the beginning of this century. A chemiſt of Berlin, having ſucceſſively thrown upon the ground ſeveral liquors from his laboratory, was ſurpriſed to ſee it ſuddenly ſtained with a moſt beautiful colour. Recollecting the liquors he had thrown on each other, he made a ſimilar mixture in a veſſel, and produced the ſame colour. He did not publiſh his proceſs, but prepared and ſold his BLUE, which was ſubſtituted for ULTRAMARINE. The account of it was firſt publiſhed in the Berlin Memoirs, 1710; but without the deſcription of its proceſs.

In a paper of Dr Woodward's, communicated to the Royal Society in the year 1724, there is given a ſhort way of making the *Pruſſian blue*, which when tried over again by Mr. Brown the chemiſt, was found to anſwer perfectly well; and gave hints and occaſions to ſeveral experiments, which gave great light into the true nature of the bodies uſed in that preparation.

The method was this. Four ounces of bullock's blood dried, and four ounces of ſalt of tartar prepared from four ounces of crude tartar and as much nitre, were calcined together; two hours after which, a black ſpungy ſubſtance remained in the crucible, weighing four ounces; a ſolution of which being made in boiling water, and afterwards filtered, left a remainder which when dried weighed nine drams. An ounce of Engliſh vitriol was diſſolved in ſix ounces of rain water, and eight ounces of crude alum in two quarts of water. Theſe being mixed hot with the blood, became green; and on adding two or three ounces of ſpirit of ſalt, they become of a fine *blue*, which will ſubſide, and leave the water clear at top. Mr. Brown found the proceſs exactly anſwer, and the product was an ounce of a very fine colour, and perfectly fit for the painter's uſe.

Among the ſeveral experiments which were made by mixing, in different manners and proportions, the ſeveral liquors of which this colour was to be prepared, all produced a *blue*; but that in different degrees, ſome being deeper, and others much paler. In one experiment the alum was wholly left out, and a very pale *blue* was produced; in another, the alum and vitriol were uſed in equal quantities, and then the product was an extremely deep *blue*.

Upon the whole, the preſcription ſeems to be given after repeated trials, and appears to be that very combination of the ſeveral ingredients, which muſt give the very fineſt colour they are capable of giving.

It is curious to know what gave the firſt hint for the production of ſo fine a colour from a combination of ſuch materials, eſpecially when we come to conſider, that the blood has the principal ſhare in this ſurpriſing change. Blood of any kind, or fleſh of any kind, would produce the ſame effects; but it is probable that fleſh would not yield ſo ſtrong or fine a colour. Beef has been tried, and found to yield a *blue*, but not ſo fine as the blood. Phil. Tranſ. abr. vol. vii. p. 747, &c.

In all the recipes which have been given for making the *Pruſſian blue*, the liquors are ordered to be mixed together boiling hot, except the ſpirit of ſalt; and experience ſhews, that the colour is moſt readily and beautifully made that way: but in experiments made with all the liquors cold, the colours have been very well produced, only in leſs beauty; and they have required waſhing ſeveral times in freſh water, to bring them to their beauty.

Mr. Brown thinks, that this *blue* is the phlogiſtic part of iron, diſengaged by the lixivium of bullock's blood, and applied to the earth of alum: and this opinion has been adopted by M. Geoffroy. The abbé Menon ſuppoſes that *Pruſſian blue* is nothing but iron entirely freed from all ſaline matter by the phlogiſton of the alkaline lixivium, and precipitated with its natural colour, which, he ſays, is *blue*: the alum ſerving to diminiſh the intenſity of the colour, by the whiteneſs of its earth. M. Macquer concludes, from many experiments, that it is nothing but iron impregnated with a ſuperabundant quantity of phlogiſton, which it receives from the phlogiſticated alkaline precipitant. He has likewiſe applied the preparation of this pigment to the dying of wool and ſilk, and found means of fixing the colour. The cloth muſt firſt be dipped in a diluted ſolution of vitriol and alum, then in the ley diluted, and afterwards in water acidulated with ſpirit of vitriol; it acquires hereby a light *blue* colour, which becomes deeper and deeper by repeating the dippings as before, and adding to the liquors each time a little more of the reſpective ſaline matters. M. Macquer obſerves, that this *blue* dye exceeds in beauty and luſtre that of indigo and woad; that it penetrates the whole ſubſtance of fulled cloth, without weakening it; that it is durable in the air, and bears boiling in alum water, but is diſcharged by ſoap. Phil. Tranſ. abr. vol. vii. p 747, &c. Mem. Acad. Scienc. for the years 1725, 1749, 1752.

The method of making this *Pruſſian blue* in perfection, has been purchaſed as a very valuable ſecret. Its proceſs is very extraordinary, and could ſcarce be derived *a priori* from any reaſoning about the nature of colours. It is allowed to be an excellent *blue* pigment, and is by ſome preferred to ULTRAMARINE; though its durability might have been ſuſpected, from the vegetable and animal matters uſed in its preparation, if the colour did not ſeem extraordinarily fixed by the operation.

The goodneſs of *Pruſſian blue* muſt be diſtinguiſhed by its brightneſs, deepneſs, and coolneſs.

There are four different proceſſes given for making the fineſt ſort of *Pruſſian blue* with quick-lime, given in the Hiſt. of the Acad. of Scienc. at Paris, for the year 1756.

Proceſs I. Take 3lb. of ox's blood, dried and reduced into a kind of ſmall ſcales, an equal quantity of quick-lime newly baked, 2lb. of red tartar, and 1lb. 8oz. of ſalt petre; pulveriſe the whole groſsly, and put it into a crucible, placed in the midſt of a great furnace, and give it a gradual fire. After four hours, when the matter is reduced into a kind of paſte which emits no more ſmoke, and is equally red, throw it by ſpoonfuls into two pails of boiling water; and, having filtrated the lixivium, mix it with a ſolution of 6lb. of alum, and 1lb. 8oz. of green vitriol. This operation will yield but 7oz. of *fecula*; but its beauty will make ſufficient amends for the ſmall quantity, as it will ſurpaſs in this reſpect all the *blues* of Pruſſia, which are prepared by other methods. It has alſo as good an effect as the fineſt *ultra-marine*; and has, beſides, the advantage of reſiſting the impreſſion of the air.

Proceſs II. Take 3lb. of dried ox's blood, an equal quantity of quick-lime, 2lb. of red tartar, and 2lb. of nitre; let them be calcined and lixiviated, as in the former proceſs: pour the lixivium into a ſolution of 4lb of alum, and 1lb. of green vitriol. This operation will yield more of the *blue fecula* than the other, but the colour will be leſs beautiful.

Proceſs III. Take 3lb. of dried ox's blood, 4lb. 8oz. of quick-lime, 2lb. of red tartar, 1lb. 8oz. of ſalt-petre. Proceed as before. This operation will produce the moſt beautiful *blue*; but the quantity will be only about 8oz. and 4 drams.

Proceſs IV. Take 3lb. of dried ox's blood, 6lb. of quick-lime, 2lb. of red tartar, and 1lb. 8oz. of nitre. Calcine and lixiviate as before; pour the warm lixivium into a ſolution of 4lb. of alum, and 1lb. of green vitriol; the *fecula* precipitated in this way will be as beautiful as thoſe of the firſt proceſs, and the quantity 26 ounces.

Blue, *Saxon*.—This dye has been known for ſome time, and is made by diſſolving indigo in oil of vitriol, by which the indigo becomes of a much more lively colour, and is extended to ſuch a degree, that it will go very far in dying. The following receipt for making it, produces a very fine colour, and never fails of ſucceſs.

Mix 1oz. of the beſt powdered indigo with 4oz. of oil of vitriol, in a glaſs body or matraſs; digeſt it an hour with the heat of boiling water, ſhaking the mixture at different times. Add 12oz. of water to it, ſtir the whole well, and when cold filter it; a very rich deep colour will be produced, and if a paler *blue* be required, it may be had by the addition of water. The heat of boiling water is ſufficient for this operation, and can never ſpoil the colour. A ſand heat, not uncommonly uſed for this purpoſe, is often found to damage the colour.

Indigo, digeſted with a large quantity of ſpirit of wine, and dried, will produce a finer colour than the former, if treated in the ſame manner with oil of vitriol.

For an account of the proceſſes for obtaining BLUE *liquors* from oak-duſt and vitriol, from logwood and verdegris, from logwood and blue vitriol, from an eſſential oil and volatile ſpirit; ſee Dr Lewis's Commercium Philoſophico-Technicum, ed. 4to. ann. 1773. p. 382, 407, 436.

Blue, *ſtone* or *powder*, uſed in waſhing of linen, is the ſame with SMALT, either in the lump or powdered.

When the SMALT is taken from the pot, it is thrown into a large veſſel of cold water: this makes it more tractable, and eaſily powdered. Afterwards, when examined after cooling, it is found to be mixed with a greyiſh matter reſembling aſhes, which they call *eſchel*. This grey matter is ſeparated by waſhing, and then the *blue* ſubſtance is powdered and ſifted through fine ſieves, to bring it to what we call *powder-blue*. Phil. Tranſ. N° 396.

Blue, *turnſol*, is a *blue* uſed in painting on wood, made of the ſeed of that plant. It is prepared by boiling four ounces of turnſol in a pint and a half of water wherein lime has been ſlacked. See Turnsol.

Blue, *ultramarine*, a beautiful blue colour, uſed by the painters, prepared from *lapis lazuli*.

Some derive its name, *ultramarine*, q. d. *beyond ſea*, from its being firſt brought into Europe out of India, and Perſia. Others ſay, it is becauſe its colour is deeper than that of the ſea.

This *blue* is one of the richeſt, and moſt valuable colours, uſed in painting.—The preparation conſiſts in firſt calcining the ſtone in an iron pot or crucible, then grinding it very fine on a porphyry; then mixing it up with a paſte made of wax, pitch, maſtick, turpentine, and oil; and at laſt waſhing the paſte well in clear water, to ſeparate the colouring part from the reſt, which precipitates to the bottom, in form of a ſubtile, beautiful, *blue* powder. The water is then poured off, and the powder at bottom is dried in the ſun; and is the true *ultramarine*.

Thoſe who prepare this colour, make uſually four kinds, which they procure by ſo many different lotions: the firſt is always the beſt; and the reſt worſe and worſe to the laſt.—There is *ultramarine* of the firſt kind, ſold for 11*l*. ſterling *per* ounce; and of the laſt, for about 12 or 15*s*.

The common opinion concerning its origin is, that the method of making it was firſt diſcovered in England; and that a member of the Eaſt India company, having a quarrel with his aſſociates, to be revenged of them, made the ſecret public.

Ultramarine muſt be choſen of a high colour, and well ground, which is known by putting it between the teeth, where, if it feel gritty, it is a ſign the triture is not ſufficient.

To know whether it be pure and unmixed, put a little of it in a crucible, and heating it red hot, if the powder has not changed its colour after this trial, it is certainly pure: on the contrary, if you perceive any change, or any black ſpecks in it, it is falſified.

Beſides this, there is another kind, called *common*, or *Dutch ultramarine*; which is only the crude *lapis armenus* and ſmalt well ground, and pulveriſed; the colour whereof, when uſed by the painters, is ſomething like that of the true *ultramarine*, though much leſs valued.

Ultramarine, on account of its high price, is frequently adulterated, either by a precipitation or magiſtery of copper made by alkaline ſalt, or by fine ſmalt. The adulteration in the former way may be diſcovered by pouring ſome diluted ſpirit of nitre on a ſmall quantity of the *ultramarine*; which, if there be any copper, will ſoon diſſolve, and form a greeniſh *blue* ſolution. The other kind of adulteration may be detected by waſhing the ſubſtance in water; the particles of the ſmalt being much groſſer than thoſe of the *ultramarine*: beſides, ſmalt will not mix ſo readily with oil, and in enamel painting they may be eaſily diſtinguiſhed, becauſe ſmalt will flux without any addition, whereas the other requires the addition of ſome vitreous body.

There is a *blue ſubſtance*, ſomething like what Kentman mentions under the name of *cæruleum patavinum*. It was diſcovered in a peat-moſs in Scotland. This earth is at firſt of a white colour, and only grows *blue* by being expoſed to the air. It has alſo ſome reſemblance to what Mr. Da Coſta in his Nat. Hiſt. of Foſſ. p. 103, calls *ochra friabilis cærulea*. It is deſcribed very minutely by Mr. Douglas, who gives an account of his various experiments upon it, and recommends it as a cheap paint in gum-water, particularly as it is levigated and prepared by nature. See Phil. Tranſ. vol. lviii. N° 27. an. 1768.

Many ſimilar ſpecimens of *blue* earth have been diſcovered in England and Ireland, and ſeveral parts of the continent.

Blue-*ball*, a name given in ſome countries to the *Cone*-Wheat.

Blue-*bottle*, in *Botany*, is the Engliſh name of the CYANUS. It is a ſmall plant, with beautiful blue flowers, common in our corn-fields, and of which many beautiful ſpecies are kept in gardens. See Centaury.

The common wild *blue-bottle* of our corn-fields, is eſteemed a cardiac and alexipharmic. Conſerves and ſyrups are prepared from it in ſome places, and ſerve very properly for the making other more efficacious medicines of the ſame intention into form. Schroder and ſome others, have greatly extolled the diſtilled water of the flowers in inflammations, and many other diſorders of the eyes; but this ſeems a leſs warranted matter. The flowers of the large garden kind, are ſaid to be particularly good in diſorders of the womb, and the leaves of either in infuſion in dropſies.

There are ſeveral ſpecies of this plant, commonly cultivated in gardens, for the beauty of their flowers They are almoſt all annuals, periſhing as ſoon as they have ripened their ſeed. In order to have them flower early, their ſeeds ſhould be ſown in July, or the beginning of Auguſt, and when the plants have once got ſtrength, they ſhould be tranſplanted into warm borders, and will endure the cold very well, and will flower very early the next ſummer.

Blue-*cap*, in *Ichthyology*. See Blew-*cap*.

Blue-*mantle*, in *Heraldry*, the title of a purſuivant at arms.

Blue-*nuns*, *filles blues*, thoſe of the order of the Annunciation.

BLUENESS, that quality which denominates a body *blue*; or, ſuch a ſize and texture of the parts that compoſe the ſurface of a body, as diſpoſes them to reflect the blue or azure rays of light, and thoſe only, to the eye.

With reſpect to the *blueneſs* of the ſky, M. de la Hire, after Leonardo da Vinci, obſerves, that any black body, viewed through a thin white one, gives the ſenſation of blue; and this he aſſigns as the reaſon of the *blueneſs* of the ſky, the immenſe depth whereof being wholly devoid of light, is viewed through the air illuminated and whitened by the ſun. For the ſame reaſon, he adds, it is, that ſoot mixed with white makes a blue; for white bodies, being always a little tranſparent, and mixing themſelves with a black behind, give the perception of blue. From the ſame principle he accounts for the *blueneſs* of the veins on the ſurface of the ſkin, though the blood they are filled with be a deep red; for red, he obſerves, unleſs viewed in a clear, ſtrong light, appears a dark brown, bordering on black: being then in a kind of obſcurity in the veins, it muſt have the effect of a black; and this, viewed through the membrane of the vein, and the white ſkin, will produce the perception of *blueneſs*.

In the ſame way did many of the early writers account for the phænomenon of a *blue* ſky; ſuch as Fromondus, Funceius, Otto Guericke, and many others: their opinion long prevailed, and has been adopted by ſome in more modern times, eſpecially by Wolf, and Muſchenbroek. But in the explication of this phænomenon, Sir Iſaac Newton obſerves, that all the vapours, when they begin to condenſe and coaleſce into natural particles, become firſt of ſuch a bigneſs as to reflect the azure rays, before they can conſtitute clouds of any other colour. This, therefore, being the firſt colour they begin to reflect, muſt be that of the fineſt and moſt tranſparent ſkies, in which the vapours are not arrived to a groſſneſs ſufficient to reflect other colours.

M. Bouguer, without having recourſe to the vapours diffuſed through the atmoſphere, in order to account for the reflection of the *blue*-making rays, aſcribes it to the conſtitution of the air itſelf, whereby theſe fainter-coloured rays are incapable of making their way through any conſiderable tract of it. And he accounts for thoſe *blue* ſhadows, which were firſt obſerved by M. Buffon in the year 1742, by the aerial colour of the atmoſphere, which enlightens theſe ſhadows, and in which the *blue* rays prevail; whilſt the red rays are not reflected ſo ſoon, but paſs on to the remoter regions of the atmoſphere. The abbé Mazeas accounts for the phænomenon of *blue* ſhadows by the diminution of light; having obſerved that, of two ſhadows which were caſt upon a white wall from an opaque body illuminated by the moon, and by a candle at the ſame time, that which was enlightened by a candle was reddiſh, and that which was enlightened by the moon was *blue*. However, the true cauſe of this appearance ſeems to be that aſſigned by M. Bouguer, which agrees with the ſolution given of it about the ſame time by Mr. Melville. But inſtead of attributing the different colours of the clouds, as Sir Iſaac Newton does, to the different ſize of thoſe globules into which the vapours are condenſed, Mr. Melville ſuppoſes, that the clouds only reflect and tranſmit the ſun's light; and that, according to their different altitudes, they may aſſume all the variety of colours at ſun-riſing and ſetting, by barely reflecting the ſun's incident light, as they receive it through a ſhorter or longer tract of air: and the change produced in the ſun's rays by the quantity of air through which they paſs, from white to yellow, from yellow to orange, and laſtly, to red, may be underſtood agreeably to his hypotheſis, by applying to the atmoſphere what Sir Iſaac Newton ſays concerning the colour of tranſparent liquors in general, and that of the infuſion of *lignum nephriticum* in particular. Edinb. Eſſ. vol. ii. p. 75. Bouguer Traité d' Optique, p. 368. Newton's Opticks, p. 228; or Prieſtley's Hiſt. of Viſion, &c. p. 436—449.

BLUFF-*head*, or **BLUFF**-*headed*, in the *Sea-language*, is when a ſhip has but a ſmall RAKE forward on, being built with her ſtem too ſtraight up.

Bluff-headed ſhips are oppoſed to thoſe that are ſharp-headed. They are ſhorter, leſs maſted, and ſail cheaper.

BLUING *of iron*, a method of beautifying that metal ſometimes practiſed; as for mourning buckles, ſwords, or the like. The manner is thus: take a piece of grindſtone, and whet-ſtone, and rub hard on the work, to take off the black ſcurf from it; then heat it in the fire, and as it grows hot, the colour changes by degrees, coming firſt to a light, then to a dark gold colour, and laſtly to a blue. Sometimes alſo they grind indigo and ſallad-oil together; and rub the mixture on the work with a woollen rag, while it is heating, leaving it to cool of itſelf.

Among ſculptors we alſo find mention of *bluing* a figure of bronze, by which is meant the heating of it, to prepare it for the application of gold-leaf, becauſe of the bluiſh caſt it acquires in the operation.

BLUNDERBUSS, in the *Military Art*, a ſhort ſort of fire-arm, with a large bore, contrived to carry a number of muſket or piſtol-bullets at once.

The *blunderbuſs* is proper to do execution in a crowd, or to make good a narrow paſſage, as the door of a houſe, ſtair-caſe, or the like.

BLUNT, in *Fencing*.—To fight with *blunts*, is to exerciſe or parade with weapons without points or edges.

BLUNTING *the angles of a battalion*, in the *Military Art*, ſignifies to retrench the four corners, and turn the ſquare into an octagon.

This is done in order to give an opportunity for preſenting the pikes, or firing on all ſides, and was a military evolution formerly much in uſe; but now diſuſed.

BLUSHING, a ſuffuſion, or redneſs of the cheeks, excited by a ſenſe of ſhame, on account of conſciouſneſs of ſome failing, or imperfection.

Bluſhing is ſuppoſed to be produced from a kind of conſent, or ſympathy, between ſeveral parts of the body, occaſioned by the ſame nerve being extended to them all. Thus the fifth pair of nerves being branched from the brain to the eye, ear, muſcles of the lips, cheeks, palate, tongue, and noſe; a thing ſeen, or heard, that is ſhameful, affects the cheeks with *bluſhes*, driving the blood into the minute veſſels thereof; at the ſame time that it affects the eye, and ear. For the ſame reaſon it is, as Mr. Derham obſerves, that a ſavoury thing ſeen or ſmelt affects the glands and parts of the mouth: if a thing heard be pleaſing, it affects the muſcles of the face with laughter; if melancholy, it exerts itſelf on the glands of the eyes, and occaſions weeping, &c. And to the ſame cauſe Dr. Willis aſcribes the pleaſure of kiſſing.

BMI, in *Muſic*. See GAMMUT.

BOA, in *Natural Hiſtory*, an aquatic ſerpent of prodigious ſize, which follows herds of oxen, from which it takes its name. It ſucks the cow's teats, and is found ſometimes in Calabria. One of theſe was killed in the reign of the emperor Claudius, in the belly of which they found a child, which had been ſwallowed whole. The bite cauſes an inflammation of the part bitten.

BOA is a genus of ſerpents in the Linnæan ſyſtem, with abdominal and ſubcaudal *ſcuta*, and without a rattle.

BOADODA *Baſhaw*, in the *Turkiſh Military Orders*, an officer of the *janizaries*, whoſe buſineſs it is to walk every day about the principal parts of the city, with a number of *janizaries* to attend him, to keep order, and ſee that all things are regular, even to the dreſs. This office is for three months, and from this the perſon is uſually advanced to be a *ſerach*.

BOAR, in *Zoology*, *ſus agreſtis*, the *wild boar*. This creature differs from the common domeſtic *hog*, in that the grown animal is not different in colour in the different individuals of the ſame ſpecies, but is always of a ruſty iron-grey. His ſnout is much longer alſo than that of the other; his ears ſhorter and rounder; and both theſe, and his tail and feet, are always black. It differs alſo, in that it is covered with two ſorts of hairs, the one kind long, the other ſhort: theſe laſt ſerve the creature to the ſame purpoſes, as the downy fur which the beaver and otter have under their long hair. It is very commonly wild in Italy, and its fleſh frequently brought to market. Ray.

The *wild* BOAR, among the *Huntſmen*, has ſeveral names, according to its different ages: the firſt year it is called *a pig of the ſaunder*; the ſecond, it is called *a hog*; the third, *a hog-ſteer*; and the fourth, *a boar*; when leaving the ſaunder, he is called a *ſingler* or *ſangler*.

The *boar* generally lives to twenty-five or thirty years, if he eſcapes accidents. The time of going to rut is in December, and laſts about three weeks. They feed on all ſorts of fruits, and on the roots of many plants; the root of fern in particular ſeems a great favourite with them: and when they frequent places near the ſea coaſts, they will deſcend to the ſhores, and demoliſh the tenderer ſhell-fiſh in very great numbers. Their general places of reſt are among the thickeſt buſhes that can be found, and they are not eaſily put up out of them, but will ſtand the bay a long time. In April and May they ſleep more ſound than at any other time of the year, and this is therefore the ſucceſsful time for the taking them in the toils. When a *boar* is rouzed out of the thicket, he always goes from it, if poſſible, the ſame way by which he came to it; and when he is once up, he will never ſtop till he comes to ſome place of greater ſecurity. If it happens that a *ſaunder* of them are found together, when any one breaks away, the reſt all follow the ſame way. When the *boar* is hunted into the wood, where he was bred, he will ſcarce ever be brought to quit it; he will ſometimes make towards the ſides to liſten to the noiſe of the dogs, but retires into the middle again, and uſually dies or eſcapes there. When it happens that a *boar* runs a-head, he will not be ſtopt, or put out of his way by man or beaſt, ſo long as he has any ſtrength left. He makes no doubles or croſſings when chaſed; and when killed makes no noiſe, if an old *boar*; but the ſows and pigs will ſqueak, when wounded.

The ſeaſon for hunting the wild *boar* begins in September, and ends in December, when they go to rut. If it be a large *boar*, and one that has lain long at reſt, he muſt be hunted with a great number of dogs, and thoſe ſuch as will keep cloſe to him; and the huntſman, with his ſpear, ſhould always be riding in among them, and charging the *boar* as often as he can, to diſcourage him: ſuch a *boar* as this, with five or ſix couple of dogs, will run to the firſt convenient place of ſhelter, and there ſtand at bay, and make at them as they attempt to come up with him.

There ought always to be relays alſo ſet of the beſt and ſtauncheſt hounds in the kennel; for if they are of young eager dogs, they will be apt to ſeize him, and be killed or ſpoiled before the reſt come up. The putting collars with bells about the dogs necks, is a great ſecurity for them; for the *boar* will not ſo ſoon ſtrike at them when they have theſe, but will rather run before them. The huntſmen generally kill the *boar* with their ſwords or ſpears; but great caution is neceſſary in making the blows, for he is very apt to catch them upon his ſnout or tuſks, and if wounded and not killed, he will attack the huntſmen in the moſt furious manner. The places in which the wound is to be given with the ſpear, are either between the eyes in the middle of the forehead, or in the ſhoulders; both theſe places make the wound mortal. When this creature makes at the hunter, his ſafety conſiſts merely in courage and addreſs; if he flies for it, he is ſurely overtaken and killed: if the *boar* comes ſtrait up, he is to be received at the point of the ſpear; but if he makes doubles and windings, he is to be watched very cautiouſly, for he will attempt getting hold of the ſpear in his mouth, and if he does ſo, nothing can ſave the huntſman but another perſon's attacking him behind; he will on this attack the ſecond perſon, and the firſt muſt then attack him again; two people will thus have enough to do with him, and were it not for the forks of the *boar*-ſpears that make it impoſſible to preſs forward upon them, the huntſman who gives the creature his death's wound, would ſeldom eſcape falling a ſacrifice to his revenge for it.

The modern way of *boar*-hunting is generally to diſpatch the creature by all the huntſmen ſtriking him at once; but the ancient Roman way was, for a perſon on foot, armed with a ſpear, to keep the creature at bay, and in this caſe the *boar* would run of himſelf upon the ſpear to come at the huntſman, and puſh forward till the ſpear pierced him through.

The wild *boar* was formerly a native of Britain, as appears from the laws of Hoel Dda, Leges Wallicæ, 41. William the Conqueror puniſhed with the loſs of their eyes, any that were convicted of killing him: Charles I. turned out wild *boars* in the New Foreſt, but they were deſtroyed in the civil wars.

The hinder claws of a *boar* are called *guards*.

In the corn he is ſaid to *feed*; in the meadows or fallow fields, to *rout*, *worm*, or *fern*; in a cloſe, to *graze*.

The *boar* is farrowed with as many teeth as he will ever have, his teeth increaſing only in bigneſs, not in number; among theſe there are four called *tuſhes* or *tuſks*, the two biggeſt of which do not hurt when he ſtrikes, but ſerve only to whet the other two loweſt, with which the beaſt defends himſelf, and frequently kills, as being greater and longer than the reſt.

It is very remarkable, that theſe creatures in the Weſt Indies are ſubject to the ſtone: few of them are abſolutely free from it, yet ſcarce any have the ſtones of any conſiderable ſize. It is common to find a great number in the ſame bladder, and they are uſually of about a ſcruple weight, and are angular, and that with great regularity, each having five angles. Phil. Tranſ. N° 36.

Among the ancient Romans, *boar*'s fleſh was a delicacy; a *boar* ſerved up whole was a diſh of ſtate.

The *boar* was ſometimes alſo the military enſign borne by the Roman armies, in lieu of the eagle.

Among phyſicians, a *boar*'s bladder has been reputed a ſpecific for the epilepſy.

The tuſh of the wild *boar* ſtill paſſes with ſome as of great efficacy in quinſies and pleuriſies. See an analyſis of it in Dr. Lewis's edition of Neumann's Works, p. 521.

Boar, in the *Manege*. A horſe is ſaid to *boar*, when he ſhoots out his noſe as high as his ears, and toſſes in the wind.

BOARD, a piece of timber ſawed thin, for the purpoſes of building. See Timber.

We ſay, a *deal-board*, an *oak-board*, &c.—*Boards* thicker than ordinary are called *planks*.—*Boards* formed ready for the coopers uſe are called *clap-boards*.—We have alſo *mill-board*, and *ſcale-board*, ſhaved very thin, for caſes, band-boxes, &c.

Deal-*boards* are generally imported into England ready ſawed, becauſe they are prepared cheaper abroad, by means of ſaw-mills.

Clap-*boards* are imported from Sweden and Dantzic.

Oak-*boards* chiefly from Sweden and Holland; ſome from Dantzic.

Pipe-*boards* are brought from Dantzic. We alſo import white *boards* for ſhoe-makers; mill and ſcale-*boards*, paſt-*boards*, &c. for divers artificers.

Scale-*board* is a thinner ſort, uſed for the covers of primers, thin boxes, and the like. It is ſawed with mills, and imported from Hamburgh.

Board, *feather-edged*, *graining*, *log*, *paſt*, *ſound*, *trail*, *waſte*, *weather*. See the ſeveral adjectives.

Board is alſo uſed for a kind of table or bench, whereon ſeveral artificers perform their work.

In this ſenſe, we ſay a work-*board*, a ſhop-*board*, a taylor's *board*, &c.

Board is alſo uſed for a flat machine, or frame, uſed in certain games, and the like.

In this ſenſe, we ſay a draught-*board*, a cheſs-*board*, a ſhovel-*board*, and the like.

Boards, in *Book-binding*. See Book-binding.

Board, *bureau*, is alſo uſed for an office where accounts are taken, payments ordered, and the like.

In this ſenſe, we ſay the *board* of works, *board* of ordnance, *board* of treaſury, and the like.

Board *of green-cloth*. See Green-cloth.

Board *of trade and plantations*, was eſtabliſhed in its preſent form by king William, in the year 1696. Commercial matters had before this time been generally referred to a fluctuating committee of the privy council: the obvious inconveniences attending this mode of management, induced king Charles II. to erect a ſpecial council of trade in the year 1668, which was ſoon after laid aſide: it was renewed again in 1672, but ſoon diſcontinued; and the former method of reference to committees of the privy council revived. In 1696, a regular and permanent *board* was eſtabliſhed, for ſettling all diſputes and regulations relating to commerce and colonies. This *board*, beſide ſuch of our miniſters of ſtate, who only attend on extraordinary occaſions, conſiſts of a firſt lord commiſſioner, and of ſeven other commiſſioners, with an annual ſalary of one thouſand pounds each.

Board *of trade*, *bureau de commerce*, an office in the French polity, eſtabliſhed in 1723, compoſed of eight perſons of experience in commerce and navigation, where all papers and propoſals relating to the improvement of trade are examined, and all difficulties which occur in affairs of navigation and commerce, either within or without the realm, are diſcuſſed.

Board-*wages* denotes a certain annual ſum allowed to houſhold ſervants for maintenance. *Board-wages*, granted to the menial officers and ſervants of the crown, commenced in 1629, when the neceſſities of king Charles obliged him to retrench the expence of his houſhold, by aboliſhing the greateſt part of the daily tables in his palace, which were eighty in number, and ſubſtituting this annual allowance in their room.

Board, or **Aboard**, in the *Sea-language*, is uſed in ſpeaking of things within a ſhip, or other veſſel.

Hence, to go *aboard* ſignifies to go into the ſhip; to heave over *board*, is to throw a thing out of the veſſel into the ſea; to ſlip by the *board*, is to ſlip down by the ſhip's ſide; *board* and *board*, is when two ſhips come ſo near as to touch one another, or when they lie ſide by ſide.

Weather-board, is that ſide of a ſhip which is to windward.

To *board a ſhip*, is to enter an enemy's ſhip in a fight. See Boarding, *infra*.

To *make a board*, or, as it is otherwiſe expreſſed, to *board it up* to a place, is to turn to windward; and to beat ſometimes upon one tack, and ſometimes upon another. In which it is to be noted, that the farther you ſtand off to one point of the compaſs, the better *board* you will make; and that it is better making *long boards* than ſhort ones, if you have ſea-room. A *long board* is when you ſtand a great way off before you tack or turn; a *ſhort board* is when you ſtand off a little; a *good board* is when we have got up much to windward, or when a ſhip advances much at one tack, and ſails upon a ſtrait line.

To leave a land on *back-board*, is to leave it a-ſtern or behind; the *back-board* being that which, in boats or ſhips, we lean our backs againſt.

BOARDED *floor*. See Floor.

BOARDING *of a ſhip*, an attack made to take her, by entering her decks with a detachment of armed men.

In order to *board* a ſhip, it is beſt to bear directly up with her, and cauſe all your ports to leeward to be beat open, and bring as many guns from the weather-ſide thither as you have ports for; and then lay the enemy's ſhip on board loof for loof, and order your tops and yards to be manned and furniſhed with neceſſaries, and let all your ſmall ſhot be in readineſs; then charge at once with both ſmall and great, and at the ſame time enter your men in the ſmoke, occaſioned by the firing, or by lighted powder-flaſks and an earthen ſhell, called a ſtink-pot, thrown on the enemy's deck, either on the bow of the ſhip, or bring your mid-ſhip cloſe up with her quarter, and ſo enter your men by the ſhrouds, or, if you would uſe your ordnance, it is beſt to board the enemy's ſhip athwart her hawſe, for then you uſe moſt of your great guns, and ſhe only thoſe of the prow. Let ſome of your men endeavour to cut down the enemy's yards and tackle, whilſt others clear the decks, and beat the enemy from aloft; then let the ſkuttles and hatches be broke open with all ſpeed, to avoid trains, and the danger of being blown up by barrels of powder placed under the decks. Thus, your men being in poſſeſſion of the ſails and helm, and the enemy every way ſtowed below the decks, the ſhip is taken, and all lies at your diſcretion.

BOARIA *Lappa*, a name given by the ancient Romans to the fruit or rough balls of the common aparine or cleavers. Pliny calls this plant ſometimes *lappa*, ſometimes *lappago*; and the fruit by the names of *lappæ boariæ*, or *lappæ caninæ*, and ſometimes *canariæ*.

BOAROLA, or **Boarina**, in *Zoology*, the name of a very ſmall bird, deſcribed by Aldrovandus, and ſome others, and ſeemingly the ſame ſpecies with the FLY-*catcher*, or MUSCICAPA.

BOAT, a ſmall, open, floating veſſel, commonly wrought or moved only by rowing; intended chiefly for the navigation of rivers, lakes, and the like.

The *boat* acquires various names, according to its various ſtructure, and the various uſes it is appointed for, and the places where it is to be uſed.—The ſeveral *boats*, and their names are,

A *jolly-boat*, a *long-boat*, a *ſkiffe*, a *pinnace*, a *cutter*, a *lanch*, a *water-boat*, a *yawl*, which are *boats* for ſhips; a *gondola*, a *Greenland-boat*, a *Bermudas-boat*, a *balloon of Siam*, a *horſe-boat*, a *periagua*, a *pleaſure-boat*, a *ponton*, a *canoe*, a *crucle*, a *currycurry*, a *deal-hooker*, a *felucca*, a *ferry-boat*, a *pram*, a *punt*, a *ſhallop*, a *Moſes*, a *tilt-boat*, a *tod-boat*, a *well-boat*, a *wherry*, &c.

The *boats*, or wherries, allowed to ply about London, are either *ſkullers*, wrought by a ſingle perſon with two oars; or *oars*, wrought by two perſons, with each an oar.

De Chales propoſes the conſtruction of a *boat*, which, what burden ſoever it bear, ſhall not only move againſt the current, without either ſails or oars, but alſo advance ſo much the faſter, as the rapidity of the water is greater. Its make is the ſame with that of the others, excepting only a wheel added to its ſide, with a cord, which winds round a roller as faſt as the wheel turns.

Something of the like kind has alſo been ſince done by M. Pitot. Vid. Mem. Acad. R. Scienc. an. 1729. p. 359, and p. 540.

A new attempt, and with great ſucceſs, is alſo ſaid to have been lately made at Vienna.

M. de la Hire has given us an examination of the force neceſſary to move *boats*, both in ſtagnant and running water, either with ropes faſtened to them, or with oars, or with any other machine: wherein, he ſhews, that the larger the ſurface of the oars plunged in the water, and the ſmaller that of the *boat* preſented to the water, is; and again, the longer that part of the oar between the hand and the places where the oar reſts on the *boat*, and the ſhorter that between this laſt point and the water; the freer will the *boat* move, and the greater effect will the oar have. See Oar.

Hence it is eaſy to calculate the force of any machine that ſhall be applied to rowing; v. gr. if we know the abſolute force of all the men who row, it muſt be changed into a relative force, according to the proportion of the two parts of the oar; i. e. if the part out of the veſſel be double the other, and all the men together can act with the force of 900 pounds, we compute firſt, that they will exert 300: which 300, multiplied by the ſurface which the veſſel preſents to the water, gives a ſolid water of a certain weight; which weight may be found, and of conſequence the velocity impreſſed on the veſſel by the oars. Or, the velocity of the oars may be found in the ſame manner, by multiplying the 300 pounds by the ſurface of all the parts of the oars plunged in the water. Nor would there be any difficulty in finding firſt the relative forces, then the abſolute ones; the velocities either of the oars, or of the veſſel, being given, or the proportion of the two parts of the oar.

Boats ſail more ſlowly and heavily over ſhallow, than over deep waters. See an account of experiments for explaining this, in Dr. Franklin's Letter to Sir John Pringle. Experiments, &c. 4to. 5th ed. p. 510.

Boat, *long*, called alſo the *ſhip's boat*, is the largeſt and ſtrongeſt *boat* belonging to a ſhip that can be hoiſted aboard of her. It has a maſt, ſail, and oars, as other *boats*; alſo a tiller to the rudder, which anſwers to the helm of a ſhip.

Her thaughts are the ſeats where the rowers ſit; and her thowls the ſmall pins between which the oars are put when they row.

Inſtead of a *long-boat*, merchant-ſhips in the Mediterranean uſe a LANCH.

A ſhip's *boat* is the very model of a ſhip, and is built in parts in all things anſwerable to thoſe which a ſhip requires, both for ſailing and bearing a ſail; and they bear the ſame names as to all the parts of a ſhip under water, as rake, run, ſtem, ſtern, bow, bildge, &c.

Its uſe is to weigh the anchor, bring goods, proviſion, &c. to or from the ſhip, and other ſervices, as occaſion requires.

The *long-boat* of a man of war may be decked, armed, and equipped for cruiſing ſhort diſtances againſt merchant-ſhips of the enemy, or ſmugglers, or for impreſſing ſeamen, &c.

The terms uſed in navigating a *boat* are, to *trim the boat*, that is, to keep her even; to *wind the boat*, i. e. to bring her head the other way; *free* or *bale the boat*, i. e. to fling out the water; *man the boat*, i. e. let ſome men go to row the *boat*; to *moor the boat*, i. e. to faſten it with two ropes, ſo that one ſhall counteract the other; *fend the boat*, i. e. ſave her from beating againſt the ſhip's ſides.

The *boat*'s gang includes thoſe who uſe to row in the *boat*, which are the cockſwain and his gang, to whom the charge of the *boat* immediately belongs.

A *bold boat* is that which will endure a rough ſea well.

A good *long-boat* will live in any grown ſea, if the water be ſometimes freed, unleſs the ſea break very much. The rope by which it is towed at the ſhip's ſtern, is called the *boat-rope*, to which, in order to keep the *boat* from ſheering, they add another, called a *geſt-rope*.

To ſave the bows of the *boat*, which would be torn out with the twitches which the ſhip under ſail gives it, they ſwite her, i. e. make faſt a rope round by the gunwale, and to that faſten the *boat*.

Boats, *train of*, a number of ſmall veſſels faſtened to each other, aſcending up the Loir in France, by ſails when the wind ſerves, otherwiſe towed by men, ſometimes to the number of ſeventy or eighty to a ſingle rope.

Boat, *coach*, *bateaux coches*, more frequently called *water-coaches*, are large covered *boats*, uſed chiefly on the river Seine, for the convenience of paſſengers, and conveyance of all ſorts of goods.

Boat, *ſcapha*, in *Surgery*, a ſpecies of BANDAGE, uſed when the crown of the head and the part between that and the forehead are to be bound. It is likewiſe called *tholus diocleus*.

Boat-*fly*, a water-inſect, whoſe back is ſhaped much like the bottom of a *boat*; the hind-legs, which are thrice as long as the fore, aptly enough reſembling a pair of oars. Accordingly, contrary to all other creatures, he ſwims, ſays Moufet, on his back.

Boat-*hook*, an iron hook, with a ſharp point on the hinder part of it, fixed on a long pole, uſed in bringing it to, or puſhing it from any other *boat*, ſhip, &c.

BOATING, a kind of puniſhment in uſe among the ancient Perſians for capital offenders.

The manner of *boating* was thus: the perſon condemned to it being laid on his back in a *boat*, and having his hands ſtretched out, and tied faſt on each ſide of it, had another *boat* put over him, his head being left out through a place fit for it. In this poſture they fed him, till the worms, which were bred in the excrements he voided as he thus lay, eat out his bowels, and ſo cauſed his death, which was uſually twenty days in effecting, the criminal lying all this while in moſt exquiſite torments. Prid. Connect. tom. ii. p. 368.

BOATSWAIN, an officer on board a ſhip, who has charge of her rigging, ropes, cables, anchors, ſails, flags, colours, and pendants; and is alſo to take care of the long-boat, and its furniture, and to ſteer her, either by himſelf, or his mate.

He calls out the ſeveral gangs aboard, to the due execution of their watches, works, &c.—He is likewiſe a kind of a PROVOST-marſhal, who ſees and puniſhes all offenders ſentenced by the captain, or a court-marſhal of the fleet.

Boatswain's *mate* is an aſſiſtant of that officer, who has the peculiar command of the long-boat for the ſetting forth of anchors, weighing or fetching home an anchor, warping, towing, or mooring. He is alſo to give an account of his ſtore.

This officer is the ſame with what the Dutch called *boots-man's mael*; the Germans, *unter boots-mann*; and the French, *boſſeman*, or *ſecond contre-maitre*.

BOB *of a pendulum*, the ſame with its ball; except that the former is uſed in ſpeaking of ſhort PENDULUMS, the latter of long ones.

Bob, in *Ringing*, denotes a peal conſiſting of ſeveral courſes, or ſets of changes.

Bob-*ſtay*, in *Sea-language*, a rope uſed to confine the bowſprit of a ſhip downward to the ſtem.

BOBARTIA, in *Botany*, a genus of the *triandria digynia* claſs of plants, the *calyx* of which is imbricated, and contains only a ſingle flower; the corolla is a glume, bivalve, and placed on the germen; the ſeed is ſingle, of an oval figure, and contained in the cup.

BOBBING, or **Bobbin**, a little piece of wood turned into a cylindric form, whereon thread is wound, to be uſed in the weaving of bone-lace.

The French alſo give the denomination *bobine* to what among us is more properly called a *ſpool* or *quill.* In which they are alſo followed by ſeveral Engliſh.

In this general ſenſe, *bobbins* are uſed to wind thread, worſted, hair, cotton, ſilk, gold, and ſilver; and they are of different lengths and ſizes, according to the materials which are ſpun or wound.

BOBBING, among *Fiſhermen*, a particular manner of FISHING for eels different from *ſniggling*.

Bobbing for eels is thus performed: they ſcour well ſome large lobs, and with a needle run a twiſted ſilk through them from end to end, taking ſo many that they may wrap them about a board a dozen times at leaſt: then they tie them faſt with the two ends of the ſilk, that they may hang in ſo many hanks; which done, they faſten all to a ſtrong cord, and, about an hand-breadth and an half above the worms, fix a plummet three quarters of a pound weight, and make the cord faſt to a ſtrong pole. With this apparatus fiſhing in muddy water, they feel the eels tug luſtily at the bait; when they think they have ſwallowed it ſufficiently, gently draw up the rope to the top, and bring them aſhore.

BOBISATIO, or BOCEDISATIO, in *Muſic*, denotes the uſing the ſeven ſyllables *bo*, *ce*, *di*, *ga*, *lo*, *ma*, *ni*, to expreſs the ſeven muſical notes, in lieu of the ſix uſual ones introduced by Aretine, *ut*, *re*, *mi*, *fa*, *ſol*, *la*, as has been ſometimes done by the Netherland and German muſicians ſince the beginning of the ſeventeenth century, to avoid the mutation neceſſary in the uſe of theſe latter.

BOCA, in *Ichthyology*, the name given by Paulus Jovius to the *boce* of Ariſtotle, called the *boops*, from the largeneſs of its eyes. It is a ſpecies of the SPARUS, and is diſtinguiſhed by having four parallel longitudinal gold and ſilver-coloured lines on each ſide. Gaza and ſome others call it *voca*; and the Italians, *boga*.

BOCAMOLLE, in *Zoology*, a name given by ſome to a very large and long Braſilian fiſh, more uſually called by its Braſilian name, *pira-jurumenbeca*.

BOCARDO, in *Logic*, the fifth mode of the firſt figure of ſyllogiſms, wherein the firſt propoſition is particular and negative; the ſecond, univerſal and affirmative; and the third, or concluſion, particular and negative. Thus:

BOC *Some animal is not man.*
AR *Every animal has a principle of ſenſation.*
DO *Therefore ſomething has a principle of ſenſation, that is not man.*

BOCCA, in *Zoology*, a name by which ſome authors have called the fiſh, more commonly known by the name of the URANOSCOPUS, or STAR-*gazer*.

It is a ſpecies of the TRACHINUS, diſtinguiſhed from the other kinds by having a great number of beards on the lower-jaw.

BOCCA, in *Glaſs-making*, the round hole in the working furnace, by which the metal is taken out of the great pots, and by which the pots are put into the furnace. This is to be ſtopped with a cover made of earth and brick, and removeable at pleaſure, to preſerve the eyes of the workmen from the violence of the heat.

BOCCALE, or BOCAL, a liquid meaſure uſed at Rome, anſwering to what among us is called a bottle, being equivalent to about an Engliſh quart. Seven *boccales* and an half make the *rubbia*.

BOCCARELLA, in the *Glaſs-manufacture*, a ſmall hole or aperture of the furnace, one of which is placed on each ſide the BOCCA, almoſt horizontally with it. Out of them the ſervitors take coloured or finer metal from the piling pot.

BOCCONIA, in *Botany*, ſo called after Paul Boccone, a conſiderable botanical writer in Sicily; the name of a genus of the *dodecandria monogynia* claſs of plants; the characters of which are theſe: the flower hath four narrow petals, with a great number of very ſhort ſtamina: in the centre is ſituated a roundiſh germen, contracted at both ends, which afterward becomes an oval fruit, contracted at both ends, having one cell, full of pulp, including a ſingle round ſeed. There is but one ſpecies of this genus known at preſent, which is the branching *bocconia*, with a woolly cow-parſnip leaf; or, as it is called by Sir Hans Sloane, the greater tree-celandine, with oak leaves.

It is very common in Jamaica, and ſeveral other parts of America, where it grows to the height of ten or twelve feet; having a ſtrait trunk as large as a man's arm, which is covered with a white ſmooth bark. The whole plant abounds with a yellow juice, like the greater celandine, which is of an acrid nature; ſo that it is uſed by the Americans, to take off warts and ſpots from the eyes.

The ſingular beauty of this plant renders it worthy a place in every curious collection; and the Indians are very fond of it, for Hernandez tells us, their kings planted it in their gardens.

BOCE, in *Ichthyology*; ſee BOCA.

BOCKING *herring*, in the *Dutch Trade*, ſignifies the ſame with BLOATED herring among us.

BOCK-LAND, or BOOK-LAND, formerly denoted that which we now call FREEHOLD-*land*, or CHARTER-*land*; and it was by that name diſtinguiſhed from FOLK-*land*, which was COPYHOLD-*land*.

In *Ancient Law Writers*, it denotes a poſſeſſion or inheritance held by evidence in writing.

The word was doubtleſs written *bock-land*, quaſi *book-land*, anſwering to free land. It ſtood oppoſed to FOLK-LAND, which was that held without writing.

BODIANO, in *Zoology*, the name of an American fiſh, of the ſize of a perch, with a purple back, and yellow ſides and belly. It is more uſually known among authors by the name PUDIANO.

BODLEIAN *Library*. See LIBRARY.

BODTY, in *Zoology*, the name of a ſpecies of American ſnake of the *amphiſbæna* kind, called alſo IBIJARA.

BODY, in *Phyſics*, a ſolid, extended, palpable ſubſtance; of itſelf merely paſſive, and indifferent either to motion or reſt, but capable of any ſort of motion, and of all figures and forms.

The word alludes to the Saxon *bodige*, *ſtature*; and to the Belgic *boode*, *a cover*, q. d. *the tabernacle of the ſoul*.

Body is compoſed, according to the Peripatetics, of *matter*, *form*, and *privation*; according to the Epicureans and Corpuſcularians, of an aſſemblage of hooked, heavy *atoms*; according to the Carteſians, of a certain quantity of *extenſion*; according to the Newtonians, of a ſyſtem, or aſſociation of ſolid, maſſy, hard, impenetrable, moveable *particles*, ranged or diſpoſed in this or that manner; whence reſult *bodies* of this or that form; diſtinguiſhed by this or that name.

Theſe elementary or component particles of *bodies* muſt be infinitely hard; vaſtly harder than the *bodies* compounded of them; nay, ſo hard as never to wear, or break in pieces. “This, Sir Iſaac Newton obſerves, is “ neceſſary, in order to the world's perſiſting in the “ ſame ſtate, and *bodies* continuing of the ſame nature “ and texture in ſeveral ages.”

BODIES, *motion of*. See MOTION.

BODY, *affections of*. See AFFECTION.

BODY, *modes of*. See MODE.

BODY, *elements of*. See ELEMENT.

BODIES, *the exiſtence of*, is a thing incapable of being demonſtrated: the order in which we arrive at the knowledge of their exiſtence, ſeems to be this.—We firſt find we have ſenſations; we then obſerve we have not thoſe ſenſations when we pleaſe: and thence conclude, we are not the abſolute cauſe thereof, but that there is required ſome other cauſe for their production. Thus we begin to know, that we do not exiſt alone, but that there are ſeveral other things in the world together with us.—But this, Dr. Clarke owns, comes far ſhort of a demonſtration of the exiſtence of a corporeal world: he adds, that all the proof we have of it is this; that God would not create us ſuch, as that all the judgments we make about things exiſting without us, muſt neceſſarily be falſe. If there be no external bodies, it follows, that it is God who repreſents the appearance of *bodies* to us; and that he does it in ſuch a manner as to deceive us.—Some think this has the force of a demonſtration: “It “ is evident God cannot deceive us; it is evident he “ does deceive and delude us every moment, if there be “ no *bodies*; it is evident, therefore, there muſt be *bodies*.”—But the minor of this argument may be denied without any ſuſpicion of ſcepticiſm.

“In effect, were it poſſible for *bodies*, i. e. ſolid, figured, &c. ſubſtances to exiſt without the mind, “ correſponding to thoſe ideas we have of external objects, yet how were it poſſible for us to know it? “ Either we muſt know it by ſenſe, or reaſon; as for “ our ſenſes, by them we have only the knowledge of “ our ſenſations or ideas: they do not inform us, that “ things exiſt without the mind, or unperceived, like “ thoſe which are perceived. It remains, therefore, that “ if we have any knowledge at all of external things, it “ muſt be by reaſon inferring their exiſtence from what “ is immediately perceived by ſenſe. But how ſhall “ reaſon induce us to believe the exiſtence of *bodies* “ without the mind, when the patrons of matter themſelves deny, that there is any neceſſary connexion betwixt them and our ideas? In effect, it is granted “ on all hands, and what happens in dreams, phrenſies, “ deliriums, extaſies, &c. puts it beyond diſpute, that “ we might be affected with all the ideas we have now, “ though there were no *bodies* exiſting without, reſembling them. Hence, it is evident, the ſuppoſition of “ external *bodies* is not neceſſary for the production of “ our ideas.” Berkley's Princ. of Human Knowledge, p. 59. See ABSTRACTION and EXISTENCE.

Body generally ſtands contradiſtinguiſhed from *ſpirit*;

though, in Spinoſa's and the Chineſe ſyſtem, this difference is ſet aſide, and *body* and *ſpirit* ſuppoſed to be the ſame ſubſtance under different modifications. Mr. Hobbes likewiſe affirms *ſpirits* to be *bodies*, the exiſtence of any ſubſtance not corporeal being rejected by him. See alſo Dr. Prieſtley on Matter and Spirit.

The Chineſe philoſophers reaſon thus: among an infinite number of properties, all equally contained in the nature of being, we are ſometimes affected with its extenſion, mobility, ſolidity, figure, and colour; in which caſe we call it ſimply *body*, or MATTER. Sometimes we add moving force to the former, which conſtitutes what we call a living being. Sometimes, again, we conſider it as poſſeſſed with ſenſe, will, and underſtanding; in which caſe we allow it a ſoul, mind, or ſpirit. On this footing, the ſeveral properties of being, however different from each other in the impreſſions they make on us, are no ways different as to their real nature; ſince they all exiſt neceſſarily with an infinity of others, and partake alike of one and the ſame infinite and unalterable exiſtence. Mem. Acad. Inſcript. tom. ix. p. 364.

The true notion of *body* is hard to frame, and philoſophers are not yet agreed on it; the rather as the purſuit leads to the perplexing controverſy *de compoſitione continui*. Some place the eſſence of *body* in ſolidity, or impenetrability; others in weight or gravity; others in extenſion; others in mobility. According to the firſt of theſe, *body* is defined as ſomewhat that perfectly fills a determinate quantity of ſpace or extenſion, ſo as neceſſarily to exclude all other *bodies* from being comprehended within the ſame dimenſions. According to the ſecond, *body* is defined as a thing which is receptive and communicative of motion or progreſſion. Sir W. Petty repreſents *body* as matter under ſome figure. The Carteſians define it any thing extended every way, or towards all ſides. According to Wolfius, the eſſence of *body* conſiſts in its compoſition, or mechaniſm of parts, from which all its other properties reſult, even extenſion itſelf, ſince we cannot conceive a compounded *body* otherwiſe than as extended, or conſiſting of parts, at leaſt poſſible if not actual ones.

The firſt or internal PRINCIPLES of *bodies*, which are not reſolvable into others, are called ELEMENTS.

LIGHT or FIRE is found an ingredient in all *bodies*; which ſome indeed, eſpecially among the chemiſts, make to be the ſame with the principle SULPHUR.

The Peripatetics maintain, that beſides the common matter of all *bodies*, there is ſomething in every ſpecies, which diſcriminates it from every other, and makes it what it is: this they call *form*; which, becauſe all the qualities, and other accidents of the *body*, muſt depend on it, they alſo imagine to be a ſubſtance, and indeed a kind of ſoul, that, united to the groſs matter, with it compoſes a natural *body*.

The motion of *bodies* is either *local* or *inteſtine*. The latter is not ſenſible; but may be inferred from a great number of operations. Dr. Hook does not deſpair, but that, under further helps and improvements of the organ of hearing, we may come at length to diſcern the inteſtine motions of *bodies* by the ear.

As to the *colours* of *bodies*, Sir Iſaac Newton ſhews, that *bodies* appear of this or that colour, as they are diſpoſed to reflect moſt copiouſly the rays of light originally endued with ſuch colours. But the particular conſtitutions, whereby they reflect ſome rays more copiouſly than others, remain yet to be diſcovered. However, ſome of the laws and circumſtances thereof he delivers in the following propoſitions.

1. Thoſe ſurfaces of tranſparent *bodies* reflect the greateſt quantity of light, which have the greateſt refracting power; i. e. which intercede mediums, that differ moſt in their refractive denſities: and in the confines of equally refracting mediums, there is no reflexion. 2. The leaſt parts of almoſt all natural *bodies* are in ſome meaſure tranſparent; and the opacity of thoſe *bodies* ariſes from the multitude of reflexions cauſed in their internal parts. 3. Between the parts of opake and coloured *bodies* are many ſpaces, either empty, or replete with mediums of different denſities; as water between the tinging corpuſcles wherewith a liquor is impregnated, air between the aqueous globules that conſtitute clouds or miſts: and even ſpaces void both of air and water, between the parts of hard *bodies*, are not wholly void of all ſubſtance. 4. The parts of the *bodies*, and their interſtices, muſt be leſs than of ſome definite bigneſs, to render them opake and coloured. 5. The tranſparent parts of *bodies*, according to their ſeveral ſizes, reflect rays of one colour, and tranſmit thoſe of another, for the ſame reaſon that thin plates or bubbles do reflect or tranſmit thoſe rays; and this appears to be the ground of all their colour. 6. The parts of *bodies*, on which their colours depend, are denſer than the medium which pervades their interſtices. 7. The bigneſs of the component parts of natural *bodies*, may be conjectured from their colours; on this principle, that tranſparent corpuſcles, of the ſame thickneſs and denſity with a plate, do exhibit the ſame colour. 8. The cauſe of reflexion is not the impinging of light on the ſolid or impervious parts of *bodies*, as commonly believed. 9. *Bodies* reflect and refract light, by one and the ſame power variouſly exerciſed, in various circumſtances. See COLOUR.

BODY, *ſolid*, that whoſe particles cohere, or are ſome way connected to each other. See SOLID.

BODY, *fluid*, that whoſe particles eaſily ſlide over each other, and are of a fit ſize to be agitated by heat; or that whoſe particles do not cohere, but are eaſily put in motion by the ſmalleſt force.

BODY, *rough*, that whoſe ſurface is beſet alternately with eminences and cavities, in contradiſtinction from a ſmooth *body*.

BODIES, *ductile*, thoſe which being ſtretched, do not break, but extend one way as much as they ſhrink another. Of theſe ſome are hard and malleable, as metals; others ſoft or viſcid, as glues, gums, &c. Mem. Acad. Scien. an. 1713. p. 268.

BODIES, *flexible*, thoſe which admit of being bent without breaking: ſuch are thread, wire, fibres, and even glaſs, when ſpun very fine. Theſe are contradiſtinguiſhed from brittle *bodies*.

BODIES, *ſpecific gravity of*. See GRAVITY, and WEIGHT.

BODY, *denſe*. See DENSITY.

BODY, *rare*. See RARE.

BODY, *luminous* or *lucid*, that which emits its own rays, or ſhines by its own light.

BODY, *illuminated*, that which diffuſes the light of another by reflexion, or which ſhines by borrowed light.

BODY, *opake*, that which intercepts the rays of light, or prevents their paſſage through it.

BODY, *tranſparent*, *diaphanous*, or *pellucid*, that which tranſmits the rays of light. See TRANSPARENCY.

BODY, *the inertia of*, denotes that power whereby it reſiſts motion. See VIS *inertiæ*.

The mutual ACTION of *bodies* on each other, is by Bacon reſolved into a principle of aſſimilation; by Hook, into congruity and incongruity; by Newton, into that of attraction and repulſion; and by others, into that of affinity, or ſimilarity and diſſimilarity, &c. See Mem. Acad. des Scien. an. 1718. p. 2560.

BODIES, *ſimple*, thoſe which are not compounded of others: ſuch are the four elements, and the celeſtial *bodies*, ſuppoſed to be. See SIMPLE.

BODIES, *mixt*, thoſe formed of a mixture of the ELEMENTS. Theſe are divided by philoſophers into perfectly and imperfectly *mixt*.

Others divide mixt *bodies* into *ſimple* and *organical* MIXTS.

BODIES, *inorganical* or *ſimply mixt*, are thoſe, whoſe properties, powers, and actions depend ſolely on the temperature of the elements they are compoſed of: ſuch are minerals.

BODIES, *organical mixt*, thoſe whoſe functions are performed by means of the mechanical ſtructure of the parts: ſuch are vegetables and animals.

BODY, *ſimple organical*, that which is not compoſed of any other organical *bodies* or parts.

BODY, *compound organical*, that whoſe component parts are organical *bodies*, being compound beings; and every compound being a machine, it follows, that every *body* is a machine. On which principle is founded the modern mechanical philoſophy.

We may add, that what the Peripatetics call *mixt bodies*, ſome late writers, after Becker and Stahl, call *compound bodies*; which they ſubdivide into *aggregates*, *mixts*, and *compounds* properly ſo called.

Thus, *mixed bodies*, according to theſe writers, are thoſe compoſed merely of principles; *compound bodies*, thoſe formed immediately of mixts into any determinate ſingle things; *aggregate bodies*, thoſe formed of ſeveral compounds into any entire parcel or ſyſtem. See AGGREGATE *bodies*.

BODIES, *homogeneous*. See HOMOGENEOUS.

BODIES, *congruous*, thoſe whoſe particles have the ſame magnitude and velocity, or at leaſt harmonical proportions of magnitude and velocity.

BODIES, *incongruous*, thoſe which have neither the ſame magnitude, nor the ſame degree of velocity, nor an harmonical proportion of magnitude and velocity.

BODY, *hard*. See HARD.

BODY, *volatile*, that which riſes by the force of heat. See VOLATILE.

BODIES are divided into *animate* and *inanimate*; i. e. into thoſe informed by a ſoul, and thoſe which are not; or thoſe that have life, and thoſe that have none.

Some conſider *bodies*, either as *natural* and *ſenſible*; viz. as formed by phyſical cauſes, and cloathed with phyſical qualities (in which ſenſe, *body* makes the object of PHYSICS);

PHYSICS): or, as *intellectual* or *quantitative*, in the general or abſtract; and according to three dimenſions: in which ſenſe, *body* makes the ſubject of geometry.

Bodies, *alkaline*, *conſiſtent*, *elaſtic*, *fixt*, *heterogeneous*, *atmoſphere of*, *deſcent of*, *mercury of*. See the ſeveral articles.

Body, with regard to animals, is uſed in oppoſition to *ſoul*; viz. for that part of an animal, compoſed of bones, muſcles, canals, juices, nerves, &c.

In which ſenſe, *body* makes the ſubject of comparative anatomy.

Body, *the human*, conſidered with regard to the various voluntary motions it is capable of performing, is an aſſemblage of an infinite number of levers, drawn by cords: if conſidered with regard to the motions of the fluids it contains, it is another aſſemblage of an infinity of tubes, and hydraulic machines. Laſtly, if conſidered with regard to the generation of thoſe ſame fluids, it is another infinite aſſemblage of chemical inſtruments and veſſels; as, philtres, alembics, recipients, ſerpentines, &c. and the whole is a compound which we can only admire, and whereof the greateſt part eſcapes our admiration itſelf.—The principal chemical apparatus in the whole *body*, is that wonderful laboratory the brain: it is in this, that precious extract, called animal ſpirits, the only material mover of the whole fabric, is ſecreted from the blood.

In the machine of the *animal body*, the retainers to the doctrine of trituration maintain the brain to do the office of the beam of a preſs; the heart, of a piſton; the lungs, of a bellows; the mouth, of a mill-ſtone; and the teeth, of peſtles; the ſtomach, of a preſs; the inteſtines, of a reſervoir; the veſſels, of ſieves or ſtrainers; and the air, of a *pondus*, or ſpring, that ſets the machine a going.

The ſoul, Rohault obſerves, is not the form of the human *body*, as the Peripatetics aſſert. So far is animal life from depending on the ſoul, becauſe of its ceaſing when the ſoul is ſeparated, that, on the contrary, the continuance of the ſoul depends entirely on the ſtate of the *body*; the former never quitting the latter, till its œconomy or order is interrupted.

The Carteſians maintain the ſoul and *body* to be too diſproportionate, for thoughts or ideas of the ſoul to be cauſed by the motions of the *body*, and *vice verſa*: thus their reciprocal motions, not being able to be the direct cauſe of the one and the other, are only deemed the occaſion, or occaſional cauſe. God, on occaſion of the motion of a *body*, impreſſes an idea or ſenſation on the ſoul; and again, on occaſion of an idea of the ſoul, communicates a motion to the *body*: of conſequence, God is the only agent in the whole intercourſe between ſoul and *body*.

According to Mr. Locke, there is no contradiction in ſuppoſing, that the firſt eternal thinking Being, ſhould, if he pleaſed, give to certain ſyſtems of created ſenſeleſs matter, put together as he thinks fit, ſome degrees of ſenſe, perception, and thought: though it is no leſs than a contradiction, to ſuppoſe that matter (which is evidently in its own nature void of ſenſe and thought), ſhould be that eternal firſt thinking Being. Eſſay on Hum. Underſtand. book iv. chap. 3. § 6.

Phyſicians divide the *body* into ſolids, and fluids.—Alſo into venters, or cavities, the head, *thorax*, and lower venter.

The reſt of the *body* they call members, or extremities.

It appears that both the height and the breadth of the human *body* are actually different in different parts of the day; ordinarily it is an inch more in the morning than at night. The *body* ceaſes to grow in height, when the bones are arrived at a degree of firmneſs and rigidity, which will not allow of farther extenſion by the effort of the heart, and motion of the blood. Phil. Tranſ. abr. vol. vii. N° 383.

This alternate increaſe and decreaſe of our *bodies* depends very much upon ſleep, meals, exerciſe, &c. and is greatly *involuntary*; but M. L'Abbé de Fontenu, diſcovered by attention, that there are alſo alternate increaſes and diminutions both of the height and breadth of our *bodies*, that may be ſaid to be *voluntary*, becauſe they do not depend ſo much on ſleep, eating, &c. but only on the different poſtures into which we put ourſelves V. *ut ſupra*; and Mem. of the A. D. S. an. 1725. H. 16.

Body, *faculties of the*. See Faculty.

Body is alſo applied by anatomiſts to ſeveral particular parts of the animal fabric.—As, the callous *body* of the brain, the cavernous or ſpongeous *bodies* of the *penis*, &c. See Corpus *calloſum*, Corpora *cavernoſa*, &c.

Body, *reticular*. See Reticular.

Body, in ſpeaking of a horſe, denotes the cheſt, but chiefly the flanks.

A horſe is ſaid to have a good *body*, when he is full in the flank; a light *body*, when he is thin or ſlender in the flank. If the laſt of the ſhort ribs be at a conſiderable diſtance from the haunch-bone, though ſuch a horſe may have a tolerable *body* for a time, if he be much laboured, he will loſe it. It is a general rule never to buy a horſe that is light-bodied and fiery, becauſe he will preſently deſtroy himſelf.

Body *of a piece of ordnance*, that part comprehended between the center of the trunnions and the caſcabel. It ought always to be more fortified than the reſt. See Cannon.

Body *of a pump*, the thickeſt part of the barrel or pipe of a pump, within which the piſton moves.

Body, in *Geometry*, denotes the ſame with solid.

Bodies, *regular* or *platonic*, are thoſe which have all their ſides, angles, and planes, ſimilar and equal.

Of theſe there are only five; viz. the *tetrahedron*, conſiſting of four angles; the *octahedron*, of eight; the *icoſahedron*, of twenty; the *dodecahedron*, of twelve pentagons; and the cube, of ſix ſquares. See Tetrahedron, &c.

Bodies, *celeſtial*, are by ſome divided into two kinds, *ſolid* and *fluid*. See obſervations on their figures, by M. Mapertuis, in the Mem. of the A. D. S. an. 1734. p. 55.

Celeſtial ſolid bodies, are thoſe which appear or are ſenſible to us, either by their own light, or the light of others reflected from them.

Celeſtial fluid bodies, are only different kinds of Æther, of which Hook makes ſeveral, ſome more fluid and ſubtile than others.

Body, *ſpiritual* or *pneumatic*, that which is not palpable or groſs enough for our feeling, as the air, light, &c.

Body, in *Law*.—A man is ſaid to be bound or held in *body and goods*; that is, he is liable to remain in priſon, in default of payment.

In France, by an ordonnance of 1667, all reſtraints of the *body*, for civil debts, are null after four months, unleſs the ſums exceed two hundred livres.

A woman, though in other reſpects ſhe cannot engage her perſon but to her huſband, may be *taken by the body*, when ſhe carries on a ſeparate trade.

Body *of the place*, in *Fortification*, denotes either the buildings incloſed, or more generally the incloſure itſelf. Thus, to conſtruct the *body* of the place, is to fortify or incloſe the place with baſtions and curtains.

Body is alſo uſed for an aſſemblage of ſeveral different things collected into one; more particularly a number of perſons united into a company or college.

A ſtate or nation, under the adminiſtration of one ſovereign, is called a *body politic*. All large empires are unnatural, becauſe the relation between the head and limbs is here too remote. No *body*, either natural or politic, can long remain ſound without exerciſe. See Corporation.

Body, *corps*, in *War*, is an aggregate or aſſemblage of forces, horſe and foot, united and marching under ſome chief.

An army, ranged in form of battle, is divided into three *bodies*: the van-guard, the rear-guard, and the main *body*; which laſt is ordinarily the general's poſt.

Body *of reſerve*, in the *Military Art*, a draught or detachment of a number of forces out of an army, who are only to engage in caſe of neceſſity.

Body, in matters of *Literature*, a name given to a collection of whatever relates to any particular ſcience: thus we ſay, the *body* of the canon law; the *body* of the Saxon law. King James I. had a deſign to compile a *body* of the Engliſh law.

The *body* of the civil law conſiſts chiefly of the Inſtitutes, Pandects, Code, and Novels. A *gloſſated* body, is that to which gloſſes are added in the margin, compoſed by ſeveral lawyers.

Body is alſo uſed figuratively for conſiſtence, ſolidity, and ſtrength. In this ſenſe, we ſay the *body* of a cloth, wine, &c.

Vintners have divers arts of increaſing or diminiſhing the *body* of wine.

Body, among *Painters*.—A colour is ſaid to *bear a body*, when it is capable of being ground ſo fine, and mixing with the oil ſo entirely, as to ſeem only a thick oil of that colour; as white lead, lamp black, vermillion, lake, indigo, &c. But verditers, ſmalts, &c. will not embody with the oil, but are ſtill apt to ſeparate from it in working.

BOEDROMIA, in *Antiquity*, from βοηδρομος, *helper*, derived from βοαω, *I cry*, and δρεμω, *I run*; ſolemn feaſts held at Athens, in memory of the ſuccour brought by Ion to the Athenians, when invaded by Eumolpus ſon of Neptune, in the reign of Erectheus.

Plutarch gives another account of the *Boedromia*, which, according to him, were celebrated in memory of the victory obtained by Theſeus over the Amazons, in the month *Boedromion*; which was, in the ancient chronology, the third month of the Athenian year. It conſiſted of thirty days, and anſwered to the latter part of our Auguſt and beginning of September.

BOERHAAVIA, in *Botany*. See HOG-WEED.

BOG, a moiſt, rotten ſpot of earth, which ſinks and gives way to the weight of the body, formed of graſs and plants putrified by ſome ſpring; frequent, eſpecially in Ireland.

The word may be derived from the Italian *buca*, *a hole*; or rather from the Belgic *boogen*, *to bend*; on account of its giving way when trod upon.

In this ſenſe, *bog* amounts to much the ſame with what in other places are called *moſſes*, *marſhes*, *fens*, &c.

In Ireland they diſtinguiſh between a *turf-bog*, called alſo *red-bog*, out of which turf or peat is dug; and a *quaking-bog*, which will ſink under a man in the place where he ſtands to a conſiderable depth, and riſe before and behind proportionably: underneath, is frequently clear water, into which a perſon often ſlips to the middle, upon breaking the ſurface.—*Quaking-bogs* frequently turn into *turf-bogs*.

Every *red-bog* is encompaſſed with a deep marſhy ſloughy ground, called the *bounds of the bog*.—Horns and ſkeletons of mooſe-deer are ſometimes found in *bogs* fourteen feet deep.

The inconveniences of *bogs* are, that a conſiderable part of the kingdom is rendered uſeleſs by them: they alſo keep people at a diſtance from each other, and thus hinder buſineſs from going forward. They occaſion the roads to be crooked and circuitous to avoid them: they are a great deſtruction to cattle, the chief commodity of Ireland; which are encouraged by the graſs growing on the edges of the *bogs* to venture in, where they are loſt. The ſmell and vapour ariſing from them is accounted unwholſome, and the fogs putrid and ſtinking. Add, that they corrupt the water, both as to its colour and taſte.

Bogs have alſo their uſes: moſt of the people in Ireland have their firing from them; the wood being impolitickly deſtroyed, and little pit-coal yet diſcovered. The Iriſh could hardly do without ſome *bogs*.—The natives had anciently another advantage from *bogs*; viz. that by means of them they were preſerved from the conqueſt of the Engliſh: and it ſeems to be from the remembrance of this that they ſtill chooſe to build near *bogs*.

As to the origin and formation of *bogs*, it is to be obſerved, that there are few places, in the northern world, which have not formerly been as famous for them as Ireland now is: every wild, ill-inhabited country has them: the *loca paluſtria*, or *paludes*, to which the ancient Gauls, Germans, and Britons retired when beaten, appear to be no other than what we now call *bogs*. The like may even ſtill be found in the barren parts of Italy, as Liguria.

Boggy lands upon levels are generally called *fens* with us; and what our farmers particularly underſtand by the term *bog-land*, is that ſort of *bog* which lies among hills, or between two eminences, and has deſcent enough to drain it, if the water could get off.

The true cauſe of *bogs*, then, ſeems to be the want of induſtry; at leaſt it is certain induſtry may remove, and much more prevent them. There are many *bogs* of late ſtanding in Ireland, formed through the miſeries of the times, and the deſolation of civil war.—It is no wonder if a country remarkable for lazineſs ſhould abound with them.

To ſhew how want of induſtry cauſes *bogs*, it muſt be remembered, that Ireland abounds with ſprings; that theſe ſprings are dry, or nearly ſo, in the ſummer-time; and that the graſs and weeds grow thick about the places where they burſt out: in the winter the ſame ſprings ſwell again, and run, and ſoften and looſen the earth about them; and the ſwerd or ſcurf of the earth, which conſiſts of the roots of graſs, being lifted up and made fuzzy by the water, becomes dried againſt the ſpring; and does not fall together, but withers in a tuft, and new graſs ſprings through it; which, the next winter, is again lifted up: thus the ſpring is more and more ſtopt, and the ſcurf grows thicker and thicker, till it firſt makes what we call a *quaking-bog*: and as it grows higher and drier, and the graſs-roots and other vegetables become more putrid, together with the mud and ſlime of the water, it acquires a blackneſs, and grows into what we call a *turf-bog*.

What confirms this account is, that *bogs* are generally found higher than the land about them, and the higheſt in the middle: the chief ſprings which cauſe them being commonly about the middle; from whence they dilate themſelves by degrees, as one would blow a bladder; but not always equally, becauſe they ſometimes meet with greater obſtacles on one ſide, than on the other.—Add, that if a deep trench be cut through a *bog*, you will find the original ſpring, and vaſt quantities of water will run from it, and the *bog* will ſubſide; ſometimes a dozen or fifteen, ſome even ſay, thirty feet.—Laſtly, thoſe hills which have no ſprings, have no *bogs*; and thoſe which have ſprings, and want culture, are never without them. In brief, wherever *bogs* are, there are great ſprings: the turf generally diſcovers a vegetable ſubſtance; it is light, and impervious to water, while the ground under it is very pervious.

It is true, there are ſome *quaking-bogs* cauſed otherwiſe: as, when a ſtream or ſpring runs through a flat; if the paſſage be not tended, it is filled with weeds in ſummer, trees fall acroſs it, and dam it up; then, in winter, the water ſtagnates farther and farther every year, till the whole flat be covered; next, there riſes a coarſe kind of graſs peculiar to theſe *bogs*; it grows in tufts, and the roots conſolidate together, and yearly grow higher, inſomuch as ſometimes to reach the height of a man: this graſs rots in winter, and falls on the tufts, and the ſeed with it, which ſprings up next year, and thus makes a new addition: ſometimes the tops of flags and graſs are interwoven on the ſurface of the water, and become by degrees thicker, till they lie like a cover on the water; other herbs take root in it, and by a plexus of thoſe roots it becomes ſtrong enough to bear the weight of a man.

Another cauſe of *bogs* is moſs, with which Ireland abounds extremely.—That which grows in *bogs* is remarkable; the light ſpongy turf above mentioned being nothing but a congeries of the threads of this moſs, which is ſometimes in ſuch quantities, and ſo tough, that the turf-ſpades cannot cut it. In the north of Ireland they call it old wives tow; not being much unlike flax. The turf-holes in time grow up with it again, and all the little gutters in *bogs* are generally filled with it. In reality, to this the *red* or *turf-bogs* ſeem to be chiefly owing.

For the draining of *bogs*, to render them fit for paſture or arable, it is not impoſſible; the ſame having been performed in England, France, Germany, &c.—People commonly diſtinguiſh between *bogs* which have no fall to carry away the water from them, and thoſe which have: the laſt are reputed drainable, the former not. But Mr. King aſſures, he never obſerved one *bog* without a fall ſufficient to drain it, nor does he believe there is any. In reality, the great objection againſt draining is the charge; which, it is commonly reckoned, will amount to much more than would purchaſe an equal quantity of good ground: for an acre of this laſt, in moſt parts of Ireland, is not worth above 4 *s. per annum*, and fourteen or fifteen years purchaſe; ſo that three pounds will buy an acre of good land: and it is very doubtful with moſt, whether that ſum will reduce a *bog*: this reaſoning paſſes current, and is the great impediment of this work.

To this it is anſwered, that *quaking-bogs*, though land be ever ſo cheap, never fail to be worth draining: one trench will drain many acres; and when dry, it is generally meadow, or the beſt grazing ground. Again, the bounds of a *red-bog* never fail to be worth the draining; being done by one deep trench drawn round the *bog*: by this, cattle are kept out of the *bog*, and the bounds turned into meadow.—Add, that even *red-bogs* might be made fit for grazing at a much cheaper rate than has hitherto been done, by a proper conduct in the digging of trenches, particularly deſcribed by Mr. King, Phil. Tranſ. N° 170. p. 948. See alſo N° 330. p. 305; and N° 314. p. 59. Plott's Hiſt. Oxf. chap. ix. § 81, &c.

In ruſhy grounds, the ſprings are commonly found to lie within a foot or two of the ſurface, when any thing of ſtonineſs or ſmall gravel is to be found, and ſometimes conſiderably lower in a hungry gravel; but it is always lower in *boggy* ground than in ruſhy, and is deep, according to the weight of earth that pens it in. The beſt way is to begin the drain at the loweſt place, and ſo carry it in towards the ſpring-head, where there muſt be made ſuch trenches, either round or croſs the *bog*, as ſhall be found neceſſary to the draining of it thoroughly.

If it be neceſſary to make ſuch large and deep drains, that there is danger of the cattle's falling into them, they may be filled up with ſtones or brick-batts, and theſe covered with boards, and the turf laid over them. The cavities among the ſtones will give paſſage to the water, and the turf will grow at top, as if nothing had been done.

It is a common practice to make a bank with the earth dug out of the trench, laying it on the ſide; but this is extremely wrong. If the trench be ſmall, the earth dug out of it ſhould be carried away in wheel-barrows; and if large, it ſhould be ſpread upon the loweſt places of the *bog*, where there is room for it.

Another excellent method is to make the trenches about a yard deep, and two feet wide, laying at the bottom of them green black-thorn-buſhes, and over theſe a ſtratum of large and round ſtones, or at leaſt of ſuch as cannot lie cloſe; over theſe lay another *ſtratum* of thorn-buſhes, and then place a quantity of ſtraw, to keep the dirt from falling in, and filling them up. By this means the trench will be kept open, which otherwiſe will naturally ſwell, and fill up of itſelf.

Bog, *moving*, or *migrating*. Theſe ſoft maſſes of earth have been ſometimes known to move out of their place. An inſtance of this there was in Ireland, in the year 1697, about Charleville, in the county of Limerick. There was heard for ſome time a noiſe under-ground like that of thunder at a great diſtance, or almoſt ſpent; and ſoon after this the earth of a large *bog* in the neighbourhood began to move, and a hill or riſing ſituated in the middle of it ſtood no longer above the level of the reſt, but ſunk flat.

The *bog* not only moved itſelf, but moved with the neighbouring paſture-lands, though ſeparated by a large and deep ditch; the motion continued a conſiderable time, and the ſurface of the moving earth roſe into a ſort of waves, but without breaking up or burſting any where. The paſture-land roſe very high, and was carried on in the ſame motion till it reſted upon a neighbouring meadow, the whole ſurface of which it covered, remaining ſixteen feet deep upon its ſurface. The whole quantity of the *bog* was torn from its former ſeat, and left great gaps in the earth where it had joined, which threw up foul water, and very ſtinking vapours. Phil. Tranſ. N° 233.

All the country came in to ſee ſo ſtrange a ſight as this, for it continued moving a long time; but few gueſſed the true cauſe of it, which was this: a more than ordinary wet ſpring occaſioned the riſing of the *bog* to a great height in one part, and thence propogated itſelf through the whole *bog*; ſo that the hill in the midſt was undermined, and naturally ſunk flat; this and the more than ordinary weight of this large *bog* preſſing upon the adjoining paſture-land, forced up its foundations, which were only a looſe ſand. This was puſhed on ſideways where there was a deſcent from the *bog*, and at length having given the *bog* more room, all was quiet and remained in that ſtate. The *bog* was more than forty acres of ground.

Bog-*bean*. See Bog-Bean.

Bog-*berry*. See Whortle-*berry*.

Bog-*wood*. See Wood *ſubterraneous*.

BOGA, in *Zoology*, a name given by many to a fiſh caught in the Mediterranean, and ſold at Naples and Meſſina, called among authors BOOPS. It is a ſpecies of the SPARUS.

BOGOMILI, or Bogarmitæ, a ſect ſprung from the Manichees, or rather from the Maſſalians, toward the cloſe of the twelfth century; whoſe chief, Baſil, was burnt alive by order of the emperor Alexius Comnenus.

Du-Cange derives the name from two words in the Bulgarian language; *Bog*, *Deus*, and *milvi*, *miſerere*, *have mercy*.

The *Bogomili* denied the Trinity; maintaining, that God had a human form; that the world was created by evil angels; and that it was the archangel Gabriel that became incarnate. They rejected the books of Moſes, and only admitted ſeven books of Scripture: they maintained the Lord's Prayer to be the only euchariſt; that the baptiſm of the Catholics was only that of St. John, and theirs that of Jeſus Chriſt; and that all thoſe of their ſect conceived the Word, or *Logos*, as much as the Virgin, denying the reality of Chriſt's body. Laſtly, that there was no other reſurrection but repentance.

BOHEA. See Tea.

BOHEMIAN *Brethren*, is an appellation anciently given to the proteſtants of Bohemia.

Laſitius has a treatiſe De Geſtis Fratrum Bohemicorum. Camerarius has alſo given the hiſtory of the *Bohemian brethren*, from whom eccleſiaſtical hiſtorians have derived a large train of ſects, as the Huſſites, Adamites, Taborites, Calixtins, &c.

Bohemian *chatterer*, in *Ornithology*, a bird that viſits this iſland perhaps once in twenty years. See Phil. Tranſ. vol. lxii. N° 20. p. 315. an. 1772.

It is alſo called AMPELIS, GARRULUS, and ROLLER.

BOJA, in *Antiquity*, a collar or chain faſtened about the necks of criminals, to prevent their eſcape.

The word is alſo written *boga*, *bodia*, and *baga*.

BOICININGA, in *Zoology*, a name by which the Braſilians call the RATTLE-SNAKE.

BOIGUACU, in *Zoology*, the name of a ſpecies of ſerpent, called alſo *iiboia*, and by the Portugueſe *cobra de veado*.

This is the largeſt of all ſerpents, growing to twenty-four feet long and more, and preying on large animals. It is very thick in the middle of the body, and ſmaller both at the head and tail. It is of a very beautifully variegated colour. Down the middle of the back runs a chain of black ſpots, a hand's breadth diſtant from one another, each having a ſpot of white in its middle; and below theſe are two other rows of ſmaller black ſpots towards the belly. It has in each jaw two rows of very ſharp teeth, white as pearl. Its head is very broad, over the eyes it riſes into two protuberances; and in ſome of this ſpecies there are two claws, like thoſe of birds, behind the *anus*, towards the tail.

This is a very terrible creature, and will ſeize on a man, and either lies in ambuſh in thickets, or on the branches of large trees, from which it throws itſelf on its prey. It has no venom in its bite; and its fleſh is eaten, and eſteemed a great delicacy.

This ſerpent is common in the Braſils. Authors give ſurpriſing accounts of its ſize: Borritius preſerved the ſkin of one which himſelf had killed, which was twelve yards long; and relates, that there was once a ſerpent of this kind killed in Java, which was thirteen yards and a half long, and had, when killed, a boar in its belly. And De Laet relates, that in the Rio de la Plata, there are ſome of them ſo large, that they will ſwallow a ſtag whole, horns and all. The natives and the Hollanders make them a part of their food.

BOIL, or Furuncle, in *Medicine*, is a ſmall reſiſting *tumor*, with inflammation, redneſs, and great pain ariſing in the *membrana adipoſa* under the ſkin. As there is no part of the body free from being the ſubject of this *tumor*, ſo the whole body is ſometimes ſo miſerably infeſted with them, that the patient knows not how to ſtir, or on what part to lie. Young infants, and adults, are equally liable to this diſorder; and though in adults there is ſeldom any great danger in it, yet it ſometimes happens when they are very numerous in tender infants, that they not only excite violent pains, reſtleſſneſs and toſſings, with great weakneſs, convulſions and epilepſies, but death itſelf ſometimes follows them.

The principal cauſe of *boils*, is a too glutinous and inſpiſſated ſtate of the blood, and the cure of them principally depends upon the reſtoring the blood to its due conſiſtence and proper circulation. People who are very ſubject to theſe tumors ſhould bleed and take purging medicines at proper intervals, and drink plentifully of warm and weak liquors, abſtaining from wine, ſtrong ſpirituous liquors, and from the uſe of tobacco.

When the diſorder is recent or not habitual, external remedies alone are ſufficient for the cure: honey mixed to a proper ſharpneſs with ſpirit of vitriol is a very good external application. The touching the *boils* with ſpirit of vitriol alone, is often alſo of great ſervice; and ſometimes the diſcutient plaſters are to be applied, as the diachylon, ſpermaceti, and ſoap-plaſter. If theſe applications, however, do not prove ſucceſsful in the diſperſing a *boil*, the only method to be taken, is that of bringing it to ſuppuration. This, however, in ſome caſes is no eaſy taſk, but the tumor remains ſometimes very hard and troubleſome, even after a proper treatment of many weeks, and ſometimes the humour that occaſions it becomes ſo acrimonious, by its long tenſion, and great inſpiſſation, that it produces ulcers, which grow gradually worſe and worſe, till at length they end in incurable *fiſtulæ*. To promote and quicken the ſuppuration, it is generally found of great ſervice to apply plaſters of diachylon with the gums, and of honey and flour mixed, and made to a proper conſiſtence; and where theſe prove inſufficient, maturating cataplaſms are to be applied, and very frequently repeated. When the *boil* is ſufficiently maturated by one or other means, which will be known from the ſoftneſs and yellowneſs of its head, it muſt be opened by inciſion, and when the matter it contained is diſcharged, the ulcer muſt be daily cleanſed, till perfectly freed from all malignity, and then healed with the vulnerary balſams.

When infants which ſuck are afflicted with *boils*, the proper method is to give cooling medicines and purges to the nurſe, and enjoin her a due regimen in diet; and the infant ſhould at the ſame time be got to take ſome gentle laxative, and the abſorbent powders, as thoſe of crabs-eyes and the like, to allay the acrimony of its juices.

Boils, *gum*. See Gum.

BOILED, or Boyled *ſilks*, thoſe which have been put, while in the balls, into hot water, to make them wind the better.

In which ſenſe, *boiled ſilk* ſtands oppoſed to *raw*.

BOILER, or **Boyler**, a large copper-veſſel, wherein things are expoſed over the fire to be boiled.

The *boiler* in the alum-works is a veſſel, in which the liquor is evaporated to a conſiſtence, and is made of lead. The general ſize is about eight feet ſquare, and they contain about twelve tuns each.

They make them in this manner: firſt they lay long pieces of caſt-iron, twelve inches ſquare, as long as the breadth of the *boiler*, and at about twelve inches diſtance from one another. Theſe are placed twenty-four inches above the ſurface of the fire. On theſe maſſy bars of iron they lay, croſs-wiſe, the common flat bars of iron, as cloſe as they can lie together, and then make up the ſides with brick-work. In the middle of the bottom of this *boiler* is laid a trough of lead, wherein they put at firſt about a hundred pound weight of the rock. They uſe Newcaſtle coals in the BOILING; and if they find the liquor not ſtrong enough, they add more of the rock at times, as it boils. Phil. Tranſ. N° 142.

The *boiler* for making colours, &c. muſt be made of pewter; becauſe iron and copper will be corroded by the ſaline ſubſtances uſed in the manufacture of them.

BOILERY, or **Boilary**, in the *Salt Works*, denotes a ſalt-houſe, pit, or other place, where SALT is made.

BOILING, or **Boyling**, *ebullition*, in *Phyſics*, the agitation of a fluid body, ariſing from the application of fire, &c.

The *phænomenon* of *boiling* may be thus accounted for: the minute particles of the fuel being detached from each other, and impelled in orbem, with a great velocity (i. e. being converted into fire), paſs the pores of the containing veſſel, and mix with the liquid. By the reſiſtance they here meet withal, their motion is deſtroyed; i. e. they communicate it wholly to the quieſcent water: hence ariſes, at firſt, a ſmall inteſtine motion in the water, and from the continued action of the firſt cauſe, the effect is increaſed, and the motion of the water continually accelerated: ſo that the water, by degrees, becomes ſenſibly agitated. But now the particles of the fire ſtriking on thoſe in the loweſt ſurface of the water, will not only give them an impulſe upwards, contrary to the laws of *æquilibrium*, but will likewiſe render them ſpecifically lighter than before, ſo as to determine them to aſcend according to the laws of *æquilibrium*; and this, either by inflating them into little veſicles, by the attraction of the particles of water around them; or by breaking and ſeparating the little ſpherules of water, and ſo increaſing the *ratio* of their ſurface to their ſolid content. There will therefore be a conſtant flux of water from the bottom of the veſſel to the top, and conſequently a reciprocal flux from the top to the bottom; i. e. the upper and under water will change places; and hence we have the reaſon of that *phænomenon*, of the water's being hot at top ſooner than at bottom.

Again, an intenſe heat will diminiſh the ſpecific gravity of water, ſo as not only to make it mount in water, but alſo in air; whence ariſe the *phænomena* of vapour and ſmoak; though the air incloſed in the interſtices of the water muſt be allowed a good ſhare in this appearance: for that air being dilated, and its ſpring ſtrengthened by the action of the fire, breaks its priſon, and aſcends through the water into the air; carrying with it ſome of the contiguous ſpherules of water, ſo many as ſhall hang in its *villi*, or can adhere immediately to it.

The particles of air in the ſeveral interſtices of the fluid maſs thus expanded, and moving upwards, will meet and coaleſce in their paſſage; by which means great quantities of the water will be heaved up, and let fall again alternately, as the air riſes up, and again paſſes from the water: for the air, after coalition, though it may buoy up a great heap of water, by its elaſticity while in the water; yet cannot carry it up, together with itſelf, into the atmoſphere; ſince, when once got free from the upper ſurface of the water in the veſſel, it will unbend itſelf in the atmoſphere, and ſo its ſpring and force will become juſt equal to that of the common unheated air. Add to this, that were the ſpring and motion of the air ſufficient to carry up the water with it, yet it would not have that effect; but the water would run off at the extremities of the air; all, except ſo much as ſhould be either entangled in its *villi*, or immediately adhere to its ſurface by attraction: and hence we ſee the reaſon of the principal *phænomenon* of *boiling*, viz. the fluctuating of the ſurface of the water. *Boiling* water diſpoſes it to freeze more readily. See WATER.

We generally annex the idea of a certain very great degree of heat to the *boiling* of liquids; but this does not ſeem to be a connection of nature's making, but of our own. It is reported by many, that a veſſel of tar being ſet over the fire till it *boils*, a perſon may, while it is *boiling*, put his hand into it without any injury; and that the artificers who uſe and prepare this commodity, know this property of it ſo well, that they uſually take the ſkum from their pots off it, while *boiling*, with their naked hands.

Water, in the receiver of an air-pump, when exhauſted, will *boil* without any great heat. The receiver ſhould, for this experiment, be one part full of water, and three empty: in this caſe, the flame of a candle being placed under the veſſel, the water will *boil* violently, while the glaſs itſelf is ſcarce warm; and when the water has been thus kept *boiling* a quarter of an hour, the glaſs will ſcarce be any thing the hotter for it. When the candle is taken away, the water will ſtill continue a great while *boiling*, and when it ceaſes firſt, will renew itſelf again from time to time to a very great ebullition. All the bubbles that riſe out of the water on this occaſion, do not raiſe the mercury in a gage to any ſenſible height. Spirit of wine, in the ſame manner, *boils* much ſooner *in vacuo* than the water, and in this ſtate will raiſe the mercury in the gage to an inch higher than its former ſtandard. If the receiver containing it in this *boiling* ſtate, be plunged into cold water, the liquor, inſtead of becoming calm, *boils* more ſtrongly than before. It might be ſuppoſed, that this *phænomenon* was owing to a *periſtaſis*; but we have more ground to ſay it came from hence, that the vapours of the ſpirit were more condenſed, and ſo made the receiver more empty, which is ſufficient to make the ſpirit of wine *boil*, though it were not hot, as liquors uſually do when put into the engine, and the air exhauſted. In all theſe, and many other caſes, *boiling* is induced without that heat, which is ſuppoſed a neceſſary concomitant of it. Phil. Tranſ. N° 122.

ALABASTER, in *boiling*, will ſwell a ſixth or eighth part above the top of the pot.

Different fluids require different degrees of heat to make them *boil*. Dr. Freind gives a table of the different times required to make ſeveral fluids *boil* by the ſame heat.

WATER, when once brought to *boil*, is not ſuſceptible of any further degree of HEAT, however the fire be increaſed: but this differs according to the weight of the atmoſphere, and the purity of the water.

Boiling *of ſilk with ſoap* is the firſt preparation in order to dying it. Thread is alſo *boiled* in a ſtrong *lixivium* of aſhes, to prepare it for DYING.

Boiling is alſo part of the proceſs of BLEACHING warp linen.

Boiling *to death*, *caldariis decoquere*, in the *Middle Age*, a kind of puniſhment inflicted on falſe coiners, thieves, and ſome other criminals.

This puniſhment was inflicted on thoſe who were guilty of murder by poiſon, 22 Hen. VIII. cap. 29. but this act was repealed by 1 Edw. VI. cap. 12.

Boiling is alſo a method of trying or aſſaying the goodneſs or falſeneſs of a colour or a dye, by *boiling* the ſtuff in water with certain drugs, different according to the kind or quality of the colour, to try whether or no it will diſcharge, and give a tincture to the water.

With this intention, red crimſon ſilks are *boiled* with alum, and ſcarlets with ſoap, in quantity equal to the weight of the ſilk.

Boiling *waters*, in *Natural Hiſtory*. See SPRING, and WATER.

BOIOBI, in *Zoology*, the name of a ſpecies of ſerpent found in America, and called by the Portugueſe *cobra de verd*. It is about an ell in length, and of the thickneſs of a man's thumb, and is all over of a very beautiful and ſhining green. Its mouth is very large, and its tongue black. It loves to be about houſes, and never injures any creature unleſs provoked or hurt; but it will then bite, and its poiſon is very fatal. The natives take, as a remedy againſt its poiſon, the root CAA-APIA bruiſed, and taken in water.

BOIQUIRA, in *Zoology*, a name by which the natives of ſome parts of America call the RATTLE-SNAKE.

BOITIAPO, in *Zoology*, is a ſerpent of Braſil, called by the Portugueſe *cobra de cipo*. It is ſeven or eight feet long, as thick as a man's arm, round, and pointed toward the tail, like a ſhoemaker's awl. It is covered with fine, and, as it were, triangular ſcales; and is of an olive colour, and yellowiſh. It lives upon frogs, &c. and its bite is dangerous, like that of many other ſerpents.

Its fleſh might be as effectually uſed as that of the viper, for purifying the blood; and as an alexipharmic.

BOLBONACH, in *Botany*. See HONESTY.

BOLE, in *Medicine*, is applied to ſeveral kinds of earths that enter ſome of the Galenical compoſitions.

Boles are native foſſile earths, uſually ſomewhat unctuous; ſo that when mixed up with water, they may be wrought into a paſte; but are not ſoluble either by water or fire: ſuch are argill, or white clay, *axungia terræ*, or *axungia lunæ*, *cimolia*, fuller's earth, *boles* white and Armenian, the Chian, Eretrian, Lemnian, and Malteſe earths, ruddle, Samian, Sileſian, Toccavian, Bohemian, French, and all the ſealed earths. But there are others of a drier and leaner kind, as chalk, ochre, and marle.

The *boles* are ſlightly ductile but not viſcid, nor do they burn to ſuch a ſtony ſubſtance as the clays, which are the diſtinguiſhing characteriſtics between the *boles* and the CLAYS. Mr. Da Coſta diſtributes them according to their colour, into the white, the aſh-coloured, the red, the yellow, the brown, and the green; and he again ſubdivides each ſort into ſuch as are not acted upon by acids and the alkaline *boles*.

The chief medicinal uſes of *boles* are as aſtringents to ſtop bleedings. They are generally hurtful in fevers, eſpecially epidemical ones, and externally in the hæmorrhoids, &c.

Bole earths ſeem diviſible into two ſpecies, according as they are more or leſs tenacious; in which view loam and clay may repreſent them all. Even theſe two ſeem only to differ in reſpect of the fineneſs or coarſeneſs of their component parts, which renders them more or leſs tenacious, clinging, or adheſive. To make a true judgment of the quality of this kind of earth, the following experiment may be uſeful.

Common loam was mixed into a maſs with water, and then dried; to ſhew that compared with clay, it would eaſily break, crumble, and fall to powder; but beating ſome loam fine in a mortar, and mixing it well with water, it clung like clay; and when dried, adhered more tenaciouſly than before.

This ſhews that not only loam and clay, or all the *bolar* earths, are nearly the ſame thing, when their component parts, or gravelly and ſandy matters, are reduced to the ſame degree of fineneſs; but alſo ſupplies us with a plain and ſimple rule for the improvement of the art of pottery, and the imitation of China ware; and perhaps certain curious *boles* may afford very delicate matters for pottery wares; and that of variety of colours not leſs curious than the white: nor is it altogether clear, why that colour alone ſhould be made the chief *baſis* of this art. The rule is, to grind or beat the earths employed, to an extreme degree of fineneſs; and accordingly porcelane has been imitated in Europe by tobacco-pipe clay, and other earths, exceedingly fine ground, mixed into a paſte with water, and properly baked and burnt.

Marles, or *boles*, alſo afford a fit matter for the making of crucibles, retorts, &c. They likewiſe ſerve to procure the diſcontinuation and diviſion of certain ſalts, and other materials, that would otherwiſe riſe, and boil over in the operation. Theſe are therefore employed in the diſtillation of NITRE, TURPENTINE, WAX, &c.

They contribute likewiſe more materially, more intimately, and eſſentially as to quantity, in the fixation of certain bodies in chemiſtry; as of oils, for example, of common ſulphur, and even of mercury: for which, ſee Becher's firſt Supplement to his Phyſica Subterranea.

There are chiefly two ſorts of *bole* uſed in medicine the *Armenian*, and the *common*.

BOLE *Armoniac*, or the *Armenian* BOLE, is a ſoft, friable, fatty earth, uſually of a pale red colour; though there are two other kinds, a yellow and a white. They are all eaſily pulverized, and adhere to the tongue.

This, popularly, though corruptly, called in Engliſh, *bole Armoniac*, is called, by the naturaliſts, *Armenia terra*, or *Armenian clay*.

The true hiſtory of this ſubſtance is this: there are three kinds of it; the *white*, the *yellow*, and the *red*, which have been all in repute in different ages of medicine, but of which the laſt only is now thought of. The firſt or *white* BOLE *Armenic* was in uſe very early in the world, though under a different name, the ancients calling it the *white Eretrian* EARTH. This was uſed in the times of Dioſcorides. The ſecond or *yellow* was introduced by Galen, and given in the great plague at Rome in his time. The third or red kind is the BOLE *Armenic* of Avicenna, which we alſo pretend at this time to uſe; but very little of it is to be found genuine among us.

The *white* BOLE *Armenic*, called *white Eretrian* EARTH by Dioſcorides, to diſtinguiſh it from the grey earth of the ſame place, which was recommended as a noble aſtringent and ſudorific, and highly valued on account of its peculiar alkaline quality, is a fine, ſoft, and pure earth, moderately heavy, and of a cloſe, compact texture, of a clear, bright-white colour, adhering firmly to the tongue, inſipid to the taſte, and melting, like butter, in the mouth. It burns to a ſtony hardneſs without changing colour, and makes no efferveſcence with acid menſtrua. This ſeems, of all foſſile ſubſtances, to approach the neareſt to the nature of pure earth. This *bole* was in high eſteem among the Greek and Roman painters: it is now dug in the eaſtern part of Armenia; but is found in no great plenty, there being only one *ſtratum* known of it, and that not very thick. It is now chiefly ſupplied from Norway, and places nearer of acceſs.

This is eſteemed a ſudorific, and by ſome aſtringent, but without foundation; for, as it appears from Neumann's experiments, that it differs from the two other kinds, in containing no irony matters, it muſt want alſo their aſtringency; and from the ſame experiments it appears, that it can be no more abſorbent than the other *boles*; and juſt as little pretence have any of them all to the antipeſtilential and alexipharmic qualities, for which they have been celebrated. See an account of their examination, both by acids and diſtillation, in Neumann's Works, p. 22, & ſeq.

Some have a method of recovering the luſtre of pearls, eſpecially the Scotch ones, by warming them a little over the fire, and rubbing them with powdered *white* BOLE. Neumann.

The *yellow* BOLE *of Armenia*, or the BOLE *Armenic* of Galen, is a very fine and beautiful earth, of a cloſe, compact texture, naturally of a ſmooth ſurface, and very hard. It is heavier than any other of the yellow earths, and is very ſoft to the touch. It is readily diffuſible in water, and remains long ſuſpended in it, adheres firmly to the tongue, melts ſlowly in the mouth, and is of a very manifeſtly aſtringent taſte. It ferments very briſkly with acid *menſtrua*, and does not become red on burning. There have been many diſputes about the place whence this excellent drug was brought: Aëtius will have it to be from the mountain Bagonoſa in Armenia; Cardan, only from the iſland of Samos; and others, from other places: but it is found to this day in Armenia, to the north-eaſt of Erzeron, in vaſt abundance. It ſeems the moſt valuable of all the medicinal earths. Experience proves it to be a very noble aſtringent. Many authors extol it highly as a ſudorific and alexipharmic; and Galen reports of it, that it often ſuddenly cured the plague, and that thoſe whom it did not cure, were relieved by no other medicines. It would be extremely worth while to encourage the uſe of this drug, as it may be had in any quantities; for much of it is carried to Germany every year, and ſometimes a little of it is brought to us; and when this is the caſe, our druggiſts, not being uſed to a *yellow* BOLE *Armenic*, ſell it under the name of BOLE of *Blois*.

The *red* BOLE *of Armenia*, or BOLE *Armenic* of Avicenna, and of moſt authors ſince his time, is the hardeſt of all the earths of this kind. It is very pure and fine, and in colour is of a ſtrong, but ſomewhat yellowiſh red, much approaching to that of ſaffron in the cake. It is of a ſurface the leaſt ſmooth and gloſſy of all the *boles*. It ſtains the fingers in handling, and is not readily diffuſible in water. It adheres firmly to the tongue, melts readily in the mouth, and is of a very manifeſtly aſtringent taſte. It does not ferment with acids, and becomes harder and of a brighter colour in burning. Theſe are the ſeveral characters, by which the *Armenian* BOLES may be diſtinguiſhed from all other earths of the ſame colours. This laſt ſpecies is what we now pretend to uſe. It is found in vaſt plenty in the north-eaſt parts of Armenia, and is ſometimes uſed in Germany, but ſcarce ever ſeen in England. What is called *bole Armenic* in our ſhops being no other than a bad compoſition of no better materials than common tobacco-pipe clay, and an ochre known among painters by the name of Spaniſh brown.

BOLE, *Armenian*, is uſed in diarrhœas, dyſenteries, catarrhs, &c. Some alſo give it an alexipharmic virtue, efficacious in peſtilential diſeaſes; but its uſe, in this intention, is at beſt dubious. See above.

The Germans, for the *Armenian* BOLE, uſe that of Tockay, in Upper Hungary, which Crato holds preferable to it. The French uſe a like clay, found in divers provinces of that kingdom; and the Engliſh, *Fullers*-EARTH.

BOLE, *common*. This is a ponderous brittle earth, of a colour between yellow and red, of an aſtringent taſte, and is found in many parts of France. It has the ſame virtues with the former, and is to be met with in the ſhops. As both theſe *boles* are frequently mixed with ſand and grit, the apothecaries prepare them in the following manner. They diſſolve them in water; and after the ſand is ſubſided, they pour the turbid ſolution into another veſſel, where it remains till the water is clear; being poured off, the ſediment is dried in little cakes, and kept for uſe.

They may be preſcribed to be taken inwardly, either alone, or mixed with the ſealed earths.

BOLE *of the Levant* is a medicinal earth brought from the Levant; nearly of the ſame nature, and having the ſame uſes with the *bole Armeniac*.

BOLE is alſo uſed for the body or trunk of a tree; and hence *boling* trees are thoſe whoſe heads and branches are cut off.

BOLE, *Bolus Bleſenſis*. See BLESENSIS.

BOLE, *Bohemic*, *Bolus Bohemica*, is a medicinal earth dug in many parts of the kingdom whoſe name it bears. It is a pure and fine *bole*, of a denſe and compact texture, of a yellowiſh pale red colour, with ſome yellowiſh veins, heavy, of a ſmooth ſhining ſurface; it eaſily breaks between the fingers, does not readily melt in the mouth, leaves no grit when melted, and is of an aſtringent taſte. It does not efferveſce with acids, and in the fire acquires a little hardneſs without change of colour. In the German practice it is uſed for hæmorrhages, &c. and eſteemed to poſſeſs an alexipharmic virtue.

Bole, *Bolus Etruſca*, the ſame with ETRUSCA TERRA.

Bole, *Bolus Goltbergenſis*, the ſame with *terra* GOLTBERGENSIS.

Bole, *Bolus Lemnia*, the ſame with LEMNIAN *earth*.

Bole, *Bolus Livonica*, the ſame with the LIVONICA *terra*.

Bole, *Bolus Luſitanica*. See LUSITANICA.

Bole, *Bolus Noceriana*, the ſame with NOCERIANA *terra*.

Bole, *Bolus Veneta*. See VENETA *bolus*. See alſo TERRA and the references under that article.

Bole *of Virginia*, *Bolus Virginiana*. See VIRGINIANA.

BOLENIÆ, or **Bolæ**, in *Natural Hiſtory*, a name given by ancient writers to a ſort of ſtones of a roundiſh figure, and marked with ſeveral ridges and lines. They are ſuppoſed to be the ſame with thoſe called BRONTIÆ and OMBRIÆ, both being imagined to fall from the clouds in time of thunder-ſtorms; but they are really no other than a common ſpecies of ECHINITÆ.

BOLETO Lichen, a name given by M. Juſſieu to a plant, which partakes of the nature of the *moreille* and of the *liverwort*, and which he has accurately deſcribed in the Memoirs of the Academy of Sciences at Paris, 1728.

The whole plant has the ſmell of the common muſhroom, and, when young, has a viſcous liquid contained under the foldings of its head, which finally, when the plant is arrived at maturity, dries into the form of an extremely ſubtle yellow powder, which is the ſeed.

BOLETUS, in *Botany*, a word uſed by Linnæus to expreſs a genus of FUNGUSES, belonging to the claſs of *cryptogamia*, uſually comprehended by authors under the name of AGARICS, though very different from them. The AGARICS and *boleti* are both horizontal muſhrooms; that is, they have no pedicle, but grow to trees, &c. by their ſide; but the firſt are lamellated underneath, in the manner of the common muſhrooms; the *boleti* are all porous underneath.

The ſpecies of *boletus*, enumerated by Mr. Tournefort, are ſeven.

The *boletus* is a kind of wood-muſhroom, almoſt round, of a white colour, ſpotted with yellow and brown marks; by ſome naturaliſts called FUNGUS *nemorum*.

The *boletus* is the moſt exquiſite of all the FUNGUS-kind. The Roman epicures were particularly fond of it. Nero uſed to call it the food of the gods. The emperor Claudius is ſaid to have been poiſoned with a medicated *boletus*, given him by his wife.

BOLINTHOS, in *Natural Hiſtory*, a name given by Ariſtotle, and ſome of the other ancient Greeks, to the *monops* of Ælian, that is, the BONASUS.

BOLLANDISTS, in *Literary Hiſtory*, a denomination given to certain Jeſuits of Antwerp, who have been a conſiderable time employed in collecting the lives and acts of the ſaints.—Thus called from F. Bollandus, one of the firſt and chief of the aſſociation.

BOLLARDS, large poſts ſet in the ground on each ſide a dock. On docking or undocking ſhips, large blocks are laſhed to them; and through theſe blocks are reeved the tranſporting hawſers to be brought to the capſtans.

BOLLITO, in the *Glaſs Works*, a name by which the Italians call a ſea-green colour of artificial cryſtal.

To prepare this colour you muſt have in the furnace a pot filled with forty pounds of good cryſtal, firſt carefully ſkimmed, boiled, and purified, without any mangeneſe; you muſt then have twelve ounces of the powder of ſmall leaves of copper thrice calcined, half an ounce of zaffer in powder; mix them together, and put them at four times into the pot, that they may the better mix with the glaſs; ſtirring them well at each time of putting in the powder, leſt they ſhould ſwell too much, and run over.

BOLLOS, in the mines of Peru, a denomination given to the ingots or bars of ſilver procured there from the ore by the operation of the fire, and the uſe of *aqua fortis*.

BOLOGNA-*bottles*. See UNANNEALED *bottles*.

BOLOGNIAN *ſtone*. See BONONIAN.

BOLSTER, among *Surgeons*, a ſoft yielding ſubſtance, either laid under the head, or a broken limb.

Bolster is alſo uſed for a ſtuffing, intended to fill out or raiſe a flat, ſinking, or hollow part.

In which ſenſe, *bolſters* are contrived for crooked, bunched, and otherwiſe diſtorted backs, ſhoulders, &c.

Bolsters *of a ſaddle*, in the *Manege*, thoſe parts which are raiſed on the bows, both before and behind, to reſt the rider's thighs, and keep him in a poſture of withſtanding the diſorders which the horſe may occaſion.

Common ſaddles have no *bolſters* behind, or even before.

Bolsters, in *Sea Language*, ſmall cuſhions or bags, filled with tarred canvas, and laid between the collars of the ſtays, and the edge of ſome piece of wood on which they lie; they are deſigned to preſerve the ſtays from being chafed by the motion of the maſts, as the ſhip rocks at ſea.

BOLT, in *Building*, an iron faſtening for a door, moved with the hand, and catching in a ſtaple or notch made to receive it.

Bolts are chiefly of three kinds; *plate*, *round*, and *ſpring-bolts*.

Bolt *of a lock* is the piece of iron, which entering the ſtaple, faſtens the door; being the part which is moved backwards and forwards by turning the KEY.

Of theſe there are two ſorts; one ſhuts of itſelf by only putting to the door, and is called a *ſpring-bolt*; the other, which only moves when the key opens or ſhuts it, is called a *dormant* BOLT.

Bolt is alſo uſed for a large iron pin, having a round head at one end, and at the other a key-hole or ſlit, wherein to put a pin or faſtening, ſerving to make faſt the bar of a door, window-ſhutter, or the like.

This is more particularly called a *round* BOLT, or *window*-BOLT.

Bolts, in *Gunnery*, are of ſeveral ſorts; thoſe which go betwixt the cheeks of a carriage to ſtrengthen the tranſoms, are called *tranſom*-BOLTS. The large iron *bolts* or knobs on the cheeks of a carriage, which keep the handſpike from ſliding when it is poiſing up the breech of the piece. The two ſhort *bolts*, that being put one in each end of an Engliſh mortar-carriage, ſerve to traverſe her, are called *traverſe-bolts*. The *bolts* that go through the cheeks of a mortar, and, by the help of quoins, keep her fixed at the elevation given her, are called *bracket-bolts*. And the four *bolts* that faſten the bracket or cheeks of a mortar to the bed, are called *bed-bolts*.

Bolts, in *Carpentry*, denote pieces of wood cleft with wedges, in order to be ſplit into laths.

Bolts, or iron pins, in a ſhip, are of ſeveral ſorts, frequently diſtinguiſhed according to the places where they are uſed; as, *chain-bolts*, *bolts for carriages*, &c. *ring-bolts*, ſerving for the bringing to of the planks, &c. *drive-bolts*, uſed to drive out others; *ſet-bolts*, employed for forcing the planks and other works, and bringing them cloſe to one another; *rag-bolts*, on each ſide full of jags or barbs, to keep them from flying out of their holes; *clench-bolts*, thoſe which are clenched or faſtened at the ends where they come through; *fore-lock-bolts*, made like locks with an eye at each end, whereinto a fore-lock of iron is driven to prevent ſtarting out; *fend*, or *fender-bolts*, made with long and thick heads, ſtruck into the outermoſt bends or wales of a ſhip, to ſave her ſides from bruiſes and hurts

Bolt is alſo uſed for a meaſure or certain quantity of canvas, amounting to twenty-eight ells.

Bolt of ſilk or ſtuff denotes a long narrow piece, of indefinite meaſure.

Bolt, *peaſe*, in Eſſex, denotes the peaſe-ſtraw, when the grain is thraſhed out of it.

Bolt, *thunder*. See THUNDER-*bolt*.

Bolt-*rope*, in *Sea Language*, is that to which the edges or ſkirts of the ſails are ſewed, to ſtrengthen and prevent them from rending.

BOLTED *flour*, that which has paſſed through the BOLTER.

BOLTEL, in *Building*, any prominence or jutting out, as of a piece of timber, end of a beam, or the like, advancing beyond the naked of the wall.

BOLTERS, or **Boulters**, a kind of ſieves for meal, having the bottoms made of woollen, hair, or even wire.

The word ſeems derived from the German *beutel*, a *ſieve*; whence alſo *beutelen*, *to bolt*.

The bakers uſe *bolters*, which are worked by the hand; millers have a large ſort, wrought by the motion of the mill.

BOLT-HEAD, the ſame as MATRASS; a veſſel uſed by the chemiſts.

BOLTING, or **Boulting**, the act of ſeparating the flour from the bran, by means of a ſieve or BOLTER.

Bolting-*cloth*, or **Bolter**-*cloth*, ſometimes alſo called *bulting-cloth*, denotes a linen or hair-cloth for ſifting of meal or flour.

Bolting-*mill*, a verſatile engine for ſifting with more eaſe and expedition. The cloth round this is called the BOLTER.

Bolting, or **Boulting**, among *Sportſmen*, ſignifies rouſing or diſlodging a coney from its reſting place.

They ſay to *bolt* a coney, *ſtart* a hare, *rouſe* a buck, &c.

Bolting, a method of pleading, or arguing, in uſe in the inns of courts; inferior to mooting. The caſe is argued firſt by three ſtudents, then by two barriſters; a *ſenior* ſitting judge.

The word comes from the Saxon *bolt*, a *houſe*; becauſe done privately within doors, for inſtruction.

BOLUC *baſſi*, in the *Turkiſh Affairs*, denotes the chief of a company, or a captain who has the command of an hundred janizaries.

BOLUS, in *Medicine*, an extemporaneous form of remedy, of a ſoft conſiſtence, ſomewhat more ſo than that of an electary, and of the quantity of one doſe, or morſel, to be ſwallowed down; contrived principally for the ſake of ſuch as have an averſion to potable medicines; as alſo for the better conveyance of certain preparations of mercury, antimony, &c. which, by their weight, would ſink to the bottom of the glaſs, were they given in draughts.

There are *boluſes* of various kinds, made with electaries, confections, conſerves, pulps, powders, ſalts, oils, eſſences, extracts, ſyrups, &c. ſome of which ingredients muſt always have ſolidity or drineſs enough to give a conſiſtence to thoſe that are liquid.

Boluſes are chiefly denominated from their intentions, as emetic *boluſes*, purgative *boluſes*, aſtringent, anodyne, antifebrile, alexipharmic, &c. *boluſes*.

The choice of the proper ingredients for a *bolus* is regulated by the following conſiderations: a due coheſion, ſoftneſs, and equable mixture, are eſſentially neceſſary to a *bolus*; for this reaſon, dry ſubſtances muſt be put to liquid ones, and liquid ones to dry, to produce the proper conſiſtence; but the thicker electaries, conſerves, and robs, are themſelves naturally in form of a *bolus*.

Acrid ſubſtances, and ſuch as are offenſive either to the ſmell or taſte, or are of a very viſcid nature, are much more properly exhibited in form of *boluſes* than of powders; ſince their offenſive qualities are by this means concealed. The draſtic purges, and mercurial preparations, are therefore very properly given in *boluſes*.

Balſams, and other ſuch liquid ſubſtances, are beſt mixed into a *bolus* with ſugar, becauſe it not only is the means of their going down eaſily, but it aſſiſts their diſſolution in the ſtomach. The alkaline, fixed and volatile ſalts, and all other ſubſtances which ſoon become liquid, are very improperly made ingredients in *boluſes* which are to ſtand any time; ſince they ſpoil the form of the medicine, and looſe their own virtues; and for the ſame reaſon, ſuch ſubſtances as will ferment when brought together, are very improper for *boluſes*, unleſs they are to be ſwallowed as ſoon as made up. To this it may be added, that the number of ingredients in a *bolus* ſhould never exceed three, or at the moſt four.

The number of *boluſes* made up at once ought only to be one, or at the utmoſt two; but the apothecaries have got an almoſt univerſal cuſtom at preſent of ſending in four at a time; by which means, the laſt which are taken, are uſually too hard to be ſwallowed, and often have loſt all their virtues.

It is the common cuſtom to wrap up *boluſes* in leaf-gold, or in a wafer; but ſome chooſe neither of theſe, but will diſſolve them in ſome liquor before they are taken. The ſignature on each *bolus* is to expreſs its nature and deſign, the liquor to be taken with or after it, and the regimen to be uſed; and it is highly neceſſary to give a convenient liquor after ſome of them, if we ſuſpect they are made of ingredients which will not eaſily diſſolve in the ſtomach: and this caution is to be regarded principally in thoſe of the terebinthinous and other balſamic kinds.

Boluſes are a form of medicines almoſt univerſally uſeful. All we have to conſider in regard to the taking them is whether the patient is in a condition to ſwallow a ſolid morſel, or not; and from hence it is eaſily inferred, that they are not to be given in quinſies, or in ulcers of the *fauces*; apoplexies, epilepſies, and ſyncopes, alſo render them very improper.

BOM, in *Zoology*, the name of an American ſerpent, remarkable for its noiſe, which is like the ſound of the word uſed as its name. It grows to a vaſt ſize, and is perfectly harmleſs, never hurting any one.

BOMARIN, in *Zoology*, a name uſed by ſome for the *hippopotamus*, or river-horſe.

BOMB, in the *Military Art*, a hollow iron ball, or ſhell, filled with gun-powder, and furniſhed with a vent for a fuſee, or wooden tube filled with combuſtible matter; to be thrown out from a mortar.

The word *bomb* comes from the Latin *bombus*, *crepitus*, or *ſibilus ani*: by reaſon of the noiſe it makes.

The method of preparing a *bomb* is as follows: a hollow iron globe AB (*Tab. Gunnery*, *fig.* 4. & 5.), is caſt pretty thick, having a round aperture A, by which it may be filled and lighted; and circular *anſæ* C, D, of hammered iron fixed in the mould when they are caſt, for the commodious putting it into the mortar. In France the handles are caſt iron.

It has been uſual to make the lower part of the *bomb* the thickeſt, that it may fall on that ſide and never on the fuſee, and that it may alſo better reſiſt the impreſſion of the powder, by which it is diſcharged from the mortar; but Mr. Muller thinks that neither of theſe conſiderations is of any great importance, and recommends rather to make them everywhere equally thick, becauſe they would thus burſt into a greater number of pieces. Artillery, p. 151. in his Syſtem, &c. Vol. v.

To prove whether it be ſtaunch, after heating it red-hot on the coals, it is expoſed to the air, ſo that it may cool gently: for ſince fire dilates iron, if there be any hidden chinks or perforations, they will thus be opened and enlarged; and the rather, becauſe of the ſpring of the included air continually acting from within. This done, the cavity of the globe is filled with hot water, and the aperture well ſtopped, and the outer ſurface waſhed with cold water and ſoap; ſo that if there be the ſmalleſt leak, the air, rarified by the heat, will now perſpire, and form bubbles on the ſurface.

If no defect be thus found on the globe, its cavity is filled with whole gunpowder; the moſt proper quantity of powder is probably two-thirds of the weight which would fill the cavity. A little ſpace or liberty is left, that when a fuſee or wooden tube *a e*, of the figure of a truncated cone, is driven through the aperture, and faſtened with a cement made of quick-lime, aſhes, brick-duſt, and ſteel-filings, worked together in a glutinous water; or of four parts of pitch, two of colophony, one of turpentine, and one of wax; the powder may not be bruiſed. This tube is filled with a combuſtible matter, made of two ounces of nitre, one of ſulphur, and three of gunpowder-duſt, well rammed.

This fuſee, ſet on fire, burns ſlowly till it reach the gunpowder, which goes off at once, burſting the ſhell to pieces with incredible violence: whence the uſe of *bombs* in beſieging towns.

Special care, however, muſt be taken, that the FUSEE be ſo proportioned, as that the gunpowder do not take fire before the ſhell arrives at the deſtined place; to prevent which, the fuſee is frequently wound round with a wet clammy thread.

The fuſees are driven into the ſhell ſo as that only about an inch and a half comes out beyond the fuſee-hole; and then the ſhell is ſaid to be fixed. They are charged long before there is occaſion to uſe them; and in order to ſecure the compoſition with which they are filled, the two ends are covered with a compoſition of tallow, mixed either with pitch or bees-wax. When the fuſee is to be put into the ſhell, the little end is opened or cut off; but the great end is never opened till the MORTAR is to be fired.

Bombs being made of different magnitudes, it may be proper to exhibit ſome of their dimenſions; as in the following table.

Diam. of Bomb.	Thickneſs of Metal		Diam. of Apert.	Quant. of Gunpow.	Weight of Bomb.
17, In. 10	2 In.	2,10	,20	48lb.	490lb.
11, 8	1	,18	,16	15	130
8	0.10	,13	,10	4	40

Others make the thickneſs of the *bomb* $\frac{1}{8}$, or $\frac{1}{9}$, or $\frac{1}{10}$, of the whole diameter; and the diameter of the aperture $\frac{1}{9}$ or $\frac{1}{7}$ of the ſame.

Mr. Muller gives the following proportions, from the 13 inch *bombs* now commonly uſed, and obſerves that they may be eaſily adjuſted to any other calibre by making the diameter of the ſhell to 30, as any part expreſſed in inches, to the ſame part expreſſed in parts of the diameter divided into 30 equal parts.

Diameter of the bore — —	30
Diameter of the ſhell — —	29.5
Diameter of the hollow ſphere —	21
Thickneſs of the metal at the fuſee-hole	3.5
Thickneſs at the oppoſite part —	5
Diameter of the fuſee-hole — —	4
Weight of the ſhell unloaded, —	$\frac{d}{11.7}$
Weight of powder contained in the ſhell	$\frac{d}{236.5}$

N. B. The letter *d* denotes the cube of the diameter of the bore.

Bombs only differ from GRANADOS, in that the latter are much leſs; and, inſtead of mortars, are thrown out of the hand.

Bombs may be uſed without mortar pieces, as was done by the Venetians at Candia, when the Turks had poſſeſſed themſelves of the ditch, rolling down *bombs* upon them along a plank ſet ſloping towards their works, with ledges on the ſides to keep the *bomb* right forwards. They are ſometimes alſo buried under ground to blow up. See CAISSON.

M. Blondel, who has wrote on the art of throwing *bombs*, obſerves, that the firſt *bombs* were thoſe thrown into the city of Watchtendonch in Guelderland, in 1588. though others pretend they were in uſe a century before, viz. at the ſiege of Naples by Charles VIII. in 1495. But they came not into common uſe before the year 1634, and then only in the Dutch and Spaniſh armies. One Malthus, an Engliſh engineer, is ſaid to have firſt carried them into France, where they were put in uſe at the ſiege of Collioufe, in 1642.

The art of throwing *bombs* makes a branch of GUNNERY, founded on the theory of PROJECTILES, and the laws and quantities of GUNPOWDER.

Meſſ. Blondel, Guiſnee, de Reſſons, de la Hire, and others, have written expreſly on the art of throwing *bombs*.

Bomb *battery*. See Battery.

Bomb-*cheſt*, is a kind of cheſt filled uſually with *bombs*, ſometimes only with gunpowder, placed under-ground, to tear and blow it up in the air, with thoſe who ſtand on it.

Bomb-cheſts were formerly much uſed to drive enemies from a poſt they had ſeized, or were about to take poſſeſſion of: they were ſet on fire by means of a *ſauciſſee* faſtened at one end, but they are now much diſuſed.

Bomb, *water*. See Water-*bomb*.

Bomb-*veſſels*, which are ſmall ſhips formed for throwing *bombs* into a fortreſs, are ſaid to be the invention of M. Reyneau, and to have been firſt uſed at the bombardment of Algiers. Till then, it had been judged impracticable to bombard a place from the ſea. See Ketch.

BOMBARD, Bombarda, a piece of artillery anciently in uſe, exceedingly ſhort and thick, and with a very large mouth, by ſome alſo called *baſiliſk*, by the Dutch *donderbuſs*. Some derive the word, by corruption, from *Lombard*, as ſuppoſing this piece firſt uſed in Lombardy. Du-Cange, after Voſſius, derives it from *bombus*, and *ardeo*; Menage, from the German *bombarden*, the plural of *bomber*, *baliſta*. But we doubt whether the Germans knew any ſuch word. It is no unuſual thing with Menage, and many other etymologiſts, to give derivations from words of their own making.

There were ſome of theſe pieces ſaid to have carried balls of 300 pounds weight: Froiſſart mentions one of fifty foot long. To load them, they made uſe of cranes, &c. The *bombard* is ſuppoſed to have been in uſe before the invention of cannons.

Bombards can hardly be ſuppoſed to have been of metal, nor charged with gunpowder. They were rather a ſort of *baliſtæ* for throwing ſtones, and were played with ropes.

BOMBARDIER, an engineer, or perſon, whoſe buſineſs is to take care of the firing and throwing *bombs* out of mortars.—He firſt drives the fuſee, then fixes the ſhell, points, loads, and fires.

Bombardier, in *Zoology*, a name given to a ſpecies of the inſect called BUPRESTIS; the wings of which are incloſed in a kind of caſe to cover and wrap them up. It keeps itſelf concealed among the ſtones, and ſeems to make little uſe of its wings; it moves by a ſort of jump, and when touched makes a noiſe reſembling the diſcharge of a muſquet in miniature, during which, a blue ſmoke may be ſeen to proceed from its *anus*. It may be made at any time to play off its little artillery, by ſcratching its back with a needle. Rolander, who firſt made theſe obſervations upon it, ſays it can give twenty diſcharges ſucceſſively. A bladder placed near the *anus*, is the arſenal whence it derives its ſtore, and this proviſion and furniture affords its chief defence againſt an enemy; although the ſmoke emitted ſeems to be altogether inoffenſive, excepting it be by cauſing a fright, or concealing its courſe.

BOMBARDING, the art or act of attacking a city or fortreſs, by throwing bombs into it, in order to ruin or ſet on fire the houſes and magazines, and do other miſchiefs.

Bombarding is not reckoned the moſt honourable method of making war, as it rather tends to do miſchief to the inhabitants than to the works.

BOMBASINE, in *Commerce*, a kind of ſilk-ſtuff manufactured at Milan, and thence ſent into France and other countries. The French alſo uſe the word *bombaſine* for ſtuff made of cotton, more properly called dimity.

BOMBAST, in *Rhetoric*, denotes a STYLE too high and pompous for the ſubject and occaſion; or a certain manner of elocution and action, which is grand when ſupported by dignity in the ſentiment, and force in the expreſſion, but never fails to appear ridiculous, where the ſentiment is mean, and the expreſſion flat.

BOMBAX, in *Botany*, a genus of the *polyandria monogynia* claſs of plants; the ſilk cotton-tree. The characters are, that the flower is quinquefid and ſpreading; that it hath many ſtamina which are the length of the petal; that a round germen is ſituated in the centre; and that the empalement afterward becomes a large, oblong, turbinated capſule, having five cells which are lignous, containing many roundiſh ſeeds, wrapped in a ſoft down. There are three ſpecies, which grow naturally in both the Indies.

Theſe plants require a large ſtove, where they may have room to grow; but as they are ſeveral years old before they flower in the countries where they grow naturally, there is little hope of their producing any in England. The ſeed is the only part uſed in medicine, which is of a balſamic nature, uſed in coughs, ſhortneſs of breath, and ſoreneſs of the lungs, cauſing expectoration, and freeing them from tough phlegm. It is alſo reſtringent, and good to ſtop fluxes of all ſorts.

BOMBINA, in *Zoology*, a ſpecies of the RANA belonging to the order of *reptiles*.

BOMBUS, in *Muſic*, an artificial motion with the hands, imitating, in cadence and harmony, the buzzing of bees. The word is originally Greek, and ſignifies the buz or noiſe of bees, gnats, and the like.

In this ſenſe, *bombus* made one of the ſpecies of applauſe uſed by the ancient auditories.

Bombus, in *Medicine*, denotes a murmuring noiſe, as of wind breaking out of a narrow into a larger cavity, frequently heard in the thick inteſtines.

The *bombus* heard in the ears, in acute diſeaſes, is laid down by Hippocrates as a ſign of death.

BOMBYCINUM, in *Ancient Writers*, properly denoted a ſpecies of ſilk, brought from Aſſyria and the iſland of Cos. In which ſenſe, it ſtood diſtinguiſhed from SERICUM, another ſort of ſilk brought from the Indies.

Bombycinum *velamentum*. See Velamentum.

BOMBYLIUS, in *Natural Hiſtory*, the name of the common *humble*-BEE, of which we have a great variety of ſpecies, many of them very beautiful.

Mr. Ray, in his Hiſtory of Inſects, mentions no leſs than nineteen ſpecies, all wholly different from one another.

In the Linnæan ſyſtem, it is a genus of the order of *diptera*.

BOMBYLOPHAGES, *humble-bee eater*, in *Natural Hiſtory*, the name of a fly of the TIPULA, or father-long-legs kind, which is larger and ſtronger than the common kinds; and loving honey, without knowing how to extract it from the flowers, it ſeizes on the *humble-bees*, and deſtroys them, in order to get at the bag of honey which they contain. It is of a blackiſh colour in the body; its head is of a bright red, and the eyes very large and prominent. It is chiefly found in mountainous places.

BOMBYLUS *teredo*, in *Natural Hiſtory*, the name of a ſpecies of *humble-bee*, which eats its way into wood, and there makes its neſt.

BOMBYX, in *Natural Hiſtory*, a name given by ſome authors to a ſpecies of winged inſect, armed with a ſting in the manner of the bees and waſps. It is of the ſhape of a waſp, but all over black in colour; it ſtings very ſeverely, always leaving the ſting in the wound. It builds its neſt of clay, which it works up to a very hard conſiſtence, and finally faſtens to a ſtone.

Bombyx is alſo a name given to the SILK-*worm*.

Bombyx, in the *Ancient Muſic*, a kind of inſtrument, which, in Ariſtotle's time, was made of a reed, *calamus*; and, by reaſon of its length, was difficult to play on.

The word ſeems alſo to have been uſed for a contrivance of horn, for ſhutting and opening the holes of wind inſtruments.

Bombyx, in the *Ancient Naturaliſts*, ſignifies indifferently either ſilk or cotton.

BOMONICA, in *Antiquity*, an appellation given, at Sparta, to the children, who, in the ſacrifices of Diana, ſtrove who ſhould receive the greateſt number of ſtripes with rods, which they ſometimes continued to do the whole day, and even, as Plutarch relates, to death itſelf.

The word is formed from *βωμος*, *altar*, and *νικη*, *victory*; importing as much as *victor ad aras*, or *conqueror at the altars*.

BON, or Ban, in *Botany*, a name given by ſome authors to the tree, the kernel of whoſe fruit is the coffee. The fruit is, by the ſame authors, called *buna*.

Bon is alſo the name of a yearly feaſt celebrated by the Japoneſe is honour of the dead.

BONA *fides*, or Bona *fide*, is uſed in ſpeaking of things done with an honeſt intention, in oppoſition to thoſe done with a deſign of fraud and deceit, ſaid to be *mala fide*.

In this ſenſe, we ſay, a grant, a conveyance, *bona fide*.

In many caſes, in the civil law, the *bona fide* of an action excuſes the want of ſome of the cuſtomary forms.

Contracts *bonæ fidei*, among *Civilians*, ſtand contradiſtinguiſhed from thoſe *ſtricti juris*; the former being gained by plain honeſty and conſcience, which ſometimes include ſeveral things not expreſly mentioned; whereas the latter are reſtrained to the expreſs terms of the deed.

A buyer *bonæ fidei*, is he who really believed the thing to belong to the ſeller at the time when he purchaſed it.

A poſſeſſor *bonæ fidei*, is he who is in poſſeſſion of a thing belonging to another, but which he truly believes is his own.

To be entitled to the benefits of next acceſſion, it is requiſite the perſons have poſſeſſed the thing *bona fide*, or really thought themſelves the proprietors.

PRESCRIPTION cannot ariſe from acts done *mala fide*; ſince what was unjuſt in its origin, can never be made juſt by time and continuance.

Bonæ *fidei*, *Actions*, thoſe wherein, for farther light, the judge might take cognizance of things not mentioned between the parties.

Bona *fide, Judgment*, that wherein the parties are obliged to pay each other what is due *bona fide*, i. e. juſtly and equitably; and the judge has a power of eſtimating what is thus due to the actor or plaintiff; a power given him by the *formula* of the *prætor*, viz. *Ex fide bona, vel quantum æquius melius.*

Bona *gratia*, a phraſe anciently uſed in ſpeaking of divorces, which were brought amicably about for ſome juſt reaſon, with the conſent of both parties, and without any crime on the part of either, as in caſe of old age, diſeaſe, barrenneſs, monachiſm, captivity, or the like.

Bona *defuncti ad colligendum.* See Colligendum.

Bona *mobilia.* See Mobilia.

Bona *notabilia*, in *Law.* Where a perſon dying has goods, or good debts, in another dioceſe, but within the ſame province, beſides his goods in the dioceſe where he dies, amounting to the value of five pounds, at leaſt; he is ſaid to have *bona notabilia:* in which caſe, the probate of his will, &c. belongs not to the biſhop of the dioceſe where he dies, whoſe juriſdiction cannot extend beyond the bounds of his own dioceſe, but to the archbiſhop of the province.

Though if a perſon happens to die in another dioceſe, than that wherein he lives, on a journey; what he hath about him above the value of five pounds, &c. ſhall not be *bona notabilia.*

Bona *patria*, a JURY or ASSISE of countrymen, or good neighbours.

Bona *peritura*, periſhable goods. By ſtat. 13 Ed. I. cap. 4. the cargo of a ſhip that has been caſt away ſhall be kept for a year and a day, and reſtored to the rightful owner; but if the goods be ſuch as will not endure ſo long, they are *bona peritura*, which the ſheriff is allowed to ſell, and to account in money for the value.

Bona *vacantia*, goods; ſuch as royal fiſh, ſhipwrecks, treaſure-trove, waifs, and eſtrays, in which no one can claim a property. Theſe goods by the law of nature, and by the imperial law, belonged to the firſt occupant or finder; but in the modern conſtitutions of European governments, they are annexed to the ſupreme power by the poſitive laws of the ſtate.

Bonis *arreſtandis, ne diſſipentur.* See Arrestandis.

Bonis, *non amovendis*, a writ directed to the ſheriffs of London, &c. where a writ of error is brought, to charge them that the perſon againſt whom judgment is obtained be not ſuffered to remove his goods, till the error is tried and determined.

Bonis, *Terris, & catallis rehabendis poſt purgationem.* See Terris.

Arreſto facto ſuper **Bonis** *mercatorum.* See Arresto.

Bonorum *attachiamenta.* See Attachiamenta.

Summum **Bonum**. See Summum.

BONASIA, in *Ornithology*, a ſpecies of the TETRAO.

BONASUS, in *Zoology*, the name of a ſpecies of wild-ox, of the ſize of the tame kind common with us, but of a thicker body, and having on its neck a mane like that of a horſe, and horns very ſhort and crooked, ſo as to be of no uſe to him in fighting.

When he is urged, he is able to throw out his dung a great way, and it is then of a hot and corroſive nature, though not ſo at other times; and this is the method of defending himſelf: a thing hardly credible, as Mr. Ray juſtly obſerves, if we had not inſtances of other animals, which poſſeſs the like faculty. See Glama.

BOND. See Counter-bond, and Obligation.

Bond-*tenants*, are the ſame in reſpect to the nature of their tenure with *copy-holders* and *cuſtomary-tenants.* Blackſtone's Comm. vol. ii. p. 148.

Bond, in Masonry and *Brick-laying*, is when bricks or ſtones are, as it were, knit and interwoven; and when they ſay, make *good bond*, they mean that the joints are not made over, or upon other joints; but reach at leaſt ſix inches, both within the wall and on the ſurface, as the art of building requires.

BONDAGE properly denotes a ſtate of ſervitude or ſlavery.

Bondage, *bondagium*, in *Engliſh Law Writers*, the ſame with VILLENAGE.

Tenants in *bondage* paid heriots, and did fealty; they were not to fell trees in their own garden, without licence of the lord.

The widow of a *tenant in bondage* held her huſband's eſtate, *quamdiu vixerit ſine marito.*

Bondage *by the forelock*, or *bondagium per anteriores crines capitis*, was when a freeman renounced his liberty, and became ſlave to ſome great man; which was done by the ceremony of cutting off a lock of hair on the forehead, and delivering it to his lord; denoting, that he was to be maintained by him for the future.

Such a *bondman*, if he reclaimed his liberty, or were fugitive from his maſter, might be drawn again to his ſervitude by the noſe; whence the origin of the popular menace, *to pull a man by the noſe.*

BONDMAN, *bondus*, in the *Engliſh Law*, is uſed for a VILLAIN, or tenant in VILLENAGE.

The Romans had two kinds of *bondmen*; one called *ſervi*, who were thoſe either bought for money, taken in war, left by ſucceſſion, or purchaſed by ſome other lawful acquiſition; or elſe born of their *bondwomen*, and called *vernæ.* Both are called in our law *villains in groſs*, as being immediately bound to the perſon and his heirs. We may add a third kind of *bondmen* mentioned by Juſtinian, called *adſcriptitii glebæ*, or *agricenſiti*; who were not bound to the perſon, but to the ground or place, and followed him who had the land. Theſe, in our law, are called *villains regardants*, as belonging to the manor or place.

In the Engliſh as well as Scottiſh laws, thoſe called by the Romans *vernæ*, are ſometimes alſo denominated *nativi*, as being born on the land.

The word is formed from the Saxon *bond*, ſignifying a *fetter.*

BONDUC, in *Botany*, the name given by Plumier to a genus of plants, afterwards characteriſed by Linnæus under the name of GUILANDINA.

BONDUCH, in the *Materia Medica*, a name by which many authors have called the Molucca, Marſao, or Bezoar nuts.

BONE, in *Anatomy*, a white, hard, brittle, inſenſible part of the BODY, framed for the defence of the ſoft parts, and the ſupport of the whole ſabric. See Body, Part, &c.

Bones are divided according to the parts wherein they are found, into the *bones* of the head, the feet, the *thorax*, &c. From their offices, figures, &c. many have likewiſe proper names, as the *os ſacrum*, *jugale*, *lacrymale*, *coccendix*, *pubis*, &c. Spongeous *bones*, *oſſa ſpongeoſa*, are thoſe full of large pores, formed like honey-combs.

Bones have their veſſels and circulating fluids, and, in ſhort, the ſame general texture which other parts have; ſolidity, and the ſtronger coheſion of parts, are the only evident diſtinguiſhing characters of the compoſition of *bones.* Monro. Med. Eſſ. Ed. vol. v. art. 24.

There is at leaſt one artery for each *bone*, ſeveral having more, for the conveyance and ſecretion of the medullary matter. After the ingreſs of the artery into the *bone*, it divides into a number of branches, which are diſtributed *quaqua verſum* on the internal membrane. The blood, which remains after the ſecretion of the marrow, is returned by proper veins, ſome of which paſs out of the *bone* either at the ſame hole whereby the artery entered it, or very near it.

In a *bone* we conſider divers things; the body, which is the middle or greater part, called by Galen *diophyſis*; the heads, which are the great protuberances at the ends; the neck, the part immediately under the head; *ſupercilia*, the extremities of the ſides of a cavity at the end of a *bone*; ridges, the prominent, ſalient parts in the length of the body of the *bone.*

Some cavities are formed for articulation, called *cotyles* and *glews*, which contain a mucilaginous humour, ſeparated from the glands of that name; others, not ſubſervient to articulation, receive different names, according to their figures; ſome being called *foramina*, or holes; others, *foſſæ*, or trenches; others, *ſulci*, or furrows, &c. Heiſter. Comp. Anat. § 45, &c.

Bones, with regard to their form and ſtructure, may be divided into flat or broad, which have thin ſolid ſides, and a thick intermediate ſpongy part; and round, which are more hollow, having the ſolid part thicker and ſtronger.

Bones may be divided with regard to their conſiſtence, 1. Into rocky, *oſſa petroſa*, which are hardeſt of all; as the temple-*bones*, thoſe of the ear, the thigh-*bone*, *tibia*, &c. 2. Soft *bones*, *oſſa mollia*; as the *ethmoides*, *vertebræ*, *carpus*, *tarſus*, and the *epiphyſes.* 3. Solid *bones*, *oſſa ſolida*, thoſe without any cavities; as the *omoplata*, *iſchion*, the teeth, &c.

The *bones*, in reſpect of their internal ſtructure, may be divided into thoſe which have a conſiderable cavity within, filled with marrow, as the *bones* of the arms and legs; and thoſe which have no ſuch cavity, or marrow, as the *bones* of the ſkull and ribs, &c.

Little *bones* are denominated OSSICLES.

The *bones* are all covered with a peculiar membrane, called the *perioſteum*; and are moſt of them hollow, and filled with an oily ſubſtance called *marrow.*

Dr. Havers, deſcribing the texture of the *bones*, obſerves, that they conſiſt of *lamellæ*, or plates lying one upon another; and thoſe, again, of fibres running lengthwiſe, ſome to the extremities of the *bones*, others not ſo far; but none of them terminating there in diſtinct ends, as they ſeem to do; but, in lieu of that, continued tranſverſely, and as it were arched: the fibres of one ſide meeting and uniting with thoſe of the other; and this at each extremity. So that the fibres are a continuation of each other; though not in the ſame uniform order, but in very long ellipſes; not all of a length, however, but in each plate ſhorter and ſhorter than in another.

Theſe *lamellæ*, or plates, are differently diſpoſed in different *bones*; v. gr. in thoſe that have a large cavity they are contiguous on each ſide, and very cloſely united; in thoſe again, whoſe cavities are ſmall, or which are altogether ſpongeous within, many of the internal *laminæ* are placed at a diſtance from each other, having betwixt them little *bony* cells; and even in *bones* that have a larger cavity, ſome of theſe leſſer cells are uſually found at each extremity. In ſuch *bones* as have their plates contiguous, there are pores through and between the plates, beſides thoſe made for the paſſage of the blood-veſſels: the firſt penetrate the *laminæ* tranſverſely, and look from the cavity to the external ſurface of the *bone*; the ſecond run longitudinally between the plates: the firſt are found in every one of the *laminæ*; though the nearer the cavity, the greater the number of pores; but they do not lie directly over one another, ſo as to form any continued paſſage from the cavity to the ſurface: the ſecond are ſeldom found but by good glaſſes; a medullary oil is diffuſed by theſe, throughout the plates; and to thoſe, the firſt kind ſeems only ſubordinate, ſerving to bring the oil into them.

On viewing the *bones* with the aſſiſtance of good glaſſes, their ſuperficial part is found to conſiſt of a great many ſmall veſſels, and ſome few of a larger ſize; which laſt, when they come to the ſurface of the *bone*, appear inveſted with either a membrane or a bony ſubſtance, perfectly tranſparent. The inſide of the *bone* is a ſpongy or cellular ſubſtance, conſiſting of long particles, cloſely united; and theſe are compoſed of numberleſs ſmall veſſels, cloſely united, and ſome running lengthways, others taking their courſe toward the ſide of the bony fibres; which, notwithſtanding their great number of apertures, are extremely hard, and lie ſome parallel, and others perpendicular to the length of the *bone*. Mr. Lewenhoeck diſcovered once, in a ſmall bit of a ſhin-*bone*, four or five veſſels, with apertures large enough for a ſilk to paſs through, each whereof ſeemed furniſhed with a valve, diſpoſed in ſuch a manner as to let out what was contained in the veſſel, but ſuffer nothing to return into it.

The way to examine the *bones*, is to ſhave off, with a very ſharp pen-knife, extremely thin pieces, lengthwiſe, croſſwiſe, and obliquely, and theſe from the outſide, inſide, and middle of the *bone*, and apply theſe, ſome dry, others moiſtened with water, to the *focus* of the double microſcope; and thus the veſſels will be ſeen in all directions: but the beſt way of ſeeing the bony ſtructure, is by putting the *bones* in a very clear fire till they are red hot, and then taking them out carefully, you will find the bony cells, though tender, perfect and entire; and, being now quite empty, they may be viewed with eaſe and pleaſure. Baker's Microſc. p. 143.

The marrow in the cavity of the *bones* is inveſted with a membrane, wherein are included little bags, or lobules; and in theſe bags are *veſiculæ*, or glandulous bladders, ſerving both for the ſecretion of the medullary oil from the blood, and for the reception and conſervation of the ſame. They ſeem to have paſſages into each other, as have alſo the bags; whereby the oil has a freer courſe to the joints and ſubſtance of the *bone*. The uſe of the marrow is to oil the ſubſtance of the *bone*, and to prevent its being too dry and brittle; it alſo lubricates the articulation of the *bones*, and hinders their ends from being worn, or overheated with motion; and it moiſtens the ligaments by which they are tied to each other: in which it is aſſiſted by the mucilaginous glands, found in all the articulations of the *bones*.

The *bones* are generally bigger at their extremities than in the middle; that the articulations might be firm, and the *bones* not ſo eaſily diſlocated: but to render the middle of the *bone* ſtrong withal, ſo as to ſuſtain its allotted weight, and reſiſt accidents, the fibres are there more cloſely compacted together, and ſupport one another; to which it may be added, that the *bone*, being hollow, is not ſo eaſily broken, as if it had been ſolid, and ſmaller; for of two *bones* of equal length, and of equal numbers of fibres, the ſtrength of the one to the ſtrength of the other, will be as their diameters.

The *bones* are joined and connected together various ways, according to the various purpoſes they are to ſerve: ſome being intended for motion, others for reſt, and the ſupport of the incumbent parts only.—That jointure intended for motion, is called DIARTHROSIS, or articulation ſeparated; that for reſt, SYNARTHROSIS, or articulation conjoined; and each of theſe again is ſubdivided into ſeveral others. See ARTICULATION.

Beſides the articulation of the *bones*, there is alſo their union or connection, called by the ancients SYMPHYSIS.

The number of the *bones* is various in various ſubjects: ordinarily it is about 242; ſome ſay 300; others, 307; others, 318: but the later writers fix it at 249 or 250; 61 of which are in the head, 67 in the trunk, 62 in the arms and hands, and 60 in the legs and feet: the variations are in the number of the *ſeſamoidea*, the teeth, and the *ſternum*.

The *bones* of the human ſkeleton, enumerated by Winſlow, are 54 in the head, without reckoning the *os hyoides*, and *bones* of the ear; 54 in the trunk, taking the *coccyx* for one *bone*, and the *ſternum* for two; 124 in the extremities, leaving out all the *ſeſamoidal bones*; ſo that the whole number is 232, to which adding the eight *bones* of the ear, and the five principal pieces of the *os hyoides*, we ſhall have in all 245, the *ſeſamoidal bones* being ſtill omitted. Winſlow's Anat. vol. i. p. 4.

The names of the ſeveral *bones* are given in the following table; their figures and places are repreſented in *Tab. Anat.* P. 1. (*Oſteol.*) and particular deſcriptions of each are given under their proper heads.

Os Frontis	1	*Vertebræ Cervicis*	7	The *Os Femoris*	2
— *Occipitis*	1	——— *Dorſi*	12	*Patella*	2
Oſſa Parietalia	2	——— *Lumborum*	5	*Tibia*	2

Beſide the *Oſſa Seſamoidea*, which are ſaid to be found to the number of 48.

Of the bones, the leaſt is the ORBICULARE; the biggeſt, the FEMUR.

* To which may be added the two *oſſa convoluta*, or lower ſhells of the noſe. See CONCHÆ *Narium*.

The blood-veſſels of the *bones* Dr. Havers divides into nutritious and medullary; the one furniſhing matter for the nutrition, the other for the lubrication of the *bones*. The chief of the nutritious enter the ends of the *bone*, viz. the arteries at one end, and the veins at the other. The medullary commonly enter the ſides of the *bone*, and that obliquely; but both by the ſame foramen.

The medullary oil is diſpenſed from the cavity where it is depoſited, throughout the whole ſubſtance of the *bone*; paſſing firſt through the tranſverſe pores of the firſt internal *laminæ* into the longitudinal ones; where it proceeds till it finds other tranſverſe pores, when it alters its courſe again, and exudes farther: thus it paſſes alternately through and between the plates, till it is diffuſed throughout. This is the method of its conveyance in *bones*, whoſe plates are contiguous: where the plates are at a diſtance, as in *bones* that have no great cavity, the ſmall caverns above mentioned contain medullary glands; whence the plates have the benefit of the marrow without the former method of conveyance.

Thus are all the *bones* ſtocked with pores, &c. excepting the TEETH; which have this further diſtinction, that they have nerves inſerted into them: whereas, in all the other *bones*, the nerves go no farther than the *perioſteum*.

Beſides the large cavities in the inſide, moſt *bones* have ſuperficial cavities, or *ſinuſes*, which may be diſtinguiſhed into *ſulci*, or furrows, the longer ſort; and *foveæ*, pits, the ſhorter ones.

On the outſide are alſo obſerved prominences, whereof there are two kinds; the one a continued part of the *bones*, jutting apparently above its plain ſurface, for the more commodious inſertion of the muſcles, &c. called *apophyſis*, or *proceſſus*; the other an additional *bone*, growing to another by mere contiguity, being generally more ſoft and porous than the other, and called an *epiphyſis*, or *appendage*. If the protuberance be round, it is called the *caput*, under which is the *cervix*; if flat, *condylus*; if ſharp, *corona*.

The natural colour of the freſh *bones* of an adult human *body* is whitiſh, with a ſmall mixture of pale red. This red colour is more conſiderable in children, but decreaſes by degrees as they grow up, and is loſt in old age. It is owing to the blood-veſſels of the *bones*, which are larger, and leſs ſurrounded by the bony juices in infancy than in age; ſo that the colour of the blood appears through the ſubſtance of the *bones*. Winſlow.

The general uſe of the *bones* is to ſupport and ſtrengthen the body, like beams and pillars in a building; to defend ſome of the more eſſential parts, as the brain, &c. to give ſhape to the body, and to aſſiſt in motion.

It is demonſtrable, that of whatever figure *bones* are, and in whatever manner their fibres are diſpoſed, their ſtrength muſt always be in a *ratio* compounded of their quantity of bony matter, and of the diſtance of their center of gravity from the center of motion.

Hence, on a double account, the part of a *bone*, formerly fractured, muſt be ſtronger than any other part of that ſame *bone*, becauſe the diameter is enlarged, and the quantity of matter is increaſed.

The human *bones* have been ſometimes known to grow ſoft and flexible, ſo as to bend any way with leſs difficulty than the muſcular parts of a healthy perſon's leg. Phil. Tranſ. N° 470. ſect. 3.

Bartholin gives an inſtance of an *anoſteus*, or boneleſs child, ſhewn at Briſtol, whoſe arms and legs were flexible like a glove

Bones have ſometimes been found incruſted with ſtone, which has given riſe to accounts of ſkeletons petrified. Phil. Tranſ. N° 477. p. 55, &c.

Bones are totally ſoluble in concentrated acids of vitriol, nitre, and ſea-ſalt, and may be ſoftened by theſe or acetous acids diluted. Gradual heat renders them opake, white, and friable; but if they are firſt urged with a ſtrong fire, ſuch as is ſufficient to melt iron or copper, they become hard, ſemi-tranſparent, and ſonorous.

By diſtillation in a retort, the *bones* reſolve into phlegm, ſpirit, volatile ſalt, fetid oil, and *caput mortuum*, which, calcined in an open fire, leaves a white earth, without any fixed ſalt. This laſt appears to be the proper conſtituent part of the *bones*, ſince after the other principles are ſeparated, the earth ſtill retains the former ſhape of the *bone*, though it be ſo brittle, that, on the leaſt touch, it moulders into duſt. When moiſtened with a little water or oil, it recovers ſome degree of tenacity again; but cannot be reſtored to its former firmneſs.

The *origin* and *formation* of *bones* is generally traced from cartilages, which all *bones* are ſuppoſed once to have been; or, according to others, membranous tendons. Some deduce theſe further from gellies; and others from mere fluids; which ſucceſſively arriving at greater and greater conſiſtency, become firſt gelatinous, then tendinous, then cartilaginous, and laſtly bony. Phil. Tranſ. N° 54. N° 71. and N° 81.

Hence the different ſtates of the *bones* in different ages, ſexes, and the like; which, in children, are found ſoft, moiſt, and cartilaginous; in aged people, hard, dry, and inflexible; the very cartilages in theſe frequently becoming bony.

Bones have been regenerated. See Phil. Tranſ. vol. lix. N° 6. an. 1769. p. 41, &c.

Dr. Niſbet, in his Human Oſteology, undertakes to demonſtrate, that the notion of all, or any *bones*, being originally cartilaginous, is without foundation in nature.

Some conſider the membrane wherewith the *bones* are lined, as a kind of *perioſteum internum*, if the expreſſion may be allowed; which, according to Havers, takes its origin from the muſcular coat of the medullary artery. Be this as it will, it is contiguous with the whole internal ſurface of the *bones*, and enters the tranſverſe pores, as the external *perioſteum* does the ſinuoſities of the *bones*; though it does not adhere ſo cloſe thereto as the external does. Monro, Oſteology, p. 19, &c. &c.

The *bones* are uſually capped at the ends with CARTILAGES, and to them are alſo annexed LIGAMENTS.

The doctrine of the *bones* makes a particular branch of *Anatomy*, under the denomination of OSTEOLOGY, or OSTEOGRAPHY.

The formation or geneſis of the *bones* is called OSSIFICATION, or OSTEOGONY.

A ſyſtem of the ſeveral *bones* of a body, dried, whitened, and joined together in their natural order by art, is called a SKELETON.

Animals without *bones*, are ſaid to be *anoſtei*; ſuch are all the ſpecies of reptiles, inſects, &c.

BONES, *extraneous* or *preternatural*, have been found in the *meninges*, the duplicatures of the *dura mater*, between the *cerebrum* and *cerebellum*, in the *matrices* of women, does, hares, cows, *omentum* of ſows, &c. Hiſt. Acad. Sc. an. 1711. 1713. Plott's Hiſt. Staff. ch. vii. § 56. 63. and 74.

BONES, *diſeaſes and injuries of the*.—Thoſe to which the *bones* are ſubject, are fractures, luxations, fiſſures, caries, cancers, nodes, rickets, tophi, exoſtoſes, or excreſcences, &c. To which may be added other leſs uſual diſorders, as preternatural hardneſſes, almoſt to a degree of petrefaction, and ſtiffneſſes to the condition of wax, unions or coalitions of all the *bones* of the body into one, creaking of the *bones* in ſcorbutic caſes, worms in the cavities of the *bones*, &c. Mr. Petit gives an inſtance of the carnification of the *bones*; wherein, by a change contrary to that of their firſt formation, they were reconverted from *bones* to fleſh, or cartilages. Phil. Tranſ. N° 251. N° 379. Mem. Acad. Scien. an. 1720.

The operations practiſed in diſeaſes of the *bones*, are excision, amputation, perforation, trepanation, ſetting or replacing, exfoliation, ſhaving, filing, &c.

BONES, *wounds of*.—As blunt inſtruments uſually make fractures of the *bones*, ſo ſharp ones, ſuch as ſwords, ſpears, &c. do, properly ſpeaking, ſometimes wound them; and theſe wounds cannot be ſuffered, without a great variety of ſymptoms, which are often very dangerous, according to the ſize and depth of the wound, and the nature of the wounded part. Such ſlight wounds as do not penetrate deep into the *bone*, are often attended with no great danger, eſpecially if proper care be taken in the dreſſing of them, and the injured *bone* be as much as poſſible kept covered with its integuments, from the injuries of the external air. All fat and oily medicines muſt be wholly rejected in wounds of this kind, as great enemies to the *bones*. But when wounds of this kind penetrate deep, and wholly divide the *bone* and its adjacent parts, or violently affect any of the organs neceſſary to life, in the head, neck, back-*bone*, or breaſt, with a puncture or diviſion of the longer veins, arteries, nerves, and tendons of the upper and lower limbs, the danger is always great, the cure difficult, and death too often the conſequence. Petit has adviſed, that, in wounds of the *bones*, if the ſolution be inflicted lengthwiſe, the lips of the wound are to be cloſed and united by the uniting bandage; but if the wounds are very oblique, or wholly tranſverſe, then they are to be joined together by ſuture, and the eighteen-headed bandage; but this is certainly a wrong method in many caſes of this kind. Indeed, in the firſt kind of theſe wounds, and when they are very ſlight, as when the ſkull is not wholly, nor indeed very deeply penetrated, and that without contuſion, nor the brain much hurt, this method may do very well; but when the contrary of theſe mild ſymptoms are the caſe, a very different method of cure is to be attempted; the wound is to be kept open with lint, and not healed up till thoroughly cleanſed; for, by a too ſpeedy cloſure of ſuch wounds, the very worſt ſymptoms, and even death very often, are brought on.

So alſo, in ſlight, oblique, or tranſverſe wounds of the *bones*, the ſuture, or the eighteen-headed bandage, may be uſed with ſafety and ſucceſs; but theſe are ſeldom neceſſary; and in oblique wounds of the head, forehead, and *cranium*, if not violent ones, the parts may be much eaſier cloſed and retained by a common bandage and plaſter, than by ſutures with the needle, or the eighteen-headed bandage; but when the divided part hangs down, the ſuture may indeed be neceſſary.

If the *bones* of the fingers are thus wounded, or wholly divided by a ſword, they may be happily cured without the ſuture, by the following method. Firſt, accurately replace the divided *bone*, then ſecure it in its place, by winding round a ſlip of plaſter, and, over this, applying a compreſs dipped in ſpirit of wine, and laying over all little ſlips of paſt-board, by way of ſplints; then binding up the whole with a proper narrow bandage, and hanging the arm in a ſling from the neck. Once, in about three days, the dreſſing is to be removed, and the wound treated with a vulnerary eſſence; and in a month the cure will be perfected.

If either of the *bones* of the *cubitus* be divided, it uſually is the *ulna*, as that is moſt expoſed to the ſword in fighting. This caſe requires neither the ſuture nor eighteen-headed bandage; but the wound being cleanſed, is to be treated with ſome vulnerary eſſence or balſam, and with lint dipped in the ſame eſſence; after which are to be laid on, in order, the plaſter, compreſs, and paſt-board ſplints, wetted with ſpirit of wine, which are to be bound round the thick part of the *cubitus* near the wound, with a long bandage, that, as they dry, they may accommodate themſelves the better to the figure of the part; and, laſtly, the arm is to be ſuſpended in a ſling hung round the neck: after this, the wound is to be dreſſed every day, or every other day, in proportion to the diſcharge, and a cure without the help of the ſuture will be eaſily effected; the ſuture, in ſuch caſes, being not only unneceſſary but pernicious. But if both *bones* are divided, then indeed the eighteen-headed bandage may be neceſſary, and uſed with advantage; but, even in this caſe, the ſuture is much better let alone: for it is always to be avoided, except when perfectly neceſſary, from the dangers of inflammation, convulſions, and other bad ſymptoms that too naturally attend it.

If the thigh-*bone*, however, ſhould be cut with a ſword, in that caſe the bloody ſuture will be of ſervice, and is even neceſſary to cloſe and retain thoſe very ſtrong muſcles: the wound is, in this caſe, to be carefully treated, and the limb laid up in a caſe of ſtraw, as in other fractures. So alſo, if the *bone* of the *humerus*, or arm, ſhould be penetrated with a ſword, that wound alſo ſhould, for the ſame reaſon, be treated by the ſuture; but then it is not to be dreſſed with the eighteen-headed bandage, but with the common long and narrow bandage uſed in other fractures of the arm; the limb is afterwards to be ſupported by a ſhort napkin, faſtened about the neck, by which means the muſcles will be brought to a more ready union, and the cure ſooner perfected.

If it ſhould happen that both *bones* of the *cubitus* or leg ſhould be divided by a ſword, ſo as to leave the limb hanging only by the fleſh, ſkin, and blood-veſſels, which is a caſe that very rarely happens, without wholly amputating the limb, then alſo the ſuture, with the eighteen-headed bandage, are the neceſſary applications; the ſuture, however, can be of no ſervice in a caſe of this kind, when the fleſh and blood-veſſels are divided, and the limb ſo far cut off, as to hang only by a ſkin, eſpecially when the part is ſo conſiderable as the leg or arm; for, in theſe caſes, the limb muſt be taken off, and the ſtump dreſſed as in other amputations.

When the lower-jaw is ſo cut by a ſword, that the piece ſeparates, and cannot be otherwiſe retained, then alſo the ſuture may be uſed, adding a proper compreſs, plaſters, and the ſuitable bandage. If the clavicle, or *acromion ſcapulæ*, ſhould in like manner be wounded by a ſword, the treatment and bandage are to be of the ſame kind, gently unbending, cleanſing, and dreſſing the part either every day, or every other day, as the diſcharge ſhall require, till the cure is perfected. Heiſter.

No medicines ſo effectually prevent the corruption of *bones* laid bare, and aſſiſt to cover them ſo ſoon with fleſh, as ointments, balſams, and dreſſing ſeldom, in order to have the aſſiſtance of the moſt effectual balſam of all, *pus*. With theſe we ſee the extremities of amputated *bones* covered over with fleſh, part of the ſkull, *tibia*, and other ſolid *bones*, covered in a little time with granulated fleſh, after they had been laid quite bare by wounds made even with bruiſing inſtruments; and likewiſe after their carious ſurface had been cut off, and a complete cure made, without the leaſt exfoliation. Monro, Med. Eſſ. Edin. vol. v. art. 24

Bone-*ſetting*, the art or act of replacing diſlocated *bones*, and the parts of fractured ones.

The Spaniards call their *bone*-ſetters *algebriſts*.

Bone-ſetting, by ſome called *συνθετισμος*, *ſynthetiſmus*, includes the four operations of extenſion, coaptation, deligation, and REDUCTION or repoſition.

FRACTURES and DISLOCATIONS of *bones* are ſo frequent, that it ſeems ſurpriſing the ſetting them ſhould ſo long have been left to quacks and ignorant perſons. It is about 150 years ſince the methodical ſurgeons have applied themſelves to this art; which they have carried to a degree of perfection beyond what it ever arrived at among the Greeks.

A *bone*-ſetter ſhould poſſeſs a perfect knowledge of anatomy, and mechanics; the former, to inform him of the ſtate and ſituation of the fractured or diſlocated *bones*; the latter, to furniſh machines, whereby to reinſtate them. The famous bench of Hippocrates was once held the moſt perfect engine of this kind. See AMBE.

M. Petit has contrived another, which not only ſeems more handy and portable, but more powerful, as well as leſs painful to the patient. By means of it, the operator is fully maſter of the powers that pull it, and may proportion them to the ſtrength and weakneſs of the ſubject. and that of the muſcles or tendons which are to be replaced. Add, that as it is neceſſary, the power which retains the body be equal to that which pulls the diſlocated member: in this machine, the ſame rope which pulls the limb, repels the body; and that the machines hitherto contrived, have only ſerved for luxations of the ſhoulder, and that of the hip, which are made upwards, and where the members are ſhortened; whereas this ſerves for FRACTURES as well as LUXATIONS, and not only where the members are ſhortened, but where they are longer. Mem. Acad. Scienc. ann. 1716, p. 330, &c.

The replacing a diſlocated *bone* of a horſe, is a work of much difficulty, and requires great force: they uſually caſt the beaſt on a ſoft place, put four ſtrong paſterns on his feet, and draw him from the ground, that his whole weight may, in a manner, reſt on the disjointed member. Some tie a leathern thong about the paſtern, faſtening the other end of it to a yielding ſhrub, and thus whip the creature to make him ſtrain with all his force, till the *bone* fly into its place.

Bones, *boiling and whitening them*, are neceſſary operations in making SKELETONS: the method of doing which is thus deſcribed by Simon Pauli. They muſt firſt be well boiled, and afterwards expoſed day and night in the open air for a conſiderable time. The beſt ſeaſon for this operation is in wet ſtormy weather, eſpecially in the months of January, February, March, &c. the air being then impregnated with a nitrous ſalt, which contributes much to give them a bright white colour. If it does not rain, they muſt be ſprinkled with a bruſh dipt in rain water; and even rubbing them gently with the bruſh may be of uſe.

In expoſing them, care muſt be taken to place them on a fir-board, by no means an oak one, which ſhould be covered with a ſtratum of ſlate-ſtone, firſt well ſoaked in water; next, fine ſea-ſand is to be ſprinkled on, an inch or two deep. The uſe of the ſand is to imbibe what marrow or fat remains in the *bones* after boiling.

Bones, *colouring and ſtaining of*.—The *bones* of living animals are capable of acquiring colour by the circulation of the blood and juices from their aliment; many inſtances of this kind, in which they have been changed into a deep red by madder-root, are recorded both in the Philoſophical Tranſactions, and in the Memoirs of the French Academy. *Bones* and horns may be likewiſe artificially ſtained with a variety of colours, by ſteeping or boiling them in decoctions of the vegetable or animal ſubſtances which are uſed for dying. They may be ſtained alſo, without heat, by metallic ſolutions, and in this way may be ſpotted or variegated at pleaſure. Thus ſolution of ſilver in *aqua fortis* gives a brown or a black, according to its quantity; ſolution of gold in *aquo regia*, or in ſpirit of ſalt, a fine purple; ſolution of copper in the acetous acid, a fine green; and ſolutions of the ſame metal in volatile alcalies, a blue, which is at firſt deep and beautiful, but changes on being expoſed to the air into a green or bluiſh-green. If the *bone* or horn is only touched with the two firſt ſolutions, and expoſed to the air, it does not fail to acquire the colour in a few hours: in the two latter, it requires to be ſteeped for a day or longer, in order to its imbibing the colour. In theſe and other caſes, where immerſion is neceſſary, the *bone* may be variegated, by covering ſuch parts as are intended to remain white, with wax, or any other matter, which the liquor will not penetrate and diſſolve. Phil. Tranſ. abr. vol. ix. p. 104, &c. Neumann's Works, by Dr. Lewis, p. 519. Lewis's Com. Phil. Techn. p. 97. 435. See DYING and IVORY.

Bones, *in the funeral ſolemnities of the ancients*.—Divers uſages and ceremonies relating to the *bones* of the dead, have obtained in different ages; as gathering them from the funeral pile, waſhing, anointing, and depoſiting them in urns, and thence into tombs; tranſlating them, which was not to be done without the authority of the pontiffs; not to ſay worſhipping of them, ſtill practiſed to the *bones* of the ſaints in the Romiſh church. Among the ancients, the *bones* of travellers and ſoldiers, dying in foreign countries, were brought home to be buried, till, by an expreſs S. C. made during the Italic war, it was forbid, and the ſoldiers *bones* ordered to be buried where they died: the reaſon was, leſt the melancholy ſight ſhould diſcourage the people from venturing their lives. Antiquaries are divided as to the manner of diſtinguiſhing the *bones* of the deceaſed, from thoſe of the beaſts and ſlaves who were ſacrificed at his funeral, and thrown into the ſame fire: probably it was done by diſpoſing the body of the dead in the middle of the pile, and the others towards the ſides. Potter's Archæol. tom. ii. lib. iv. cap. 6.

The Romans had a peculiar deity, under the denomination *Oſſilago*, to whom the care of the induration and knitting of the human *bones* was committed; and who, on that account, was the object of the adoration of all breeding women. Pitiſc. Ant. tom. ii. p. 341.

Bones, in *Commerce*, are very uſeful articles, for making different kinds of toys; and alſo in ſeveral of the chemical arts; as for making caſt iron malleable, for abſorbing the ſulphur of ſulphureous ores, for forming teſts and COPPELS, or veſſels for refining gold and ſilver with lead; for burnt *bones* compoſe a maſs of a porous texture, which abſorbs vitrified lead and other metals, while the unvitreſcible gold and ſilver remain entire behind. They are uſed for the preparation of milky glaſſes and porcelains, for the rectification of volatile ſalts, and of empyreumatic oils, and for making glue. The *bones* of different animals are not equally fit for different uſes; even the glue or gelatinous part of the *bones* of one animal, is notably different both in quantity and coheſiveneſs, from that of another. Neumann's Works, p. 518.

The *bone* of the cuttle-fiſh is uſed by goldſmiths for making moulds; thoſe of bullocks for painters black; alſo, in lieu of ivory, for toys and cutlers work; where, if they be leſs white than ivory at firſt, they do not ſo ſoon turn yellow.

Papin has given a method of turning *bones* to food. Phil. Tranſ. Nº 187. p. 329.

The Turks are ſaid to have applied *bones* to building, and to have built a wall with the *bones* of the Chriſtians killed at the ſiege of Philadelphia.

A piece of this *bone* wall was ſent to Dr. Woodward, who found the tradition to be an error; the ſubſtance not being *bone*, but a looſe, ſoft, porous earth, formed in an old aqueduct, now in the wall; or rather, an incruſtation of ſeveral bodies, chiefly vegetable, cemented together by ſpar̄y and ſtony matters, found in the ſpring.

Bones, *foſſile*, or *petrified*, are thoſe found in the earth, frequently at great depths, in all the *ſtrata*, even in the bodies of ſtones, and rocks.

There are divers ſorts of foſſile *bones*; ſome of a huge ſize, uſually ſuppoſed to be the *bones* of giants, but more truly of elephants, or hippopotami; other ſmaller, as *vertebræ*, teeth, and the like.

It has been diſputed whether theſe be really animal ſubſtances, or mineral; that is, ſtones thus figured. Modern naturaliſts generally allow them to be animal, not merely on account of their figure and reſemblance, but of their chemical principles, which are found to be wholly of the animal kind. It is ſuppoſed they were repoſited in thoſe *ſtrata* at a time when all things were in a ſtate of ſolution, and that they incorporated and petrified with the bodies where they happened to be lodged.

Bone is alſo applied abuſively in ſpeaking of other matters which bear ſome analogy either in reſpect of ſtructure or office, to the *bones* of animals.

In this ſenſe, rocks are ſometimes called the *bones* of the earth. Divers ſpecies of figured ſtones, as the *cephalites*, *cardites*, &c. are denominated mineral *bones*, *enoſta*, *oſteocolla*, &c. Some naturaliſts conſider ſhells as a ſpecies of *bones*. The lobſter, according to Fontenelle, is an animal which carries its *bones* on its outſide.

Bones, *Giants*. See Giants *bones*.

Bones, *Mammout*. See Mammoth.

Bon-*fire*. See *Bon*-Fire.

Bone-*lace*. See Lace.

Bone, *hurle*, *Neper's*, *quitter*, *ring*, *whale*. See the ſeveral articles.

BONGO *pala*, in *Botany*, a name by which ſome authors have called the tree which produces the nutmeg.

BONIFACIA, in *Botany*, a name uſed by John Bauhine, and ſome others, to expreſs the broad-leaved Ruscus, or Butcher's-*broom*, commonly called the Alexandrian bay.

BONITO, in *Zoology*, the name of a fiſh, of the tunny or Trachurus kind, and called by ſome *curvata pinima*.

It is a large ſea-fiſh, with a long, broad, and thick body: its eyes are large, as are alſo its gills, and the greater part of its body is free from ſcales. It is a fiſh of very great beauty. It is an extremely common fiſh in ſome ſeas; our Eaſt India ſhips uſually fall in with immenſe ſhoals of them.

BONNA, in *Natural Hiſtory*, a name given by Pliny, and ſome other of the ancient Latin writers, to the Bonasus.

BONNET, in a general ſenſe. See Cap, Hat, &c.

Bonnet, in *Fortification*, a kind of little ravelin, without a ditch, having a parapet three feet high; anciently placed before the points of the ſaliant angles of the *glacis*; being paliſadoed round: of late alſo uſed before the angles of baſtions, and the points of ravelins, and fauſſebrayes. See *Tab. Fortif. fig.* 21. *lit. m.*

The *bonnet* has two faces, from ten to fifteen, or more rods long: the parapet is made of earth, from thirty to thirty-ſix feet thick, and from nine to twelve feet high: it is environed with a double row of paliſadoes ten or twelve paces diſtant from each other; hath a parapet three feet high, and is like a little advanced *corps du guard*.

Bonnet *à prêtre*, or *prieſt's* cap, is an outwork, having at the head three ſaliant angles, and two inwards.

It differs from the *double* Tenaille only in this, that its ſides, inſtead of being parallel, grow narrower, or cloſer at the gorge, and open wider at the front; on which account it is alſo denominated Queue d'aronde, or ſwallow's tail.

Bonnets, in *Sea-language*, ſmall ſails, ſet on the courſes, on the mizen, main-ſail, and fore-ſail of a ſhip, when theſe are too narrow, or ſhallow to clothe the maſt; or in order to make more way in calm weather.

Bonnets are commonly one third of the depth of the ſails they belong to.

What the *bonnet* is to the courſe, that is the drabler to the *bonnet*; being only in uſe when the courſe and *bonnet* are too ſhallow to clothe the maſt: there are alſo *bonnets* in form of ſheaths, being ſmall ſails faſtened by the narrow end to each extremity of the yards, wider at bottom than at top, of good uſe when the ſea is ſmooth.

The words are, *lace on the bonnet*, that is, faſten it to the courſe; *ſhake off the bonnet*, that is, take it off the courſe.

Bonnet *pepper*. See Capsicum.

BONNY, in *Mineralogy*, a name given by our miners to a bed of ore found in many places in hills, not forming a vein, nor communicating with any other vein, nor terminating in ſtrings, as the true veins do: it is a bed of ore of five or ſix fathoms deep, and two or ſomewhat leſs than that, in thickneſs, in the largeſt ſort; but there are ſmaller, to thoſe of a foot long. They have their trains of shoad-*ſtones* from them, and often deceive the miners with the expectation of a rich lead vein. They differ from the squatts only in being round beds of ore, whereas thoſe are flat. Phil. Tranſ. Nº 69. p. 2098.

BONO *et malo*, *Writ de*; a ſpecial writ of gaol-delivery was anciently iſſued for each particular priſoner under this title: but theſe being found inconvenient and oppreſſive, a general commiſſion for all the priſoners has long been eſtabliſhed in their ſtead. 2 Inſt. 43.

BONONIAN *ſtone*, a ſmall, grey, ſoft, gloſſy, fibrous, ponderous, ſulphureous ſtone, about the bigneſs of a large walnut: when broken, having a kind of cryſtal, or ſparry talc within; found in the neighbourhood of Bologna, or Bononia in Italy; and, when duly prepared, making a ſpecies of Phosphorus.

This ſtone is found in divers parts of that country, particularly in a river at the foot of Mont Peterno; where a chemiſt, one Vincenzo Caſciarolo, having gathered ſome pieces, and carried them home, in hopes by the fire to draw ſilver out of them, inſtead of what he expected, found that admirable phænomenon they exhibit, which conſiſts in this, that having been expoſed to the light, they retain it, and ſhine for the ſpace of ſix or eight hours in the dark. This diſcovery was made about the year 1630.

M. Homberg is ſaid to be the perſon who firſt taught us the true manner of preparing and calcining the *Bononian ſtone*, having made a journey to Italy on purpoſe to learn it.—Though others allege, that the true art of preparing and calcining the ſtone is loſt; there having been but one, an eccleſiaſtic, who had the true ſecret, and who is ſince dead, without communicating it to any perſon. See Phil. Tranſ. Nº 21.

This property of affording a phoſphorus by calcination, is common to the other gypſums, when pure from metallic or other heterogeneous mixtures; the artificial gypſums ſucceed equally with the natural, and it is found to belong to a variety of other ſubſtances. M. Marcgraaf obſerves, that all ſubſtances which have this property, contain a vitriolic acid, united to an alkaline or calcareous earth.

M. Elpigni obſerves, that one Zagonius had a method of making ſtatues and pictures of the *Bononian ſtone*, which would ſhine variouſly in the dark; but he adds, the perſon died without diſcovering his ſecret. See Phil. Tranſ. Nº 134.

For the method of preparing this phoſphorus, and other obſervations upon it, ſee Lapis *Bononienſis*. See alſo the articles Light, and Phosphorus.

BONOSIANI, or **Bonosiaci**, an ancient branch of Adoptiani, in the fourth century, denominated from their leader Bonoſus, a biſhop of Macedonia.

BONPOURNIKEL, a denomination given to a coarſe kind of bread uſed in Weſtphalia.

BONS-*hommes*, or **Bon-***hommes*, a ſort of hermits of St Auguſtin, founded by F. de Paula. They were brought over into England in 1283, by Edmund earl of Cornwall, and ſettled at Aſhorug in Bucks, beſides which they had only one houſe more at Edingdon in Wiltſhire. They followed the rule of St. Auſtin, and wore a blue habit.

The name is ſaid to have ariſen from Lewis XI. of France, who uſed to call F. de Paula, prior of the order, *le bon homme*. Till then they had been called the *Minimi*, or the order of Grammont. See Albigenses.

BONT-*viſch*, in *Zoology*, the name given by the Dutch to an Eaſt Indian fiſh, ſeeming to approach to the nature of the European Turdus, but that it has no ſcales. See *Tab. of Fiſh*, Nº 64.

BONTIA, in *Botany*. See *Barbadoes wild* Olive.

BONZES, or **Bonzus**, a name given to the prieſts and religious of China, Japan, and Tonquin.

The *bonzes* are the great adverſaries of the miſſionaries; and to their influence are attributed the perſecutions which have been raiſed in thoſe countries againſt the Chriſtians.

They generally live in a ſort of community, in places apart, or conſigned wholly to them. The iſland Pou-to, near Chuſan, is a famous ſeat of *bonzes*, being wholly inhabited by them, to the number of 3000, all of the ſect of Hoſhang, or unmarried *bonzes*.

They live a kind of Pythagorean life, and have not leſs than 400 pagods, or temples, in this little iſland. They have alſo female *bonzes*, a ſort of nuns. Phil. Tranſ. Nº 280.

In order to diſtinguiſh themſelves from the laity, they wear a chaplet round their necks, conſiſting of an hundred beads, and carry a ſtaff, at the end of which is a wooden bird; they live upon the alms of the people, and yet are very charitably diſpoſed, maintaining ſeveral orphans and widows out of their own collections.

The *bonzes* of China are the prieſts of the Fohiſts, or ſects of Fohi; and it is one of their eſtabliſhed tenets, that there are rewards allotted for the righteous, and puniſhments for the wicked, in the other world; and that there are various manſions, in which the ſouls of men will reſide, according to their different degrees of merit. The *bonzes* of Pegu are generally gentlemen of the higheſt extraction.

BOOBY, in *Natural Hiſtory*, the name of a bird common about Jamaica, and in ſeveral other parts of the world. It is deſcribed by Sir Hans Sloan, in his Hiſtory of Jamaica, under the name of *avis fuſca anſeri baſſano affinis*. It feeds upon fiſh, and dives under water after them, but is often robbed of its prey by another voracious bird, called the *albatroſſe*, or the man of war bird. The frequent conteſts between theſe two birds are very diverting, the one being as unwilling to part with the prey it has ſo dearly earned, as the other reſolute to have it; but the ALBATROSSE generally ſucceeds.

BOOK, a writing compoſed on ſome point of knowlege by a perſon intelligent therein, for the inſtruction or amuſement of the reader.

The word is formed from the Saxon *boc*, which comes from the Northern *buech*, of *buechaus*, *a beech* or *ſervice-tree*, on the bark of which our anceſtors uſed to write.

Book may be defined more preciſely, a compoſition of ſome man of wit or learning, deſigned to communicate, to prove, or illuſtrate ſome ſcience, art, truth, or invention.

Book is diſtinguiſhed from PAMPHLET, or ſingle paper, by its greater length; and from TOME or VOLUME, by its containing the whole writing.—Iſidore makes this diſtinction between *liber* and *codex*; that the former denotes a ſingle book, the latter a collection of ſeveral: though, according to Scipio Maffei, *codex* ſignifies a *book* in the ſquare form; *liber*, a *book* in the roll form.

We ſay, an old *book*, a new *book*; a Latin, a Greek *book*; to read, to write, to publiſh a *book*; the PREFACE, the TITLE, the DEDICATION, the INDEX of a *book*.—To *collate a book*, is to ſee that it be perfect, and that none of the ſheets be either wanting, or tranſpoſed.—Bookbinders ſpeak of *folding*, *ſewing*, *beating*, *preſſing*, *covering*, *gilding*, and *lettering* of *books*. See BOOK-BINDING. A large collection of *books*, is called a LIBRARY.—An inventory of a library, in order for the reader's finding any *book*, is called a CATALOGUE.

The *hiſtory*, or *notitia* of *books* makes the firſt part, according to ſome, the whole, of the literary ſcience.—The principal points in the notitia of a *book*, are, its *author*, *date*, *printer*, *edition*, *verſions*, *comments*, *epitomes*, *ſucceſs*, *eulogies*, *cenſures*, *condemnation*, *ſuppreſſion*, *adverſaries*, *vindicators*, *continuators*, and the like.

The hiſtory of a *book* is either of its *contents*, which is given by analyſing it, as is done by journaliſts; or of its *appendages* and *accidents*, which is the more immediate province of thoſe called *literators*, and *bibliothecarians*.

The *contents* of a *book* are the matters delivered in it; which make the province of the author.—Of theſe there is one principal matter, called the *ſubject*; in reſpect of which the reſt are only *incidents*.

The *appendages* of a *book* are, the *title*, *preface*, *epiſtle dedicatory*, *ſummaries*, *table of contents*, *index*, and the like, which are the proper province of the editor, unleſs perhaps the title page, which is frequently uſurped by the bookſeller.

In the *compoſition* of a *book*, there occur *ſentiments*, which are alſo the materials of it; *method*, the order wherein theſe are diſpoſed; and *ſtyle*, or *expreſſion*, which is the language wherein they are clothed.

The giving hiſtories, catalogues, and bibliothecas of *books*, is ſaid to have been firſt introduced by the Germans: we may add, that they have beſt ſucceeded in them; and to them the chief works of this kind are owing.—J. Alb. Fabricius has given us the hiſtory of the Greek and Latin *books*; Wolfius, that of the Hebrew *books*; Boecler, of the principal *books* in each ſcience and faculty; Struvius, of the *books* of hiſtory, law, and philoſophy; the abbot Fabricius, of the *books* of his own library; Lambecius, of thoſe in the Vienna library; Le Long, of the *books* of Scripture; Mattaire, of the *books* printed before the year 1550; and Morhoff, a general literary hiſtory of this kind, under the title of Polyhiſtor. The various catalogues of choice libraries are uſeful and neceſſary for the ſame purpoſes: ſo are likewiſe the Relationes, &c. and the Reviews, which have been periodically publiſhed.

As to the *materials* of *books*, they were firſt written on ſtones, witneſs the Decalogue given to Moſes (which is the oldeſt *book* we have any warranted account of); then, on the parts of plants, e. gr. the leaves, chiefly of the palm-tree; the rinds and barks, eſpecially of the *tilia*, or *philyra*, and the Egyptian PAPYRUS. By degrees, wax, then leather, were introduced, eſpecially the ſkins of goats and ſheep, of which, at length, parchment was prepared: then lead came in uſe; alſo linen, ſilk, horn, and, laſtly, PAPER itſelf.

The parts of vegetables continued long the common matter of *books*; inſomuch that moſt of the names and terms belonging to *books*, in moſt languages, are taken thence; as the Greek *biblos*, the Latin *liber*, *codex*, *folium*, *tabula*, and the Engliſh *book* itſelf.—We may add, that vegetable barks appear ſtill in ſome meaſure retained for *books* in certain of the Northern countries, as among the Calmuc Tartars, where a library was diſcovered by the Ruſſians, of an unuſual form as well as matter; the *books* were exceedingly long, but of no breadth; the leaves very thick, and made of barks of trees, ſmeared over with a double varniſh; the ink or writing being white on a black ground. Hiſt. Acad. R. Inſcr. T. 3 p. 6.

BOOK, *everlaſting*.—We find in ſignior Caſtagnatta's account of the ASBESTOS, a ſcheme for the making a *book*, which from its imperiſhable nature, he is for calling the *book of eternity*. The leaves of this *book* were to be of the ASBESTOS paper, the covers of a thicker ſort of work of the ſame matter, and the whole ſewed together with thread ſpun from the ſame ſubſtance. The things to be commemorated in this *book* were to be written in letters of gold, ſo that the whole matter of the *book* being incombuſtible and everlaſtingly permanent againſt the force of all the elements, and ſubject to no changes from fire, water, or air, muſt remain for ever, and always preſerve the writing committed to it.

BOOKS, *form of*.—The firſt *books* were in form of blocks and tables, of which we find frequent mention in Scripture, under the appellation *ſepher*, which the Septuagint render αξονες, q. d. *ſquare tables*: of which form the *book* of the covenant, *book* of the law, *book* or bill of divorce, *book* of curſes, &c. appear to have been.—As flexible matters came to be wrote on, they found it more convenient to make their *books* in form of rolls, called by the Greeks κοντακια, by the Latins *volumina*, which appear to have been in uſe among the ancient Jews, as well as Grecians, Romans, Perſians, and even Indians. And of ſuch did the libraries chiefly conſiſt, till ſome centuries after Chriſt.—The form which obtains among us is the ſquare, compoſed of ſeparate leaves; which was alſo known, though little uſed, among the ancients; having been invented by Attalus, king of Pergamus, the ſame alſo who invented parchment: but it has now been ſo long in poſſeſſion, that the oldeſt manuſcripts are found in it. Montfaucon aſſures us, that of all the ancient Greek manuſcripts he has ſeen, there are but two in the roll form; the reſt being made up much after the manner of the modern *books*. See BOOK-BINDING.

The rolls, or volumes, were compoſed of ſeveral ſheets, faſtened to each other, and rolled upon a ſtick, or *umbilicus*; the whole making a kind of column, or cylinder, which was to be managed by the *umbilicus*, as a handle; it being reputed a kind of crime to take hold of the roll itſelf. The outſide of the volume was called *front*; the ends of the *umbilicus* were called *cornua*, *horns*; which were uſually carved, and adorned likewiſe with bits of ſilver, ivory, or even gold and precious ſtones. The title Συλλαβος, was ſtuck on the outſide. The whole volume, when extended, might make a yard and half wide, and fifty long. Fabric. Bibl. Antiq. c. 19. § 7. p. 607.

To the form of *books* belongs alſo the *œconomy of the inſide*, or the order and arrangement of points and letters into lines and pages, with margins, and other appurtenances. This has undergone many varieties: at firſt, the letters were only divided into lines, then into ſeparate words; which, by degrees, were noted with accents, and diſtributed by points and ſtops into periods, paragraphs, chapters, and other diviſions. In ſome countries, as among the Orientals, the lines began from the right, and ran to the left; in others, as in Northern and Weſtern nations, from the left to the right: others, as the Grecians, followed both directions alternately, going in the one, and returning in the other, called *bouſtrophedon*. In the Chineſe *books*, the lines ran from top to bottom. Again, the page in ſome is entire, and uniform; in others, divided into columns; in others, diſtinguiſhed into text and notes, either marginal, or at the bottom: uſually it is furniſhed with ſignatures and catch-words; alſo with a regiſter to diſcover whether the *book* be complete.—To theſe are occaſionally added the apparatus of ſummaries, or ſide-notes; the embelliſhments of red, gold, or figured initial letters, head-pieces, tail-pieces, effigies, ſchemes, maps, and the like.—The end of the *book*, now denoted by *finis*, was anciently marked with a ◁, called *coronis*; and the whole frequently waſhed with an oil drawn from cedar, or citron chips, ſtrewed between the leaves to preſerve it from rotting.—There alſo occur certain *formulæ* at the beginning and end of *books*: as, among the Jews, the word חזק, *eſto fortis*, which we find at the end of the *books* of Exodus, Leviticus, Numbers, Ezekiel, &c. to exhort the reader to be courageous, and proceed on to the following *book*.—The concluſions were alſo often guarded with imprecations againſt ſuch as ſhould falſify them; of which we have an inſtance in the Apocalypſe. The Mahometans, for the like reaſon, place the name of God at the beginning of all their *books*, which cannot fail to procure them protection, on account of the infinite regard had among them to that name. wherever found For the like reaſon it is, that divers of the laws of the ancient emperors begin with the *formula*, *In nomine Dei*. At the end of each *book* the Jews alſo added the number of verſes contained in it, and at the end of the Pentateuch the number of ſections; that it might be tranſmitted to poſterity entire. The Maſoretes, and Mahometan doctors, have gone farther; ſo as to number the ſeveral words and letters in each book, chapter, verſe, &c. of the Old Teſtament, and the Alcoran. See ALCORAN, MASSORA, &c.

The kinds and denominations of *books* are various. With regard to their uſe and authority, *books* may be divided into *human*, and *divine*, alſo called *ſacred* and *inſpired books*.

BOOKS, *Sibylline*, thoſe compoſed by certain pretended propheteſſes, depoſited in the Capitol, under the care of *duumviri*. See SIBYLS.

BOOKS, *Canonical*, thoſe received and allowed by the church, as parts of Holy Scripture.—Such are the *books* of the Old and New Teſtament, as commonly bound up together.

BOOKS, *Apocryphal*, thoſe excluded out of the canon, yet received and read in ſome churches.

BOOKS, *Authentic*, thoſe which are deciſive, and of authority: ſuch, in the civil law, are the Code, Digeſt, &c. in our law, the Statutes, &c. Bacon, de Augm. Sc. l. 8. c. 3.

BOOKS, *Auxiliary*, thoſe leſs eſſential, yet of uſe, as ſubſervient to the others: as, in the ſtudy of the law, *books* of Inſtitutes, *Formulæ*, Maxims, Reports, &c.

BOOKS, *Elementary*, thoſe which deliver the firſt principles of ſciences: ſuch are thoſe under the titles of Rudiments, Methods, Grammars, &c. by which they ſtand contradiſtinguiſhed from *books of a ſuperior order*, which aim at making further advances in the ſcience.

BOOKS, *Library*, ſuch as are not ordinarily read over, but turned to, and conſulted occaſionally: ſuch are Dictionaries, &c.

BOOKS, *Exoteric*, thoſe intended for the uſe of popular and ordinary readers.

BOOKS, *Acroamatic*, thoſe containing more ſecret and ſublime matters, calculated for adepts and proficients in the ſubject.

BOOKS, *Public*, the records of paſt times and tranſactions kept by public authority.

BOOKS, *Church*, or *Eccleſiaſtical*, thoſe uſed in the public offices of religion.

BOOKS, again, with regard to their ſcope and ſubject, may be divided into *hiſtorical*, thoſe which relate facts, either of nature or mankind; *dogmatical*, thoſe which lay down doctrines, or general truths; *miſcellaneous*, thoſe of a neutral kind, containing both facts and doctrines; *hiſtorico-dogmatical*, thoſe which only rehearſe doctrines, or, at moſt, indicate the arguments by which they are proved, as Mallet's Geometry; *ſcientifico-dogmatical*, thoſe which not only recite the doctrines, but demonſtrate them, as Euclid's Elements. Wolf. Phil. Rat. § 3. c. 1. § 744, 750, 751, &c.

BOOKS, *Pontifical*, among the Romans, were thoſe appointed by Numa to be kept by the *pontifex maximus*; deſcribing all the ceremonies, ſacrifices, feaſts, prayers, and other religious matters, with the manner, and circumſtances, wherewith each was to be celebrated: theſe were alſo called *indigitamenta*, as containing the names of all the gods, and the occaſions, and *formulæ* of invoking each. Liv. 1. p. 23.

BOOKS, *Ritual*, thoſe which directed the order and manner of founding, building, and conſecrating cities, temples, and altars; the ceremonies belonging to walls, gates, tribes, *curiæ*, camps, and the like.

BOOKS, *Augural*, called by Cicero, *reconditi*, were thoſe wherein the ſcience of foretelling futurity from the flight and chattering of birds was contained. Cicer. Orat. pro domo ſua ad pontif. Serv. ad Æn. l. 5. v. 738. Lomei de Bibl. c. 6.

BOOKS, *Aruſpicine*, thoſe wherein the myſteries of divining from the entrails of victims were preſcribed.

BOOKS, *Acherontic*, thoſe wherein the ceremonies and diſcipline of Acheron were contained; ſometimes alſo called *libri Etruſci*, as being ſuppoſed to have been compoſed by Tages the Hetrurian, though others pretend, that he had received them from Jupiter himſelf: ſome ſuppoſe theſe to have been the ſame with the *libri fatales*; others, with the *libri aruſpicini*. Serv. ad Æn. l. 8. v. 398. Lomei, ubi ſupra.

BOOKS, *Fulgural*, thoſe written touching thunder, and lightning, and their interpretation. As that compoſed by the Tuſcan nymph Bigois, preſerved in the temple of Apollo. Serv. ad Æn. l 6. v. 72.

BOOKS, *Fatal*, thoſe wherein the ages, or terms of the life of men were written, according to the Hetrurian diſcipline. Theſe were conſulted by the Romans in all public calamities; and inſtructions taken from them, how to expiate the offended deities. Cenſor. de Die Natal. c 14.

BOOKS, *Black*, thoſe which treat of necromancy and witchcraft; or thoſe which are printed in the old black letter, the Celtic character, now only retained by the Germans. The ſame denomination is alſo given to ſome other *books*, on account of the colour of their backs, or the diſmalneſs of their contents; whence alſo *Red book*, and *Domeſday book*.

BOOKS, *Good*, in the common uſage, are thoſe of devotion and piety; as ſoliloquies, meditations, prayers, &c.—Vid. Shafteſb. Charact. tom i. p. 165. Item, tom. iii. p. 327.

A *good book*, in the bookſellers language, is a ſaleable one; in the language of the curious, a ſcarce one; in that of men of ſenſe, an uſeful and inſtructive one.

Among five principal things which Rabbi Akiba recommended to his ſon, one was, that if he ſtudied the law, he ſhould take care to do it in a *good book*, leſt he ſhould be obliged to unlearn all again.—Vid. Cren. de Furib. Librar. See alſo, further on, the head of judging and chooſing of BOOKS.

BOOKS, *Spiritual*, thoſe which treat more expreſly of the ſpiritual or chriſtian life, and their exerciſes, as contemplation, &c.

BOOKS, *Profane*, ſuch as do not treat of matters of religion.

BOOKS, with regard to their authors, may be divided into *anonymous*, thoſe without any author's name; *cryptonymous*, thoſe whoſe authors names are concealed in ſome anagram, or the like; *pſeudonymous*, thoſe which bear falſe names of authors; *poſthumous*, thoſe publiſhed after the author's death; *genuine*, thoſe really written by the perſons whom they pretend for their authors, and ſtill remaining in the ſtate wherein they were left by them; *ſpurious*, or *ſuppoſititious*, thoſe pretending to be written by others than their real authors; *interpolated*, thoſe which ſince their compoſition have been corrupted by ſpurious additions, or inſertions.

BOOKS, with regard to their qualities, may be divided into *clear* or *perſpicuous*, which, in the dogmatical kind, are thoſe where the authors define all their terms accurately, and keep ſtrictly to thoſe definitions in the courſe of their works: *obſcure*, thoſe where words are uſed vaguely, and without defining: *prolix*, thoſe which contain more things than were neceſſary to the author's deſign; as if, in a *book* of ſurveying, a man ſhould give all Euclid: *uſeful*, thoſe which deliver things neceſſary to be known, either in other ſciences, or in the buſineſs of life: *complete*, thoſe which contain all that is known concerning the ſubject: *relatively complete*, thoſe which contain all that was known concerning the ſubject, at a certain time; or, if a *book* were written with any particular deſign, or view, it may be ſaid to be *complete*, if it contain neither more nor leſs than is neceſſary for the accompliſhing that end: in the contrary caſes, *books* are ſaid to be *incomplete*.

BOOKS, with regard to the matter they conſiſt of, may be divided into *Paper-books*, thoſe written either on linen and cotton paper, or on the PAPYRUS, of which laſt kind few are now remaining. Montfaucon Pal. Græc. l. 1. c. 2. p 13.—*Parchment-books*, *libri in membrana*, thoſe written on ſkins, or pelts, chiefly of ſheep.—*Linen-books*, *libri lintei*, among the Romans, were thoſe written on blocks, or tables, covered with a linen cloth. Such were the Sibylline *books*, and divers ancient laws, epiſtles of princes, leagues, annals, &c. Plin. Hiſt. Nat. l. 13. c. 2.—*Leathern-books*, *libri in corio*, mentioned by Ulpian, are by Guilandinus taken for ſuch as were written on barks, different from that uſually written on; which was the *tilia*: by Scaliger, with more probability, for ſuch as were written on certain ſkins, or certain parts of ſkins, different from thoſe commonly uſed, which were the pelts, or back-parts of ſheep. Ulp. l. 52. Guiland Papyr Membr. 3. n 50. Scaliger, ad Guiland.—*Black-books*, *libri in ſchedis*, thoſe written on wooden planks, or tablets, ſmoothed for that purpoſe with an *aſcia*, and a plane. Such were the ordinary *books* among the Romans.—*Waxen-books*, *libri in ceris*, mentioned by Pliny, have occaſioned ſome diſpute.

Herm. Barbarus ſuſpects the term to be a corruption, and inclines to read *in ſchedis* inſtead of *in ceris*, on the authority of ſome ancient MSS. Others ſee no need of the emendation, ſince it is known the Romans ſometimes covered their planks, or *ſchedæ*, with a thin ſkin of wax, to make them ſuſceptible of eraſements, and amendments, which the *libri in ſchedis* were not, and conſequently, were leſs fit for works that required elegance and accuracy than the waxen ones, which are alſo called *ceræ*, or *libri cerei*.—*Elephantine-books*, according to Turnebus, were thoſe written on thin ſlices, or leaves of ivory; according to Scaliger, thoſe made of the guts of elephants; according to others, thoſe wherein the acts of the ſenate, relating to the emperors, were written; according to others, certain huge, or bulky *books*, conſiſting of 35 volumes, containing all the names of the 35 tribes. Salmuth. ad. Panciroll. P. 2. p. 255. Guiland. Pap. Mem. 2. n. 48. Scal. ad. Guil. p. 16. Calv. Lex Jur. p 534. Fabr. Deſcrip. urb. c. 6.

Books, with regard to their manufacture and commerce, may be divided into *Manuſcript*, thoſe written with the hand, whether originally by the authors, called *autographs*, or at ſecond hand by *librarii*, or *copiſts*.—*Printed*, thoſe wrought off from the preſs.—*Books in quires*, or *ſheets*, thoſe not bound, or ſtitched.—*Books in folio*, thoſe wherein a ſheet is folded but once, or makes two leaves, or four pages: *books in* 4°, where it makes four leaves; *in* 8°, where eight; *in duodecimo*, where twelve; *in* 16°, where ſixteen; *in* 24°, where twenty-four.

Books, with regard to circumſtances and accidents, may be divided into *Loſt*, thoſe which have periſhed by the injuries of time, or the malice or zeal of enemies. Such are divers even of the ancient *books* of Scripture, written by Solomon, and others of the prophets. Fabr. Cod. Pſeud. Vet. Teſt. t. ii. p. 171. p. 247.—*Books Promiſed*, thoſe which authors have given expectations of, which they have never accompliſhed.—Janſ. ab Almeloveen has given a Bibliotheca of *books* promiſed, but ſtill latent, or not publiſhed.—*Books Fictitious*, thoſe which never exiſted: to which may be added, divers feigned titles of *books*. Loeſcher has publiſhed a great number of plans, or projects of *books*, many of them good and uſeful enough, if there were but *books* written correſponding to them. M. Dugono has a whole volume of *ſchemes*, or *projects of books*, containing no leſs than 3000.

Books *in Ana*, *Anti*, *&c.* See Ana, Anti, &c.

The *ſcope* or *deſign* of *books* is various; that of ſome is, to trace the origin of things diſcovered; of others, to fix and eſtabliſh ſome truth, or raiſe ſome doctrine to a higher pitch of ſubtility; of others, to remove ſome ſcruple, or prejudice, which had before obtained, or fix more accurate and preciſe ideas of things; of others, to explain the names and words uſed in different nations, ages, and ſects; of others, to improve our knowlege of facts, and events, and ſhew the order and ways of Providence: laſtly, others aim at divers, or all of theſe ends.

The *uſes* of *books* are numerous: they make one of the chief inſtruments, or means of acquiring knowlege: they are the repoſitories of laws, and the vehicles of learning of every kind: our religion itſelf is founded on books: "Without them," ſays Bartholin, "God is ſilent, "juſtice dormant, phyſic at a ſtand, philoſophy lame, "letters dumb, and all things involved in Cimmerian "darkneſs." De Libr. Legend. Diſſ. 1. p. 5.

The eulogiums which have been beſtowed on *books* are infinite: they are repreſented, "as the refuge of truth, "which is baniſhed out of converſation; as ſtanding "counſellors, and preachers, always at hand, and al-"ways diſintereſted; having this advantage over oral "inſtructors, that they are ready to repeat their leſſon, "as oft as we pleaſe."—*Books* ſupply the want of maſters, and even, in ſome meaſure, the want of genius and invention; and can raiſe the dulleſt perſons, who have memory, above the level of the brighteſt, without them.

An author, who wrote not inelegantly, though in a barbarous age, ſums up all their praiſes. Vid. Lucas de Penna ap. Morhoff Polyhiſt. lib. i. cap. 3. p. 27. *Liber eſt lumen cordis, ſpeculum corporis, virtutum magiſter, vitiorum depulſor, corona prudentum, comes itineris, domeſticus amicus, congerro tacentis, collega & conſiliarius præſidentis, myrothecium eloquentiæ, hortus plenus fructibus, pratum floribus diſtinctum, memoriæ penus, vita recordationis; vocatus properat, juſſus feſtinat, ſemper præſto eſt, nunquam non morigerus, rogatus confeſtim reſpondet: arcana revelat, obſcura illuſtrat, ambigua certiorat, perplexa reſolvit, contra adverſam fortunam defenſor, ſecundæ moderator, opes adauget, jacturam propulſat, &c.*

Perhaps their greateſt glory is, the affection borne them by many of the greateſt men in all ages: M. Cato, the elder Pliny, the emperor Julian, and others, are on record for an exceſſive devotion to *books*. The laſt has perpetuated his paſſion by ſome Greek epigrams in their praiſe. Richard Bury, biſhop of Durham, and lord chancellor of England, has a treatiſe expreſs on the Love of *Books*. Philobiblion, ſive de Amore Librorum. Vid. Plin. Epiſt. vii. lib. iii.—Cato's attachment to *books* may be obſerved in the following paragraph.

M. Catonem vidi in bibliotheca ſedentem multis circumfuſum Stoicorum libris. Erat enim, ut ſcis, in eo inexhauſta aviditas legendi, nec ſatiari poterat: quippe qui, ne reprehenſionem vulgi inanem reformidans, in ipſa curia ſoleret legere, ſæpe dum ſenatus cogeretur, nihil operæ reipublicæ detrahens. Vid. Cic. de Divin. lib. iii. n. 11. See alſo Cic. Orat. pro Arch. tom. iv. p. 2182.

The *ill effects* objected to *books* are, that they employ too much of our time and attention; engage us in purſuits of no uſe to the commonwealth, and indiſpoſe us for the functions of civil life; that they render men lazy, and prevent their exerting their own talents, by furniſhing them, on every occaſion, with things of the growth of others; and that our natural lights become weakened and extinguiſhed, by inuring ourſelves to ſee only with foreign lights: beſides, that ill men are hereby furniſhed with means of poiſoning the people, and propagating ſuperſtition, immorality, enthuſiaſm, or irreligion, which will always ſpread faſter, and be received more greedily than leſſons of truth and virtue.—Many other things are added concerning the emptineſs of *books*, and the errors, fables, and follies they are fraught with; which, together with the multitude and perplexity of them, are ſuch, that it may ſeem eaſier to diſcover truth in the nature and reaſon of things, than in the uncertainty and confuſion of *books*.—Add, that *books* have turned the other inſtruments of knowlege out of doors, as experiments, obſervations, furnaces, and the like, without which the natural ſciences can never be cultivated to purpoſe; and that, in mathematics, *books* have ſo far ſuperſeded the exerciſe of invention, that the generality of mathematicians are now contented to learn the ſolution of problems from others; which is to relinquiſh the chief end of their ſcience: ſince what is contained in mathematical *books* is properly the hiſtory only of mathematics, not the ſcience, art, or talent of ſolving queſtions; which is hardly to be had from *books*, but only from nature and meditation.

For the art of *writing* or *compoſing books*, we have much fewer helps and inſtructions than for the art of ſpeaking; though the former be the more difficult of the two; as a reader is not ſo eaſy to be impoſed upon, but has better opportunities of detecting faults than a hearer.—A great cardinal, indeed, reduces an author's buſineſs to a few heads; were they but as eaſily practiſed as preſcribed: "Let him conſider who it is writes, what, how, why, "and to whom." Auguſt. Valer. di Caut. in edend. lib.

The conditions required in a book are, according to Salden, "Solidity, perſpicuity, and brevity:" the firſt will be beſt attained, by keeping the piece long by us, often reviewing and correcting it by the advice of friends: the *ſecond*, by diſpoſing the ſentiments in a due order, and delivering them under proper and uſual expreſſions: the *third*, by throwing every thing aſide that does not immediately concern the ſubject.

Were theſe rules obſerved, it would ſcarce be poſſible for any, except an angel from heaven, to write many *books*. *Vix totidem quot Thebarum portæ vel divitiis oſtia Nili.*

The cuſtom is much altered ſince the times of the ancients, who carried their ſcrupulouſneſs in what relates to the compoſition of *books* beyond all that has been above expreſſed: ſo auguſt was the idea they formed of a *book*, that nothing would ſuffice leſs than its being a treaſure: *theſauros oportet eſſe, non libros*: no labour, no aſſiduity and exactneſs, were thought enough to fit a work for the public view: every ſentiment and expreſſion were to be maturely weighed, and turned on all ſides; and not ſuffered to paſs, unleſs every word were a pearl, and every page beſet with gems. So that they put the reader in poſſeſſion in a ſingle hour, of what had coſt them perhaps ten years intenſe thought and application.—Such were thoſe *books*, which were reputed *cedro digni*, fit to be anointed with cedar-juice, and thus rendered incorruptible, for the inſtruction of all future ages.

Books, *for the origin of*, we have nothing that is clear: the *books* of Moſes are doubtleſs the oldeſt of all that are extant: but there were *books* before them, for Moſes cites ſeveral.

A *book* of Enoch is cited in the Epiſtle of Jude, v. 14, and 15. from which ſome endeavour to prove the reality of antediluvian writings; but the *book* cited by that apoſtle is generally allowed both by ancient and modern writers to be ſpurious.

Of profane *books*, the oldeſt extant are Homer's poems, which were even ſo in the time of Sextus Empiricus; though we find mention in Greek writers of about ſeventy others prior to Homer; as Hermes, Orpheus, Daphne, Horus, Linus, Muſæus, Palamedes, Zoroaſter, &

&c. but of the greater part of theſe, there is not the leaſt fragment remaining; and of the others, the pieces which go under their names are generally held by the learned ſuppoſititious.—F. Hardouin goes farther; charging all the ancient *books*, both Greek and Latin, except Cicero, Pliny, Virgil's Georgics, Horace's Satires and Epiſtles, Herodotus, and Homer, as ſpurious, and forged in the thirteenth century, by a club of perſons under the direction of one Severus Arcontius. Fabr. Bib. Græc. lib. i. cap. 1. § 1. § 6. tom. i. Hardouin. de Num. Herod. in Proluſ. Act. Erud. Lipſ. an. 1710, p. 70.

Among the Greeks, it is to be obſerved, the oldeſt *books* were in verſe, which was prior to proſe: Herodotus's hiſtory is the oldeſt book extant of the proſaic kind. Strabo, Geog. lib. i. Heuman. Via ad Hiſt. Liter. § 20. p. 50. § 21. p. 52.

Books, *the multitude of*, has been long complained of: the complaint is as old as Solomon, who lived three thouſand years ago: they are grown too numerous, not only to procure and read, but to ſee, to learn the names of, or even to number. England has more to fear on this ſcore than other countries; ſince, beſides our own produce, we have, for ſome years paſt, drained our neighbours. However, as biſhop Caramuel's ſcheme miſcarried, which was, to write about an hundred volumes in folio, and then prevail on the civil and military powers to oblige all their ſubjects to read them, we need not much regret the multitude of *books*.

In reality, there are few of the immenſe number of *books*, which deſerve ſeriouſly to be ſtudied: for the reſt, part of them, like this, are only to be occaſionally conſulted, and the reſt read for amuſement. A mathematician, for inſtance, ought not to be entirely ignorant of what is contained in the mathematical *books*; but then a general knowledge is ſufficient, which may eaſily be had by running over the chief authors; out of whom references may be made, directing to the places where they may be found, when wanted. For there are many things which are much better preſerved in *books* than in the memory: as aſtronomical obſervations, tables, rules, theorems, proportions, and, in fine, whatever does not ſpontaneouſly adhere to the memory, when once known. For the leſs we croud that faculty, the readier and freer will the genius remain for inventing.

Thus, a few *books* well choſen, and thoroughly ſtudied, may ſuffice. It may be added, that as knowledge is naturally advantageous, and as every man ought to be in the way of information, even a ſuperfluity of *books* is not without its uſe, ſince hereby they are brought to obtrude themſelves on us, and engage us when we had leaſt deſign.—This advantage, an ancient father obſerves, we owe to the multiplicity of *books* on the ſame ſubject, that one falls in the way of one man, and another beſt ſuits the level, or the apprehenſion, of another.—"Every "thing that is written, ſays he, does not come into the "hands of all perſons: perhaps ſome may meet with "my *books*, who may hear nothing of others which have "treated better of the ſame ſubject. It is of ſervice, "therefore, that the ſame queſtions be handled by ſe"veral perſons, and after different methods, though all "on the ſame principles, that the explications of diffi"culties, and arguments for the truth, may come to the "knowledge of every one, by one way or other."—Add, that the multitude is the only ſecurity againſt the total loſs, or deſtruction of *books*: it is this that has preſerved them againſt the injuries of time, the rage of tyrants, the zeal of proſecutors, and the ravages of barbarians; and handed them down, through long intervals of darkneſs, and ignorance, ſafe to our days. *Solaque non norunt hæc monumenta mori.* Bac. de Augm. Sc. lib. i. Auguſt. de Trin. lib. i. cap. 3. Barthol. lib. cit. Diſſ. i. p. 8. &c.

To *judge of a book*, thoſe who have treated of the ſubject, direct us to obſerve the title, the author's or editor's name, the number of the edition, the place where, and year when it was printed (which in old *books* is frequently marked at the end) and the printer's name, eſpecially if it be a celebrated one: proceed then to the preface, and look for the author's deſign, and the occaſion of his writing: conſider alſo his country (each nation having its peculiar genius), which may ſometimes be learned from the dedication: if his life be annexed, run it over, and note his profeſſion, what rank he was of, and any thing remarkable that attended his education, ſtudies, converſation, or correſpondences with learned men: not forgetting the elogies which have been given the author, which often occur at the beginning, or even any critique or cenſure, eſpecially if made by a man of judgment. If the preface does not give an account of the method of the work, run briefly over the order and diſpoſition of it, and note what points the author has handled; obſerve whether the things and ſentiments he produces be trite and vulgar, or ſolid, and fetched from greater depths. Note, whether he go in the common road, or make any innovation, and introduce any new principle.

But it is a ſmall number of *books*, we have opportunity of thus judging of, by peruſing them; beſides, when we have read a *book* over, the judgment comes too late for many purpoſes: it ſeems neceſſary therefore to have other indications, whereby to prevent our being at the charge of procuring, or the pains of peruſing a worthleſs *book*. Divers rules of this kind are given by Baillet, Struvius, Stollius, and others; which though, in reality, no more than preſumptions, and frequently liable to be falſified, are not without their uſe. The journaliſts de Trevoux objected to them all: "The ſhorteſt way, ſay "they, to judge of a *book* is to read it, if you be quali"fied in the ſubject; otherwiſe to refer yourſelf to thoſe "who are ſo." Heuman is ſomewhat more explicit; making it a mark that "a *book* is good, when it is "eſteemed by perſons intelligent in the ſubject it treats "of; and when thoſe who commend it receive no "advantage from the applauſe they beſtow on it, nor "are leagued with the author in any cabal, for eſpouſ"ing any particular principle, ſyſtem, or party, in reli"gion or learning." Baillet. Jugem. des Sçav. tom. i. b. 2. p. 121. Struv. Introd. at Not. Rei Liter. cap. 5. § 3. p. 390. Stoll. Introd. Hiſt. Liter. P. i. § 11. p. 9. Budd. de Criteriis boni Libri, paſſim. Mem. de Trev. an. 1712. Art. 17. Heuman. Conſp. Reipubl. Liter. cap. vi. § 11. p. 280.

But more particularly, it is an indication that a *book* is good, 1. If the author be known to excel in that talent more immediately neceſſary for ſuch a ſubject; or have already publiſhed any thing on the ſame that is eſteemed. Thus we may conclude, that Julius Cæſar will teach us the art of war better than Peter Ramus; Cato, Palladius, and Columella, agriculture better than Ariſtotle; and Cicero, oratory better than M. Varro: add, that it is not enough the author be ſkilled in the faculty, but that he be ſo in the particular branches of it he treats of; ſome, for inſtance, excel in the civil law, yet not in the public law: Salmaſius proved himſelf an excellent critic in his Exercitat. Plinian. but was much inferior to Milton in his Defenſio Regia. 2. If the *book* be on a ſubject that requires great reading, it may be preſumed good, if the author hath a copious library, or can have acceſs to one; or if he lived in a place where *books* were not wanting; though here is danger too of running into exceſs in quotations; eſpecially, ſays Struvius, if the author be a lawyer. 3. A *book* which took up a long time in compoſing, cannot often fail of being good. 4. *Books* on points of doctrine by eclectic writers, are to be preſumed better than thoſe writ by the retainers to particular ſects. 5. The age of a writer may alſo give us ſome indication: *books*, which require labour, are uſually better performed by younger perſons, than thoſe who are far advanced in years. 6. Another indication may be taken from the author's ſtate and condition: thus hiſtory written by a perſon who was an eye-witneſs of what he relates, or is concerned in public affairs, or has acceſs to the public records, or other monuments, from whence intelligence may be drawn; who is not biaſſed by party, or any other indirect or ſiniſter motive, will be ſuppoſed to be good. Thus Salluſt and Cicero were well able to write the hiſtory of Catiline's conſpiracy. D'Avila, de Comines, Guicciardin, Clarendon, &c. were preſent in the civil wars they deſcribe: Xenophon, having an employment in the Spartan ſtate, has treated excellently of that commonwealth; and Amelot de la Houſſaye, by living long at Venice, was enabled to explain the ſecrets of their policy. Camden wrote annals of the affairs of his own time; Thuanus had correſpondence with the beſt writers in every country; and Puffendorf had acceſs to the public archives. So, in literary matters, we give credit to thoſe who have the direction of libraries. 7. The time or age wherein the author lived may give ſome light; every age having, according to Barclay, its peculiar genius and excellency. See Bartholin. Struv. Budd. Heuman. Baill. lib. cit.

Some judge by the bulk or ſize of *books*; following the grammarian Callimachus's rule, that every great *book* is of courſe an ill one, μεγα βιβλιον, μεγα κακον: a ſingle leaf of the Sibyl was doubtleſs preferable to the vaſt annals of Voluſius; yet Pliny's obſervation will nevertheleſs hold true, that "a good *book* is ſo much the better "by how much it is bigger." Plin. Epiſt. 20. lib. 1. Martial preſcribes a remedy againſt the largeneſs of a *book*, when that is the only complaint, read but a little of it,

Si nimius videar, ſeraque coronide longus
Eſſe liber, legito pauca, libellus ero.

Yet is the ſmallneſs of a *book* a real preſumption in its favour: he muſt be a poor author who cannot furniſh a pamphlet, or looſe ſheet, with things curious, and written with ſpirit: but to ſupport the ſame through a volume in folio, requires very extraordinary abilities indeed. Addiſ. in Spect. N°. 124.

See further concerning *books*, in the writers on literary hiſtory, libraries, ſtudies, learning, arts, and ſciences; more eſpecially in Salden, Bartholin, Hodannus, Sacchinus, Baillet, Buddeus, Saalbach, Putherbeus, Raynaud, Schufner, Lauffer, Schwartzius, Crenius, Morhoff, and others, who have written treatiſes expreſs concerning *books*.—Chriſt. The importation of *books* firſt printed in this kingdom, and reprinted abroad, is prohibited. Vid. Stat. 12 Geo. II. c. 36. § 1.

There was a clauſe in the ſtatute of the 8th of Q. Anne, ch. 19. impowering the chancellor, and ſome other great officers of ſtate, to ſet the price of *books*; but this is now repealed by 12 Geo. II. ch. 36. ſect. 2.

Books, *burning of*, was a kind of puniſhment much in uſe among the Romans, by legal ſentence: ſometimes the care of the execution was committed to *triumviri* appointed on purpoſe; ſometimes to the prætors, and ſometimes to the ædiles; Labienus, whom from his ſatirical ſpirit ſome have called *Rabienus*, is ſaid to have been the firſt who underwent the ſeverity of it. His enemies procured a *ſenatuſconſultum*, whereby all his *books*, publiſhed during ſeveral years, were ordered to be collected and burnt: "The thing (ſays Seneca) then appeared new "and ſtrange, to take revenge on learning!" *Res nova & inſueta! Supplicium de ſtudiis ſumi.* Caſſius Servius, a friend of Labienus, hearing the ſentence pronounced, cried aloud, "That they muſt burn him too, ſince he "had got all the *books* by heart:" *Nunc me vivum uri oportet, quia illos didici.* Labienus could not ſurvive his *books*, but ſhutting himſelf up in the tomb of his anceſtors, pined away, and was buried alive.

Divers other ancient teſtimonies concerning the burning of *books* are given in Reimm. Idea Syſt. Antiq. Liter. p. 389.

Books, *cenſors of*. See Censor.

Books, *privileges of*. See Privilege.

Book, *common place*. See Common-Place.

Book, *text*. See Text.

Book is alſo uſed for a part or diviſion of a volume, or large work.

In this ſenſe we ſay the *book* of Geneſis, the firſt *book* of Kings, the five *books* of Moſes, &c.—The Digeſt is contained in fifty *books*, the Code in twelve *books*.

Books are uſually ſubdivided into chapters, ſometimes into ſections, or paragraphs: accurate writers quote chapter and *book*.

Book is alſo uſed for a liſt or catalogue of perſons names.—Such among the ancients were the *cenſorial* books, being tables or regiſters containing the names of all thoſe who were cenſed or taxed under Auguſtus. Tertullian aſſures us, that our Saviour's name was found in the cenſorial *books* of Auguſtus. Adv. Marcion. lib. iv. cap. 7. See Census.

Books, in *Matters of Commerce*, denote the ſeveral regiſters wherein merchants and other dealers keep their accounts.

We ſay, ſuch a perſon's *books* are in good order: merchants cannot poſſibly do without *books*; they are even obliged by the laws to keep *books*. But more or fewer are required, according to the nature and extent of their dealings, or the preciſion and exactneſs they deſire therein.

The ancients had alſo their *books* of accounts; witneſs the *codex accepti & expenſi*, ſo often mentioned in Roman writers; and the *patrimonial books*, which were rentals, containing an account of the lands, goods, and chattels, and other effects belonging to each perſon.

Book-*Keeping*, the art of keeping accounts; that is, of recording the tranſactions of a perſon's affairs in ſuch a manner, that the true ſtate of any part, or of the whole, may be thereby known with the greateſt clearneſs, exactneſs, and eaſe.

By the *tranſactions of one's affairs* are meant, either ſuch as relate to the perſons with whom we deal, or the things in which we deal; which laſt are either money, the principal means of commerce, or goods, comprehending all other effects.

All authors agree, that the Italians, particularly thoſe of Venice, Genoa, and Florence, firſt introduced the method of *keeping books* double, or in two parts, probably about the middle of the fifteenth century; hence, among us, it is called *The Italian method:* though it was not introduced into England till a century later; the firſt *book* on this art having been publiſhed at London in 1569, by James Peele.—Stevin apprehends, that the art of *book-keeping*, by double entry, was known to the Romans, and originally received from the Greeks.

Books, *merchants*, may be generally divided into *eſſential* and *auxiliary*.—*Eſſential*, or *neceſſary*, are thoſe without which regular accounts cannot be kept; in which number ſome include the *journal*, *waſte-book*, and *ledger*; others only the two latter.—Vid. Malc. Treat. of Book-Keeping, ch. i. ſect. 2. p. 3.

Subſidiary or *auxiliary*, are ſeparate *books*, wherein particular accounts are kept more diſtinctly, for eaſing the ledger.—Such are the *caſh-book*, *debt-book*, *book of expences*, &c.

Theſe *books* are kept in the ſame manner, in effect, in moſt trading cities in Europe; but not as to coin: each being regulated by that ſort of coin which has courſe in the ſtate where they are.

In England, *books* are kept in *pounds*, *ſhillings*, and *pence*: in France, in *livres*, *ſols*, and *deniers*: in Holland, Flanders, Zealand, and Brabant, in *ponden*, pounds, *ſchellingen*, ſhillings, and *groſs*, *groot*; they alſo keep them in *guilders*, *ſtivers*, and *penningen*: at Dantzick, and in all Poland, in *rixdollars*, *groſs*, and *deniers*; they are likewiſe kept in *florins*, *groſs*, and *deniers*: through moſt parts of Germany, in *florins*, *cruitzers*, and *pennings*: at Hamburgh, in *marks*, *ſols*, and *deniers lubs*: at Liſbon, in *rees*: at Florence, in *gold crowns*, *ſols*, and *deniers*: in Spain, in *maravedis*; ſometimes in *rials*, or *pieces of eight*: at Meſſina, and through Sicily, in *ounces*, *tarins*, *grains*, and *piccolis*: at Venice, in *ducats*: in Muſcovy, in *rubles*, *altins*, and *grives*: through all the ſtates of the Grand Signior, in *piaſters*, *abouquels*, and *aſpers*.

Book, *waſte*, is the firſt, and moſt eſſential: in this, all kinds of matters are mixed together; no order but that of time being preſerved; it being a diurnal regiſter of occurrences in buſineſs, to be afterwards ſeparated and transferred into the others; ſo that this may be ſaid to contain the elements of all the reſt.—It may be kept two ways; the firſt, by entering things down ſimply as they happen; v. gr. *Bought of ſuch a one, ſold to ſuch a one, paid ſuch a one, lent ſo much, &c.* the ſecond, by entering at once, each article, debtor and creditor: this laſt is eſteemed the beſt; becauſe, forming a kind of little journal, it ſaves the keeping any other.

The *waſte-book* begins with the inventory of a merchant's effects and debts; the difference between theſe is what the merchant calls his neat ſtock; and contains a complete record of every tranſaction of his affairs, with all the circumſtances, in a plain narration of matter of fact; every tranſaction following another in the order of the dates.

This *book* is in reality a journal, or day-book; but that name being applied to another, the name *waſte-book* is given to this by way of diſtinction: though what relation the word *waſte* bears to the nature of this *book*, is not very obvious.—Some authors better call it the *memorial-book*, or *memorandum-book*, as its principal uſe is for taking memorandums.

Book, *journal*, or *Day*-**Book**, is that wherein the affairs of each day are entered orderly down, as they happen, from the *waſte-book*.—Each article in this *book* is to conſiſt of ſeven parts; viz. the date, debtor, creditor, ſum, quantity and quality, how payable, and the price.

The journal, ſo far as it differs from the *waſte-book*, is only a *book* of aid to the ledger.—There are two different methods of keeping it: in the firſt, which is that hitherto chiefly in uſe, the journal is a complete tranſcript of the *waſte-book*, in the ſame order of time, but in a different ſtile; becauſe the *waſte-book* expreſſes every tranſaction in a ſimple narration of what is done; whereas the *journal* diſtinguiſhes the debtors and creditors, as a preparation for the ledger; thus, when any tranſaction is to be transferred from the *waſte-book* into the *journal*, they examine it by the rules of the ledger, as if it were to be entered immediately there; and, finding the debtors and creditors to which it belongs, theſe are diſtinctly marked by their denominations of *debtor* and *creditor*, in the ſtile of the journal; at leaſt, the accounts that are debtors are expreſly ſo named; and by their being directly connected debtor to ſome other accounts, theſe are ſufficiently determined to be the creditors, though the word *creditor* be not written.

Model of an article in the Journal.

	l.	s.	d.
15th July, 1723. Wine Dr. *to* Caſh——*L.* 160 : — : — *Bought of* Duval, *ready Money*, 16 *Pipes of Burgundy, at* —— —— *L.* 10. —— ——	160	0	0

The other form of a journal, which Mr. Malcolm judges preferable in certain reſpects to the former, makes the journal a complete tranſcript of the waſte-book, without any alteration, leaving on the left ſide of every page a large margin, about a third part of the page; on which againſt every tranſaction, are to be written the names of the debtors and creditors of that tranſaction, with their titles of debtor and creditor, and ſums of money; obſerving, that where there are ſundry debtors or creditors to one creditor or debtor, they write their names next each other, and the name of the one correſponding debtor or creditor, againſt the total of the other ſums; by which means the balance and connexion appears at ſight. Then, when the tranſaction is transferred to the ledger, they write on this margin the numbers of the folios where the accounts ſtand in the ledger; for the purpoſes already mentioned in ſpeaking of the former method.

This *book* may be called either the *waſte-book*, or *journal*, being in reality both; not only as every *waſte-book* is a *journal*, but as there is here alſo that which diſtinguiſhes both a *waſte-book*, and a *journal*.

By an ordonnance of the year 1673, all traders in France, whether by wholeſale or retail, are obliged to keep a journal, containing all their affairs, debts, active and paſſive, bills of exchange, &c. For want of keeping this, and ſurrendering it on a failure, they are to be reputed fraudulent bankrupts, and ſubjected to the penalties thereof.

Ledger, or *Ledger*-Book, ſometimes alſo called the *great-book*, and the *poſt-book*, is a large volume, containing all the tranſactions of a man's affairs in ſuch order, as that thoſe belonging to every different ſubject lie together in one place; making ſo many diſtinct or ſeveral accounts. The ledger is only the waſte-book ſtill further digeſted; being extracted either immediately from it, or from the journal. It is uſually ruled in ſix columns. In it all the accounts diſperſed in the journal are drawn out and ſtated in debtor and creditor. To form each account, two pages are required oppoſite to each other; that on the left ſerving for debtor, the other for creditor: each article to conſiſt of five parts, or members; the date, the perſon whom we credit, or are credited by; the ſubject, i. e. the thing credited or indebted for; the page where it is found; and the ſum or amount of the article.—Two inſtances, the one of an article of credit, the other of debt, will illuſtrate the form and uſe of this *book*.

Model of an article in debtor.

Model of an article in creditor.

		l.	s	d
Cr. *By* Caſh, *for his remittance on* James	*Fo.* 16.	1900	0	0

The management of the ledger being of great importance in accounts, we will ſubjoin from Mr. Malcolm the following caſes relating to it.

1. That for every diſtinct ſubject, with which you have an account (i. e. for every perſon with whom you deal on mutual truſt and credit, or who, by any means, becomes your debtor, or you his) as well as for every thing you deal in, there muſt be a certain ſeparate ſpace, or portion, allowed; wherein are to be written all, and only, the tranſactions relating to that ſubject, whoſe *Name* is to be inſcribed, or written on the head thereof; making thereby diſtinct particular accounts.

2. Every account is to be diſtinguiſhed into two parts, taking for each an equal portion (leſs or more, as you think fit) of right and left pages, of one *folio* or opening; the name of the ſubject being written on the head of the account, on both ſides, which are diſtinguiſhed by the words *debtor* on the left ſide, and *creditor* on the right, for the uſes following: to which the columns explained below are ſubſervient.

3. Every perſonal account to contain, on the debtor ſide, all the articles which that perſon owes you, and the payments you make of your debts to him: and, on the creditor ſide, all that you owe to him, and the payments he makes of his debts to you. Or, becauſe this rule conſiders payments under the notion of mutual oppoſite debts upon the receiver, if this be once ſuppoſed, the rule may be briefly expreſſed thus: every perſon is debtor for what he owes me, and creditor for what I owe him.

4. Every real account ought to contain, on the debtor ſide, the quantity and value of what was upon hand at the beginning of the account, and what was afterwards received, with all coſts and charges: and, on the creditor ſide, the quantity and value of what is diſpoſed of, or any way taken away, or gone out of it, with all the returns that ſubject makes me. Or, more briefly, thus: it is debtor for all received, firſt coſt and charges; and creditor for all gone out of it, with the returns.

5. Every tranſaction muſt be entered in the *ledger-book*, with a balance of debt and credit, i. e. ſo as that every article be placed on the debtor ſide of one account, and the creditor ſide of ſome other, making thereby equal debt and credit in the ledger; and where the perſonal and real accounts concerned in the tranſaction do not, in the articles belonging to them, make this balance (as they will in moſt caſes), then ſome imaginary account muſt be uſed to ſupply the defect.

6. Thoſe accounts, whoſe articles of debt and credit, in any tranſaction, balance one another, are, in the ledger, to be connected together in the ſtile of every article, as mutual and correſpondent debtors and creditors; by writing in each of the correſponding accounts the name of the other, after the particle *to* in the debtor's account, and *by* in the creditor's, which connects the two; the name of the account, in which the articles are written, with its quality of debtor and creditor, being underſtood as joined to, and ſo is read before the word *to*, or *by*, in every article (though it be written only once for all upon the head of the account.) Then, after the name of the correſponding creditor or debtor, follows a brief narration of the fact; the date and other numbers being placed in their proper columns.—Hence we find the uſe of the column that ſtands next to the money-columns, which is this, to write in it the number of the folio where ſtands the correſponding account, with which the account, in which you write, is connected in every article.

To facilitate the uſe of the ledger, there is an alphabet to ſerve as an index, or repertory, conſiſting of twenty-four leaves, each cut on the edge, and marked with one of the twenty-four letters; wherein the initial letters of the perſons names, with whom you have accompts, are inſerted, with the folio of the ledger, where the account is ſtated.

The more exact *book*-keepers extend the index to the things or commodities a man has dealings in, as well as the perſons he deals with. Generally, it is a letter of a man's ſurname, and the proper name of the thing, that directs its place in the index: thus John Gordon is put under G; and claret wine under C, unleſs all ſorts of wines be comprehended in one account, in which caſe it is put under W.

Book, *debt*, Book *of payments*, or *Bill*-Book, a *book* wherein is entered the day whereon all ſums fall due, whether to be paid, or received by bills of exchange, merchandizes, or otherwiſe: to the end that, by comparing receipts and payments, proviſion may be made, in time, of a fund for payment; by receiving bills, &c. due, or taking other precautions.

Two models will ſuffice for the uſe and form of this *book*: it is only to be obſerved, that, like the ledger, it muſt be on two oppoſite pages; moneys to be received on the left hand, thoſe to be paid on the right.

Book, *caſh*, is the moſt important of all the auxiliary ones: it is ſo called, becauſe it contains, in debtor and creditor, all the caſh that comes in, or goes out, of the merchant's ſtock.—In this are entered all the ſums received and paid daily; thoſe received on the left hand, with the perſon's name, of whom received, for what, for whom, and in what ſpecies: thoſe paid on the ſide of creditor; mentioning likewiſe the ſpecies, the reaſon why, the perſon to whom, and for whom, the payment is made.—For inſtance:

The better to conceive the nature of this *book*, it is to be obſerved, that in buſineſs, where caſh happens to be an account which has numerous articles, it is convenient to keep a particular account thereof, in a *book* diſtinct from the ledger; and for this reaſon called the *caſh-book*. This is formed, in all reſpects, like the caſh account in the ledger, with a debtor and creditor ſide; in which all the caſh received and given out is entered; either in a ſimple ſtile, or in that of the ledger: but which way ſoever the narration is made, every article muſt be duly entered on the oppoſite ſide of the correſponding account in the ledger; with a reference to the ledger account of caſh: for ſuch an account there muſt alſo be, into which the ſums of the debtor and creditor ſides of the particular account muſt be transferred once a week or month, as is found convenient: thus, in the *caſh-book*, the ſums being written down againſt them, write, transferred to the ledger, and mark the folio; and in the ledger account, enter the ſum with the date of the transfer, debtor *to*, and creditor *by*, ſundry accounts, as *per caſh-book*. The caſh account in the ledger is neceſſary for the balance of the whole; and the convenience of the ſeparate account of all the particulars is, that we have them all together, in one continued account: whereas, the rule of the ledger being not to allow more than one folio for one account, till that be filled up, the account might hereby lie in ſeveral different folios.

Book *of invoices*, a *book* to ſave the journal from the eraſures inevitable in taking accompts or invoices of the ſeveral goods received, ſent, or ſold; where it is neceſſary to be very particular, and to render thoſe invoices eaſier to find than they can be in the *waſte-book* or *journal*. The invoices here entered are to be thoſe of goods bought, and ſet to account of ſome other; thoſe of goods ſold by commiſſion; of goods ſent away to be ſold on our own account; and thoſe of goods ſold in partnerſhip, whereof we have the direction, or whereof others have the direction.

This *book* contains an account or invoice of all the goods which a perſon ſhips off, either for his own account, or for others in commiſſion, according to the bills of lading; with the whole charges till on board; every invoice following after another, in order as they happen.

The invoice *book* is only a copy of what is written in the *waſte-book*, in thoſe caſes.—After the date, the narration is to begin thus:—Shipped aboard the ſhip—A. B. maſter, bound for ——, the following goods; conſigned to—for my account, or by order, and the account of.—Or, it may be begun thus:—Invoice of goods ſhipped aboard—&c.

The deſign of this *book* is for the more ready finding out theſe invoices, than can be done in the *waſte-book*.

Book, *factor*, or *Book of Sales*, is an account of what a perſon receives to ſell in commiſſion for others, and of the diſpoſal thereof.—It is numbered and diſtinguiſhed into folios, like the ledger; on the left-hand ſide is written, in a plain narrative ſtile, an account of the goods received, with all charges: and, on the oppoſite ſide, an account of all the ſales and diſpoſals of thoſe goods.—So that this is only a copy of the employer's account of goods in the ledger, in the ſtile of the *waſte-book*. Where a perſon does little in commiſſion, a ſeparate *book* for this purpoſe is needleſs.

Book *of accounts current* is kept in the form of debtor and creditor, like the ledger; and ſerves for accounts ſent to correſpondents, to be regulated in concert with them, before they are entered in the ledger. This is properly a duplicate of the accounts current, kept to have recourſe to on occaſion.

Book *of commiſſions, orders*, or *advices*, is a *book*, in which are entered all the commiſſions, orders, and advices, which a perſon receives from his correſpondents. This ſhould have a broad margin for receiving the entry of remarks concerning their execution.

Book *of acceptances* is deſtined for the regiſtering all bills of exchange, notified by letters of advice from correſpondents; ſo that the merchants may know, when the bills are preſented, whether they have orders to accept them or not.—When they chooſe to decline accepting a bill, againſt the article thereof in the *book*, they put P, i. e. proteſt; that, on offering the bill, the bearer may be told he may proteſt it: on the contrary, if they accept it, they write againſt it an A; adding the date, or day of acceptance. And this, upon being transferred to the debt-*book*, is cancelled.

Book *of remittances* ſerves to regiſter bills of exchange, as they are remitted by correſpondents, to require the payment thereof.—If they be proteſted for want of acceptance, and returned to thoſe who remitted them, mention is made thereof againſt each article, by adding a P in the margin, and the date of the day when they were returned, then cancelled.

The *books* of acceptances and remittances have ſo near a relation to each other, that many merchants, &c. make but one of the two, which they keep in the form of debtor and creditor; putting acceptances on the ſide of debt, and remittances on that of credit.

Book *of copies of letters*, ſerves to keep copies of letters, which a merchant writes to his correſpondents, that he may have recourſe to them, as occaſion requires.

Book *of expences*, a detail of the petty expences, both domeſtic and mercantile; which at the end of each month are ſummed up, and make an article for the caſh-*book*.

This *book*, being a ſeparate account of all the expences of living, ſerves to keep both the profit and loſs account, and alſo the caſh-*book*, more diſtinct: the greater and more conſiderable articles are to be placed here particularly; but the ſeveral ſmall articles, of daily diſburſements, only in totals: though under what denominations, and how general or particular the articles of this *book* are to be made, muſt be left to every one's choice. All that is neceſſary to obſerve here is, that the caſh paid out, on ſuch accounts, muſt be carefully entered here; and thence, once a week or month, be transferred to the caſh-*book*, and to the profit and loſs account in the ledger; which is debtor to caſh for it.

Book *of numero's* or *wares* is kept for the eaſy knowledge of all the goods brought in, ſent out, or remaining in a warehouſe.—On the left-hand page are entered the quantity, quality, and number or mark, of the goods brought in; on the right, the diſcharge of the goods out of the warehouſe, againſt the reſpective articles of the firſt. Thus,

N° 1	*A bale of white pepper* —— *weighing*	400*lb.*
2	*A piece of crimſon damaſk* —— *ells*	63

March 1	*Sold to* Charles Mitchell.
Apr. 10	*Sent to* Nichols *of* Briſtol.

Book, *month*, is numbered in folios like the ledger, and divided into ſpaces, on the top of each of which are the names of the 12 months of the year; January, February, &c. allowing a whole folio, or what you pleaſe, to each month; and a different ſet of 12 ſpaces for every different year.—On the left-hand page enter the payments to be made to you, in that month; and on the right-hand page the payments you are to make. Make a column likewiſe on the left-hand of every page; in which, write the day of payment; and after this, the name of the debtor or creditor; and draw the ſum into the money-columns.

There are alſo *pocket memorandum-books*, publiſhed annually, digeſted into *weeks* and *days*, properly divided, for the clear and methodical entry of occaſional memorandums.

Book *of veſſels* is kept in the form of debtor and creditor; a particular account being kept for each veſſel. To the ſide of debtor, are put victualling, fitting out, wages, &c. To the ſide of creditor, are put every thing the veſſel has produced; whether by way of freight or otherwiſe. Laſtly, the total of each is entered in the journal, upon balancing the accounts of each veſſel.

Book *of workmen* is particularly in uſe among manufacturers, who have conſiderable works in their hands. It is kept in form of debtor and creditor for each workman employed. On the ſide of debt are put the matters given them to work; and on that of credit, the work they return.

Book *of cargo*, or *loading*, *livre de bord*, is kept by the clerk or purſer of a ſhip; wherein are entered all the goods aboard the veſſel, whether thoſe only for freight, or for ſale, or exchange; the whole according to the ſpecification in the maſter's bills of loading.

Book, *bank*. In cities, where there are public banks, or bankers, as at Venice, Amſterdam, Hamburgh, and London, a *book* is neceſſary wherein to keep an account of the ſums paid to, or received from the bank, or bankers.

Book, abſolutely uſed, denotes the waſte-book, ſometimes the journal, or day-book.

In this ſenſe it is, they ſay, I have put down ſuch a ſum in my *book*; you ſhall have an extract of my *book*, &c.

Book-keeping, though chiefly in uſe among merchants and great dealers, is yet applicable with advantage to perſons of all other conditions; as retailers, ſtewards, gentlemen of land-eſtates, &c. with this only difference, that the narrower their affairs and tranſactions are, the fewer *books* they need to keep, and *vice verſa.* The ſame ways of accounting, which in great and diffuſed trade prevent confuſion, by an artful and regular diſpoſing of things, if applied to mean and narrow dealings, will create confuſion, at leaſt will be attended with needleſs trouble; ſince a few things ſhew themſelves readily, and are examined by mere inſpection: ſuppoſing no other method but a waſte-book record; every corner whereof, in very ſmall dealings, the owner's eye is acquainted with, ſo that he can readily turn to what he wants: but this, in larger accounts, is impoſſible; which makes order, the ſtricteſt form, and much writing, abſolutely neceſſary.—Yet this one rule muſt be indiſpenſably obſerved in all caſes; viz. That a true and exact memorial of every thing belonging to the account be made, juſt as things occur; and if buſineſs increaſe, ſo that a nearer approach to the perfection of accounting be neceſſary, this will ſerve as a ground-work, on which you may raiſe the account to what form you pleaſe. But the leaſt a man can do, will be ſome part of the method explained under the article **Books**; of which all methods whatever are a part; as comprehending the greateſt ſimplicity in the waſte-book, and art in the ledger.

For a perſon in a ſingle ſtate, who has no buſineſs, but the receiving at certain times in the year a ſum of money, which he lays out again for his private and perſonal expences, a pocket-book is ſufficient.

For one in a married ſtate, whoſe fortune conſiſts alſo of money, as he has a greater variety of expences, he muſt be careful to keep an exact account of what caſh he receives and pays: and, to make this account more diſtinct and orderly, it will be beſt to keep the particulars of the payments in a ſeparate book, and, to bring them into a caſh-book once a week, in totals, digeſted under ſuch denominations as he thinks fit, as *bread*, *beer*, *fleſh*, *coals*, *candles*, &c.—Things thus brought into the caſh-account, may be again drawn into an abſtract, ſhewing the total of each kind of expences for every month, by dividing a page into twelve columns, with the names of the twelve months; and then in ſo many articles on the margin ſetting the names of the ſeveral heads of expences, and againſt each, under the reſpective month, the ſum of that kind of expences in that month; then will the ſum of the money in the columns under each month be the total expence of that month, and the aggregate of theſe ſums the year's expences.—For artificers, handicrafts-men, and the like, they may keep accounts of the expences of living, as above; but it will alſo be neceſſary to make a diſtinct account of the charges and profit of their buſineſs, which may eaſily be done, by an exact account of all they pay or owe for the materials and inſtruments of their work, with ſervants wages, and taxes upon their trade; and of all they receive or that is due for their work. They may conveniently keep accounts for the materials of their work, to ſatisfy them of the diſpoſal thereof, and to ſerve as a check on ſervants who have acceſs to thoſe things; and they muſt keep accounts for the perſons they deal with, both in buying and ſelling.—As for petty traders, who deal in ſome hundreds of trifling wares, and make ſales to the value of a farthing or halfpenny, theſe cannot pretend to keep orderly accounts; the beſt they can do is, to be careful that ſervants do not wrong them; for they have no account of goods; and if you aſk what of any kind remains with them, they muſt examine, if their memory fails.—Theſe can only have a caſh-account, which they are to charge once a week with the money received, and diſcharge for what they give out: it is not convenient that they ſhould touch the caſh-box or till, oftener than once a week, when it is compleated; but if they do, they muſt keep a ſeparate account of what they take out, to know what was received. Beſides which, they ſhould have a

Book, *Memorandum*, or *Day*-**Book**, wherein all things delivered on credit are to be entered, and from thence transferred to a ledger; in which an account is opened for every debtor or creditor, with a debt and credit both on one ſide with a double money column.

As for more conſiderable ſhop-keepers, who commonly deal in only a few different ſpecies of goods, as drapers, mercers, &c. they uſually keep a ledger for perſons and wares diſtinct, without any formal connection or reference of the accounts, in their ſeveral articles; whereby there can no regular balance be made. In the accounts of perſons, they uſe the formality of a debtor and creditor ſtyle, which is mere ſhew, without the real value of a regular account; there being no oppoſite correſponding debtors and creditors to be found. For their ledger of wares, as they call it, contains nothing of this; and is but an imperfect contrivance, which they ſatisfy themſelves with, to know how much remains. But the worſt is, that in allotting ſpaces for the accounts of wares, they frequently allow no more than they ſuppoſe may ſerve for the retail of the quantity firſt entered on that ſpace; and when this is diſpoſed of, take a new ſpace for a new parcel; which, in a quick trade, is not only troubleſome but confuſed, if there be any of the old parcels remaining; unleſs they carry it to the new account. In reality, dealers in retail, if conſiderable in their way, ought not to come ſhort of the utmoſt pitch of art: at leaſt, they ſhould keep three grand books, a *waſte*, *journal*, and *ledger*; unleſs they ſhall think fit to join the firſt two into one. The *waſte-book* is to contain every thing done in the ſhop, both what is ſold on truſt, and for caſh. This and the *journal* may be made in one, by marking the debtors and creditors on the margin, againſt every tranſaction of value. For the *ledger-book*, becauſe there are commonly many articles of debt to one of credit, on men's accounts with whom they deal, and many articles of credit for one of debt, upon account of wares, they may keep the debt and credit both on one ſide, by double money columns; in one of which let the debt, and in the other the credit be ſet.

For gentlemen of landed eſtates, the books neceſſary to be kept are, 1. A great *waſte-book*, containing a plain narrative of all things as they occur; as receits, and payments, every thing given and received; and, in ſhort, whatever is done relating to any thing or perſon they are concerned with: out of which are to be made up, 2. A *caſh-book*, containing in a plain narrative ſtyle, upon the debtor-ſide, all receits of money; and upon the creditor-ſide, all payments; and though there be ſeveral articles received or paid together belonging to the ſame account, which are entered particularly in the waſte, yet they may be ſet down here in a total ſum: for example, there is paid 26*l.* for divers pieces of houſhold furniture, all particularly mentioned in the *waſte-book*, yet in the *caſh-book* there needs no more than to ſay, *paid for houſhold furniture*, *&c.* 3. A book of accounts with tenants, where, in diſtinct places, every one's charge and diſcharge may be fairly written, without any great formality of ſtyle; and if it hath a ſhow of debtor and creditor ſide, it will be the more diſtinct: 4. A book of petty accounts with ſervants and workmen, &c. 5. A book of real accounts; containing an account of cattle, corn, and other ſtock or furniture, to know at all times what you have, and how it is diſpoſed of. If a gentleman advances no nearer to the artificial part of accounting, he muſt keep an account with every perſon, with whom he has dealings; which may be done in the ſame book with his tenants accounts, only allotting diſtinct parts for them; the laſt will take no great room compared with the other: theſe books of accounts muſt have indexes.

For factors or ſtewards on land-eſtates, a general *waſte-book* will be neceſſary, to contain all matters tranſacted, relating to their maſter's concerns, under their management. Out of which let them make a *caſh-book*, in the manner above directed; alſo a *book* of real accounts, that they may know what real effects, beſides money, they have the charge of, and how it is diſpoſed of; particularly the corn-rents, which have been delivered by the tenants, and put in the granaries under their charge, to be diſpoſed and given out according to order. Malcolm's Treat. of *Book-keeping*, Append. p. 7. 30.

Book *of Rates*, is a *Book* eſtabliſhed in parliament, ſhewing at what value goods, which pay POUNDAGE, are to be reckoned at the CUSTOM-houſe. See CUSTOM, DUTY, POUNDAGE, and TONNAGE.

The *book of rates* annexed to the act of TONNAGE and POUNDAGE made in the 12th year of king Charles II. is ſubſcribed with the hand of Sir Harbottle Grimſtone, then ſpeaker of the houſe of commons.—An additional *book of rates* of goods and merchandizes uſually imported, and not particularly rated in the former, with rules, orders, &c. is ſigned by Spencer Compton, Eſq. ſpeaker of the houſe of commons, 11 Geo. I. c. 7.

Book-binding, the art of ſewing together the ſheets of a *book*, and ſecuring them with a back, and ſtrong paſte-board ſides, covered with leather, &c.

Binding is diſtinguiſhed from *ſtitching*, as, in the latter, the leaves are only ſewed, without bands, or backs.

We ſay, French-*binding*, law-*binding*, marble-*binding*, *binding* in parchment, in ſheep, in calves leather, &c. alſo half-*binding*, wherein the leaves are generally left uncut, and only the back covered with leather, the paſte-board ſides being covered with marbled, or blue paper.

Dutch-*binding* is, where the backs are of vellum.—The Italians are ſtill contented to bind in a coarſe, thick paper, called *binding alla Ruſtica*, the inconvenience of which is its being liable to wear out without careful uſe.

Without doubt, the art of *binding* is almoſt as ancient as the ſcience of compoſing *books*; and both the one and the other followed immediately the firſt invention of letters. Whatever the matter might be, on which men firſt wrote, there was a neceſſity of uniting the ſeveral parts together; as well for the making them of one piece, as for the better preſerving them: hence the origin of *book-binding*.

According to Olympiodorus *(apud Phot.)* it was one Phillatius, a learned man at Athens, who firſt taught the uſe of a kind of glue, to faſten the ſeveral leaves together: on which account a ſtatue was erected to him.

Books, *the manner of binding in volumes*, i. e. of gluing the leaves together; that of rolling them on round pieces, or cylinders of wood, appears the moſt ancient; though that of binding them ſquare, and of ſewing ſeveral quires one over another, lays claim to conſiderable antiquity. The firſt of the two, which we call *Egyptian-binding*, held a long time after the age of Auguſtus; but it is now diſuſed, excepting in the Jewiſh ſynagogues, where they continue to write the *books* of the law on vellum ſewed together; making, as it were, only one long page, with two rollers, and their claſps of gold or ſilver, at each extremity.

The form now in uſe is the ſquare *binding*, which is ſaid to have been invented by one of the Attali, kings of Pergamus; to whom we likewiſe owe the manner of preparing parchment; called in Latin, from the name of his capital, *Pergamena*, or *Charta Pergamea*.

Books, *manner of binding*.—The firſt operation is to fold the ſheets according to the form, viz. into two for folios, four for quartos, eight for octavos, &c. which the workmen do with a ſlip of ivory or box, called a *folding-ſtick*: in this they are directed by the catch-words and ſignatures at the bottom of the pages. The leaves thus folded, and laid over each other in the order of the ſignatures, are beaten on a ſtone with a heavy *hammer*, to make them ſolid and ſmooth, and then preſſed. Being thus prepared, they are ſewed in a *ſewing-preſs*, upon pack-threads or cords, which are called *bands*, at a proper diſtance from each other, and in a convenient number; which is done by drawing a thread through the middle of each ſheet, and giving it a turn round each band, beginning with the firſt, and proceeding to the laſt. The common number of bands are ſix in folios, and five in quartos, octavos, &c. Sometimes they uſe a ſaw to make places for the bands, which are ſunk into the paper, ſo that the back of the book when bound is ſmooth, without any appearance of bands. After this the backs are glued, the ends of the bands being opened, and ſcraped with a knife, for the more convenient fixing the paſte-boards; then the back is turned with a hammer, the book being fixed in a preſs between boards, called *backing-boards*, in order to make a groove for admitting the paſte-boards. The boards being then applied, holes are made for drawing the bands through, the ſuperfluous ends being cut off, and the parts hammered ſmooth. Then the book is preſſed, in order for cutting; which is performed by a particular machine called a *plough*, to which is fixed a knife. After this the book is put into a preſs called a *cutting-preſs*, betwixt two boards, the one lying even with the preſs, for the knife to run upon; the other above it, for the knife to cut againſt. The book being cut, the paſte-boards are ſquared with a proper pair of iron ſhears; and it is then ready for ſprinkling, gilding, blacking, or marbling the leaves. The colours with which it is ſprinkled, are uſually vermilion, or ſap-green; which is done by a bruſh made with hog's briſtles, holding the bruſh in one hand, and moving the hair with the other.

In the French-*binding*, a *book* is put in parchment, i. e a ſlip of parchment is applied over the back, between each band, and the ends paſted on the inſide of each paſte-board. This preparation, called *indorſing*, ſeems peculiar to the French binders; who are enjoined by ordonnance to back their *books* with parchment, on the penalty of 30 livres, and the re-binding of the *book*: it is done in the preſs, where the back being grated to make the paſte take hold, the parchment is applied; and they afterwards add glue to fortify it.

Manner of gilding books on the edges.—The *book*, being put tight into the preſs, between two boards, is ſcraped with a knife called a *ſcraper*; and after that with another called a *ſmoother*, in order to take out all ſcratches. Being thus made ſmooth, they ſcrape a little yellow OCHRE upon the *book*, wet it with a little ſize-water, and rub it off with ſome clean ſhavings. The gilding-ſize is made with the white of an egg, mixed with water, and beat well together. The leaves being wetted with the ſize-water, with a bruſh, the gold is then laid upon it, and afterwards dried before the fire. When dried, it is burniſhed off with a dog's tooth ſet in a handle. Blacking the leaves is done with fine antimony, the leaves being wet, and the antimony rubbed upon them until quite dry, when it is burniſhed like the gold.

The head-band is now added; which is an ornament of thread or ſilk of two or three colours, placed at each extreme of the back, acroſs the leaves; and woven or twiſted, ſometimes about a ſingle, and ſometimes a double piece of rolled paper, or, what is more laſting, of glued pack-thread.

For the covers; the ſkins uſed undergo ſeveral preparations, which we ſhall explain, in calf, as being the leather moſt uſed; and as being that to which all the reſt, with a little variation, may be referred.—The calf-ſkin being moiſtened in water, is cut to the ſize of the *book*, and the thickneſs of the edges pared off on a marble ſtone kept for that purpoſe. The cover is next ſmeared over with paſte made of wheat-flour; then ſtretched over the paſte-board on the outſide, and doubled over the edges withinſide. They then *cord the book*, or *bind* it firmly between two boards, to make the cover ſtick the ſtronger to the paſte-boards, and the back; on the exact performance of which depends a great part of the truth and neatneſs of the *book*. The back is then warmed at the fire to ſoften the glue, and the leather of the back is rubbed down with a folding-ſtick or bodkin, to ſet and fix it cloſe to the back of the *book*. It is now ſet to dry; and when dry, uncorded: the *book* is then waſhed over with a little paſte and water, the edges and ſquares blacked with ink, and then ſprinkled fine with a bruſh, by ſtriking it either againſt the hand, or a ſtick; or with larger ſpots mixed with vitriol, which is called *marbling*. Two blank leaves on each ſide, are then to be paſted down to the cover; and when dry, the leaves are BURNISHED in the preſs, and the cover rolled on the edges.

The cover is now glazed twice with the white of an egg; it is then filleted, plain, or with gold; and at laſt poliſhed with a poliſhing iron, paſſed hot over the glazed colour.

If the *book* be required to be lettered, they paſte a piece of red morocco on the back, between the firſt and ſecond band, to receive the title in gold letters; and ſometimes a ſecond between the next bands underneath, to receive the number of the volume.

The plain *binding*, properly ſo called, is now complete; the gilding on the back and cover, as it makes a part of the *book-binder's* buſineſs among us (though, with the French, &c. it is a diſtinct profeſſion), we ſhall here ſubjoin.

Manner of gilding books on the backs and covers.—In ordinary *binding*, they gild little elſe but the backs, and the outward edges of the cover. On the backs are gilt the title of the *book*, &c. with flowers, roſes, knots, ſtars, &c. between the bands: on the covers are ſometimes added compartments, arms, &c. All theſe ornaments are made with each its ſeveral gilding-tool, engraved in *relievo*; either on the points of puncheons, as thoſe of letters, roſes, ſtars, &c. or around little cylinders of braſs, as the lines, embroideries, &c. The puncheons make their impreſſion by being preſſed flat down; and the cylinders by being rolled along by a handle, to which they are fitted on an iron ſtay, or axis.

To apply the gold, they glaze thoſe parts of the leather, whereon the tools are to be applied, three or four times with a liquor made of the whites of eggs diluted with water by means of a ſponge; and, when near dry, they ſlightly oil them, and then lay on pieces of leaf-gold, and on theſe apply the tools, with a careful even preſſure of the hand, or roll the cylinders, both the one and the other reaſonably hot. If the figures be large, and require a great *relievo*, as arms, &c. they are beat or preſſed down. The gilding thus finiſhed, they rub off the ſuperfluous gold, and poliſh the whole; the gloſs of which is greatly aſſiſted by a final preſſing between horns peculiar for the purpoſe.

Our *book-binders*, for gilding on rough leather, make uſe of reſin, dried and powdered, inſtead of whites of eggs; and the gold leaf, firſt cut to a proper ſize, is laid on a hot ſomewhat oiled ſtamp, and preſſed down: and thus the reſin melts only in thoſe parts where the hot ſtamp is applied and the gold fixes on it, whilſt the other parts of the leather remain rough as at firſt. Dr. Lewis's Com. Phil. Techn. p. 615. See **Gilding**.

Ahaſ. Fritſch, chancellor of the univerſity of Jena, has a diſſertation expreſs concerning **book-binders**, *De Bibliopegis*; wherein he treats of the laws preſcribed by theſe artificers, and the tax or price ſettled by the magiſtrate for *binding books*, of every ſort, in ſheep-ſkin, vellum, &c.—The rates fixed for *binding* in ſheep, throughout the electorate of Saxony, are, for large folios, 1 guilder or florin, 3 groſſes; common folio, 1 florin; large quarto, 12 groſſes; common quarto, 8 groſſes; large octavo, 5 groſſes; common octavo, 4 groſſes; duodecimo, 3 groſſes; ſedecimo, 2 groſſes.

Book-land. See **Bock**-*land*.

Book-seller, a profeſſed trader in *books*; whether he prints them himſelf, or procures them to be printed by others, for ſale.

Book-ſellers, among us, are the ſame with *bibliopolæ* among the ancients, whoſe office was diſtinct from that of *librarii*. Petty dealers, or venders of ſmall ware, like our publiſhers, were more particularly denominated *libelliones*. At Rome, the Argiletum was the mart of *books*, as Paul's Church-yard, or Fleet-ſtreet, and Paternoſter row, have been among us: whence that of Martial,

Argiletanas mavis habitare tabernas,
Cum tibi, parve liber, ſcrinia noſtra vacent.

Book-ſellers are a kind of agents, or curators in the republic of letters: in many places, they are ranked among the members of univerſities, and entitled to the privileges of ſtudents: as at Tubingen, Saliſburg, and Paris, where they have always been diſtinguiſhed from the vulgar and mechanical traders, and exempted from divers taxes and impoſitions laid on other companies.

Formerly, the offices of *book-ſellers* and printers were united in the ſame perſons. Labbe gives a liſt of learned *book-ſellers*; moſt of whom were alſo authors.—Of late days, *book-ſellers* have drawn their buſineſs into leſs compaſs, and leaving the labour of compoſing *books* to one ſet of perſons, and that of printing them to another, content themſelves with the gainful part; thus miniſtering to the republic of letters not with the head, or the hand, but the purſe only.

In this view, they have been very important and uſeful agents between authors and the public; and have contributed, in no ſmall degree, to the encouragement of genius and literary induſtry, and the ſpread of ſcience. There are few authors, who have undertaken the printing and publiſhing of any work likely to be tranſmitted to poſterity, without being connected with ſome *book-ſeller*, or *book-ſellers*, eminent in their profeſſion.

The fairs of Francfort and Leipſic are famous for the reſort of *book-ſellers*, not only from all parts of the empire, but Holland, Flanders, &c. They have each their ſhop or warehouſe, over which is inſcribed the name of ſome celebrated *book-ſeller* of former times; *officina Elzeviriana*, *Frobeniana*, *Morelliana*, *Janſoniaua*, &c.

An acquaintance with the *book-ſellers* marks or ſigns, frequently expreſſed on the title-pages of their *books*, is of ſome uſe; becauſe many *books*, eſpecially in the laſt century, have no other deſignation either of printer, *book-ſeller*, or even city.—The *anchor* is the mark of Raphelengius at Leyden; and the ſame with a *dolphin* twiſted round it, of the Manutii at Venice and Rome; the *Arion* denotes a *book* printed by Oporinus at Baſil; the *caduceus*, or *pegaſus*, by the Wecheliuſes at Paris and Francfort; the *cranes*, by Cramoiſy; the *compaſs*, by Plantin at Antwerp; the *fountain*, by Vaſcoſan at Paris; the *ſphere* in a balance, by Janſon or Blaew, at Amſterdam; the *lily*, by the Juntas at Venice, Florence, Lyons, and Rome; the *mulberry-tree*, by Morel at Paris; the *olive-tree*, by the Stephenſes at Paris and Geneva; and the Elzevirs at Amſterdam and Leyden; the *bird between two ſerpents*, by the Frobeniuſes at Baſil; the *truth*, by the Commelins at Heidelberg and Paris; the *Saturn*, by Colinæus; the *printing-preſs*, by Badius Aſcenſius, &c.

Chevillier ſhews, that the univerſity of Paris had formerly the ſole power of creating and appointing *book-ſellers*, who were to take an oath to the univerſity; and were reputed part of the academical body, and as ſuch entitled to the exemptions of the other members thereof. They were to give ſecurity to the univerſity for their behaviour, and produce atteſtations of their capacity for the diſcharge of their office: the univerſity alſo depoſed and expelled them at diſcretion: they were obliged to appear at all aſſemblies of the univerſity, when ſummoned, and aſſiſt at the public proceſſions thereof: they were obliged to lend their *books* to be read, or even copied by ſuch as were diſpoſed to borrow, on certain conditions, preſcribed by the univerſity. If they kept any *books* by them which were not correct, the univerſity puniſhed them: they were not allowed to buy any *book* of a ſtudent, without leave of the rector: nor were they allowed to gain above four *deniers* in a *livre*, by any copies ſold to the members of the univerſity. Every *book-ſeller* was obliged to have a catalogue of all his *books* hung up in the ſhop, with the prices, as rated by the univerſity: no *book-ſeller*, who had not taken the oaths to the univerſity, might ſell a book of above ten *ſols* value. Diſſ. de l'Orig. de l'Imprim. l. 4.

This ſtate laſted from the thirteenth century till the invention of printing, and even till the end of the fifteenth century; during which time there were only allowed twenty-four *book-ſellers*, two binders, two illuminers, and two ſworn *book*-writers, or copiſts.—But from that time the kings of France began to take cognizance of them: Lewis XI. thought fit to preſcribe ſome new regulations in 1467: under Francis I. the *book-ſellers* were brought wholly under the royal authority, and received ſtatutes from the king.

The chief ſcience of *book-ſellers*, is the knowlege of the titles, different editions, prices, and ſcarcity of *books*, without regard to their contents, or qualities, otherwiſe than as theſe affect the ſale of them.

Book-worm, is an inſect of the mite kind, which afterwards becomes a fly, bred from eggs depoſited in the month of Auguſt in *books*, eſpecially in the leaves neareſt the covers. It is not unlike the mite or **blatta** found in corn. When the time of its transformation approaches, the inſect ſeeks to get into the air, and eats every thing which it finds in its way, till it gets to the extremity of the *book*. The mixture of juice of wormwood and other bitter ingredients in their paſte, which is an expedient uſed by book-binders for this purpoſe, is no ſecurity to books againſt *book-worms*. The beſt and the only ſecurity is from mineral ſalts, which all inſects hate. For this purpoſe, book-binders ought to mix with the paſte employed in binding, the ſalt which is known under the name of **arcanum** *duplicatum*, alum, and vitriol; with this precaution, *books* may be perfectly guarded from all injury and inſult from this miſchievous little creature. We cannot take too much care to preſerve what only can tranſmit our knowlege to poſterity. M. Prediger, among other inſtructions to German book-binders, printed at Leipſic in 1741, recommends their making paſte of ſtarch, inſtead of flour: he wiſhes them to powder ſlightly the books, their covers, and the ſhelves on which they ſtand, with a mixture of powder of alum, and fine pepper; and is alſo of opinion, that in the months of March, July, and September, books ſhould be rubbed with a piece of woollen cloth ſteeped in powdered alum. Melanges D'Hiſt. Nat. tom. v. p. 296.

BOOKING, among *Merchants*, &c. the making an entry of any matter in the Journal. See **Book**, **Book-keeping**, and **Journal**.

BOOM, in the *Sea-language*, a long pole, wherewith they ſpread out the clue of the ſtudding-ſail, ſometimes alſo that of the main-ſail and fore-ſail, to make them broader, and receive more wind.

Booming of the ſails is never uſed but in quarter winds, or before a wind. By a wind, ſtudding ſails, and *booming* the ſails is not proper.

When a ſhip is ſaid to come *booming* towards us, it imports as much, as that ſhe comes with all the ſail ſhe can make.

Boom alſo denotes a pole with a buſh or baſket on the top, placed to direct ſhips how to ſteer into a channel; otherwiſe called a *beacon*.

Boom likewiſe is uſed, in *Marine Fortification*, to denote a cable or cables ſtretched athwart the mouth of a river, or harbour, with yards, top-maſts, battlings, or ſpars of wood, laſhed to it, and girded with iron hoops rivetted together, and nailed to the ſpars, to prevent an enemy's entering. Such a *boom* M. Chateau Renault had with diligence and art prepared at Vigo, for the defence of the plate fleet lying there in 1702; but how ſtrong ſoever, it was forced by Sir Thomas Hobſon. The cables of which the *boom* is formed, are bent to a pair of ſheet anchors on each ſide of the channel. Other cables are ſometimes faſtened to that within the *boom*, and bent to anchors laid down the ſtream; and theſe cables are prepared with ſpars like the other: where wood is ſcarce, the *boom* is prepared with old ropes, &c. and iron hoops; every part of it being well covered with pitch ſtrewed with gravel. The *boom* is generally ſo contrived, as to open at one end for the paſſage of veſſels.

BOOMITES, a term uſed by ſome authors to expreſs a kind of agate, of a very remarkable brightneſs and tranſparence, which repreſents the figures of ſhrubs, trees, moſſes, &c in the manner of the *dendrachates*, a common *mocho-ſtone*. This is however very different in the degree of tranſparence and brightneſs.

BOOMKIN. See BUMKIN.

BOOPHTHALMUS, derived from βȣς, *an ox*, and οφθαλμος, *eye*, *Ox-eye* STONE, in *Natural Hiſtory*, a name given by Scheuchzer to a peculiar AGATE, in which there frequently appear circles of conſiderable ſize, reſembling ſome large animal's eyes. The ground colour of the ſtone is grey, and the circles of a deep bluiſh black.

BOOPS, in *Zoology*, the name of a fiſh caught in the Mediterranean, and ſold at Naples, Meſſina, and Genoa. It is a ſmall fiſh, ſeldom exceeding five inches in length, and very remarkable for the largeneſs of its eyes; and a ſpecies of the SPARUS. It is of a rounded, not flat ſhape. and its ſcales are large. See *Tab. of Fiſh*, N° 56. Beſides this, which is the common ſpecies of the *boops*, there are two other kinds, the one commonly called BOUGE-*ravel*. The other a ſmall kind, not above three inches in length, and without ſcales. Its mouth is ſmall, and its eyes extremely large. Its tail is broad and thick. This, in the taſte and conſiſtence of its fleſh, no way differs from the common *boops*.

BOOPS is alſo the name of a ſpecies of the WHALE.

BOOK-*worm*, in *Natural Hiſtory*, a name given by Rumphius to the *ſolen lignorum*, a ſea-worm, which bores the bottoms of ſhips.

BOOT, a leathern cover or defence for the leg, uſed on horſe-back, both to keep the body more firm, and defend the part from the injuries of the weather.

Boots ſeem to have been called thus, from their reſemblance to a ſort of jacks, or leathern bottles, formerly in uſe, and called *bottæ*, in the old French *bouts*. Borel derives the name from the ancient French word *bot*, *a ſtump*, becauſe the *boot* gives the leg this appearance.

It is not long that the *boots* uſed on horſe-back have been called by this name. In the reign of Charles VII. of France, they were called *houſes*, *hoſe*.

The ancient monks uſually wore *boots*; that is, the denomination *bottæ*, or *botti*, was given to their buſkins.

The Chineſe had a kind of *boots* made of ſilk, or fine ſtuff, lined with cotton, a full inch thick, which they always wear at home and abroad.

There are alſo chirurgical *boots*, for the cure of *vari & valgi*, or crooked and diſtorted legs.

The *boot* was much uſed among the ancients, by the foot, as well as horſemen.

The *boot* is the ſame with what was called by the ancient Romans, *ocrea*; in middle-age writers, *greva*, *gamberia*, *bainberga*, *bembarga*, or *benberga*. Du-Cange Lat. Gloſſ.

The *boot* is ſaid to have been the invention of the Carians: it was at firſt made of leather, afterwards of braſs and iron, and was proof both againſt cuts and thruſts. It was from this that Homer calls the Greeks *brazen-booted*. Plin. Hiſt. Nat lib vii. cap. 56. Homer. Il. vii v. 41.

The *boot* only covered half the leg; ſome ſay only the right leg, which was more expoſed than the left, it being advanced forwards in an attack with the ſword; but in reality it appears to have been uſed on either leg, and ſometimes on both. Thoſe who fought with darts, or miſſive weapons, advanced the left leg foremoſt; ſo that this only was *booted*. Veget lib i. cap. 20. Pitiſc. Lex. Ant. tom. ii. p. 309. and Aquin. Lex. Mil. tom. ii. p. 102.

BOOTS, *Fiſhing*, are a thick ſtrong ſort, uſed in dragging ponds, and the like.—*Hunting-boots*, a thinner kind, uſed by ſportſmen.—*Jack-boots*, a kind of very ſtrong *boots*, uſed by the troopers.

BOOT, *brodequin*, is likewiſe a kind of torture for criminals; to extort a confeſſion, by means of a *boot*, ſtocking, or buſkin of parchment; which being put on the leg moiſt, and brought near the fire, in ſhrinking ſqueezes the leg violently, and occaſions intolerable pain.

There is alſo another kind of *boot*; conſiſting of four thick ſtrong boards bound round with cords: two of theſe are put between the criminal's legs, and the two others placed one on the outſide of one leg, and the other on the other; then, ſqueezing the legs againſt the boards by the cords, the criminal's bones are ſeverely pinched, or even broken, &c.

The *boot* is now diſuſed in England; but it ſubſiſts ſtill in ſome other countries.

BOOT-*houſing*. See HOUSING.

BOOT-*laſt*, a wooden cylindric inſtrument, uſed by ſhoemakers for widening the leg of a *boot*. It is ſlit in two parts, between which a wedge is driven when it is put into the *boot*.

BOOT-*topping*, in *Sea-language*, the act of cleaning the upper part of a ſhip's bottom, or that part which lies immediately under the ſurface of the water, and daubing it over with tallow, or with a coat or mixture of tallow, ſulphur, reſin, &c.

BOOTES, in *Aſtronomy*, a conſtellation of the northern hemiſphere, whoſe ſtars, in Ptolemy's catalogue, are 23; in Tycho's, 28; in Bayer's, 34; in Hevelius's, 52; and in Mr. Flamſtead's catalogue, 54. Their longitudes, latitudes, magnitudes, &c. are as follow:

Names and ſituations of the ſtars.	Bayer's Cha.	Signs	Longitud.			Latitude.			Magnitude.

This conſtellation is called by divers other names, as *Arctophylax*, *Bubulcus*, *Bubulus*, *Thegnis*, *Clamator*, *Vociferator*, *Piorans*, *Plauſtri-Cuſtos*, *Philometus*, *Arcas*, *Icarus*, *Lycaon*, and *Arcturus-Minor*; by others, *Septentrio*, *Lanceator*, *Ceginus*; by Heſychius, *Orion*; by others, *Canis-Latrans*; by the Arabs, *Aramech*, or *Arcamech*. Schiller, inſtead of *bootes*, makes the figure of St. Sylveſter; Schickhard, that of Nimrod; and Weigelius, the three Swediſh crowns. Wolf. Lex. Math. p. 266.

BOOTH, *Botha*, denotes a ſtall, or ſtanding in a fair or market: the term is alſo applied to any temporary ſtructure formed of boards and boughs, and deſigned for ſhade and ſhelter.

BOOTY, the moveables taken from an enemy in war.

Among the Greeks, the *booty* was divided in common among the army, the general only claiming a larger ſhare. By the military diſcipline of the Romans, ſpoils taken from the enemy belonged to the republic, particular perſons had no right to them. The generals who piqued themſelves on their probity, carried it wholly to the public treaſury. Sometimes, indeed, they divided it among the ſoldiery, to animate them, and ſerve in lieu of reward. But this diſtribution depended on the generals, who were to conduct themſelves herein with great equity and moderation; otherwiſe it became a crime of peculate to lay hands on the pillage, as regularly belonging only to the ſtate. The conſuls Romulius and Veturius, were condemned for having ſold the *booty* taken from the Æqui. Liv. lib. iii.

Among the Jews, the *booty* was divided equally between the army and the people, though under the kings a different kind of diſtribution obtained. Numb. xxxi. 27.

Among the Mahometans, two thirds of the ſpoils are allowed to the army; the other third to God, to Mahomet, and his relations, and to the orphans, the poor, and the pilgrims. Calmet. Dict. Bib. tom. i. p. 321.

Among us, formerly, the *booty* was ſometimes divided among the ſoldiery. If the general be in the field, every body takes what he can lay hold on: if the general be abſent, the *booty* is diſtributed among the ſoldiery, two parts being allowed to the cavalry, and one to the infantry. A captain is allowed ten ſhares, a lieutenant ſix, and a cornet four. See PRIZE.

BOQUINII, a ſort of ſacramentarians, who aſſerted that the body of Chriſt was preſent only in the euchariſt to thoſe for whom he died, that is the elect.

They took the denomination from one Boquinus, a Lutheran divine, who was one of the chief of the party.

BORA, in *Natural Hiſtory*, the name of the BUFONITE, in ſome authors; theſe are ſuppoſed by many to be real ſtones, but are truly the teeth of a fiſh.

BORAGO, in *Botany*. See BORRAGE.

BORAK, among *Mahometans*, a fabulous animal, ſuppoſed to be of a middle kind, between an aſs and a mule, whereon their prophet was carried in his nocturnal flight from Jeruſalem into the Heavens.

This animal the Arabs called *Al Borak*, q. d. *ſhining*. The night when the journey was performed is called *Leilat al Meerage*, i. e. *the night of aſcenſion*; and the flight itſelf *Al Meſra*; concerning which, there are a multitude of traditions.

BORAMETZ. See ZOOPHYTE.

BORASSUS, in *Botany*, the name of a genus of plants deſcribed by Linnæus, but not claſſed, and called in the Hortus Malabaricus *ampana*, and *carimpana*. The characters are theſe: the male and female flowers grow on ſeparate plants, and give the plant ſuch a different figure, that they are called by the two names before mentioned: the male being the *ampana*, and the female the *carimpana*. The male, or *ampana*, has for the cup of its flower the whole compound *ſpatha*, which is amentaceous and imbricated: the flower is divided into three ſegments, the petals being hollowed, and of an oval figure: the ſtamina are ſix thick filaments, and the *antheræ* are thick and ſtriated. In the female, the cup is the ſame as in the male, but the petals of the flower, which is divided into three parts, in the manner of the male, are very ſmall, of a roundiſh figure, and remain when the piſtil, &c. fall off. The germen of the piſtil is roundiſh; the ſtyles are three in number and ſmall, and the ſtigmata are ſimple: the fruit is a roundiſh obtuſe berry, of a rigid ſtructure, and containing only one cell: the ſeeds are three in number, and are of an oval compreſſed figure.

BORAX, a ſaline matter with all the properties of a neutral ſalt, chiefly uſed in ſoldering, and fuſing of metals; ſometimes alſo in medicine, as an emetic, and promoter of delivery.

The word *borax* is formed from the modern Greek, βορακιον, and this, probably, from the Arabic, *bauracon*, nitre, as being reputed a ſpecies of that ſalt.

The *borax* now uſed in Europe, is prepared or refined from the TINCAL that is brought from the Eaſt Indies. Dr. Lindolff thinks it might be made in Europe without tincal, by alum, ſoap, and a ſtrong alcaline lye. D. W. Linden thinks that Dr. Lindolff is well acquainted with the nature of *borax*, and that it might be made after his method; but that it would be too expenſive, and not ſuperſede the importation of tincal. He therefore recommends the ſour and acid water that comes out of coal mines, train oil, or any other fiſh oil, or indeed any fat that could be had cheap; the ſtrongeſt alkali of kelp; and all theſe ingredients to be worked in a liquid ſtate, till they are well mixed, and cryſtallize like a ſalt, which he thinks would anſwer all the ends of *borax*.

Borax is ſoluble with difficulty, in water, and cryſtallizable as alum, only that it requires more water for its ſolution, and retains leſs of it, in its cryſtallization. It ſuffers no decompoſition by fire; but may be decompoſed by vitriolic, nitrous, and marine acids, which unite with the ſaline alcaline matter that is its baſis, and form with it the ſame neutral ſalts exactly, as thoſe that are produced from the union of theſe acids with the marine alkali; i. e. the vitriolic acid forms Glauber's ſalt, the nitrous acid forms cubic nitre, and the marine acid forms ſea-ſalt. Acids thus combining with the baſis of *borax*, ſeparate from it a ſaline ſubſtance, ſingular and little underſtood, called SEDATIVE ſalt.

This was firſt diſcovered by Homberg, who obtained the ſedative ſalt by diſſolving it with vitriol; but the younger Lemery diſcovered that the ſame ſalt might be alſo obtained by the nitrous and marine acids: theſe chemiſts uſed, for this purpoſe, the embarraſſing and tedious operations of diſtillation and ſublimation; but Mr. Geoffroy has ſhewn the method of obtaining the ſame ſalt from *borax* by acids with evaporation and cryſtallization only, in greater quantity and with leſs trouble. He has alſo demonſtrated that *borax* contains the baſis of ſea-ſalt. M. Baron has ſhewn, that *borax* yields the ſedative ſalt by means of vegetable acids; and that the ſalt is a conſtituent part of the *borax* and only diſengaged from the alkaline matter with which it is united by the acids, and that it may be reunited with its alkali and again form *borax*. Macquer. Dict. Chem. and Mem. Acad. Sc. An. 1728, 1729, 1732.

Borax is uſually ſuppoſed to have been known to the ancients under the denomination *chryſocolla*: though Mr. Geoffroy gives good reaſons for believing the modern *borax* a different thing from the CHRYSOCOLLA of the ancients.

Pliny divides the ancient *borax* or *chryſocolla* into *natural* and *artificial*: the *natural*, according to him, is only a ſlimy humour running in mines of gold, ſilver, copper, and even lead; which, being congealed and hardened by the winter's cold, becomes of the conſiſtence of pumice-ſtone. See BAURAC.

For the *artificial*, it is made by letting water run in the veins of the mine, all the winter long, till June; and letting the mine dry the reſt of the year.—So that artificial *borax* is no more than the mineral putrified and corrupted.

The ſame naturaliſt diſtinguiſhes it into *black*, *green*, *yellow*, and *white*; which aſſume their ſeveral colours, as well as values, from the different mines wherein they are formed. The moderns alſo diſtinguiſh two kinds of *borax*; *natural*, which is crude; and *artificial*, which is purified and refined. Crude, or natural *borax*, *borace non rifatto*, is a mineral ſalt, dug out of the earth in ſeveral parts of Perſia; and found alſo at the bottom of a torrent, running in the mountains of Purbeth, near the frontiers of White Tartary: when taken up, it is expoſed to the air; where it acquires a reddiſh fatneſs, which ſerves to feed it, and prevent its calcining. When in its perfection, it is ſent to Amadayat, in the territories of the Great Mogul, where the European merchants buy it.

In thoſe places whence it is brought, it is ſaid that there oozes out of the ſides of the hills, containing metals, and particularly copper, a thick turbid water, of a bluiſh grey colour, and of a brackiſh bitter taſte. The courſe of this water is directed into wide and ſhallow pits, lined with a ſtiff clay; here it is left expoſed, in order to evaporate; and the grey fine mud left in its paſſage is daily mixed with it; till it acquires the conſiſtence of a ſoft pap; and then a large quantity of ſome animal fat melted over the fire is thrown into it, in the middle of a hot day: it is then well ſtirred, and covered with ſticks and branches of trees; and over theſe is laid a cruſt of any common clay. In this ſtate it is left, till it becomes quite dry: it is then ſifted, and what remains in the ſieves is ſent to us under the name of *rough borax*; however, it is not yet certainly known whether this matter be a natural or an artificial ſubſtance, nor whence, nor how it is obtained. Dict. Chem.

There is alſo another kind of natural *borax*, drier, and of a greeniſh colour, like Engliſh copperas; only differing from the former, by its being longer expoſed to the air.

For *artificial* or *refined borax*, *borace riſatto*, it was the Venetians who firſt found out the art of preparing it; or rather, of purifying the natural: it is ſaid to be done by diſſolving it in water; then filtrating and cryſtallizing it; uſing, for that purpoſe, cotton matches; about which the *borax* cryſtaliizes, like ſugar-candy and verdegris on wood.—The Dutch, who are now the only maſters of this manufacture, after refining it, reduce it into little pieces, like tagged points; and it is thus commonly uſed. It is ſaid to be refined by lime-water.

Borax, refined, either in the Dutch or Venetian manner, ſhould be clear and tranſparent, almoſt inſipid to the taſte; and above all, care muſt be taken it have no mixture of Engliſh alum. In this ſtate it conſiſts of large, white, eight-ſided cryſtals, each of which is compoſed of ſmall, ſoft, bitteriſh ſcales.

Borax is of great uſe in collecting the particles of any metal over the fire, and running them into a maſs; and this, with very little diminution of their weight. Dirt or aſhes, though in ever ſo ſmall a quantity, will certainly hinder ſome ſmall particles of gold or ſilver from running together into a maſs over the fire; but if they are ſo diſpoſed by a very ſtrong fire as to meet into a regulus, a great part of the metal will always adhere to the dirt that is thrown away. The leſs perfect metals not only ſuffer the above mentioned accidents, but their ſurfaces being greatly increaſed, copper and iron turn entirely into *ſcoriæ*, and are deſtroyed, and lead and tin are ſo in great part. It is therefore very detrimental when theſe baſer metals are mixed in any, even in ever ſo ſmall a quantity, with gold or ſilver; for in the melting, there come upon the ſurfaces, light *ſcoriæ*, in which part of the gold or ſilver are retained, as in the pores of a ſpunge, and prevented from running into a regulus.

To remedy this miſchief, *borax* is added, becauſe as it helps the melting of metals and of all bodies by fire, its bringing the whole maſs into a quick fuſion, gives the metals an opportunity to ſink together in a maſs to the bottom, and vitrifies the lighteſt *ſcoriæ*, throwing them off to the ſurface; and the uſe of this ſalt is not reſtrained to gold and ſilver, but takes place as well in regard to iron as copper.

This ſalt alſo cauſes metals to melt in a much leſs fire than they otherwiſe would, and is of very ſingular uſe in preſerving the leſs perfect metals while in fuſion. It flows over them, and covers their ſurface while tortured in the fire, as if it were with a kind of very thin glaſs, which defends them againſt the combined force of the fire and air, ſo deſtructive of the imperfect metals.

The aſſayers have a cuſtom of rubbing with *borax* the inſides of veſſels, in which the more precious metals are to be melted, which always fills up the ſmall cavities in their ſides, that might otherwiſe take in a part of the metals. When gold is melted with *borax* alone, it makes it pale; but this is obviated by the adding a ſmall quantity of nitre, or of *ſal ammoniac*. Care muſt be taken, however, not to add both theſe ſalts together, becauſe they would cauſe a detonation. The above mentioned uſe of *borax* has cauſed it to be reckoned, by ſome writers, among the reducing bodies; that is, ſuch bodies as reſtore metals, however deſtroyed, to their priſtine form: but this is an error; for *borax* does not reduce the deſtroyed metals, but only the ſcattered particles of them, while they yet retain their true metallic form.

Borax is alſo uſed by the dyers to give a gloſs to ſilks; in Italy by the ladies as a coſmetic; and in making GLAUBER's *ſalt*. See A. D. S. an. 1732. p. 398. H. 52.

A principal uſe of *borax* is to facilitate the ſoldering of metals, by accelerating the fuſion of the ſurfaces of the metals to be joined, and clearing them of any calx or other matter by which they might be prevented from being perfectly applied to each other.

Borax, in *Medicine*, is uſed to promote delivery. Med. Eſſ. Edinb. vol. i. p. 341.

The uſe of *borax* is that of an inciſive and aperient ſalt, by virtue of which it is effectual againſt diſeaſes which proceed from an inſpiſſation of the humours, and obſtructions thence ariſing. The doſe is a dram.

Its ſtimulus, however, is too weak to be depended upon for preſent relief in a difficult birth, unleſs it be joined with other ingredients of more efficacy. For this reaſon, *borax* is commonly given in powder mixed with ſaffron, myrrh, oil of cinnamon, caſtor, the volatile ſalt of amber, and the like.

Some adviſe a few grains of it to be taken in a poached egg, as a provocative to venery.

Borax calcined, is reckoned of ſpecific virtue in fluxes of the belly, or the *ſemen*, as being a kind of ſtyptic earth. The doſe is from a ſcruple to half a dram.

Borax is of ſome further uſe in medicine, as it enters the compoſition of the *unguentum citrinum*. It is alſo uſed in the preparation of a *fucus* for the ladies.

Borax, *glaſs of*, is obtained by melting the cryſtals of this ſalt; and it is the only ſalt that aſſumes a vitreous appearance from fire without addition. The glaſs becomes opake, and pulveriſes in the air. *Borax* forms with earths different ſorts of glaſs, which are in general very hard and compact, and at firſt extremely tranſparent; but they are liable to become cloudy and opake by being long expoſed to the air.

It is alſo uſed in preparing the imitations of precious ſtones.

Borax is alſo a name given by ſome to the BUFONITES, or toad-ſtone; a kind of BEZOARD ſaid to be found in the head of the TOAD.

BORBONIA, in *Botany*, a genus of the *diadelphia decandria* claſs of plants. The characters are theſe: the flower hath five leaves, and is of the butter-fly ſhape. The ſtandard is obtuſe and reflexed; the wings are heart-ſhaped, and ſhorter than the ſtandard: the keel hath two obtuſe lunulated leaves. It hath nine ſtamina joined in a cylinder, and one upper ſtanding ſingle. In the centre is ſituated a germen, which afterward becomes a round pointed pod terminated with a ſpine, having one cell incloſing a kidney-ſhaped ſeed. There are three ſpecies, which are natives of the Cape of Good Hope; and as they do not perfect their ſeeds in this country, are with difficulty propagated here.

Borbonia *Aſtra*, a denomination formerly given by ſome writers to the *ſolar* FACULÆ, on a ſuppoſition that they were ſatellites, or ſecondary planets.

Fromundus mentions a Frenchman, named Tarde, who had written a book expreſs under the title ASTRA BORBONIA. Phil. Tranſ. N° 330. p. 287.

BORBORITÆ, or **Borboriani**, a branch of the ancient Gnoſtics, in the 11th century, who, to the other errors of that ſect, added this, of denying a future judgment. Their name is derived from βορϐορος, *filth*, on account, as it is ſaid, of a cuſtom they had of beſmearing their faces and bodies with it. Epiphan. Hereſ. 25, and 26. Auguſt. de Hereſ. c. 5.

Some alſo have given this appellation, by way of reproach, to the MENNONITES.

BORBOTHA, in *Ichthyology*, a name given by ſome authors to the MUSTELA *fluviatilis*, or eel-pout. See GADUS.

BORDAGE, the condition or ſervice of the *bordarii*. Du-Cange. Gloſſ. Lat.

BORDARII, often mentioned in the Domeſday inquiſition, were diſtinct from the *ſervi* and *villani*, and ſeem to be thoſe of a leſs ſervile condition, who had a *bord* or cottage, with a ſmall parcel of land, allowed to them, on condition they ſhould ſupply the lord with poultry and eggs, and other ſmall proviſions for his board and entertainment. Though, according to Spelman, the *bordarii* were inferior to *villani*, as being limited to a ſmall number of acres.

Bordarii alſo denote ſervants, or workmen, employed about the houſe in the neceſſary offices of fetching wood, drawing water, grinding corn, cleaning yards, and the like: by which they ſtand diſtinguiſhed from VILLANI, employed in the tillage of the lands. See VILLAIN.

BORDAT, a ſmall narrow ſtuff, which is manufactured in ſome parts of Egypt, particularly at Cairo, Alexandria, and Damieta.

BORDER, in *Gardening*, denotes a narrow bed adjoining to a walk, ſerving to bound and incloſe the parterres, and prevent their being injured by the feet.

The uſe of *borders* is to incloſe parterres. They ought always to be laid with a riſing in the middle, by which they will have a better effect to the eye than if quite flat, and their breadth ſhould be between four and ſix feet.

Some are continued about parterres, and are wrought with a ſharp riſing in the middle, and planted with low ſhrubs and flowers. Others have only a verge of graſs in the middle, being edged with two ſmall paths, raked ſmooth and ſanded; theſe are ſometimes adorned with vaſes of flowers, of large growth, or flowering ſhrubs, along the middle verge of graſs. Others are quite plain, and are only ſanded, as in the parterres of orangeries; and are filled with caſes ranged in regular order along thoſe *borders*, which are edged with box on the ſides next the walks, and on the other with verges, and graſs-work next the parterre. Sometimes a yew is planted between each caſe, which makes the *border* appear richer, and the parterres handſomer during the winter ſeaſon.

The floriſts make *borders* in any part of their gardens, which they uſually edge with green boards; and this gives them a very neat look: in large parterres, all that is to be expected, is to ſtock them well with flowers, that will ſucceed one another during the ſummer ſeaſon. Miller.

Border, in *Heraldry*. See BORDURE.

BORDERS, among *Floriſts*, are ſuch leaves as ſtand about the middle-thrum of a FLOWER.

BORD-FREE. See FREE.

BORD-HALFPENNY, or BROD-HALFPENNY, money paid in markets, and fairs, for ſetting up boards, tables, and ſtalls, for the ſale of wares.

BORD-LANDS, the demeſnes anciently kept by the lords in their hands for the maintenance of their *board* or table. This was alſo anciently called *bordage*.

BORD-SERVICE, called alſo BORDAGE, the tenure of lands, on condition of furniſhing proviſion for the lord's board or table.

Some lands in the manor of Fulham, and elſewhere, are ſtill held of the biſhop of London, by the ſervice, that the tenants pay ſix pence per acre in lieu of finding proviſion for their lord's table.

BORDURE, or BORDER, in *Heraldry*, a kind of addition on the limb of a ſhield, in form of a hem, or girdle, encompaſſing it all round, and parallel to the boundary of the eſcutcheon, and ſerving as a DIFFERENCE. See *Tab. Herald. fig.* 10.

The *bordure* muſt be about one fifth part of the breadth of the field.

Simple bordure is that which is of the ſame colour or metal throughout; and is the firſt addition of younger brothers.—There are others, *componed*, *countered*, *ingrailed*, *indented*, and *charged* with other pieces; which make different additions for younger brothers, in ſeveral degrees.

If the line which conſtitutes the *bordure* be ſtrait, and the *bordure* plain, as they call it in blazoning, the colour of the *bordure* alone is named: as, he beareth gules, a *bordure* or.—If a *bordure* be charged with any parts of plants or flowers, they ſay, *verdoy* of trefoils, or of ſuch vegetables and flowers, whatever they be. If it conſiſts of ermines, vairy, or any of the furs, the term is, *perflew* of ermines: if the *bordure* be charged with martlets, the word is, *charged* with an *enaluron* of martlets: *enurny* is uſed for beaſts; and *entoyre* for things inanimate. A *bordure* is never of metal upon metal, and ſeldom of colour upon colour; but of the ſame tincture with the principal bearing or charge.

BORE.—The *bore* of a gun or piece of ordnance is uſed for the chaſe or barrel; though it ſeems rather to denote the diameter of the chaſe. See CALIBER, and CANNON.

BORE, *ſquare*, in *Smithery*, denotes a ſquare ſteel point, or ſhank well tempered, fitted in a ſquare ſocket in an iron wimble, ſerving to widen holes, and make them truly round and ſmooth within.

BOREA, an ancient name for a ſpecies of JASPER, of a bluiſh green colour.

BOREAL *Signs*, in *Aſtronomy*, the firſt ſix ſigns of the zodiac, or thoſe on the northern ſide of the equinoctial.

BOREALIS *Aurora*. See AURORA *Borealis*.

BOREAS, a Greek name now in popular uſe, for the north wind. Etymologiſts uſually derive the word from βοη, *clamor*, *noiſe*; or from βορα, *food*, becauſe it creates an appetite.

Pezron obſerves, that anciently, and with much greater propriety, *Boreas* ſignified the north-eaſt wind, blowing at the time of the ſummer ſolſtice: he adds, that the word comes from the Celtic *bore*, *morning*; becauſe their principal light, in that ſeaſon, came from that quarter, whence alſo the winds then uſually blew.

The Greeks erected an altar to *Boreas*. He is repreſented on the temple at Athens with his robe before his mouth, as if he felt the cold of the climate over which he preſides, agreeably to the deſcription of Ovid, who calls him *gelidus tyrannus*, *the ſhivering tyrant*. Met. vi. ver. 711. But he is uſually deſcribed by the Roman poets as violent and impetuous. Ibid. ver. 686—ver. 707.

The qualities allowed by naturaliſts to this wind are coldneſs and dryneſs.

BOREASMI, were feaſts inſtituted at Athens in honour of BOREAS.

BORECH, in *Natural Hiſtory*, a kind of ſalt brought from Perſia.

BORECOLE, in *Botany*, a ſpecies of the BRASSICA, or cabbage. Of this there are three ſorts; the common, the green, and the Siberian or curled colewort, called by ſome Scotch kale. The two former are ſown about the middle of April, and are fit for tranſplanting about two months after. The latter kind may be ſown in the middle of July, and will be fit for uſe from Chriſtmas till April.

Borecole has lately been found to be an excellent food for cattle. See CABBAGE.

BOREE, or BOUREE, a kind of dance, compoſed of three ſteps joined together by two motions; and begun with a crochet, riſing. The firſt couplet contains twice four meaſures, and the ſecond twice eight. It conſiſts of a balance-ſtep and a coupee: it is ſuppoſed to come from Auvergne; others ſay from Biſcay.

BORING, the act of perforating a ſolid body, or making a hole throughout its whole length or thickneſs.

Surgeons ſpeak of *boring* the bones of the ſkull, properly called TREPANNING.

BORING *birch*, and other trees, is practiſed in the ſpring for their juice, called alſo TAPPING and *bleeding*. Phil. Tranſ. N° 44. p. 880.

BORING, in *Farriery*, an operation ſometimes practiſed for the cure of horſes whoſe ſhoulders are wrenched. The method is thus: they cut a hole through the ſkin in the middle of the ſhoulder, and, with the ſhank of a tobacco-pipe, blow it as a butcher does a ſhoulder of veal; then they run a cold flat iron, like a horſeman's ſword-blade, eight or ten inches up, between the ſhoulder-blade and the ribs, which they call *boring*; after that, they burn him round his ſhoulder with a hot iron. This, ſays Bartlett, is an abſurd and uſeleſs, as well as a cruel practice.

BORING *of cannon*, in *Foundery*. See CANNON.

BORING *of maſts*, from top to bottom, is propoſed by Dr. Hook as a means of ſtrengthening and preſerving them; as this would make them dry and harden the better, and prevent their cleaving and cracking: for want of this, the outſide drying, when the inſide does not, the former ſhrinks faſter than the latter; the conſequence of which is prejudicial.

BORING, in *Mineralogy*, a method of piercing the earth by a ſet of ſcooping irons, made with joints ſo as to be lengthened at pleaſure. The ſkilful mineraliſt will be able to gueſs where a vein of ore may lie, though there are none of the common outward ſigns of it upon the ſurface of the earth; and in this caſe, he has recourſe to *boring*, the ſcooping irons are drawn back at proper times, and the ſamples of earth and mineral matter they bring up, are examined; and hence it is known whether it will be worth while or not to open a mine in the place.

BORING *of water-pipes*. The method of *boring* alder-poles for water-pipes is thus: being furniſhed with poles of a fit ſize, horſes, or truſſels, are procured of a due height, both to lay the poles, and reſt the auger on in *boring*; they alſo ſet up a lath, whereby to turn the leſſer ends of the poles, and adapt them to the cavities of the greater ends of others, in order to make the joint ſhut each pair of poles together. The outer or concave part is called the female, and the other, or inner, the male part of the joint. In turning the male part, they make a channel or ſmall groove in it, at a proper diſtance from the end; and, in the female part, bore a ſmall hole to fit over this channel; they then bore through their poles, ſticking up great nails at each end, to guide them right: but they commonly bore a pole at both ends; ſo that if it be crooked one way, they can nevertheleſs bore it through, and not ſpoil it. Neve Build Dict. in voc. Alder.

This operation is now performed with a horſe-mill, as at *Paul's Wharf* for the New River company.

Belidor, in his Hydraulics, has deſcribed a machine, in which a water-wheel is made uſe of both to turn the auger, and to bring forward the carriage on which the pipe to be *bored* reſts. This machine (See *Tab. II. Mechanics*, *fig.* 67.) is put into motion by the water-wheel A, in the axis of which there is a cog-wheel B, that turns the lanterns C and D; the trundles of D turn two ſmall wheels E and F; the firſt of which is vertical and turns the auger; the other is horizontal and moves the carriage by means of the two arms H and I. H draws the wheel G towards F, and I puſhes it in a contrary direction; and theſe combined actions cauſe the carriage to advance towards F and the auger to bore the pipe. The auger being about 12 feet long and proportionally heavy is ſupported by the pieces L, L; and they are prepared ſo as to give no obſtruction in the following manner: C, C, *fig.* 68, are two planks of wood which are faſtened to the timber-work of the mill; theſe encompaſs another plank hung by a cord, at the bottom of which are fixed the pieces *b*, *b*, with joints at *e* and *e*: and, that they may not move out of the vertical plane, they are joined by tennons to the plank *a*, in which they may work freely: on the ſide of one of theſe pieces is fixed a ſpring *g*, in order to hinder them from uniting, by forcing them into a mortiſe in *d*; in this ſituation the two pieces are penetrated with a hole through which the auger is to paſs. The cord is faſtened to the plank *a*, as in *fig.* 69, and goes over the two pullies *b*, *b*: at the other end of the cord there is hung a weight *e*, reſting on the piece N, which is ſupported at one end by the piece O, and fixed at the other by a joint to the lever K, which has its centre of motion in the piece of wood H; ſo that, leaning againſt the extremity M of the lever, N quits the ſupport O, the weight ſinks down, and draws up the piece *a*; then the ſides *b*, *b*, *fig.* 68. quit the mortiſe *d*, and the ſpring *g* ſeparates them: and thus the ſupporter does not in the leaſt hinder the motion of the auger.

BORITH, in the Holy Scriptures, an herb thought to be the *kali* or ſaltwort; of the aſhes of which ſome make ſoap, and a very good lye to waſh linen with. It is mentioned in Jeremiah, chap. ii. ver. 22.

BOROLYBICUS, the wind which blows in the middle between the north and weſt points; called alſo the north-weſt wind.

BOROUGH, **BURROUGH**, **BOROW**, or **BURGH**, is frequently uſed for a town, or corporation which is not a city.

Borough, in its original Saxon *borge*, or *borgh*, is by ſome ſuppoſed to have been primarily meant of a tithing or company conſiſting of ten families, who were bound and combined together as each others pledge.

Afterwards, as Verſtegan informs us, *borough* came to ſignify a town that had ſomething of a wall or incloſure about it: ſo that all places which among our anceſtors had the denomination *borough*, were one way or other fenced or fortified.

But, in later times, the ſame appellation was alſo beſtowed on ſeveral of the *villæ inſigniores*, or country towns of more than ordinary note, though not walled.

The ancient Saxons, according to Spelman, gave the name *burgh* to thoſe called, in other countries, cities. But divers canons being made for removing the epiſcopal ſees from villages and ſmall towns to the chief cities, the name CITY became attributed to epiſcopal towns, and that of *borough* retained to all the reſt; though theſe too had the appearance of cities, as being governed by their mayors, and having laws of their own making, and ſending repreſentatives to parliament, and being fortified with a wall and caſtle, and the like.

BOROUGH, or *burgh*, is now particularly appropriated to ſuch towns, and villages, as ſend burgeſſes or repreſentatives to parliament.

Boroughs are equally ſuch, whether they be incorporate or not; there being great numbers of our Engliſh *boroughs* not incorporated; and, on the contrary, ſeveral corporations that are not *boroughs*; e. gr. Kingſton, Deal, Kendal, &c.

Boroughs are diſtinguiſhed into thoſe by *charter*, or *ſtatute*; and thoſe by *preſcription*, or *cuſtom*.

The number of *boroughs* in England and Wales, including cities and cinque ports, which elect members is 215; ſome whereof ſend one, ſome two repreſentatives.

BOROUGHS, *Royal*, in Scotland, are corporations made for the advantage of trade, by charters granted by ſeveral of their kings; having the privilege of ſending commiſſioners to repreſent them in parliament, beſides other peculiar privileges.

Theſe form a body of themſelves, and ſend commiſſioners, each, to an annual convention at Edinburgh, to conſult the benefit of trade, and the general intereſt of the *boroughs*.

According to Chamberlayne, they have the ſole power of trade and merchandize, excluſive of all others, a power of holding courts, exerciſing the JURISDICTION of ſheriffs, making by-laws, &c.

The company of merchants in a *royal borough* make what is called a GILD; the chief of which is a dean of GILD, who is next magiſtrate to the bailiff.

The *royal boroughs* are not only ſo many diſtinct corporations, but do alſo conſtitute one entire body, governed by, and accountable to one general court, anciently called *the court of four boroughs*, held yearly to treat and determine concerning matters relating to the common advantage of all *boroughs*.

The *four boroughs* which compoſed this court were, Edinburgh, Stirling, Roxburgh, and Berwick; which two laſt falling into the hands of the Engliſh, Linlithgow and Lanerk were put in their places; with a ſaving to the former, whenever they ſhould return to their allegiance.

But this court not being ſufficient to anſwer the neceſſities of the *royal boroughs*, they were all empowered, under James III. in 1487, to ſend commiſſioners to a yearly convention of their own, which was then appointed to be held at Inverkeithing, and is now held at Edinburgh, under the denomination of the *convention of boroughs*, veſted with great power.

BOROUGH-*Courts* are certain courts held in *boroughs*, by preſcription, charter, or act of parliament: ſuch are the ſheriff's court, and court of huſtings in London.

BOROUGH-*Engliſh*, denotes a cuſtomary deſcent of lands or tenements in certain places, whereby they come to the youngeſt, inſtead of the eldeſt ſon; or if the owner hath no iſſue, to the youngeſt, inſtead of the eldeſt brother; for that the youngeſt is ſuppoſed, in law, the leaſt able to ſhift for himſelf. 1 Inſt. 140. b. And in ſupport of this reaſon, other uſages in favour of the youngeſt are alleged, as that in Kent, where the lands being equally divided among all the ſons, the youngeſt is to have the privilege of aſtre or hearth in the manſion-houſe, in his ſhare, as being ſuppoſed the tendereſt, and more in need of warming. Others, notwithſtanding, ſuſpect a different reaſon for the riſe of *Borough-Engliſh*, viz. the places where this cuſtom now obtains, were anciently liable to that cuſtom granted the lords of manors in Scotland by king Eugenius, who had the privilege of enjoying the firſt night of their tenants brides; ſo that the eldeſt ſon being preſumed to be the lord's, they uſually ſettled their lands on the youngeſt ſon, whom they thought their own; which being practiſed a long time, grew at length into a cuſtom. This cuſtom, however, never obtained in England, though it did in Scotland, till it was aboliſhed by Malcolm III. Perhaps, ſays judge Blackſtone, the origin of this practice may be illuſtrated by that of the Tartars, mentioned by Du-Halde, among whom the ſame cuſtom of deſcent to the youngeſt ſon prevails. As the nation is compoſed of ſhepherds and herdſmen, the elder ſons migrate from their father with an allotment of cattle, to ſeek a new habitation. The youngeſt ſon, continuing lateſt with his father, is naturally the heir of his houſe. This cuſtom of migrating obtained in many other northern nations; and *Borough-Engliſh* may be a remnant of that paſtoral ſtate of our Britiſh and German anceſtors, which Cæſar and Tacitus deſcribe. Blackſtone's Comm. vol. ii. p. 83, 84.

Borough-Engliſh obtains only in ſome ancient boroughs and copyhold manors.

BOROUGH-*Head*, or *Head*-**BOROUGH**, is the chief man of the *decenna* or *hundred*; choſen by the reſt to ſpeak and act in their behalf.

In many pariſhes, *head-borough* alſo ſignifies a kind of head-CONSTABLE, where there are ſeveral choſen as his aſſiſtants, to ſerve warrants, &c.

BOROUGH-*Holder*, in *Ancient Law Writers*, the head-man or chief pledge of a tithing, choſen by the reſt to ſpeak and act in their common behalf.

The word is formed from *boroe-ealder*, as being the ſenior man of the borough or tithing.

Borough-holders are the ſame with what are otherwiſe written, *borſholders*, *burſholders*, *boſholders*, *borow-holders*, *borghealders*, *burgheſaldi*, and *borgeſaldrii*; of later days, *borough-heads*, and HEAD-BOROUGHS.

BOROUGH, or *Borgh*, denotes a pledge of ſecurity for another's keeping the peace, and conforming to the laws.

The word is Saxon, and is ſometimes alſo written *borough*; in Latin writers, *borgha* and *burgha*.

BORGH-*breach*, *Borgi fractura*, in *Ancient Law Writers*, denotes a breaking of the pledge or ſecurity given by the members of tithings for the behaviour of each other.

This is the ſame with what is otherwiſe called *borg-brege*, *borgh-brege*, *barg-breche*, and *borghi-fractura*.

BOROUGHS, *Law*, or *Borrows*, in the law of Scotland, the ſame with what in England is called *binding to the* PEACE.

In caſe of a contravention of *law-borrows*, the ſurety or cautioner is equally liable with the principal for the penalty ſpecified therein; the one half to the king, and the other to the complainer.

BOROW-*holes*, the holes, in the remoteſt corner of which the female rabbits depoſite their young, to prevent the males from eating them.

BORRAGE, *borrago*, in *Botany*, a genus of the *pentandria monogynia* claſs of plants. Its characters are theſe: the flower is of one leaf, having a ſhort tube, and ſpread wide open above. The chaps of the flower are crowned by five prominences. It hath five ſtamina, which are joined together; and four germina ſituated in the centre, which afterward become ſo many roundiſh rough ſeeds, inſerted in the cavities of the receptacle. There are four ſpecies; the firſt of which is the common *borrage*, whoſe flowers are uſed in medicine, and the herb for cool tankards in ſummer. If the ſeeds are permitted to ſcatter, plants will come up in plenty. See *Tab. of Botany*, *Claſs* 2.

The common *borrage* has long held its rank as a cordial of the firſt claſs, though perhaps it would not be eaſy to ſay on what foundation. Its flowers are of the number of the four cordial ones of the ſhops, and it has been recommended as a medicine of great efficacy in malignant and peſtilential fevers, and againſt the bites of poiſonous animals. By the experiments of M. Marcgraaf, Mem. de Berlin, 1747, it appears that the juice affords a true nitre.

BORRELISTS, a ſect or ſort of Anabaptiſts in Holland, who allow of no uſe of ſacraments, public prayers, or other external worſhip, nor of any human gloſs or explication of Scripture; but profeſs to adhere to the faith and manners of the New Teſtament times in all their ſimplicity.

They took their denomination from their founder, *Borrel*, a perſon of great learning in the Hebrew, Greek, and Latin tongues, and brother of M. Borrel, ambaſſador of the States to the French king.

BORSELLA, in the *Glaſs-Works*, an inſtrument wherewith they extend or contract the glaſſes at pleaſure; alſo ſmooth and levigate them.

BOS, the *ox*, in the Linnæan ſyſtem of *Zoology*, a genus of quadrupeds of the order of *pecora*; the characters of which are, that the horns are hollow and turned forward, bent like creſcents, and ſmooth on the ſurface; the fore-teeth are eight in number, and there are no canine teeth. Of this genus, beſides the common tame one, there are four ſorts naturally wild; the BISON, BONASUS, BUBALUS, and URUS.

Bos *grunniens*, or *grunting ox*, ſo called becauſe it grunts like a hog, is a ſpecies of the ox, with a mane on the neck, and the whole body covered with long hair, a hunched back, and tail like that of a horſe; it is found in the country of the Calmucs. Pennant.

Bos *Indicus*, or *Indian ox*, is another ſpecies, with a large lump on the ſhoulders, and ſhort horns, bending cloſe to the neck in ſome of the ſpecies, and almoſt upright bending a little forward in others. In Surat there is a ſmall kind, not bigger than a great dog, with a fierce look, which is uſed for drawing children in ſmall carts. See *tab. Quadrupeds, fig.* 6.

Bos, in *Antiquity*, was peculiarly uſed for an ancient Greek ſilver coin, which was *didrachmus*, or equivalent to two drams.

BOSA, in the *Egyptian Medicine*, denoted a maſs prepared of the flower of the lolium, hemp-ſeed, and water; of the ſame inebriating virtue with the *aſſis*, or opium.

BOSCAGE, denotes a place ſet with trees, a grove, or thicket.

Boscage, *boſcagium*, in a *Law ſenſe*, ſignifies *maſt*, or ſuch ſuſtenance as woods and trees yield to cattle.

Boscage, among *Painters*, is ſaid to denote a picture or landſcape, repreſenting much wood and trees.

Boscage ſometimes denoted a tax or duty laid on wood brought into the city.

BOSCHAS, in *Zoology*, the name of our common wild DUCK, called alſo by ſome *anas torquata minor*, or the ſmaller ring-DUCK.

BOSCO. See ATTACHIAMENTA *de boſco & ſpinis*.

BOSCOI, or **Bosci**, in *Eccleſiaſtical Hiſtory*, denotes a ſpecies or tribe of monks in Paleſtine, who fed on graſs like the beaſts of the field.

The word is Greek, βοσκοι, q. d. *grazers*; formed from βοσκω, *poſco*, *I feed*.

The *boſcoi* are ranked among the number of Adamites, not ſo much on account of their habit, as food. They took no care about proviſion; but when eating-time came, or any of them was hungry, went into the fields, with each his knife in his hand, and gathered and eat what he could find.

BOSCUS, in *Ancient Law Writers*, ſignifies a wood of any kind. The word is alſo written corruptly *buſcus*, *buſcaria*, and *buſcale*. It is formed from the Greek, βοσκω, *I feed*, as ſerving for paſture. In which ſenſe, *boſcus* amounts to the ſame with the Italian *boſco*, and French *bois*. *Boſcus* is divided into high wood, or timber, called alſo *ſaltus*, and *haut-bois*; and *copice*, or underwood, *ſub-boſcus*, or *ſub-bois*.

BOSEA, in *Botany*, or *yerva-mora*, a genus of the *pentandria digynia* claſs of plants; commonly called the golden-rod tree. Its characters are theſe: the flower hath no petals, but five ſtamina, which are as long as the empalement: in the centre is ſituated an oval, oblong, pointed germen, which afterward becomes a globular berry with one cell, including one pointed ſeed. We have but one ſort of this plant, which is a native of the Canary iſlands. They have not been known to flower in this country, nor will they endure the open air through the winter.

BOSPHORICUM *Marmor*, a name given by the ancients to a ſpecies of marble, of a yellowiſh white colour, with beautiful veins of a ſomewhat darker hue; called alſo, from its tranſparency, *phengites*.

BOSPHORUS, or **Bosporus**, in *Geography*, a long and narrow ſea, which it is ſuppoſed a bullock may ſwim over; in a more general ſenſe, a long narrow ſea running in between two lands, or ſeparating two continents, and by which, two ſeas, or a gulph and a ſea, are made to communicate with each other.

In which ſenſe, *boſphorus* amounts to the ſame with what we otherwiſe call an arm of the ſea, channel, or ſtrait; the Italians, *faro*; the Latins, *fretum*; and the French, *pas*, *manche*.

The word is Greek, βοσπορος, formed from βȣς, *bos*, and πορος, *paſſage*.

The name *boſphorus*, is chiefly confined to two ſtreights, in the Mediterranean ſea, viz. the *boſphorus of Thrace*, commonly called the *ſtreights of Conſtantinople*, or *channel of the Black ſea*; and the *Cimmerian* or *Scythian boſphorus*, ſo called, it ſeems, from its reſemblance to the Thracian; now more commonly the *ſtreights of Kapha*, or *Kiderleri*, from two cities ſtanding on it.

The origin of the name is better agreed on, than the reaſon why it was firſt given to the Thracian *boſphorus*: Nymphius tells us, on the authority of Accarion, that the Phrygians, deſiring to paſs the Thracian ſtreight, built a veſſel, on whoſe prow was the figure of a bullock; and which was hence called βȣς, *bullock*; and ſerved them for a ferry-boat.—Dionyſius, Val. Flaccus, Callimachus, Apollodorus, Marcellinus, &c. ſay, that Iö, being transformed into a cow by Juno, paſſed this ſtreight ſwimming, which hence was called *boſphorus*.—Arrian tells us, that the Phrygians were enjoined by the oracle, to follow the route which a bullock ſhould mark out to them; and that, upon ſtirring one up, it jumped into the ſea to avoid their purſuit, and ſwam over this ſtreight. Others ſay, that an ox, tormented by a gad-fly, threw itſelf in, and ſwam over: and others, that anciently the inhabitants of theſe coaſts, when they would paſs over, joined little boats together, and had them drawn over by bullocks, &c.

Some late writers rather ſuppoſe *boſphorus* to have been ſo called, becauſe here was anciently the beaſt-market. Tournef. Voyag. tom. ii. Let. 12. and Let. 14.

BOSQUETS, in *Gardening*, a term for groves included in gardens.

The word is derived from the Italian, *boſchetto*, which is a diminutive of *boſco*, *a wood* or *grove*.

Theſe are ſmall compartments of gardens, which are formed of trees, ſhrubs, and tall flowering plants, ſet in quarters, and either placed regularly in rows, or diſpoſed in a more irregular manner. Theſe quarters ſhould be ſurrounded with ever-green hedges, and the entrances made into porticos with yews. In the inſide there muſt be ſome walks, either ſtraight or winding. Theſe, if the quarters are large, ſhould be eight feet wide, and laid with turf, and kept well mowed and rolled. The hedges of theſe quarters ſhould be kept low, that the heads of the ſhrubs may be ſeen from the outſide. There is a great deal of fancy to be employed in the planting theſe *boſquets*, which ſhould be ſhewed in ſetting to view at once ſuch ſhrubs as have the moſt differently ſhaped, and differently coloured leaves that may be; as the long, the round, and the jagged, and the various ſhades of deep and lighter green, and the mealy or hoary white leaves. Beſides, there is alſo a very great variety of beautiful fruits, which theſe ſhrubs produce in autumn, which give a very elegant and pleaſant proſpect even after the leaves are fallen. The ſhrubs which produce theſe, are, 1. The euonymus, or ſpindle-tree. 2. The opulus, or water-elder. 3. The cock-ſpur hawthorn. And, 4. The flowering-aſh, as it is called; beſides a great number of others. But it is a good rule in this kind of plantation, never to mix the ever-green trees with thoſe which loſe their leaves in winter. Theſe *boſquets* are only fit for large gardens. Miller.

Boſquets are generally laid out into ſome regular figure, as a circle, ſquare, polygon, or the like, and make a conſiderable article in the decoration of a fine GARDEN.

BOSS, or **Bosse**, in *Sculpture*, ſignifies RELIEVO, or prominency.

The word is French, *boſſe*, which ſignifies the ſame; whence alſo to emboſs. See EMBOSSING.

Boss *of a buckler*, among the *Ancients*, the *umbo*, or ομφαλος, which juts out in the middle.

Boss, among *Bricklayers*, denotes a wooden utenſil wherein the labourers put the mortar to be uſed in tiling. It has an iron hook, whereby it may be hung on the laths, or on a ladder.

BOSSAGE, a projecting ſtone in *Architecture*, laid rough in building, to be afterwards carved into mouldings, capitals, arms, or the like.

Bossages alſo denote ſtones which ſeem to advance beyond the naked of a building, by reaſon of indentures, or channels left in the joinings; uſed chiefly in the corners of buildings, and thence called *ruſtic quoins*.

The cavities or indentures are ſometimes round, ſometimes ſquare, ſometimes chamfrained, or bevelled, ſometimes in the diamond form: ſometimes they are incloſed with a cavetto, ſometimes with a liſtel.

BOSTANGI-*Baſchi*, in the *Turkiſh Affairs*, an officer in the grand ſignior's houſhold, who has the ſuperintendance of all the gardens, water-works, and houſes of pleaſure, with the workmen employed therein. The poſt of *boſtangi-baſchi*, or chief gardener, is one of the moſt conſiderable in the Turkiſh court. He has the emperor's ear, and, on that account, is much courted by all who have buſineſs depending at the Port; he is governor of all the villages on the channel of the Black ſea, and has the command of above ten thouſand *boſtangis*, or gardeners, in the ſeraglio, and other places about Conſtantinople. But that which gives him the greateſt eclat, is the honour he has of holding the rudder whenever the ſultan takes his pleaſure on the water.

BOSTRYCHITES *lapis*, derived from βοςρυχιζω, *I fold the hair in braids*, in *Natural Hiſtory*, a name given by ſome to a ſtone ſuppoſed to contain women's hair included in it: ſome have underſtood by it, thoſe pieces of cryſtal which have accidental foulneſſes in them, reſembling hair, or pieces of hair, cauſed by earthy or metalline matter; others call by this name thoſe German agates, which contain either the confervæ or other capillary water-plants, or other foulneſſes running into their form: the firſt of theſe very frequently have the confervæ of a great length, and variouſly undulated and turned about, ſo as very elegantly to repreſent a looſely flowing lock of hair.

BOSTRYCHITES is alſo a name given by ſome authors to a ſpecies of pyrites, whoſe irradiations were ſuppoſed to imitate hair.

BOTABOTA, in *Natural Hiſtory*, a name given by ſome writers to that ſpecies of ſea-ſwallow, whoſe neſts are ſo famous for ſoups in China, and in ſome parts of Europe. The neſts are ſuppoſed to be reſtorative, and greatly provocative to venery; for which laſt quality it is, that the eaſtern nations in general are ſo fond of them.

BOTAGIUM, in *Middle Age Writers*, a fee paid for wine ſold in *botæ*, or *butts*.

Wine that taſtes of the caſk is called *vinum botatum*.

BOTALE *foramen*, in *Anatomy*, an aperture in the heart of a FOETUS, whereby the blood is enabled to circulate, without going into the lungs, or the left ventricle of the heart. See FOETUS, CIRCULATION, and HEART.

BOTANIST, a perſon who underſtands the nature, hiſtory, and diſtinctions of vegetables, on ſettled and certain principles, and can call every plant by a diſtinct, proper, and intelligible name. Linnæi Fundam. Botan. p. 1. See BOTANY.

BOTANOPHILI, among the writers on the ſubject of vegetables, thoſe who have treated of them, not as botaniſts, on their natural and eſtabliſhed diſtinctions, but in regard to different operations, as gardeners, phyſicians, &c.

BOTANY, the ſcience of plants; or that part of phyſiology which treats of plants, their ſeveral kinds, forms, virtues, and uſes.

The word comes from βοτανη, *herb*; and that from βοτος, of βοω, *I feed*; becauſe moſt animals feed on herbs. See PHYTOLOGY, &c.

Authors are divided about the preciſe object and extent of *Botany*, which ſome will have to include the whole province of plants, in all their ſtates, uſes, and relations; others reſtrain it to the knowlege of the claſſes, genera, ſpecies, external figures, and deſcription of plants, excluſive of their origin and generation, which belong to *Phyſiology*; of their culture and propagation, which belong to *Gardening* and *Agriculture*; and of their virtues, which are objects of conſideration in *Phyſic* and *Pharmacy*.

This ſcience was cultivated in ſome degree among the ancients; but chiefly with reſpect to its medical application and uſe. However, as they adopted no regular ſyſtem of diſtribution and arrangement, they made a ſlow progreſs, and the knowlege they gained was ſoon and eaſily loſt. If we except Solomon, of whom we read that *he ſpake of trees from the cedar-tree that is in Lebanon, even unto the hyſſop that ſpringeth out of the wall.* 1 Kings, chap. iv. ver. 33. and begin only with thoſe writers on the ſubject of *botany*, any of whoſe writings now remain; the firſt, in order of time, is Hippocrates, who flouriſhed in the fifth century before Chriſt, and who has enumerated about 250 different plants. Ariſtotle alſo may be mentioned, though there is reaſon to doubt whether the books concerning the generation of plants, which ſome have aſcribed to him, are *his*, or a collection by ſome late writer from the works of Theophraſtus. Theophraſtus, the diſciple of Ariſtotle, is therefore properly the next to Hippocrates, on the genuineneſs of whoſe writings we can depend; he flouriſhed about 300 years before Chriſt; there remain nine books of his on the hiſtory of plants, and ſix on the cauſes of them: he reckons about 500 plants.

Among the Romans, Cato, Varro, Virgil, and Columella might be mentioned; but the moſt eminent were Dioſcorides, who lived under Anthony and Cleopatra; he is called the prince of botaniſts, and yet the number of plants which he has deſcribed amount only to 600; and C. Plinius Secundus, under Veſpaſian and Titus, who enumerates more than 1000 plants. Galen, of Pergama in Aſia, who lived at Rome about the year 133, though he did not write profeſſedly on *Botany*, has introduced many incidental obſervations on this ſubject: and other phyſicians proſecuted this ſtudy, as far as it was immediately connected with that of their profeſſion, from the ſecond to the ſixth century of the Chriſtian æra; ſuch as Oribaſius, Aëtius, Trallianus, and P. Ægineta. The principal Arabian *Botaniſts*, who moſtly with the ſame views cultivated this ſcience, from the eighth to the twelfth century, were Meſue, Serapio, Razis, Avicenna, and Averrhoes. The ſucceeding period, till the fifteenth century, was very unfavourable to every kind of ſcience; however, in this century, and eſpecially in the next, *botany* was induſtriouſly revived by means of numerous and laboured commentaries on Theophraſtus, Dioſcorides, Pliny, Cato, Avicenna, and Meſue: and the principal perſons who were employed in this way were Leonicenus, Braſavolus, Cordus, Fuchſius, Bodæus, Matthiolus, and Dalechampius. Turner, Gerrard, and Tradeſcant were the firſt *botaniſts* in England; they applied themſelves to the culture of medical and rare plants towards the cloſe of the ſixteenth century. It was after this period that *botany* began to acquire a conſiderable degree of importance and reputation; and that ingenuity and induſtry were employed in collecting and claſſing new ſpecies of plants. It would be tedious ſo much as to recount all the names of thoſe who are diſtinguiſhed in this reſpect; let it ſuffice to mention Geſner, Dodonæus, Cæſalpinus, Proſper Alpinus, the two Bauhins, Columna, Parkinſon, Plukenet, Moriſon, Malpighi, Grew, Hermannus, Ray, Magnol, Tournefort, Sloan, Sherrard, Linnæus, and Miller. In a word, *botany* is arrived at a degree of perfection among the moderns, to which the ancients were ſtrangers; not only as to the method of claſſing, diſtributing, and characteriſing plants, but alſo as to the *copia* or number of plants known and deſcribed. The numerous travels and voyages of *botaniſts* have very much contributed to the extent of this ſcience.

This article will terminate with a brief account of the principal ſyſtems, that have been eſtabliſhed by *botanical* writers. Nothing has been more conducive to the ſucceſsful cultivation of this ſcience, than a clear and diſtinct method of arrangement, whereby the ſeveral claſſes, genera, ſpecies, and varieties may be readily diſtinguiſhed; and it is eaſy to foreſee, that in proportion as the Linnæan ſyſtem prevails, and different writers agree in adopting the ſame language, the ſtudy of *botany* muſt be greatly facilitated and promoted. Linnæus diſtributes the ſyſtems which have already obtained into *heterodox* and *orthodox*. The former are founded in an alphabetical arrangement; in the ſtructure of the root; in the different ſpecies of flowers; in the *habit* of plants; their time of flowering; their native ſoil and climate; their medicinal uſe, and the order of the diſpenſaries. The *orthodox* ſyſtems, as he calls them, are either univerſal or partial; ſuch as belong to plants in general, or ſuch as are accommodated to the nomenclature and arrangement of particular kinds. The univerſal ſyſtems are four; though, by various modifications, this number has been conſiderably augmented. Linnæus has diſtinguiſhed the ſeveral patrons of them under the claſſes and appellations of *Fructiſtæ*, *Corolliſtæ*, *Calyciſtæ*, and *Sexualiſtæ*. The *Fructiſtæ* are ſuch as form the ſeveral claſſes of vegetables from the *pericarpium*, the *ſeed*, and the *receptacle*: of this number are Cæſalpinus, Moriſon, Ray, Knaut, Hermann, and Boerhaave. The *Corolliſtæ* diſtinguiſh the ſeveral claſſes by means of the *corolla* and *petals*; ſuch are Rivinus and Tournefort, and their diſciples. The *Calyciſtæ* diſtribute them from the *calyx*, as Magnol; and the *Sexualiſts* found their ſyſtem on the different ſexes of plants. To this compendious abſtract of the hiſtory and principal ſyſtems of *botany*, it may be proper to add, that Cæſalpine, who was an Italian phyſician in 1583, was the firſt ſyſtematical writer, and he diſtributed plants into claſſes, according to the form of their ſeeds: Ray, from being firſt a *Fructiſt*, became afterwards a *Corolliſt*: Boerhaave endeavoured to combine the ſyſtems of Hermann, Ray, and Tournefort; but as the ſyſtem of the latter was at one time very generally received, and notwithſtanding the prevalence of the Linnæan or ſexual ſyſtem, has ſtill ſome advocates, it may be proper to obſerve, that Tournefort conſiders plants as compoſed of five parts, viz. roots, ſtalks, leaves, flowers, and fruit; neglecting the three former parts, he diſtributes them into various *claſſes*, according to the diſpoſition and ſtructure of the flower; and in reſolving them into genera, he takes into conſideration both the flower and fruit. Mr. Ray, urged chiefly by the ſhort duration of the flower, ſought the characters of the ſeveral genera, not merely in the flower and fruit, but in the figure of the organical parts, as the leaves, ſtalks, and roots, and in their colour, ſmell, taſte, and the outward ſurface of the whole plant. See FACE *of a plant*.

See a further account of theſe ſyſtems under PLANTS, and PETAL.

The claſſes, according to Tournefort's diſtribution, are
the

the following twenty-four; viz. 1. Plants with monopetalous, campaniform, or bell-faſhioned flowers. 2. Thoſe with monopetalous, infundibuliform, or funnel-like flowers. 3. Plants with anomalous, monopetalous flowers. 4. Plants with monopetalous, labiated flowers. 5. Plants with polypetalous, cruciform flowers. 6. Plants with polypetalous, roſaceous flowers. 7. Plants with polypetalous, roſaceous, and umbellated flowers. 8. Plants with caryophyllous, or pink-like, polypetalous flowers. 9. Plants with liliaceous, or lily-like flowers. 10. Plants with polypetalous, papilionaceous flowers. 11. Plants with polypetalous, anomalous flowers. 12. Plants with floſculous flowers. 13. Plants with ſemi-floſculous flowers. 14. Plants with radiated flowers. 15. Plants with ſtamineous flowers. 16. Plants without flowers, but having viſible ſeeds. 17. Plants with neither viſible flowers nor ſeeds. 18. Trees with apetalous flowers. 19. Trees with apetalous, amentaceous flowers. 20. Trees with monopetalous flowers. 21. Trees with roſaceous flowers. 22. Trees with papilionaceous flowers. For a deſcription of which, ſee the ſeveral articles AMENTACEOUS, APETALOUS, &c.

Each claſs in this ſyſtem contains ſeveral *genera*, amounting in the whole number to 673, and comprehending 8846 ſpecies, to which the author afterwards added 1300 more, referring them to their proper genera in his ſyſtem. Thoſe who are deſirous of farther information with regard to the hiſtory and various ſyſtems of *Botany*, are referred to the preface of Johnſon's Herball, fol. 1636; Linnæus's Philoſophica Botanica, 1751; Tournefort's Iſagoge in Rem Herbarium apud Inſtitutiones, &c. tom. i. ed. Pariſ. 1719. For a particular account of the Linnæan ſexual ſyſtem, ſee FRUCTIFICATION and SEXUAL *Syſtem*. See alſo PLANTS, VEGETATION, &c. &c.

BOTANY, *terreſtrial*, that employed about the plants growing on the ſurface of the earth.

BOTANY, *marine*, that concerned in the conſideration of ſea-plants, as fucuſes, *alcyonia*, *algæ*, &c.

BOTANY, *ſubterranean*, that about the plants under ground, as the *tubera terræ*, or truffles, &c.

BOTARGO, a ſort of ſauſage, made of the roes of the mullet-fiſh; much uſed on the coaſts of the Mediterranean, as an incentive to drink.

The manner of preparing *botargo*, as practiſed at Martegue in Provence, is deſcribed by Mr. Ray.—The mullets, *mugiles*, are taken in *burdigoes*, which are places in the ſhallows, incloſed with hedges of reeds. The male mullets are called *alletants*; the female *boter*, of the roes or ſpawn of which the *botargo* is made, thus.

They firſt take out the ſpawn entire, and cover it round with ſalt for four or five hours; then they preſs it a little between two boards or ſtones; then they waſh it, and at laſt dry it in the ſun for thirteen or fourteen days, taking it in at night. Ray. Trav. p. 396. ſeq.

The people of Provence call it *bou-argues*. The beſt is brought from Alexandria and Tunis. There is alſo a manufacture of it near Marſeilles. It is much uſed throughout all the Levant.

BOTATRISSA, in *Ichthyology*, a name given by Bellonius, Geſner, and other authors, to that ſpecies of the GADUS called by authors the *lota*, and *muſtela fluviatilis*; by us, the EEL-*pout*. It is diſtinguiſhed from the other *gadi*, by having two fins on the back, and the two jaws of equal length, with beards at the mouth.

BOTAURUS, in *Zoology*, a name by which ſeveral have called the bird known among us by the name of *butter-bump*, BITTERN, or *mire-drum*.

BOTE, BOTA, in our old *Law Books*, ſignifies *compenſation*, *recompenſe*, or *amends*, for any injury done. See ESTOVERS.

Hence *man-bote*, ſatisfaction due for a man ſlain.

Hence alſo *boteleſs*, where no judgment or favour will acquit a man; as, v. gr. for ſacrilege, &c. And hence our common phraſe to *boot*, ſpeaking of ſomething given by way of compenſation.

BOTE, *cart*, *fire-bote*, *hay-bote*, *houſe-bote*, *kin-bote*, *plough-bote*, *theft-bote*. See the adjectives.

BOTENALKAITOS, a ſtar in the conſtellation CETUS, called alſo BATENKETOS.

BOTESCART, in *Ancient Engliſh Writers*, the ſame with BOATSWAIN.

BOTHAGIUM, *bothage*, or *boothage*, cuſtomary dues to the lord of the market, for the liberty of pitching and ſtanding of BOOTHS.

BOTHNA, *buthna*, or *bothena*, in the Scotch *Law*, a park or field wherein cattle are incloſed, and fed.

The word is alſo written *barthena*; formed from the ancient Scottiſh *buth*, a *flock of ſheep*.

BOTHENA is alſo uſed for a barony, lordſhip, or ſheriffdom.

In which ſenſe, it is ordained by ſtatute, that the king's moot or court of each *bothena*, that is, each ſheriffdom, ſhall be held within forty days.

BOTHRION, βοθριον, denotes the ALVEOLUS or ſocket of a tooth.

BOTHRION is alſo uſed to denote a ſmall, narrow, but deepiſh ulcer of the CORNEA of the eye, reſembling a round puncture.

The word is alſo written *bothrias*; by others corruptly, *botryon*. In Latin writers it is ſometimes called *foſſula*.

BOTIA, *bocia*, or *botus*, among *Chemiſts*, a glaſs veſſel with a round belly and long narrow neck, otherwiſe called *egg*, *ovum ſublimatorium*, *cucurbita*, and *urinale*.

BOTIA, in *Medicine*, the ſame with STRUMÆ and SCROPHULÆ.

BOTIN, or BUTINE, among *Alchemiſts*, denotes turpentine, or balſam of turpentine, when gathered under the proper influence.

BOTONOMANCY, from βοτανη, *herb*, and μαντεια, *divination*, an ancient ſpecies of divination, by means of plants; eſpecially ſage, and fig-leaves.

The manner of performing it was thus: the perſons who conſulted, wrote their own names, and their queſtions, on leaves, which they expoſed to the wind; and as many of the letters as remained in their own places, were taken up, and being joined together, contained an anſwer to the queſtion. Potter. Arch. Græc. lib. ii. cap. 18. tom. i.

BOTONTINI, in *Middle Age Writers*, denote mounts or hillocks, raiſed to ſerve as land-marks or boundaries of grounds.

The word is alſo written *botontones*, *botones*, and *bodones*. Du-Cange Gloſſ. Lat.

BOTOTOE, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a very beautiful bird of the parrot kind; it is ſomewhat ſmaller than the common parrot, and is all over of a fine deep blue colour.

BOTRYITES, in *Natural Hiſtory*, a ſtone of the gem kind, reſembling a branch of young grapes.

The word is formed from βοτρυς, a *grape*. In Engliſh writers, it is ſometimes called the *grape-ſtone*.

BOTYRITES, or BOTRITES, alſo denotes a ſort of burnt CADMIA, found ſomewhat in the form of a bunch of grapes adhering to the upper parts of furnaces, where that mineral is calcined.

It differs from the *placites*, which is that gathered on the lower part of the furnace; though Schroder gives a different diſtinction, viz. into *botrites*, found in the middle of the furnace, *placites* in the upper, and *oſtracites* in the loweſt part.

BOTT, among *Bone-lace Weavers*, a kind of round cuſhion of light matter placed on the knee, whereon they work or weave their LACE with bobbins, &c.

Among the French, the *bott*, called *oreiller*, is a little ſquare wooden frame or deſk, covered ordinarily with green ſtuff.

BOTTLE, a ſmall veſſel proper for holding liquors.

The word is formed from *butellus*, or *botellus*, uſed in barbarous Latin writers, for a leſſer veſſel of wine; being a diminutive of *bota*, which denoted a butt or caſk of that liquor.

We ſay a glaſs *bottle*, a ſtone *bottle*, a leathern *bottle*, a wooden *bottle*, a ſucking *bottle*.

The ancient Jewiſh *bottles* were cags made of goats or other wild beaſts ſkins, with the hair on the inſide, well ſewed and pitched together; an aperture in one of the animal's paws ſerving for the mouth of the veſſel. Calmet. Dict. Bib. tom. i. p. 323.

Glaſs *bottles* are better for cyder than thoſe of ſtone. Foul glaſs *bottles* are cured by rolling ſand or ſmall ſhot in them; muſty *bottles*, by boiling them. See GLASS.

Bottles are chiefly made of thick coarſe glaſs; though there are likewiſe *bottles* of boiled leather made and ſold by the caſe-makers.

Fine glaſs *bottles* covered with ſtraw or wicker, are called *flaſks* or *bettees*.

The quality of the glaſs has been ſometimes found to affect the liquor in the *bottle*. Mem. Acad. Scienc. 1704.

BOTTLE is alſo a meaſure at Amſterdam, the ſame with the MINGLE.

BOTTLE-*flower*, in *Botany*. See CENTAURY.

BOTTLE-*head*, a ſpecies of whale.

BOTTLE-*noſe*, in *Zoology*, a name by which the people in ſome parts of England call the *anas arctica Cluſii*.

BOTTLING, or BOTTELING, the operation of putting up liquors in bottles corked, to keep, ripen, and improve.

The writers on good huſbandry give divers rules concerning the *bottling* of beer, cyder, and the like. The virtues of Spaw, Pyrmont, Scarborough, and other waters, depend on their being well bottled and corked, otherwiſe they loſe both their taſte and ſmell. To preſerve them, it is neceſſary the bottles be filled up to the mouth, that all the air may be excluded, which is the great enemy of bottled liquors. The cork is alſo further ſecured by a cement. Some improve their bottled beer, by putting cryſtals of tartar and wine, or malt ſpirits; and others, by putting ſugar boiled up with the eſſence of ſome herb, and cloves, into each bottle.

Cyder requires ſpecial precautions in the *bottling*; being more apt to fly, and burſt the bottle, than other liquors. The beſt way to ſecure them, is to have the liquor thoroughly fine before it be bottled. For want of this, ſome leave the bottles open a while, or open them after two or three days *bottling*, to give them vent. If one bottle break, through fermentation, it is beſt to give them all vent, and cork them up again. Mean cyder is apter to break the bottles than rich. Some ſoak the corks in ſcalding water, to render them more pliant and ſerviceable. See CYDER.

Another particular to be obſerved is, to lay the bottles ſo as that the liquor may always keep the cork wet and ſwelled. Something alſo depends on the place where the bottles are ſet, which ought to be ſuch as expoſes them as little as poſſible to the alterations and impreſſions of the air: the ground is better for this purpoſe than a frame; ſand better than the bare ground, and a running water, or a ſpring often changed, beſt of all.

To haſten the ripening of bottled liquors, they are ſometimes ſet in a warm place, or even expoſed to the ſun, when a few days will bring them to maturity.

BOTTOM, the loweſt part of a thing, as contradiſtinguiſhed from the top.

Hydroſtatical writers ſpeak of the preſſure of fluids, on the *bottom* of veſſels; in which caſe, the law of gravitation is, that the altitude remaining the ſame, the preſſure will be as the *bottom*. M. Leibnitz has aſſerted, that a body in falling through a fluid, does not preſs on the *bottom*, that is, does not encreaſe the preſſure on it; which is found to be falſe. Phil. Tranſ. Nº 351. p. 570. A. D. S. an. 1692. p. 16.

When water boils, the *bottom* of the veſſel is found conſiderably colder than it was ſome time before boiling; inſomuch that the hand may bear it in the former caſe, not in the latter. Hiſt. Ac. Sc. ann. 1703. p. 29.

BOTTOM, in *Navigation*, denotes the ground or ſurface of the earth under the water.

They ſay, a rocky, ſandy, gravelly, clayey *bottom*; a *bottom* with good hold, with a bad hold, &c.

The *bottom* of the ſea, Ray obſerves, is level, i. e. the deſcent from the ſhore to the deep is equable and uniform: but the *bottoms* of ſome ſeas are found higher than of others. Count Marſigli has made divers enquiries into the ſtructure of the *bottom* of the ſea, and its beds of ſtones, ſalt, bitumen, &c. Ray, Wiſd. of Creat. part i. p. 84.

Over the natural *bottom* of the ſea is formed an accidental *bottom*, by the mixture of different matters, ſand, ſhells, mud, &c. ſtrongly compacted by the glutinous quality of the ſea-waters, almoſt to a degree of petrefaction. Theſe incruſtations being neceſſarily formed in *ſtrata*, there are ſome places wherein the fiſhermen can diſtinguiſh the annual augmentations. Hiſt. Acad. Sc. 1710.

BOTTOM *of a ſhip*.—Merchant ſhips are much broader *bottomed* than frigates; men of war are a mean between the two. Sir William Petty preſented the model of a double *bottomed* ſhip.

BOTTOM is alſo uſed to denote the whole ſhip, or other veſſel.

In this ſenſe we ſay, Engliſh *bottoms*, foreign *bottoms*. By the act of navigation, certain commodities imported in foreign *bottoms*, pay a duty called petty cuſtom; from which they are exempt, if imported in Engliſh *bottoms*.

BOTTOM is alſo uſed for what remains at the *bottom* of a veſſel. In this ſenſe, Paracelſus calls the ſediment of urine, *fundus urinæ*.

BOTTOM-*ſtone*, a kind of iron-ſtone, or ore, in the Staffordſhire mines.

BOTTOM-*nails*. See NAIL.

BOTTOMRY, in *Navigation* and *Commerce*, the act of borrowing money on a ſhip's *bottom*; that is, by engaging the veſſel for the repayment of it, ſo as that, if the ſhip miſcarry, the lender loſes the money advanced; but if it arrives ſafe at the end of the voyage, the borrower is to repay the money lent with a certain premium or intereſt agreed on; and this on pain of forfeiting the ſhip. See ASSURANCE and POLICY.

The rate or intereſt of money, taken on *bottomry*, follows that of inſurance. In queen Anne's war, when inſurance to the Eaſt Indies and back was 16 *per cent. bottomry* was 45 *per cent.* And in king William's war, when inſurance to the ſame place was 22 *per cent. bottomry* was 55.

Bottomry, if conſidered only as hiring money, would be illegal, and fall under charge of uſury, on account of the exceſſive intereſt: but it is not a mere hiring of money, ſince the lender likewiſe ſtands to the hazard of the voyage. The money here advanced is called *pecunia trajectitia*, as being carried on the lender's hazard, or adventure, beyond the ſeas; ſo that, if the ſhip be loſt, the lender loſes all; whereas, when money is lent at intereſt, it is delivered at the peril of the borrower. And the profit here is merely the price of the loan; but the profit of the other is a reward for the danger and adventure of the ſea, which the lender takes on himſelf, and makes the intereſt lawful.

If money be lent on ſhip-board by a merchant or paſſenger, and before the day of payment the ſhip happens to be caſt away; if there be ſuch a ſaver as will admit of a contribution, the party lending is not to have his whole money, but it ſhall come into the average; becauſe if that money had been ſo lent, it would have been in common danger with the reſt: but, if the time appointed were paſt, before the misfortune happened, then the borrower muſt repay the lender his whole money, free from contribution. Therefore by the maritime laws, in caſe the borrower detains any money thus lent, beyond the appointed time for the repayment, he ſhall at his return from the voyage, not only pay the profit agreed on before, but be obliged alſo to augment the ſame, according to the longer time accrued ſince the day of payment.

A maſter of a ſhip hath no power to take up money on *bottomry* in places where his owners dwell, unleſs he is a part owner, and in that caſe he may take up ſo much only, as his part will anſwer in the ſaid ſhip: for if he exceeds that, his own eſtate ſhall ſtand liable to make ſatisfaction. But when a maſter is in a ſtrange place, where he hath no owners, nor any goods of theirs or of his own; and for want of money, which he cannot procure by exchange or otherwiſe, his voyage might be retarded, there money may be taken upon *bottomry*, and all the owners are liable for it; that is, they are anſwerable by their veſſel, but not in their perſons, by the act of the maſter: and the owners may have their remedy againſt ſuch maſter, whom they put in truſt.

When a maſter or owner of a ſhip takes up money on *bottomry*, and buys in lading, but endeavours to defraud the prince or ſtate of their cuſtoms, or puts ſuch goods on board as incur a forfeiture of the ſhip; in ſuch caſe the borrower only runs the hazard, not the lender. And where bonds or bills of *bottomry* are ſealed, and the money is paid, if the ſhip receives injury by ſtorm, fire, enemy, or any other accident, before the commencement of the voyage; then the perſon borrowing ſhall only run the hazard, unleſs it be otherwiſe provided, by particular words, that the contract is to have its beginning from the time of the ſealing. But if the condition be, that if ſuch ſhall ſail from London to a port abroad, and ſhall not arrive there, &c. then, &c. here the contingency begins not until the departure.

BOTTOMRY, *bill of*, is a contract between two perſons, the one borrowing, and the other lending a ſum of money, by which the borrower ſetting forth his intention to make a voyage in a certain ſhip therein named, acknowleges the receipt of a certain ſum of money from the lender, on this condition, that if the ſhip does happily perform her voyage, without any diſaſter by enemies or otherwiſe, then he is to reſtore that ſum to the lender, with an additional ſum, therein expreſſed, for the intereſt, within a certain time after his return; but that if the ſhip be loſt, or taken by enemies or pirates, then the perſon of the borrower to be for ever diſcharged, and the lender to bear the loſs.

BOTTONY, or BOTONE, in *Heraldry*, is uſed in ſpeaking of a CROSS, which terminates at each end in three knots or buttons, reſembling, in ſome meaſure, three-leaved graſs.

A *croſs bottony*, is the ſame with what Segion terms *croix trefflée*; and Baron, *globoſa crux*. Gibbon, the better to explain the form, renders it, *Crux ad ſingulas ejus extremitates in tres gemmas, vel nodos, pro trifolii ſpecie terminata*. He bears argent a croſs *bottony* ſable, by the name of *Winwood*. Vid. *Tab. Herald. fig.* 11.

BOTTRYS, in *Botany*, a name given to a ſpecies of the *chenopodium*. See GOOSE-*foot*.

BOTRYTIS, in *Botany*. See BYSSUS.

BOTTS, in *Zoology*, a ſpecies of worms which infeſt horſes and other cattle. See HORSE-*worms*.

The name is alſo given to a ſort of grubs which deſtroy the graſs in bowling-greens, &c.

BOVATA *terræ*, in *Ancient Law-writers*, ſignifies an oxgate of land, or ſo much as may be ploughed in a year with one ox; by ſome reckoned at fifteen acres, by others at eighteen, by others at twenty, and by others at thirteen or twenty ſhillings yearly rent.

This is otherwiſe called *bovatus*, and *bovariata terræ*.

BOVEY *coal*. See COAL.

BOUCHE *of court*, the privilege of having meat and drink at court ſcot-free.

The word is alſo written *bowge, bouge,* and *budge*; it is mere French, where it ſignifies *mouth.*—The French ſtill uſe the phraſe, *Avoir bouche à la cour*; that is, *to have table or diet at court.*

This privilege is ſometimes only extended to bread, beer, and wine: it was a cuſtom anciently in uſe, as well in the houſes of noblemen as in the king's court.

Thomas earl of Lancaſter retained Sir John de Ewre, to ſerve him with ten men at arms in time of war, allowing them *bouge of court*, with livery of hay and oats, horſe-ſhoes and nails. Sir Hugh Merrill had the ſame privilege for life, on condition of ſerving king Edward II. Kennet. Gloſſ. ad Paroch. Ant. p. 378.

BOUDS, a name given in ſome countries to the WEEVILS.

BOUGE-*ravel*, in *Zoology*, the name of a fiſh of the BOOPS kind, caught in the Mediterranean, and brought to ſome of the Italian markets. Its noſe is long and pointed; its back is of a reddiſh blue, its tail red, and its belly of a fine ſilvery white. Its whole body is ſhorter and broader than the common kind of *boops* Willughby.

BOUGH, in *Antiquity.*—Green *boughs* made part of the decoration of altars and temples, eſpecially on feſtival occaſions.

Oaken *boughs* were offered to Jupiter; thoſe of laurel to Apollo; of olive to Minerva; myrtle to Venus; ivy to Bacchus; pine to Pan; and cypreſs to Pluto.

BOUGEOIR, the French name for wax candleſticks.

BOUGIE, in *Surgery*, a kind of large medicated tent, worn in the urethra, for the cure of a gonorrhœa, &c.

There was no occaſion for *bougies* till towards the middle of the ſixteenth century, when the *gonorrhœa virulenta* appeared as a ſymptom of the *lues venerea.* An. 1551, Andreas Lacuna of Caſtile, publiſhed at Rome, in twelve pages, the Method of knowing and extirpating Caruncles in the Neck of the Bladder, which he owns he learned from a Portugueſe quack of the name of Philippus; he believed him to be the inventor of the *bougies* ſo employed, and that he had cured ſome people of faſhion in Rome by means of them. Dr. Fordyce. See Review of the Venereal Diſeaſe, Edit. 3. and Dr. Aſtruc, &c. De Morbis Ven. 2d Edit. 4to. Lat. Par. an. 1740.

The properties requiſite in the *bougie*, are a ſufficient degree of firmneſs, that it may be introduced with ſome force; a ſuppleneſs and tenacity, that it may conform to the motions of the body without breaking; a lenient ſuppurative diſpoſition, to bring on a diſcharge without pain; and laſtly, a ſmoothneſs of ſurface, that it may not only be introduced with more eaſe, but that it may lie eaſy in the paſſage, until it begins to diſſolve.

The beſt baſis of ſuch a *bougie*, is *diachylon ſimplex*, which may be rendered efficacious by a great variety of mixtures; but though an addition of certain gums, or of the mucilage plaſter, will alone anſwer the purpoſe in ſome diſorders of the urethra; yet, as a long uſe of mercurial applications is almoſt a ſpecific for venereal ulcers, and has alſo a powerful effect on every other ſpecies of ſtubborn ulcers, our experiments are naturally directed to mercurial preparations.

Perhaps we may diſcover hereafter the due proportion of quickſilver to the plaſter; at preſent, half an ounce to every ounce of plaſter, renders it much more mercurial than any plaſter now in uſe. The *diachylon* muſt be made with oil, and a little *pix Burgundica* added to it, that it may be ſufficiently tenacious: to every ounce of plaſter, it is proper to add two drams of crude antimony, finely levigated, which greatly conduces to the ſmoothneſs and good conſiſtence of the *bougie*; beſide that it may poſſibly have other virtues. Upon this plan the preſcription ſtands thus:

> Diach cum pice Burgund. ℥ii.
> Argent. viv. ℥i.
> Antim. crud pulv. ℥ß.

The quickſilver, whether it be divided in balſams, ſulphur, or honey, muſt not be put into the plaſter until the moment before the *bougies* are made; nor muſt the plaſter be boiling hot at that time, leſt by the heat the quickſilver ſhould ſeparate from the body it is divided in, and fall down to the bottom in form of globules. When the quickſilver is mingled with the plaſter, moderately hot, ſlips of fine rag muſt lie ready to dip in the compoſition. Theſe ſlips muſt be of different lengths, from ſix to nine or ten inches, and about three inches broad; roll them up looſely, and taking hold of one extremity with the left hand, let it fall upon the ſurface of the plaſter, and then draw it out gently. As it is drawn out it will unroll, and take up a quantity of plaſter on the ſurface, equal to the thickneſs of a ſilver groat; though to facilitate the unrolling of the rag, it will be proper to aſſiſt its motion with the end of the *ſpatula*, or ſome other inſtrument. The plaſter, however, muſt be hot enough to ſoak through, and diſcolour the rag, otherwiſe it will not make ſo good a *bougie*.

If the cloth be exactly three inches broad, it will make ſix *bougies* of a moderate ſize; but their ſize may be ſuited to the occaſion. It is generally adviſeable that the *bougie* ſhould be ſmaller at the end which is introduced through the ſtrictures, than at that which is left out at the *penis.* For that purpoſe many cut off a part of the oblong ſquare before mentioned, in ſuch manner as to reduce it almoſt into the ſhape of a long right angled triangle: but as this way of cutting it weakens the *bougie* exceedingly, and as it is not at all neceſſary that the *bougie* ſhould be taper from one extremity to the other, it is much better to cut off a little ſlope of about an inch and a half long from the end that is to be paſſed into the urethra, which will leſſen it where it is neceſſary to be ſmall, and leave it ſtrong in the other part, where the diminution is not neceſſary.

The plaſter taken up by the cloth, when dipped, will have little bubbles upon its ſurface, and not be ſo ſmooth as if it had been ſpread: therefore an iron *ſpatula* a little warmed, may be paſſed over the plaſter before it be cut into *bougies*, which will render it more compact and even. It is a much more exact and ſpeedy method to cut the *bougies* off with a knife and ruler, than with ſciſſars. When they are rolled up, it muſt be with that ſide outward which is covered with plaſter; and they muſt firſt be rolled by hand as cloſe as poſſible, before they are rolled upon a board or marble; for upon this circumſtance the neatneſs of the *bougie* depends.

BOUILLON, among *Farriers*, a lump or excreſcence of fleſh, growing either on or juſt by a horſe's fruſh, and making him halt.

BOVINA *affectio.* See AFFECTIO.

BOVISTA, in *Botany*, a term uſed by ſome authors to expreſs puff-ball, or duſty muſhrooms. which are ſometimes vulgarly called the devil's ſnuff-boxes.

BOULCOLACA, among the modern Greeks, denotes the ſpectre of ſome wicked perſon who died excommunicated by the patriarch, re-animated by the devil, and cauſing great diſturbance among the people; of which many ſtrange ſtories are told.

The word is Greek, and is ſometimes written βρȣκολακος, *broukolakos*; and ſuppoſed to be derived from βȣρκος, or βȣρκα, *mud*, and λακκος, a *ditch*, on account of the filthineſs of the ſight.

BOULDER-*walls*, a kind of walls built of round flints or pebbles, laid in a ſtrong mortar; uſed where the ſea has a beach caſt up, or where there are plenty of flints.

BOULIMY, in *Medicine.* See BULIMY.

BOULINIS, or BOULIGNIS, a copper coin ſtruck at Bologna in Italy, equivalent to the BAIOCCO.

BOULTINE, or BOLTEL, in *Architecture*, the workman's term for a convex moulding, whoſe periphery is juſt ¼ of a circle placed next below the plinth, in the Tuſcan and Doric capitals.—See *Tab. Archit. fig.* 5.

BOULUKE, in the *Military Orders of the Turks*, a body of the janizaries, with an officer in the place of a colonel at their head, ſent upon ſome particular enterprize; they are ſelected out of the body for this, and, as ſoon as the buſineſs is over, are received again into their former companies.

BOUNCE, in *Ichthyology*, a name given by the people of the weſtern parts of England to a ſpecies of the SQUALUS, diſtinguiſhed by Artedi by the name of the reddiſh variegated *ſqualus*, with the *pinna ani* in the middle ſpace between the *anus* and tail. This is the fiſh called *ſcymnos* and *ſcylius* by the old writers, and CATULUS *major* by the later writers. The Italians call it *ſcorzone.*

BOUND, in *Dancing*, a ſpring from one foot to the other; by which it differs from a hop, where the ſpring is from one foot to the ſame. It alſo differs from a half *coupée*, as, in the latter, the body always bears on the floor, either on one foot or the other; whereas, in the *bound*, it is thrown quite from the floor.

BOUND-*maſonry.* See MASONRY.

BOUND, *hide.* See HIDE-*bound.*

BOUND, *hoof.* See HOOF-*bound.*

BOUND-*bailiffs.* See BAILIFF.

BOUNDS *of an eclipſe.* See ECLIPSE.

BOUNDS *of lands.* See ABUTTALS.

BOUNDARY-*column.* See COLUMN.

BOUNTY, in *Commerce*, denotes a premium paid by the government to the exporters of certain commodities, on their taking oath, or in ſome caſes, giving bond, not to reland the ſame in England.

There are divers *bounties* ſettled by act of parliament, as a *bounty* of one penny *per* ell on the EXPORTATION of Britiſh ſail-cloth; and the like on ſilk ribbands and ſtuffs, on ſilk ſtockings, on fiſh and fleſh, on gold and ſilver lace of Britiſh manufacture; and on ſeveral ſpecies of corn, when not exceeding certain prices, at the port of exportation.

BOUNTY, *Queen Anne's*, for augmenting poor livings under 50*l. per annum*, conſiſts of the produce of the firſt-fruits and tenths, after the charges and penſions payable out of the ſame are defrayed. A corporation for management of the ſame was ſettled, &c. in 1704. See AUGMENTATION.

BOURDIN, with the epithet *grand*, a name given by Bellonius to a genus of univalve ſhell-fiſh, commonly known among authors by the name of *auris marina*. See EAR-*ſhell*.

BOURDONNE', in *Heraldry*, is underſtood of a croſs, whoſe extremities are turned round like the ends of a pilgrim's ſtaff; more frequently called *pommeté*, *globatus*.

BOURGER-*meſters*. See BURGHER-*maſters*.

BOURGUIGNOTTE, a defenſive weapon wherewith to cover the head; being a kind of caſk, open before, and proof againſt either pike or muſket: its name aroſe from the *Bourguignons*, who firſt introduced it.

BOURIGNONISTS, a name given the followers of Antoinette Bourignon, who ſet up a kind of QUIETISM in the Low Countries; pretending to be guided by an immediate revelation.

BOURREE. See BOREE.

BOUSTROPHEDON, in *Literature*, is uſed in ſpeaking of the ancient method of writing among the Greeks, wherein the lines were continued forwards and backwards, like the furrows in ploughing.

The word is compounded of βυς, *bullock*, and ϛρεφω, *I turn*.

Pauſanias mentions ſeveral ancient inſcriptions written in this manner: the laws of Solon are alſo ſaid to have been thus written; which, as the author laſt cited explains it, is when the ſecond line is turned on the contrary ſide, beginning at the end of the former, thus:

ΕΚ ΔΙΟΣ ΑΡ
VΘΞƎWUX

Potter. Arch. Græc. lib. i. cap. 26. tom. i.

BOUTADE, in *Muſic*, an irregular flight or movement, without art or ſtudy.

The word was alſo formerly uſed for a *ſolo* on the *viol di gamba*, thus called as being ſuppoſed to be extemporary.

Richelet ſpeaks of a dance called *boutade*, invented by the famous Bocan, in the reign of Lewis XIII. ſo called from the briſk humorous manner of its beginning; but now out of uſe.

BOUTAEL, in *Zoology*, the name of an Eaſt Indian fiſh, of the LAMPREY kind, called alſo *neegen oogen*, and, by Mr. Ray, *lampetra Indica*. It is caught in lakes, ponds, and other ſtanding waters, and is a very wholeſome and well-taſted fiſh.

Its general deſcription ſeems to make it rather of the *muſtela* than the *lampetra* kind; but if, as its name expreſſes, it has ſeveral apertures for the gills, its Dutch name ſignifying nine eyes, it is abſolutely a new GENUS of fiſhes.

BOUTANT, in *Architecture*.—An *Arc*-BOUTANT is an arch or buttreſs, ſerving to ſuſtain a vault; and which is itſelf ſuſtained by ſome ſtrong wall, or maſſive pile.

The word is French, and comes from the verb *bouter*, *to but*, or *abut*.

A pillar BOUTANT is a large chain or pile of ſtone, made to ſupport a wall, terrace, or vault.

BOUTE, in the *Manege*. A horſe is called *bouté*, when his legs are in a ſtrait line from the knee to the coronet; ſhort-jointed horſes are moſt apt to be *bouté*.

BOUTS-*rimes*, a popular term in the French poetry; ſignifying certain *rhymes*, diſpoſed in order, and given to a poet together with a ſubject, to be filled up with verſes ending in the ſame words, and the ſame order.

The invention of the *bouts-rimes* is owing to one Du Lot, a poet, in the year 1649. In fixing the *bouts*, it is uſual to chooſe ſuch as ſeem the remoteſt, and have the leaſt connexion.

Some good authors fancy, that theſe rhymes are of all others the eaſieſt, that they aſſiſt the invention, and furniſh the moſt new thoughts of all others. Sarraſin has a poem on the defeat of the *bouts-rimes*.

The academy of Lanterniſts at Tholouſe have contributed towards keeping in countenance the *bouts-rimez*; by propoſing each year a ſet of fourteen, to be filled up on the glories of the grand monarque: the victorious ſonnet to be rewarded with a fine medal.—An inſtance hereof may be given in the following one, filled up by P. Commire.

Tout eſt grand dans le roi, l'aſpect ſeul de ſon buſte
Rend nos fiers ennemis plus freids que des glaçons.
Et Guillaume n' attend que le tems des moiſſons,
Pour ſe voir ſoccomber ſous un bras ſi robuſte.
Qu'on ne nous vante plus les miracles d' Auguſte;
Louis de bien regner lui feroit des leçons:
Horace en vain l'egale aux dieux dans ſes chanſons:
Moins que mon heros il étoit ſage & juſte, &c.

BOUVIERA, in *Zoology*, a name given by ſome to a ſmall, broad, and flat freſh-water fiſh, called more uſually BUBULCA.

BOW, *Arcus*, a weapon of offence made of wood, horn, or other elaſtic matter, which, after being ſtrongly bent, by means of a ſtring faſtened to its two ends, in returning to its natural ſtate, throws out an arrow with great force.

It is alſo called the *long-bow*; by way of diſtinction from the *croſs-bow*, or *arbalet*.

The *bow* is the moſt ancient, and the moſt univerſal of all weapons. It has been found to obtain among the moſt barbarous and remote people, and who had the leaſt communication with the reſt of mankind.

The uſe of the *bow* and arrow was firſt aboliſhed in France under Lewis XI. in 1481, and in their place was introduced the Swiſs ARMS, that is, the halbard, pike, and broad-ſword.

The *long-bow* was formerly in great vogue in England; moſt of our victories in France were acquired by it; and many laws were made to regulate and encourage its uſe. The parliament under Henry VIII. complain, "of the "diſuſe of the *long-bow*, heretofore the ſafe-guard and "defence of this kingdom, and the dread and terror of "its enemies." 33 Hen. VIII. cap. 6.

By this act, all men under ſixty years of age, are commanded to exerciſe ſhooting with *long-bows*, and to have a *bow* and arrows always ready. Children from ſeven years old to ſeventeen, are alſo enjoined to be bred up in ſhooting. Servants were not excuſed, but to be ſupplied with a *bow* by their maſters, and the price to be deducted out of their wages. Aliens were forbid the uſe of the *long-bow*, without a ſpecial licence from the king.

The art of uſing *bows* is called ARCHERY, and thoſe practiſed therein, ARCHERS, or *bowmen*.

The two ends or extremities of a *bow*, to which the ſtring is faſtened, are called its horns, *cornua*.

The ſtrength of a *bow* may be calculated on this principle, that its SPRING, i. e. the power whereby it reſtores itſelf to its natural poſition, is always proportionate to the diſtance or ſpace it is removed therefrom.

The moſt barbarous nations often excel in the fabric of the particular things which they have the greateſt neceſſity for in the common offices of life. The Laplanders, who ſupport themſelves almoſt entirely by hunting, have an art of making *bows*, which we, in theſe improved parts of the world, have never arrived at.

Their *bow* is made of two pieces of tough and ſtrong wood, ſhaved down to the ſame ſize, and flatted on each ſide; the two flat ſides of the pieces are brought cloſely and evenly together, and then joined by means of a glue made of the ſkins of pearch, which they have in great plenty, and of which they make a glue ſuperior in ſtrength to any which we have.

The two pieces, when once united in this manner, will never ſeparate, and the *bow* is of much more force to expel the arrow, than it could poſſibly have been under the ſame dimenſions, if made of only one piece.

Among the ancients, the *bow*-ſtring, called τριχωσις, was made of horſes hair, and hence alſo called ιππεια; though Homer's *bow*-ſtrings are frequently made of hides cut into ſmall thongs; whence τοξα βοεια. The uppermoſt part of the *bow* to which the ſtring was faſtened, was called κορωνη, being commonly made of gold, and the laſt thing towards finiſhing the *bow*. The Grecian *bows* were frequently beautified with gold or ſilver; whence we have mention of *aurei arcus*; and Apollo is called Αργυροτοξος. But the matter of which they were ordinarily compoſed, ſeems to have been wood; though they were anciently, Scythian like, made of horn, as appears from that of Pandarus in Homer. Iliad. δ. v. 105. Potter. Arch. Græc. tom. ii. cap. 4.

There are two kinds of *bows*, different in ſtructure and manner of uſe, viz. 1. The common or long *bow* among us, beſt made of Spaniſh or Engliſh yew, ſometimes of withen or elm, which is inferior to the former; the ſhaft is made of birch or brazil, with grey or white feathers. 2. The croſs-*bow*, chiefly uſed when, through any imbecility of the arm or back, the former cannot be managed.

The invention of the *bow* is uſually aſcribed to Apollo, and was firſt communicated to the primitive inhabitants of Crete, who are ſaid to have been the firſt of mortals who underſtood the uſe of *bows* and arrows. And hence, even in latter ages, the Cretan *bows* were famous, and preferred by the Greeks to all others. Some, however, rather chooſe to honour Perſes, the ſon of Perſeus, with the invention of the *bow*; while others aſcribe it to Scythes, ſon of Jupiter, and progenitor to the Scythians, who were excellent at this art, and by many reputed the firſt maſters of it. From them it was derived to the Grecians, ſome of whoſe ancient nobility were inſtructed by the Scythians in the uſe of the *bow*, which in thoſe days paſſed for a moſt princely education. It was firſt introduced into the Roman army, in the ſecond Punic war. Potter. Arch. Græc. tom. ii. lib. iii. cap. 4. Aquin. Lex. Milit. tom. ii. p. 260.

The Indians ſtill retain the *bow*. In the repoſitory of the Royal Society, we ſee a Weſt Indian *bow* two yards long.

The Scythian *bow* was famous for its incurvation, which diſtinguiſhed it from the *bows* of Greece and other nations; being ſo great as to form an half-moon, or ſemicircle: whence the ſhepherd in Athenæus, being to deſcribe the letters in Theſeus's name, and expreſſing each of them by ſome appoſite reſemblance, compares the third to the Scythian *bow*; meaning not the more modern character Σ, but the ancient C, which is ſemicircular, and bears the third place in ΘHCEVC.

Bow, *croſs*, is alſo called ARBALET; which word is derived from *arbaliſta*, i. e. *arcubaliſta*, a *bow with a ſling*.

The *arbalet* conſiſts of a ſteel-bow, ſet in a ſhaft of wood, furniſhed with a ſtring and a trigger; and is bent with a piece of iron fitted for that purpoſe.—It ſerves to throw bullets, large arrows, darts, &c.

The ancients had large machines uſed for throwing many arrows at once, called *arbalets*, or BALLISTÆ.

Bow, in *Muſic*, denotes a machine that ſerves to play, or give the ſound to VIOLS, VIOLINS, and other inſtruments of that kind, by drawing it gently over the ſtrings thereof.

The *bow* conſiſts of three parts; the firſt is the ſtick, or wood, to which the hair is faſtened; the ſecond is compoſed of about eighty or an hundred horſe-hairs, or filaments of ſilk; the third is the nut, a ſort of half wheel, which ſerves to keep the hairs in the due degree of tenſion.

The ancients do not appear to have been acquainted with *bows* of hair: in lieu of theſe, they ſtruck their inſtruments with a PLECTRUM; over which our *bows* have great advantage, for giving long and ſhort ſounds, and other modifications, which a plectrum cannot produce.

Bow, in *Trade* and *Manufactures*, denotes a flexible inſtrument, conſiſting of a piece of ſteel or iron, to the two ends of which is faſtened a cat-gut, uſed by ſmiths, watchmakers, and other artificers, for the piercing and turning of divers ſorts of works.

This is more peculiarly called a DRILL-*bow*.

It is ſometimes alſo made of wood, whalebone, and the like.

Operators in moſaic have a ſort of *bow* made of a piece of elaſtic wood, with a braſs wire faſtened to the ends of it, which ſerves to ſaw hard and precious ſtones.

Letter-caſters have alſo a *bow*, wherewith to keep the *matrix* even. See FOUNDERY.

Bow, among *Builders*, denotes a beam of wood, or braſs, with three long ſcrews, that govern or direct a lath of wood or ſteel to any arch; chiefly uſed in drawing draughts of ſhips, and projections of the ſphere, or wherever it is requiſite to draw large arches.

Bow is alſo the name of an inſtrument formerly uſed at ſea for taking the ſun's altitude; conſiſting of a large arch of 90 degrees graduated, three vanes, a ſhank or ſtaff, a ſhade-vane, a ſight-vane, and an horizon-vane.—But it is now out of uſe.

Bow-*bearer*, an under-officer of the foreſt, who is to obſerve and take notice of all manner of treſpaſs againſt vert or veniſon; and to attach, or cauſe to be attached, the offenders, in the next court of attachment.

Bow-*cap*, among *Botaniſts*, one of the forms or poſitions of the LEAVES of FLOWERS, wherein the leaves are laid ſomewhat converſely over each other, but not plaited.

Bow-*compaſs*. See COMPASS.

Bow-*dye*, a new kind of ſcarlet red, ſuperior to madder; but inferior to the true ſcarlet grain for fixedneſs and duration. It was brought into England, and firſt practiſed at the village of Bow, near London, by Kephler, a Dutchman, in the year 1643.

Bow *of the gills*, a term uſed by ſome *Ichthyologiſts*, to expreſs the convex part of each GILL, each being a long ſemicircle, terminated by many *laminæ*, which form what is called the *leaf*.

Bow-*grace*, in the *Sea Language*, a frame or compoſition of old ropes, or junks of cables, uſed to be laid out at the *bows*, ſtems, and ſides of ſhips, to preſerve them from great flakes of ice, chiefly when they ſail in high north or ſouth latitudes.

Bow-*net*, or *wheel*, an engine for catching fiſh, chiefly lobſters and craw-fiſh, made of two round wicker-baſkets, pointed at the end, one of which is thruſt into the other; at the mouth is a little rim, four or five inches broad, ſomewhat bent inwards. It is alſo uſed for catching ſparrows.

Bow, *rain*. See RAIN-*bow*.

Bows *of a ſaddle*, are two pieces of wood laid archwiſe, to receive the upper part of a horſe's back, to give the ſaddle its due form, and to keep it tight.

The fore-*bow*, which ſuſtains the pommel, is compoſed of the WITHERS, the BREASTS, the POINTS or toes, and the CORKING.

The hind-*bow* bears the TROUSSEQUIN, or quilted roll.

The *bows* are covered with ſinews, that is, with bulls pizzles beaten, and ſo run all over the *bows*, to make them ſtronger. They are likewiſe ſtrengthened with bands of iron, to keep them tight. It is on the lower ſide of the *bows* that the ſaddle-ſtraps are nailed; the uſe of which is to make faſt the girths.

Bow *of a ſhip* is the rounding part of a ſhip's ſide forward, or that part of her which is broadeſt before: it begins at the place where the planks arch inwards, and compaſſing about towards the ſtem, ends where they cloſe at the ſtem or prow.

If a ſhip has a broad round *bow*, they call it *a bold* or *bluff bow*; if ſhe has a narrow thin *bow*, they ſay ſhe has *a lean bow*.

The proportioning of the *bow* is of great importance to the ſailing of the ſhip; it being this part that firſt breaks off the ſea, and on which is, in a manner, all the bearing of the ſhip. If the *bow* be too broad, the veſſel will not make her way eaſily through the water, but carry a great load of dead water before her; and if it be too lean or thin, ſhe will pitch or beat much into a hollow ſea, for want of breadth to bear her up.

Bouguer obſerves, that a *bow* which meets with the leaſt reſiſtance in a direct and oblique courſe, has alſo the additional property of driving the leaſt to leeward. Traité du Navire.

The piece of ordnance that lies in this place is alſo called the *bow-piece*; and the ANCHORS that hang there, are called her *great and little* BOWER.

Bow, *on the*, in the *Sea Language*, denotes an arch of the horizon, comprehended between ſome diſtant object, and that point of the compaſs which is right a-head, and to which the ſhip's ſtem is directed.

Bow-sprit, or Bolt-sprit, a kind of maſt in a veſſel, ſtanding foremoſt on the prow, and projecting ſlopeways over the ſtem: its lower end is faſtened to the partners of the fore-maſt, and farther ſupported by the fore-ſtay: it ſerves to carry the ſprit-ſail, ſprit-top-ſail, and jack-ſtaff.—*Vid. Tab. Ship. fig. 1. n. 124. fig. 2. n. 16.*

The *bow-ſprit* ſhould be two thirds of the length of the main-maſt, and its thickneſs equal to the mizen-maſt: when it is twelve fathoms five foot long, its yard muſt be eight fathoms two foot long; and the top-maſt of the *bow-ſprit*, three fathoms one foot.

To the *bolt-ſprit* are faſtened all the ſtays belonging to the fore-maſt, fore-top-maſt, and fore-top-gallant, &c. with their bowlines and jacks, beſides the riggings which belongs to its own ſails.

If a ſhip ſpends her *bolt-ſprit*, or, as the term is, if the *bolt-ſprit drop by the board*, the fore-maſt will quickly follow, if it be a rough ſea, eſpecially in ſailing by a wind.

Bow-*ſtaves*. See GARBLING *of Bow-ſtaves*.

Bow-*ſaw*. See SAW.

BOWELLING, *exenteratio*, the act of pulling out the intrails of an animal.

Bowelling makes part of the progreſs of EMBALMING.

BOWELLING is alſo a part of the puniſhment of traitors in England, who are to have their *bowels* ripped open, torn forth, and burnt before them. *Fractioni, ſuſpendio, decollationi, exenterationi, & quaterizationi adjudicavit.* Knyght. ſub Edw. II. in the ſentence of Hugh Spencer.

BOWER. See ANCHOR.

BOWER, in *Gardening*, a ſhady place, under covert of trees or branches interwoven.

A *bower* differs from an ARBOUR, in that the latter is always built long and arched, but a *bower* either round or ſquare at the bottom, and made with a ſort of dome or cieling at the top.

BOWER, *Lady's*, in *Botany*. See VIRGIN's *Bower*.

BOWET, or BOWESS, among *Falconers*, denotes a young hawk when ſhe draws things out of her neſt, and covets to clamber on the boughs.

BOWGE *of court*. See BOUCHE *of Court*.

BOWL, denotes either a ball of wood for the uſe of BOWLING; or a veſſel of capacity for holding liquors.

BOWL-*waſſel*. See WASSEL-*Bowl*.

BOWLDER-*ſtones*, a ſpecies of ſmall ſtones, of an indeterminate texture and figure, generally roundiſh, found on the ſhores of the ſea and banks of rivers.

Bowlders, or *bowlder*-ſtones, are only lumps and fragments of ſtones or marble, broken from the adjacent cliffs, and rounded by being bowled, and tumbling to and again by the action of the water; whence the name *bowlder*-ſtones, as being formed by an action like that of a bowl, and thereby reduced to the ſhape of one.

Neither the *bowlders* nor rubble ſtones are ever inveſted with an exterior ſtrong cruſt or ſkin: it is plain from the manner of their formation they cannot. This is one mark by which they are diſtinguiſhed from flints, pebbles, or the other native nodules, which were formed before the ſubſiding of the matter of the *ſtrata*, and are always covered with ſuch a cruſt or ſkin, unleſs it has been worn off.

BOWLING, or BOW-LINE, in *Sea-language*, a rope faſtened to the middle of the leech, or perpendicular edge of the ſquare ſails of a ſhip, ſerving to make the ſail ſtand ſharper or cloſer by a wind.

The *bow-line* is faſtened by two, three, or four ropes, called bridles, like a crow's foot, to as many parts of the ſail; only the mizen-*bow-line* is faſtened to the lower end of the yard.

The *bow-line* belongs to all ſails, except the ſprit-ſail, and ſprit-top-ſail; where it is omitted for want of room to hale it forwards by; and thence it is, that thoſe ſails cannot be uſed cloſe by a wind.

The ancients appear to have been acquainted with the uſe of the *bow-line*; which is the reaſon they always ſailed before the wind.

By means of this rope, a ſail may be drawn away, and the wind, when received ſideways, prevented from ſwelling it too much, which would hinder the ſhip's run inſtead of forwarding it: it alſo ſerves to hinder the wind from eſcaping or blowing by on the ſide they are drawn on.

The phraſes peculiar to this rope are; *ſharp the bow-line*; i. e. hale it taught, or pull it hard; *hale up the bow-line*, i. e. pull it harder forward on; *check, eaſe*, or *run up the bow-line*; i e. let it be more ſlack.

BOW-LINE *bridles*, are the ropes by which the *bow-line* is faſtened to the leech of the ſail.

BOW-LINE-*knot*, denotes a knot that will not ſlip, by which the *bow-line-bridle* is faſtened to the crengles.

BOWLING, among *Gameſters*, the act or art of throwing bowls.

Bowling, among us, is chiefly the name of a game or exerciſe, practiſed either in open places, as bares and *bowling-greens*, or in cloſe *bowling-alleys*.

The ſkill of *bowling* depends much on a knowledge of the ground, and the right choice of a bowl ſuitable to it: for cloſe alleys the flat bowl; for green ſwards plain and level, the bowl as round as a ball, is preferred.

The terms uſed in *bowling*, are, to *bowl wide*, which is when the bias does not hold, or is not ſtrong enough; *narrow*, when it is too ſtrong, or holds too much; *finely bowled*, is when the ground is well choſen, and the bowl paſſes near the block, even though it goes much beyond it; *bowling through*, or a *yard over*, is done in order to move the block; an *over bowl*, that which goes beyond it; a *bowl laid at hand*, is that put down within the gameſter's reach, to be in the way of the next bowler, and hinder his having the advantage of the beſt ground; *bowling at length*, neither *bowling* through nor ſhort; *a dead length*, a juſt or exact one; *throwing* or *flinging*, is diſcharging a bowl with a ſtrength purpoſely too great for a length, in order to carry off either the block or ſome near bowl; *bowl-room*, or *miſſing-wood*, is when a bowl has free paſſage, without ſtriking on any other; *get off*, is when a bowl being narrow, is wanted to be wider; *bowl beſt at block*, that neareſt the block; *drawing a caſt or bowl*, is to win it by *bowling* nearer, without ſtirring either the bowl or block; a bowl is ſaid to *rub*, when it meets with ſome obſtacle in the ground, which retards its motion, and weakens its force; *it is gone*, when far beyond the block.

Block ſignifies a little bowl laid for a mark, alſo called a JACK.

Mark, is a proper *bowling* diſtance, not under ſo many yards; and being at leaſt a yard and a half from the edge of the green.

Ground, a bag or handkerchief laid down to mark where a bowl is to go.

Lead, the advantage of throwing the block, and *bowling* firſt.

Caſt, is one beſt bowl at an end.

End, a hit, or when all the bowls are out.

The *game*, or *up*, is five caſts, or beſt bowls.

BOWLING-*green*, in *Gardening*, a kind of parterre in a grove, laid with fine turf, requiring to be frequently mowed, laid out in compartments of divers figures, with dwarf-trees, and other decorations.

Bowling-greens are of Engliſh origin, but have been adopted by the French and Italians, who have them only for ornament; being unacquainted with, or not fancying the exerciſe, on account of which they were firſt made in England.

BOWSE, a ſea-term, ſignifying as much as *hale*, or *pull* together.

Thus, haling upon a tack is called *bowſing upon a tack*; and when they would have the men pull all together, they cry, *bowſe away*.

Bowſe is chiefly uſed by the gunners when they hale upon their tackles, to thruſt a piece out of a port; in which caſe they cry, *bowſe hoa*, i. e. pull more upon the tackle; alſo when there is occaſion to pull more on the tackle than otherwiſe, they ſay, *bowſe upon the tackle*.

BOWYERS, artificers whoſe buſineſs is to make bows.

In which ſenſe, *bowyers* ſtand diſtinguiſhed from fletchers, who made arrows.

The *bowyers* company was incorporated in 1620, and conſiſts of a maſter, two wardens, twelve aſſiſtants, and thirty on the livery.

BOX, *Buxus*, in *Botany*, the *box-tree*; a genus of the *monoecia tetrandria* claſs of plants, the characters of which are theſe. It hath male and female flowers on the ſame plant; the male flowers having a three-leaved, and the female, a four-leaved empalement. The male flowers have two, and the female three, concave petals. The male flowers have four upright ſtamina, with the rudiment of a germen, but no ſtile or ſtigma: the female flowers have a roundiſh, blunt, three-cornered germen. The empalement afterward becomes a roundiſh capſule, ſhaped like an inverted pottage-pot, opening in three cells, each having two oblong ſeeds There are three ſpecies; the *box-tree* with oval leaves, the narrow-leaved *box*, and the dwarf, or Dutch *box*.

The two firſt ſorts have been frequently raiſed from ſeeds, and conſtantly produced plants of the ſame kinds with thoſe, from which the ſeeds were taken. The dwarf *box* will never riſe to conſiderable height with any culture; nor has it been ſeen to flower, where the plants have been encouraged to grow many years in the greateſt luxuriancy.

The ſeaſons for planting this are the autumn, and very early in the ſpring. And the beſt ſpecies for this purpoſe, is the dwarf Dutch *box*. The edgings of *box* are now only planted on the ſides of borders next walls, and not as was ſome time ſince the faſhion, all round borders or fruit-beds, in the middle of gardens, unleſs they have a gravel walk between them, in which caſe it ſerves to keep the earth of the borders from waſhing down on the walks in hard rains, and fouling the gravel.

In the laſt age, it was alſo a very common practice to plant borders, or edgings, of aromatic herbs, as thyme, ſavory, hyſſop, lavender, and the like: but theſe are all apt to grow woody, and to be in part, or wholly, deſtroyed in hard winters. Daiſies, thrift, or ſea-july-flower, and chamomile, are alſo uſed by ſome for this purpoſe; but they require yearly tranſplanting, and a great deal of trouble, elſe they grow out of form; and theſe are alſo ſubject to periſh in very hard ſeaſons.

Box is cultivated for the ornament of gardens, chiefly for hedges and borders, the ſmallneſs of its leaf making it cut very cloſe and even. Its wood is yellow, hard, cloſe, even, very heavy, and eaſily taking a poliſh: whence its uſe in making muſical inſtruments, combs, ſpoons, toothpick-caſes, and other Tunbridge ware. It does not ſwim in water, nor is it liable to rot or to be worm-eaten; whence its uſes for the axle-trees of wheels. It yields a chemical oil and ſpirit by diſtillation, of ſome uſe in medicine, and its decoction is by ſome held equal in virtue to *guaiacum*.

Among the ancients, the *box-tree* was conſecrated to Cybele, becauſe flutes were then made of its wood, as is done to this day. Pitiſcus imagines it was alſo ſacred to Bacchus, from a paſſage in Statius, *Cum Bacchia mugit buxus*; but without much foundation, the word *buxus* here only denoting flutes, as being the matter they were uſually made of; not that the tree was conſecrated to Bacchus.

The honourable Daines Barrington is of opinion, that it is not indigenous in Great Britain. See his paper on this ſubject, Phil. Tranſ. vol. lix. N° 5. an. 1769.

BOX-*tree, ſand, Hura*, in *Botany*, a genus of the *monoecia adelphia* claſs of plants. Its characters are theſe: it hath male and female flowers on the ſame plant; the male flowers have no petals, but a column of ſtamina, which are joined at bottom into a cylinder. The female flowers have a ſwelling empalement of one leaf, with one tubulous petal; the roundiſh germen is ſituated in the bottom of the empalement, which afterward becomes an orbicular ligneous fruit, depreſſed at top and bottom, having twelve deep furrows, with ſo many cells, which open at the top with an elaſticity, each containing one round flat ſeed. We know but one ſpecies of this genus, which grows naturally in the Spaniſh Weſt Indies. The fruit of this plant, if it remains on until it be fully ripe, will burſt in the heat of the day, with an exploſion like the report of a piſtol; by which the ſeeds are caſt round to a conſiderable diſtance: theſe ſeeds, when green vomit and purge, and are ſuppoſed to be ſomewhat akin to the *nux vomica*.

This fruit is by the inhabitants of the Weſt Indies cut open on the ſide where the footſtalk grew, and the ſeed carefully taken out; the ſhell is uſed as a ſtandiſh to contain ſand for writing, which gave occaſion for the name of *ſand-box* tree.

As this plant has ample leaves, which are of a beautiful green colour, it makes an agreeable variety among other tender exotic plants in the ſtove; for where they are kept warm, and duly refreſhed with water, they retain their leaves all the year in verdure. Miller.

Box-*tree*, African, *Myrſine*, a genus of the *pentandria monogynia* claſs of plants, the corolla of which has five petals; the filaments are joined to the top of the petals; and the capſule is muricated, and contains five cells, with a ſingle ſeed in each.

Box is alſo uſed to denote a caſe for holding things; of which there are ſeveral kinds, as a ſalve *box*, *pyxis unguentaria*, that uſed by ſurgeons to carry with them.

Box is ſometimes alſo uſed for a kind of meaſure, though variable according to the commodity. Thus the *box* of quickſilver contains from one to two hundred weight; of prunellas, about fourteen hundred; of rings for keys, two groſs, &c.

Box, *coach*, a place under the coachman's ſeat, wherein he puts what may be wanted for the ſervice of the coach or horſes.

Box, *dice*, a narrow deep cornet, channelled within, wherein the dice are ſhaken and thrown.

This anſwers to what the Romans called *fritillus*; whence *crepitantes fritilli*, and, in Seneca, *reſonante fritillo*. The ſame author alſo uſes *concutere fritillum*, figuratively for playing.

Beſides the *fritillus*, the Romans, for greater ſecurity, had another kind of *dice-box*, called *pyrgus*, and ſometimes *turricula* It was placed immoveable in the middle of the table, being perforated or open at both ends, and channelled alſo within: over the top was put a kind of funnel, into which the dice were caſt out of the *fritillus*; whence deſcending, they fell through the bottom on the table; by which all practiſing on them with the fingers was effectually prevented. For want of ſome contrivance of this kind, our ſharpers have opportunities of playing divers tricks with the *box*, as palming, topping, ſlabbing. Hyde. Hiſt. Nerdilud. § 5. p. 27, 28.

Box-*iron*, a kind of caſe wherein the heaters are incloſed for ironing linen.

Box-*money*, at *Hazard*, is that which is paid the box-keeper, or him who furniſhes the *box* and dice. Betters have the advantage over caſters, as they have no *box*-money to pay, which at long run would beggar the moſt fortunate player. Hence ſome gameſters will never caſt, to ſave the expence of *box*-money.

Box *of a plough*, a name by which the farmers call that croſs piece in the head of the plough, through which the ſpindle of the two wheels paſſes, and to which are faſtened the two crow-ſtaves, ſerving, by their holes, to regulate the height of the beam, the tow-chain below, the ſtake which ſupports the bridle-chain above, and the gallows behind, into which are fixed the wilds with the crooks of iron, for the drawing the whole plough along. This part of the plough is placed croſs-wiſe with the beam, and ſtands much below it, and not far from the ground.

Box, *ſtrong*, a coffer of iron, or of thick wood, ſecured with iron plates, and a lock with ſeveral bolts, difficult either to be opened or forced; chiefly uſed for putting money in.

Box, in *Zoology*, a name given by ſome authors to a ſmall fiſh caught in the Mediterranean, and more uſually known by the name of Boops, from the largeneſs of its eyes.

Box *and needle*, in *Navigation*, is the ſame with the compass.

Box *of a watch*, the outer caſe or cover.

Box *of a wheel*, the aperture wherein the axis turns.

Box-*galls*. See Galls *of the box*.

Box-*puceron*. See Grub *of the box*.

Box-*thorn*, in *Botany*. See Box Thorn and Lycium.

Box-*hauling*, in *Sea Language*, a particular method of veering a ſhip, when the ſwell of the ſea renders tacking impracticable. It is performed by putting the helm *a-lee*, to throw the head up to windward, when by the action of the waves on the weather-bow, it falls off or turns to leeward; the after-ſails are at this time diminiſhed, that they may not prevent the ſhip from turning: but they are again extended as ſoon as the ſhip, in veering, brings the wind on the oppoſite quarter, in order to aſſiſt her motion of wheeling. See Veering.

Boxes in a play-houſe, are little apartments behind and aſide of the pit. We ſay, the front-*boxes*, the ſtage-*boxes*, &c.

BOXERS, a kind of *athletæ*, who combat or contend for victory with their fiſts.

Boxers amount to the ſame with what, among the Romans, were called *pugiles*.

The ſtrange disfigurements theſe *boxers* underwent were ſuch, that frequently they could not be known, and rendered them the object of many railleries. In the Greek anthology, there are four epigrams of the poet Lucilius, and one of Lucian; wherein their disfigurements are pleaſantly enough expoſed. Anthol. Græc. lib. ii. Ep. 1, 2, 3, 10, 14.

BOXING, the exerciſe of fighting with the fiſts, either naked, or with a ſtone, or leaden ball graſped in them.

In which ſenſe, *boxing* coincides with the *pugiliatus* of the Romans, and what, on our amphitheatres, is ſometimes called *trial of manhood*.

When the champions had σφαιρας, or balls, whether of lead or ſtone, it was properly denominated σφαιρομαχια. Potter. Arch. Græc. lib. ii. cap. 21. vol. I.

The ancient *boxing* differed from the *pugna cæſtuum*, in which the combatants had leathern thongs on their hands, and balls to offend their antagoniſts; though this diſtinction is frequently overlooked, and fighting with the *cæſtus* ranked as a part of the buſineſs of *pugiles*.

We may diſtinguiſh three ſpecies of *boxing*; viz. where both the head and hands were naked; where the hands were armed and the head naked; and where the head was covered with a kind of cap called amphotides, and the hands alſo furniſhed with the *cæſtus*.

Boxing is an ancient exerciſe, having been in uſe in the heroic times, before the invention of iron or weapons.

Thoſe who prepared themſelves for it, uſed all the means that could be contrived to render themſelves fat and fleſhy, that they might be better able to endure blows: whence corpulent men or women were uſually called *pugiles*, according to Terence: *Siqua eſt habitior paulo, pugilem eſſe aiunt.* M. Burette has given the hiſtory of the ancient pugilate, or *boxing*, with great exactneſs. Mem. Acad. Inſcript. tom. iv. p. 353, &c.

Boxing, among *Sailors*, is uſed to denote the rehearſing the ſeveral points of the compaſs in their proper order.

Boxing likewiſe denotes an operation performed, by laying the head ſails aback, in order to receive the wind in a direction perpendicular to their ſurfaces, that the ſhip's head may hereby be thrown back into the line of her courſe, after ſhe had inclined to windward of it by neglect of the helmſman, or otherwiſe. Falcon. Mar. Dict.

Boxing is alſo uſed for the tapping of a tree, to make it yield its juice. See Bleeding and Sap.

The *boxing* of maple is performed by making a hole with an ax or chiſſel into the ſide of the tree, about a foot from the ground; out of it flows a liquor from which sugar is made. Phil. Tranſ. N° 364.

BOXUS, in *Natural Hiſtory*, a name given by ſome authors to the common misletoe.

BOYAR, or Boiar, a term uſed for a Ruſſian lord, or grandee. According to Becman, *boyars* are what, in other countries, are called the upper nobility: he adds, that the czar of Muſcovy, in his diplomas, names *boyars* before waywodes.

BOYAU, in *Fortification*, a branch of the trenches; or a line or cut, which runs from the trenches to cover ſome ſpot of ground; being drawn parallel to the defence of the place, that it may not be enfiladed, that is, that the ſhot from the town may not ſcour along it.

BOYER, in *Navigation*, a kind of Flemiſh ſloop, or ſmall veſſel of burden, having a boltſprit, a caſtle at each end, and a tall maſt; chiefly fit for the navigation of rivers, and, in many of its parts, reſembling a smack.

The *boyer* has a double bottom, and a forked maſt, that it may run better with the bowling-line, without driving.

BOYES, an order of American prieſts, or magicians, uſed by the ſavages for calling up their gods, either to be revenged on thoſe who have done them any injury, or to be cured of ſome diſeaſe, wherewith they are infeſted, or to drive out ſome devil.

They are alſo conſulted with regard to the event of their wars. Each *boye* has his peculiar duty: who is invoked by certain forms of words, ſung in a quaint tone, accompanied with the fumes of tobacco.

BOYEUPECANGA, in *Zoology*, the name of a very large ſerpent, diſtinguiſhed by this name on account of certain prominences on its back. It is a very large and remarkably thick ſerpent, and of very fatal poiſon. Ray.

BOYLE's *Lectures*, a courſe of eight ſermons or lectures, preached annually, ſet on foot by the honourable Robert Boyle, eſq. by a codicil annexed to his will in 1691; whoſe deſign, as expreſſed by the inſtitutor, is, to prove the truth of the Chriſtian religion againſt infidels, without deſcending to any controverſies among Chriſtians; and to anſwer new difficulties, ſcruples, &c.

For the ſupport of this lecture, he aſſigned the rent of his houſe in Crooked-lane, to ſome learned divine within the bills of mortality, to be elected for a term not exceeding three years, by the late archbiſhop Tenniſon, and others. But the fund proving precarious, the ſalary was ill paid: to remedy which inconveniencies, the ſaid archbiſhop procured a yearly ſtipend of 50 pounds, for ever, to be paid quarterly; charged on a farm in the pariſh of Brill, in the county of Bucks.

To this appointment we are indebted for many elaborate defences both of natural and revealed religion.

BOYLING. See BOILING and EBULLITION.

BOYUNA, in *Zoology*, the name of an American ſpecies of ſerpent. It is very long and ſlender, and all over of a black colour. It has exactly the ſmell of a fox, but ſo ſtrong, that no body can endure to be near it. Ray.

BRABANCIONES, in *Middle Age Writers*, a kind of Netherland ſoldiery, infamous for rapine, being little better than commiſſioned *banditti*, who hired themſelves to fight for any that could pay them beſt.

The word is variouſly written by the hiſtorians of thoſe days; all given them from the country of Brabant, which was the chief nurſery of thoſe troops. They are alſo frequently confounded with the *Routiers*, *Roturiers*, *Ruptarii*, *Ruterarii*, *Coteraux*, &c. Daniel. Hiſt. de la Mil. Franc. liv. iii. chap. 8.

BRABE, an herb mentioned by Oribaſius; the deſcription he gives of which is, that it grows a cubit high, ſhooting forth branches on each ſide, with leaves reſembling thoſe of the *lepidium* in ſhape, but ſofter and whiter, and at the top bearing an umbel of flowers like the elder.

BRABEJUM, in *Botany*; *African almond*, a genus of the *tetrandria monogynia* claſs of plants. Its characters are theſe: the flower is compoſed of four narrow obtuſe petals, which are erect, and hath four ſlender ſtamina. In the centre is a ſmall hairy germen, which afterward becomes an oval, hairy, dry berry, encloſing an oval nut. We have but one ſpecies of this plant, which is a native of the country about the Cape of Good Hope.

In Europe it ſeldom grows above eight or nine feet high; but in its native ſoil, it is a tree of a middling growth: as it is too tender to live through the winter in the open air, ſo we cannot expect to ſee it grow to a great ſize.

BRABEUTES, or BRABEUTA, in *Antiquity*, an officer who preſided at the public games, and decreed the prizes to the victors.

The word is formed from βραϐειον, *prize* or *reward*.

The Latins called him *deſignator* and *munerarius*.

The generality of writers confound the *brabeutes* with the AGONOTHETA, between whom there however appears to have been this difference, that the former preſided at the gymnic combats, the latter at the ſacred ones.

BRACE, in *Writing*, a term uſed to ſignify a certain crooked ſtroke or figure of a pen, made at the end of two or more lines in an account, which expreſs two or more articles charged with one and the ſame ſum at the end, which is uſually placed in the center of the *brace*.

Debts due to me, ſome of which are good, others dubious.

Good Debts.			*Bad Debts.*		
From Mr. James *	300	500	From Mr. John * *	400	900
From Mr. Peter *	200		From Mr. Nicolas*	500	

BRACE is commonly taken for a couple, or pair; and in this ſenſe is applied by huntſmen to ſeveral beaſts of game; as a brace of bucks, foxes, hares, &c.—They alſo ſay, a *brace* of greyhounds.

BRACE, in *Architecture*, denotes a piece of timber framed in with bevel-joints; ſerving to keep the building from ſwerving either way.

When a *brace* is framed into a king-piece, or principal rafter, it is called by ſome a *ſtrut*.

BRACE, BRACCHIO, or BRASSE, alſo denotes a foreign long meaſure, anſwering to our FATHOM.

BRACE is alſo uſed for a meaſure taken from the length of the arm, when extended; and is uſed in divers cities of Italy, in lieu of the foot or yard. Its length is various; the *brace* of Bergamo, according to Scamozzi, is nineteen Paris royal inches, and a half; according to M. Petit, ſixteen inches two thirds; the *brace* of Bologna is fourteen inches; that of Breſſe, ſeventeen inches ſeven lines and a half, according to Scamozzi; and according to M. Petit, ſeventeen inches five lines; the Mantuan *brace* is ſeventeen inches four lines; that of Milan, twenty-two inches; thoſe of Parma, twenty inches one third; of Sienna, twenty-one inches two thirds; of Florence, twenty inches two thirds, according to Maggi; twenty-one inches four lines and a half, according to Lorini; twenty-two inches two thirds, according to Scamozzi, and twenty-one inches one third, according to Picart.

BRACED, in *Heraldry*, is uſed in ſpeaking of chevronels which are intermingled. He bears azure a chief or, and three chevronels *braced*, in the baſe of the eſcutcheon, by the name of *Fitz-Hugh*.—*V. Tab. Heraldry*, *fig.* 17.

BRACELET, an ornament uſually worn round the wriſt.

The word is French, *bracelet*; which Menage derives further from *braceletum*, a diminutive of *bracile*, a word occurring in writers of the Juſtinian age; all formed from the Latin *brachium*, *arm*.

Bracelet amounts to the ſame with what was called by the ancients, *armilla*, *brachiale*, *occabus*; in the middle-age, *boga*, *bauga*, *armiſpatha*.

Among the ancient Romans, the men as well as the women, wore *bracelets*; but the latter, it is to be obſerved, never wore them till they were betrothed.

Bracelets were at firſt properly military ornaments or rewards, frequently conferred among the ancients, by generals and princes, on thoſe who behaved gallantly in fight. They became afterwards arbitrary decorations, aſſumed at pleaſure; and are ſometimes ſaid to have been worn for health as well as ornament; and particularly as AMULETS, to break the force of charms and faſcinations.

Among the Romans we meet with divers ſpecies and denominations of *bracelets*; as the *brachiale*, which covered the whole length of the arm; the *dextrale*, or *dextrocherium*, only the wriſt, and that only of the right arm; *viria*, or *viriola*, peculiar to the male ſex; *ſpinther*, to the women, being worn on the left arm; *viruo*, uſed as an AMULET; *amphidion*, worn either on the arm or about the neck; *calbeum*, or *galbeum*, worn by generals in their triumphs. Pitiſc. Lex. Ant. tom. i. & ii. Du-Cange. Gloſſ. Lat. tom. i. & ii. Kennet. Rom. Ant. Not. P. II. lib. iv. cap. 16.

Bartholin has a treatiſe on the *bracelets* of the ancients. The northern people uſed alſo to ſwear on their *bracelets*, to render contracts more inviolable.

Bracelets are ſtill much uſed by the ſavages of Africa and America, made of metal, glaſs-beads, ſhells, and the like.

BRACELET is alſo uſed, in *Anatomy*, to denote the circular ligament which inveſts the *carpus*, called alſo *ligamentum annulare*.

BRACELETS, in ſome *Ancient Law Books*, denote beagles, or hounds of the ſmaller kind.

BRACES, in the *Sea Language*, are ropes belonging to all the yards of a ſhip, except the mizen, two to each yard, except thoſe of the top-gallant, and ſprit-ſail top-ſail yards: being reeved through blocks faſtened to pendants ſeized to the yard-arms.—See *Tab. Ship. fig.* 1. *n.* 11. 21. 50. 68. 89. 11. 130. 139.

The uſe of *braces* is, to *ſquare the yard*; that is, to ſet it ſquare.—Hence, *to brace the yard*, is to bring it to either ſide. *To traverſe the yard*, is to ſet it any way overthwart.—*To right the yard*, is to bring it ſo as it may ſtand at right angles with the length of the ſhip.

All *braces* come aftward on; the main *brace* comes to the poop, the main-top-ſail *brace* to the mizen-top, and thence to the main-ſhrouds; the fore and fore-top-ſail *braces* come down by the main, and main-top-ſail ſtays, and ſo of the reſt.

The mizen-bowline ſerves for a brace to that yard; and the croſs-jack *braces* are brought forward to the main-ſhrouds, whenever a ſhip ſails cloſe by a wind.

BRACHERIUM, or BRACHERIOLUM, a kind of ſteel-bandage worn about the hips, and uſed for the retention and cure of ruptures. Du-Cange Gloſſ. Lat.

BRACHIÆUS, or BRACHIALIS, a name given to two muſcles of the arm, the one external, the other internal.

Brachiæus is a name given by Spigelius and others to a muſcle of the arm, now generally known under the name of *brachialis*, or *brachiæus internus*.

BRACHIÆUS *externus* ariſes about the middle and poſterior part of the *humerus*. It joins its fibres with the *muſculus longus* and *brevis*; and being externally tendinous, they, together, cover all the elbow, and are inſerted into the *olecranum*.—See *Tab. Anat.* (*Myol.*) *fig.* 7. *n.* 12. ANCONÆUS *externus*, and ſometimes the *internus*, is called by this name.

BRACHIÆUS *internus* lies partly under the *biceps*; it riſes by a fleſhy beginning from the middle and internal part of the *humerus*; and is inſerted into the upper and fore-part of the *cubitus*, by a very ſhort, but ſtrong tendon: it ſerves to bend the arm.—See *Tab. Anat.* (*Myol.*) *fig.* 1. *n.* 25. *fig.* 2. *n.* 14. *fig.* 7. *n.* 11.

The upper part of this muſcle is forked, or ſloped, and, at the bending of the joint of the elbow, the lower part of it contracts. It is fixed to the ſurface of the *os humeri* by a great number of fleſhy fibres, from the lower inſertion of the *deltoides* almoſt down to the two *foſſæ* at the lower extremity of the bone, and from one edge of the foreſide of this lower extremity to the other. The fibres are for the moſt part longitudinal; thoſe neareſt the ſurface of the muſcle being longeſt, the more internal grow gradually ſhorter.

The lateral fibres are a little oblique, and this obliquity increaſes as they deſcend lower. Theſe lateral fibres are partly fixed in the intermuſcular ligaments of the *os humeri*; of which ligaments, that which lies toward the internal condyle, is longer and broader than that toward the external. The loweſt of theſe fibres are very oblique, and form on each ſide a kind of ſmall ſeparate *faſciculus*. In paſſing over the joint, all theſe fibres contract in breadth, and afterwards end in a ſtrong flat tendon, inſerted in the muſcular impreſſion, which is directly below the *coronoide apophyſis* of the *ulna*.

The ſloped or forked extremity of this muſcle embraces the large tendon of the *deltoides*; the internal part of the fork meets the inferior inſertion of the *coraco-brachialis*, and the foreſide of the whole muſcle is covered by the two fleſhy bodies of the *biceps*. Winſlow.

BRACHIAL *nerves*. See Nerve.

BRACHIALIS, *coraco*. See Coraco-Brachialis.

BRACHIONUS, in *Zoology*, the name of a genus of ANIMALCULES of the ARTHRODIA kind, containing all the WHEEL animals.

BRACHITÆ, a branch of Manichees, who appeared in the third century.

BRACHIUM, in *Anatomy*. See Arm, and Humerus.

Brachium, the *arm*, in *Botany*, is the tenth degree in the Linnæan ſcale for meaſuring plants, being twenty-four Paris inches.

Brachium *moventium ſecundus*, in *Anatomy*, a name given by Veſalius, and other of the old writers, to the muſcle now generally called *deltoides*.

Brachium *movens quartus*, in *Anatomy*, the name by which Veſalius calls the muſcle now generally known under the name of *latiſſimus dorſi*. Fallopius, and many others, have alſo called it *quartus humeri*.

Brachii *tertius*, in *Anatomy*, a name given by Veſalius and others to a muſcle ſince called, from its ſhape, *teres major*, and *rotundus major*.

BRACHMANS, a branch of the ancient gymnoſophiſts, or philoſophers of India, remarkable for the ſeverity of their lives and manners.

The Greeks uſually give them the name *gymnoſophiſts*; though Clemens, Porphyry, &c. make the *brachmans* only a branch of the gymnoſophiſts, whom they divide into two ſects, *Brachmanes*, and *Samanæi*.

There are ſome in the Indies who ſtill bear the name, and live in the ſame manner as the ancient *brachmans*: the Portugueſe call them *bramanes*, or *bramenes*; we uſually, bramins.

Some ſay, they derive their name from the patriarch Abraham, whom, in their language, they call *bachma*, or *brama*. Others deduce it from the name of their God, *Brachma*; which ſome again take to be the ſame with Abraham; whence Poſtel calls them *abrachmanes*. F. Thomaſin derives the word from the Hebrew *barach*, *to fly* or *eſcape*; becauſe the *brachmans* retire into the country, and live in deſarts. The ſame author gives us another derivation, viz. from the Hebrew *barach*, *benedicere*, *orare*, to *bleſs*, *pray*; becauſe this is their principal occupation.

Porphyry obſerves that the ancient *brachmans* ſucceeded into the order, by right of family; whereas the Samanæans were elected into it: the former therefore were all of the ſame family, the latter of various.

The *brachmans* were perfectly at liberty, paid no taxes, nor were under the command of any perſon: they lived on herbs, pulſe, and fruits; abſtaining from all animals, and thinking it an impiety to touch them. The greateſt part of the day and night they ſpent in ſinging hymns in honour of the deity; praying and faſting continually. The greateſt part of them lived in ſolitude, without marrying, or poſſeſſing any eſtates. There was nothing they appeared to wiſh for ſo earneſtly as death; looking on life as a burdenſome thing, and waiting with impatience for the ſeparation of their ſoul and body. This is the account Porphyry gives of them.

Kircher obſerves, that the *brachmans* held the opinion of Pythagoras, relating to the ſoul and its tranſmigration; and led a life in all reſpects agreeable to his: or rather, it was from the *brachmans*, that Pythagoras borrowed his opinions, his manner of living, &c.

The modern *brachmans* are the ſucceſſors of the ancient, and the prieſts or divines of the idolatrous Indians.

Rogers diſtinguiſhes ſix ſorts of them; the *Weiſtnowa*, the *Seivia*, the *Smaerta*, the *Schaerwaecka*, the *Paſenda*, and the *Tſchectea*.

Theſe are much converſant in aſtrology and aſtronomy.

They have ſo great a veneration for cows, that it is ſaid, they look on themſelves as bleſſed, if they can but die with the tail of one of them in their hand. They ſometimes make a proceſſion of four hundred leagues, drawing after them whole cities and towns; feeding the people, when ſtopped at the paſſages of rivers overflowed, in a manner which is ſaid to be miraculous; by giving them every thing they deſire, without making any proviſion.

Mr. Marſhal obſerves, that whenever they write any thing, they put a figure of 1 in the firſt place; to ſhew, as they ſay, that they acknowledge but ONE GOD. They account the world the body of God, the higheſt heavens his head, the fire his mouth, the air his breath, the water his ſeed, and the earth his legs and feet. They maintain a pre-exiſtent ſtate; and, from that, account for the tempers and manners of men in this: they alſo maintain the *metempſychoſis*, but in a groſſer ſenſe than Pythagoras; believing that the ſouls of ill men paſs into reptiles, inſects, and vegetables, for their puniſhment and purgation.—They compute the world to be about 3892850 years old; and ſeem to have ſome obſcure traditions of the Moſaic paradiſe, Adam, Eve, and the deluge. They have alſo a notion of God's being incarnate, and living ſome time among men.

Their religion conſiſts in leading a pure life, waſhing away their ſins in the river Ganges, muttering over divers prayers, and doing ſtrange and incredible penances. —They burn their dead with much ceremony; and ſtrewing the aſhes on the place where the deceaſed firſt lay after his death, they judge from ſome figure or impreſſions pretended to be made on it, into what body his ſoul is gone; viz. if the impreſſion of the foot of a dog or ox, &c. appear, they give out he is tranſmigrated into one of thoſe animals; if there be no impreſſion, he is then gone to the ſtarry region.

They have alſo abundance of cabbaliſtic notions; v. gr. ſay they, if the numbers 28,35,2,7—6,3,32,31—34,29,8,1,—4,5,30,33, be written in the ſame order in the ſquares of a ſquare figure, and your enemy's name written under it, while you wear it, he cannot hurt you, &c. Phil. Tranſ. N° 268.

The *brachmans* of Indoſtan have a language peculiar to themſelves, which they call *hanſcbrit*; in which they have ſeveral ancient books, written, as is alledged, by their great prophet *Brahma*; as the *ſhaſtram*, which is their bible, and *porane*, a hiſtory which they eſteem ſacred, and pretend to have been dictated by God himſelf.

The *brachmans* of Siam and Coromandel maintain, that the earth will be deſtroyed by fire; and the former aſſert, that another will ariſe out of its aſhes, in which there ſhall be no ſea, nor any change of ſeaſons, but an eternal ſpring; and the latter maintain a plurality of worlds, which are alternately deſtroyed and renewed.

Robert de Nobili, an Italian Jeſuit, and one of the Indian miſſionaries, in the beginning of the ſeventeenth century, in order to ſecure ſucceſs to his miſſion, aſſumed the title and appearance of a *brachman*, and at length perſuaded the credulous people, that he was, in reality, a member of that venerable order. He forged a deed in the ancient Indian characters, ſhewing that the *brachmans* of Rome were older than thoſe of India, and that the Jeſuits of Rome deſcended, in a direct line, from the god *Brahma*. He farther declared on oath, that he derived his origin from this Indian deity. By this impoſture he proſelyted twelve eminent *brachmans*, whoſe influence proved very favourable to his miſſion. After his death, the Portugueſe Jeſuits carried on the impoſture with very conſiderable ſucceſs. Theſe miſſions, however, were ſuſpended and abandoned, in conſequence of a papal mandate, iſſued out in the year 1744, by Benedict XIV. who declared his diſapprobation of the artifices that had been uſed in the converſion of the Indians. Moſheim's Eccleſ. Hiſt. vol. iv. p. 211, &c. 8vo. edit.

The modern *brachmans* own a Supreme Being, who created *Brahma*, and gave him a power to create the world. They have alſo their ſubaltern deities, their pagods or temples, and idols, whom they fan to defend from flies, dancing before them, &c.

They hold a feaſt in honour of the ſun, conſidered as the ſource of heat and light, whereby all nature is fecundified.

BRACHURI, in *Zoology*, a name given by Dr. Hill to a genus of ANIMALCULES of the tailed kind.

Theſe *animalcules* are of a roundiſh figure, with tails ſhorter than their bodies; their ſkin is perfectly ſmooth, thin, and colourleſs. They are frequent in water-ponds, in pepper-water, and many other infuſions of vegetable ſubſtances.

BRACHYCOLON, from βραχυς, *ſhort*, and κολον, *member*, is when one member of a period is ſhorter than another.

In which ſenſe, the word ſtands contradiſtinguiſhed from *iſocolon*, where the members are equal, or conſiſt of the ſame number of ſyllables.

BRACHYGRAPHY (from βραχυς, *ſhort*, and γραφω, *ſcribo*, *I write*) denotes the art of ſhort-hand writing, called alſo TACHYGRAPHY.

BRACHYLOGY, from βραχυς and λογος, *expreſſion*, in *Rhetoric*, BREVITY, the expreſſing any thing in the moſt conciſe manner. This, ſo far as conſiſtent with perſpicuity, is a virtue and beauty of ſtyle; but if obſcurity be the conſequence, which is often the caſe, it becomes a blemiſh and inexcuſable defect.

Quintilian gives us an inſtance of *brachylogy* from Salluſt: *Mithridates corpore ingenti perinde armatus*; Mithridates, as it were, armed with the hugeneſs of his ſtature. Inſt. Or. lib. viii. cap. 3.

BRACHYPOTÆ, or Brachypoti, from βραχυς and ποτης, *drinker*, thoſe who drink but little and at long intervals.

The word ſometimes alſo ſignifies thoſe who drink ſeldom, though in greater quantity.

BRACHYPTERA, in *Zoology*, the name of a genus of birds, of the claſs of the hawks, diſtinguiſhed by the ſhortneſs of their wings.

The word is derived from βραχυς, *ſhort*, and πτερον, a *wing*.

The hawks of this genus have their wings ſo ſhort, that, when folded, they do not nearly reach to the end of the tail. Of this genus are the goſs-hawk, the ſparrow-hawk, and the three kinds of the butcher-bird. Willughby, Ornith. p. 36.

BRACHYPYRENIA, from βλαχυς and πυρην, *nucleus*, in *Natural Hiſtory*, a genus of foſſils of the claſs of SEPTARIÆ.

The *brachypyrenia* have a ſhort roundiſh *nucleus*, incloſed by and contained within the body of the maſs.

BRACHYTELOSTYLA, in *Natural Hiſtory*, the name of a genus of cryſtals.

The word is derived from βραχυς, *ſhort*, τελειος, *perfect*, and ϛυλος, a *column*, and expreſſes a perfect cryſtal, with a ſhort intermediate column.

The bodies of this genus are cryſtals compoſed of a ſhort hexangular column, terminated at each end by an hexangular pyramid. Of this genus there are ſix known ſpecies. Hill's Hiſt. Foſſils, p. 163.

BRACKET, in *Building*, denotes a kind of wooden ſtay, in form of a knee or ſhoulder, ſerving for the ſupport of ſhelves, &c. or a cramping iron, which ſerves as a ſtay in timber-work.

The word is alſo written *braget*, and ſeems derived from the Italian *brachetto*, a diminutive of *brachio, arm*.

MODILLIONS are a ſort of *brackets* to the *corona* of an entablature.

BRACKETS, in *Artillery*. See CHEEKS *of a Mortar*.

BRACKETS, in a ſhip, are ſmall knees uſually carved, and ſerving to ſupport the GALLERY.

The timbers which ſupport the gratings in the head, are alſo called *brackets*. See CHEEKS.

BRACTEA, a thin flake or ſpangle of any ſubſtance; it is uſed by many authors in the ſame ſenſe with the word *lamina*, but uſually in a ſort of diminutive ſenſe, expreſſing a ſmall plate.

BRACTEA, in *Botany*, denotes the floral leaf.

BRACTEARIA, in *Natural Hiſtory*, the name of a genus of foſſils, of the talc claſs; the characters of which are, that they are compoſed of ſmall plates in form of ſpangles, and each of theſe, naturally very thin or fiſſile, into very thin ones.

The word is derived from the Latin *bractea*, a *ſpangle*, or ſmall and thin glittering particle of any thing.

There are many ſpecies of this genus denominated from the variety of their colours; as MICA *aurea*, or gold-glimmer, and MICA *argentea*, ſilver-glimmer, cat's-ſilver, &c.

BRACTEATED, among *Antiquaries*, denotes a coin covered over with a thin plate, or leaf of ſome richer metal. See MEDAL.

Bracteated coins, or medals, *nummi bracteati*, are uſually made of iron, copper, or braſs, plated over, and edged with gold or ſilver-leaf, and then ſtamped with the hammer or mill.

Medaliſts find ſome *bracteated* pieces even among the truly ancient coins. The French call them *fourrées*.

BRADS, a ſlender kind of NAIL, uſed in building, having no ſpreading heads as other nails have.

Of theſe, ſome are called *joiners brads*, and are for hard wainſcots; others *batten-brads*, for ſoft wainſcot; and ſome *bill-brads*, or *quarter-heads*, uſed when a floor is laid in haſte, or for ſhallow joiſts ſubject to warp.

BRADYPEPSIA, from βραδυς, *ſlow*, and πεπτω, *I digeſt*, in the *Medical Writings of the Ancients*, the name of a diſtemper, which conſiſted in a ſlow, weak, and languid concoction of the food.

It is cauſed by a diminution of the force or heat of the ſtomach, or a defect in the gaſtric liquors. See DIGESTION.

BRADYPUS, in *Zoology*, the name given to a genus of quadrupeds of the order of Linnæus, called ANTHROPOMORPHA, otherwiſe termed *ignavus*, and in Engliſh the SLOTH. Its characters are, a mouth without fore-teeth, the canine teeth are obtuſe and longer than the grinders, of which there are five on each ſide; the body is covered with hair; the feet have no great toe, and are made for climbing; and only two paps upon the breaſt. Of this genus there are known two ſpecies; the one is called the American SLOTH, with a ſhort tail, and three toes on each foot; the other is named the Ceylon SLOTH, with only two toes to each foot, and no tail.

BRAG, a name given to a game at cards, from the nature of it; the principal ſtake being won by him who *brags* with moſt confidence and addreſs; i. e. who challenges the other gameſters to produce cards equal to his. In this game a pair of aces is the beſt *brag*, a pair of kings the next, and ſo on: and a pair of any ſort wins the ſtake from the moſt valuable ſingle card. The knave of clubs pairs with any other card in hand: but a hand of cards of leſs value in this game has ſometimes gained the ſtake from one of ſuperior value, by the confidence and art of *bragging*: the conteſt being given up on the part of the latter through fear of loſing. One ſtake is gained by the higheſt card, that is turned up in dealing, three cards being dealt round to each perſon and the laſt turned up; the higheſt card is the ace of diamonds: the other ſtake is won by the perſon, who firſt makes up the cards in his hands one and thirty; each dignified card paſſing for ten, and drawing from the pack. Each gameſter depoſits three ſtakes, one for each card.

BRAGGOT, a ſort of drink made in ſome parts of England, of malt, with honey, ſpices, and other ingredients.

It is derived from the old Britiſh word *brag*, which ſignifies *malt*, and *gots*, *a honey-comb*.

BRAILS *in a ſhip*, ſmall ropes uſed in furling the ſails acroſs. The *brails* are reeved through blocks, which are ſeized on either ſide the ties, a little diſtance off upon the yard, ſo that they come down before the ſails of a ſhip, and are faſtened at the ſkirt of the ſail to the crengles.—Their uſe is, when the ſail is furled acroſs, to hale up its bunt, that it may the more readily be taken up, or let fall. See *Tab. Ship. fig.* 5. *n.* 6.

Theſe *brails* belong only to the two courſes and the mizen-ſail.

They ſay, *hale up the brails*, or, which is all one, *brail up the ſails*; the meaning of which is, that the ſail is to be haled up, in order to be furled, or bound cloſe to the yard.

BRAIN, in a general ſenſe, is that large, ſoft, whitiſh maſs, incloſed in the *cranium*, or ſkull; wherein all the organs of ſenſe terminate, and the ſoul is ſuppoſed principally to reſide. See *Tab. Anat.* (*Oſteol.*) *fig.* 4. *lit. a. a. a. d. d. d. fig.* 5. *lit. a. a. b. b.*

The *brain* is encompaſſed with two *meninges*, or membranes, called *dura* and *pia mater*.

Its figure is the ſame with that of the bones that contain it, viz. roundiſh, oblong, and flat on the ſides: it is divided into three principal parts; viz. the *cerebrum*, or *brain ſtrictly ſo called*, the CEREBELLUM, and the MEDULLA OBLONGATA; to which ſome add a fourth, viz. the MEDULLA *ſpinalis*, which is a continuation of the latter.

BRAIN, in a more proper ſenſe, is that large globulous part which fills the fore and upper part of the ſkull.

It is divided by a duplicature of the *dura mater*, called from its figure *falx*, into two equal parts, called *right* and *left hemiſpheres*; though the figure of the *brain* be pretty far from a ſphere; and theſe parts are more like quarters of an oblong ſpheroid. It is alſo ſeparated from the CEREBELLUM by another duplicature of the ſame *dura mater*.

It conſiſts of two kinds of ſubſtance; the one cineritious, or aſh-coloured, ſoft and moiſt; which, being the exterior, is alſo called the *cortex*, or CORTICAL part of the *brain*: the thickneſs of this is about half an inch, though by reaſon of the ſinuſes and futures in the *brain* it appears more.—The other, or inner ſubſtance, is white, more ſolid, as well as more dry than the *cortex*, and is called the *marrow* or *medullary*, and ſometimes the *fibrous* part, in contradiſtinction to the other, which is alſo called the *glandulous* part.

The *cortex*, according to Malpighi, is formed from the minute branches of the carotid and vertebral arteries; which, being woven together in the *pia mater*, ſend from each point thereof, as from a baſis, little branches, which, being twiſted together into the form of a gland, incloſe the *medulla*, ordinarily to the thickneſs of half an inch; but in ſome places make deeper ſinuſes and furrows within it. Theſe branches make circumvolutions like the inteſtines; each of which may be reſolved into others, like, but leſs than the firſt.

This part, therefore, moſt authors take to be glandulous; or an aſſemblage of innumerable minute glands, contiguous to each other, deſtined for the ſecretion of animal ſpirits from the blood, brought hither by the carotids, &c. Theſe glandules, Malphigi obſerves, are of themſelves oval, but by their mutual compreſſure they become angular; and run waving within each other: ſeveral of theſe connected form others larger, and theſe again unite into others, from the aggregate whereof are formed tubes, of which the outer *cortex* is compoſed. Theſe little glands conſiſt of the branches of the arteries which bring the blood; of the veins ariſing at their extremities, which carry it back again; of ſecretory tubes ſecerning the animal ſpirits, and of excretory ducts for diſcharging them into the *medulla*: though theſe are too minute to have ever been ſeen.

The inner, or medullary part of the *brain*, conſiſts of a number of infinitely fine fibres, ariſing from the leaſt and minuteſt branches or filaments of the glands of the *cortex*;

cortex; as is diſtinctly ſeen in the CEREBELLUM, though ſcarce viſible in the *cerebrum:* theſe receive the fluid ſeparated and ſubtilized, from the glands of the *cortex*; and by means of the nerves, which are no more than productions of this part, diſtribute it all over the body. Authors here, however, are divided; the generality, with Malpighi, making the ſubſtance of the *cortex* glandulous, as above; others, with Ruyſch and Leewenhoeck, deny any thing like glands in it; and allow nothing but little *cryptæ*, or ſinks, opening laterally to the arteries; and thence receiving a juice already ſecerned from the blood, and tranſmitting it to the MEDULLA. This doctrine, it ſeems, is the reſult of anatomical injections, and microſcopical obſervations; but the other, appearing the moſt conſiſtent with the œconomy of nature in other things, is generally adhered to.

The *cortex* covers the whole medullary ſubſtance both of the *brain* and CEREBELLUM; ſo that wherever the cortical ſubſtance ends, there the medullary commences; and this in the appendices, ventricles, interſtices, and ſinuſes of the MEDULLA, as well as in the external ſurface. Something medullary, therefore, ariſes from every point of the *cortex*; at its firſt riſe, it muſt needs be exceedingly fine and ſlender: but, being joined with other parts of the ſame kind, it gradually thickens, and at length becoming ſenſible, conſtitutes the *medulla cerebri*, the *corpus calloſum*, the MEDULLA *oblongata*, and its *crura*, the *thalami* of the optic nerves, the MEDULLA *cerebelli*, and its production into the MEDULLA *oblongata*; which, with theſe additions, forms the *corpora pyramidalia* and *olivaria*, and is extended into the ſpinal marrow. And from the ſame medullary ſubſtance, both in the *cranium*, and in the caſe formed by the union of the *vertebræ*, ariſe all the nerves.

Though the primary *fibrillæ*, or filaments, when united, ſeem to form one compact body or maſs; yet Boerhaave ſhews, they are really diſtinct and ſeparate from each other: that thus ariſing from each part of the *cortex*, and tending, as it were, to the centre of the ſphere, they firſt form the *medulla*; that others, reflected hence and collected above, form the *corpus calloſum* and *fornix*; and below, form the *corpus calloſum* and legs, of the MEDULLA *oblongata*; that the like *fibrillæ*, ariſing from the CEREBELLUM, join with them: the reſult of which juncture is the MEDULLA *ſpinalis*. And laſtly, that the like *fibrillæ* ariſing from the *cortex*, continued within the cavities of the MEDULLA, join with them, and add freſh conſiſtence to them.

Hence we ſee the reaſon of the bulk, figure, and poſition of the *cortex* of the *brain*, as well as the uſe and neceſſity of the cavities called *ventricles* of the *brain:* of theſe ventricles there are four; one in each hemiſphere, ſeparated by a thin tranſparent ſubſtance, running all along from the FORNIX under the *corpus calloſum*, and diſtinguiſhed by the name of the *ſeptum lucidum:* theſe two are called the *lateral ventricles*.

The third is under the FORNIX, and called *rima:* the fourth between the CEREBELLUM and MEDULLA *oblongata*.

From the whole, it appears paſt doubt, that the fibres of the *brain* are exceedingly minute canals; that they receive an humour, infinitely the moſt ſubtile, fluid, and moveable, of any in the whole body; prepared and ſecreted by the artful ſtructure of the *cortex*, driven into theſe tubules by the force of the heart, and from every part hereof collected into the MEDULLA *oblongata*. And this is what ſome call *animal ſpirits*, others the *nervous juice*; the great inſtrument of ſenſation, muſcular motion, &c.

In the ſpace between the two hemiſpheres of the *brain*. under the *falx*, or rather under the longitudinal ſinus of the *dura mater*, is a white ſubſtance, of a texture more compact than the reſt of the *medulla* of the *brain*; and for that reaſon called *corpus calloſum*; which runs along the whole tract of the *falx*, and receives from each ſide the terminations of the MEDULLA, interſperſed between the ſeveral windings of the *cortex*, and ſuppoſed by ſome to be a kind of baſe or ſupport to it. The manner wherein this is formed is ſhewn above: we ſhall only add, that, on occaſion hereof, ſome authors, M. Aſtruc for inſtance, inſtead of two ſubſtances, viz. the CORTEX and MEDULLA, divide the *brain* into three; viz. the uppermoſt, or *cineritious*, which conſtitutes the *cortex*; the middle, which is whiter and denſer than the firſt, and therefore called the *callous*; and the loweſt or inmoſt, which, being intermixed with *radii* or *ſtriæ* of the white and cineritious ſubſtance, he calls the *ſtriated* part: Aſtruc adds, that the fluid ſecreted in the *cortex* is conveyed into innumerable minute hollow medullary *fibrillæ*, of the ſame nature with the callous ſubſtance, and contiguous thereto. This middle, or callous part, he obſerves, is not diſtinguiſhed by any appearance of fibres, but is uniform, homogeneous, elaſtic, and not unlike the pith of the elder-tree: for which reaſon, he thinks, it may be probably conjectured to conſiſt of innumerable cells, communicating with each other, divided by the interpoſition of membranaceous, flexible, elaſtic, vibrative parietes or columns; which being flowed over by the ſpirits, and continually expoſed to the ſhakings thereof, conſtitute the fibres of the *brain*.

Now the ſecreted fluid flowing equally from each point of the cineritious ſubſtance into the callous, muſt equally fill and diſtend the cells thereof: and leſt any place ſhould want its ſhare, proviſion is made for a ſtrict communication; not only by the apertures of the cells into each other, but alſo by the ſtructure of the *brain*; the upper part communicating with the under, by the *ſeptum lucidum*; the lateral with the lateral, by the *lata commiſſura*; laſtly, the fore-parts with the hind-parts, by the *crura*, *brachia*, and roots of the *fornix*. Theſe cells, he continues, being filled, the ſpirits will proceed to the contiguous *ſtriæ* of the medullary ſubſtance; which, ariſing from the *cortex*, compoſe the ſtriated part of the *brain:* and theſe *ſtriæ* rendered narrower and ſlenderer, and paſſing without the ſurface of the *brain*, conſtitute the firſt principles of the nerves, &c.

The other parts of the *brain* are the FORNIX, a production of the MEDULLA: which, at its extremity next the CEREBELLUM, ſends out two proceſſes or legs, by whoſe juncture is formed a kind of arch, thence called *fornix*, which ſeparates the third ventricle from the two upper ones. At the bottom of the *fornix* are two holes, by which the third ventricle has a communication with the others; that before is called *vulva*, and that behind *anus*. The third ventricle, or *rima*, which is in the MEDULLA *oblongata*, has likewiſe two apertures; the one the orifice of the *infundibulum*, or funnel, which is a canal reaching to the *glandula pituitaria:* the other is a duct, whereby the third ventricle communicates with the fourth in the MEDULLA *oblongata*, under the CEREBELLUM. That fourth ventricle is in the form of a quill, whence it is ſometimes called *calamus ſcriptorius*.

In the lateral ventricles are found the *plexus choroides*, which is an aſſemblage of minute veins and arteries; and four eminences, the firſt the *corpora ſtriata*, the others the *thalami nervorum opticorum*.

At the entrance of the canal reaching from the third ventricle to the fourth, is ſituated the *pineal gland*; ſo called from the figure of a pine-apple, which it reſembles: this gland Des Cartes ſuppoſes to be the ſeat of the ſoul. Behind the pineal gland are four eminences; two upper and greater, called NATES; and two ſmaller and lower, called TESTES. See MEDULLA *oblongata*, to which all theſe parts properly belong.

The veſſels of the *brain* are nerves, arteries, and veins. By turning up the *brain*, the origin of the nerves proceeding from it is diſtinctly ſeen: theſe are in number ten pair, viz. the olfactory, optic, movers of the eyes, pathetic; the fifth pair, called *nervi innominati*, or *trigemini*, and ſixth pair, called alſo the *motores oculorum externi*, or *oculares externi*, the auditory nerves, PAR VAGUM, and the ninth pair. See NERVE.

The blood-veſſels of the *brain* are the two internal carotid, and the vertebral arteries. The firſt, piercing the *dura mater*, communicate with the cervicals, and proceeding thence ſend a branch to the *plexus choroides*; till arriving at the *pia mater*, and making ſeveral turns and circumvolutions thereon, they terminate, at laſt, in the little glands that conſtitute the *cortex*. The vertebral arteries, paſſing the *dura mater*, go along the under-ſide of the MEDULLA *oblongata*; till giving branches to the ſpinal arteries, they join in one branch called the cervical artery, which communicates with the *carotides* by two branches, as before. The veins of the *brain* do not run along by the ſides of the arteries, as in other parts of the body, but riſe from their extremities in the *cortex*; whence they diſcharge themſelves into the ſinus of the *dura mater*.

For the great bulk of the *brain*, this reaſon may be aſſigned; viz. that on account of the exceeding ſubtility and fineneſs of the animal ſpirits, and the ſlowneſs in which their ſecretion muſt be effected; together with the great quantity of them required in diſcharging the animal functions; there muſt of neceſſity be an infinite number of glands to ſeparate and prepare them. From the ſame principle, we ſee why the *brain* is much bigger in men than in other animals; and in other animals, why, *cæteris paribus*, it is generally biggeſt in thoſe which diſcover the greateſt ſhare of ſagacity, v. gr. in monkeys; becauſe a conſiderable ſtock of animal ſpirits is to be employed in the affairs of cogitation, memory, &c. Accordingly, anatomiſts obſerve, that in fools the *brain* is ſmaller (*cæteris paribus*) than in men of ſenſe: this ſome may account for, by ſuppoſing it the cauſe of the folly; a ſufficient ſtock of ſpirits being wanting to reaſon ſtrongly: and others from the œconomy of nature,

ture, which proportioned the ſtock of ſpirits to the expence that would be required.

From the texture, diſpoſition, and tone of the fibres of the *brain*, philoſophers ordinarily account for the phænomena of ſenſation and imagination. Dr. Aſtruc goes farther, and from the analogy between the fibres of the *brain*, and thoſe of muſical inſtruments, ſolves the phænomena of judgment and reaſoning, and the defects and perfections of both. He lays it down as an axiom, that every ſimple idea is produced by the oſcillation of one determinate fibre; and every compound idea from contemporary vibrations of ſeveral fibres: that the greater or leſs degree of evidence follows the greater or leſs force where the fibre oſcillates.

He takes occaſion to obſerve, that the fibres of the *brain*, from their natural analogy to thoſe of muſical inſtruments, may be perverted ſeveral ways; viz. by being rendered too dry or too moiſt, too ſtiff or too lax, &c. In a phrenſy, he thinks the fibres too dry, and too much diſtended by the heat of the blood, &c. In a *mania*, theſe fibres he thinks too rigid, as well as too dry and diſtended. In a lethargy, they are too much ſoftened by phlegm; in idiocy, or fooliſhneſs, they are ſometimes too ſoft, and ſometimes too hard. Laſtly, he thinks that in melancholy, by the repeated ſucceſſive vibrations which the attentive meditation of a thing induces, two or more fibres, which of themſelves exhibit diſſimilar and unequal ideas, are (the other parts remaining ſound) ſenſibly brought to an iſochroniſm: ſo that the ſoul, judging well in other reſpects, yet in this always makes a falſe judgment.

Dr. Hartley has likewiſe founded his theory on vibrations excited in the medullary ſubſtance of the *brain*, ſpinal marrow, and nerves. Obſervations on Man, &c. vol. i. See ASSOCIATION, and VIBRATION.

The generality make wit and genius to depend on the conformation, magnitude, and qualities of the *brain*. Des Cartes ſuppoſes the pineal gland, Vieuſſens the *centrum ovale*, to be the part of the *brain* where the ſoul more immediately reſides. Willis lodges common ſenſe in the *corpora ſtriata*, the imagination in the *corpus calloſum*, and the memory in the *cortical* ſubſtance. Dr. Hook endeavours to ſhew how all ideas may be diſpoſed and mechanically laid up in the *brain*, for the uſe of the MEMORY. Phil. Tranſ. Nº 67. Hook. Poſth. Works, p. 140.

We find great diverſities in reſpect of figure, ſtructure, bulk, &c. in the *brains* of different animals. The *brains* are divided into two parts, with an interval between, as is well known to mountebanks, who, in virtue thereof, ſometimes raiſe an opinion of their ſkill in the vulgar, by running a pin through the middle of a cock's head, without damage to the bird.

Through the whole bird kind, the cortical part of the *brain* is extremely over-proportioned to the medullary; ten times more in proportion than in men; add, that it is uſually alſo ſmooth, and without ſinuoſities. Dr. Willis, who diſſected a great variety of *brains*, obſerved a near reſemblance between the *brains* of men and quadrupeds, and between thoſe of birds and fiſhes: though M. Steno obſerves, that the *brains* of birds and fiſhes are not at all like thoſe of men. Winſlow.

The *brain* is ſubject to divers diſorders, as wounds, contuſions, depreſſions, conſtipations, inflammations, petrifactions, diſruptions, &c. Phil. Tranſ. Nº 228. Med. Eſſ. Edinb. tom. ii. p. 245. Hiſt. Acad. Scienc. an. 1703. 1710. 1722.

A watery *brain* appears to be the cauſe of the epilepſy; and an extremely dry or rigid one, of the phrenzy; and theſe have been found to be the ſtates of the *brain*, in diſſections of perſons affected with thoſe diſeaſes. Paracelſus even attributes leproſies, conſumptions, and jaundices, to diſorders of the *brain*. Hiſt. Ac. Sc. an. 1705, 1706. Caſt. Lex. Med. p. 159.

Bartholin ſpeaks of divers extraneous bodies found in the *brain*; particularly a point of a dart, an inch long, which remained there, without much inconvenience, fourteen years, and was at length expelled by ſuppuration at the *fauces*. Act. Med. Hafn. tom. ii. art. 132.

Anatomiſts, in their figure and deſcriptions of the *brain*, only repreſent the cavities which are ſeen upon ſeparating the hemiſpheres, and taking away the *corpus calloſum*, without obſerving that the *crura fornicis* ſink down, and then turn forwards on each ſide of the *medulla oblongata*, in cavities which are extended far forwards, under the commonly known anterior ventricles. In theſe inferior cavities, the *crura fornicis* are of a beautiful form, reſembling a white ſilk-worm, or ſea-horſe; on which account they were called *hippocampi* by Julius Cæſar Arantius, who is the only author that has given any deſcription of them, till lately Mr. Du Verney has revived them, by an exact deſcription and delineation. He obſerves likewiſe, that the *ſeptum lucidum* between the anterior ventricles, has a cavity between the two *lamellæ* of which it is compoſed, in which he has often found water; and that the internal ſide of the *ſeptum* is made rough, by a great many ſmall grains and *papillulæ*. Comm. Acad. Petrop. tom. iv. p. 130.

Some are of opinion, that the motion of the *brain* is owing to the air entering by the olfactory nerves into the ventricles of the *brain*; which air, rarefied by the heat, loſes its ſpring, and is expelled by the elaſtic contracting *dura mater*. Med. Eſſ. Edinb. vol. ii. p. 481.

The *brain* does not appear abſolutely neceſſary to animal life. We have ſeveral inſtances in authors, of children brought forth alive, and ſurviving their birth for ſome time, without any *brain*: and there are ſome anatomical inſtances, of animals ſurviving the loſs of their *brain*. To which may be added, many inſtances given by Mr. Boyle, not only of animals living a long time after the ſeparation of the head from the body, but even of the copulation and impregnation of ſome inſects under thoſe circumſtances: whence it appears, that the ſpinal marrow is ſufficient, on occaſion, for the buſineſs of ſenſation, motion, ſecretion of animal ſpirits, &c.

The *brain* of birds were a great delicacy among the ancients, who yet never touched thoſe of other animals. Some vainly preſcribe hares *brains*, as a remedy againſt difficult dentition. Among the Greeks, calves *brains* were uſed as a ſort of charm to excite love.

The accurate Mr. Lewenhoek examined, on ſeveral occaſions, the *brains* of different creatures by his microſcope; as that of the Indian hen, the ſheep, the ox, the ſparrow, &c. He could there always diſtinguiſh multitudes of veſſels ſo extremely ſmall, that if a globule of blood (a million whereof exceed not a grain of ſand in bigneſs) were divided into five hundred parts, thoſe parts would be too large to paſs into ſuch veſſels. He obſerved alſo, that theſe veſſels in the *brain* of a ſparrow, were as large as in that of an ox; and argues from thence, that there is really no other difference between the *brain* of a large animal and that of a ſmall one, but only that the one contains a much greater number of theſe veſſels than the others, and that the globules of the fluid paſſing through them, are in all animals of the ſame ſize.

In examining the *brain* of ſeveral ſorts of fowls, particularly the turkey, what is commonly called the cortical part of the *brain*, conſiſts of a very clear and tranſparent oily matter, which would be much better denoted by the term vitreous than cortical, but a great number of ſmall blood-veſſels are found ſpread through every part of this; and where a ſmall parcel of it is cut for a microſcopic examination, there flows a ſmall globule of a pellucid fluid from it. And Mr. Lewenhoek thinks, that, notwithſtanding the minuteneſs of theſe veſſels, there is a circulation carried on through them, and that of a red fluid; for wherever they lie three or four together, without any intervening matter, the congeries of them always appears red.

The medullary part of the *brain* of the ſame animal appears like a fiſher's net, between all the meſhes of which there is placed a very pliable ball-like ſubſtance, which changes its figure into a round or oval, according as the meſhes happen to be pulled or relaxed: theſe balls ſeemed to conſiſt of a clear and watery fluid, contained in a caſe or capſule of a membranous matter. Phil. Tranſ. Nº 168. p. 884.

See further concerning the *brain* in anatomical and medical writers, particularly Steno, Ridley, Willis, and Vieuſſens, who have treatiſes expreſs on this ſubject. Phil. Tranſ. Nº 215. Nº 51. p. 1034.

BRAIN, *fungus of the*. See FUNGUS.

BRAIN, *traces of the*. See TRACE.

BRAKE, in the *Country Language*, denotes a place where female FERN grows, and ſometimes the FERN itſelf.

BRAKE is alſo uſed for a farrier's inſtrument, otherwiſe called BARNACLES.

The word alſo occurs for a baker's treading-trough.

BRAKE, in the *Hempen Manufacture*, denotes a wooden toothed implement, wherewith to bruiſe and break the bun of hemp, and ſeparate it from the rind.

BRAKE *of a pump*, ſignifies the handle whereby it is wrought.

BRAMA, BREAM, in *Ichthyology*, a river-fiſh of the leather-mouthed kind, eſteemed a ſpecies of carp, and called by the generality of authors *cyprinus latus*.

It is a very broad and thin fiſh; the head is ſmall, the back of it broad and flat, and the back riſing from the head and tail toward the middle, like that of a hog.

BRAMA *Saxatilis*, in *Ichthyology*, the name of a ſea-fiſh, reſembling the common freſh-water BREAM in ſhape, but growing to three or four feet long. Its eyes are large; its ſnout of a pale red, as are alſo its belly-fins and its tail. It is caught among the rocks in deep water, and ſeldom is taken any other way than by hooks, and is a very well taſted fiſh. It is found in Surinam. This fiſh is a ſpecies of the SPARUS.

BRAMBAS, in *Natural Hiſtory*, a name given by the people of Guinea, and ſome other parts of Africa, to a peculiar ſpecies of lemon-tree. The leaves of this are of a deep green, and of an admirable fragrancy, when rubbed between the hands. The fruit is very ſmall, and has a remarkable thin ſkin. The juice is uſed in dying. Phil. Tranſ. Nº 108.

BRAMBLE, or **BRAMBLING**, in *Ornithology*, the common Engliſh name of the MONTIFRINGILLA, or *oroſpiza*, called in ſome places the mountain-finch; a ſmall bird, ſomewhat reſembling the chaffinch. Ray.

BRAMBLE-*buſh*, in *Botany*, a ſpecies of the *rubus*. See RASPBERRY-*buſh*.

BRAMBLE-*galls*. See GALLS *of the bramble*.

BRAMBLE-*net*, otherwiſe called *hallier*, is a net uſed by bird-catchers of ſeveral ſizes.

BRAMICIDE, the crime of killing a bramin, reputed in the Eaſt Indies one of the five moſt enormous ſins.

BRAMINS. See BRACHMANS.

BRAN, the ſkins or huſks of corn, eſpecially wheat, ground, ſeparated from the *farina* or flour, by a ſieve or boulter.

Of *wheat-bran* it is that ſtarch-makers make their ſtarch; which is nothing elſe but the *fæcula* remaining at the bottom of the veſſels, wherein the *bran* has been ſteeped in water.

Bran is held detergent, and, on that account, is of ſome medicinal uſe in gargariſms and glyſters. It is alſo a chief ingredient in the compoſition of cataplaſms. Some apply it hot againſt the pleuriſy; boiled, it purges ſcurf and dandriff, and cleanſes the hands in lieu of ſoap. Among the ancients, it was alſo uſed as an erotic, to excite love.

Dyers rank *bran* in the number of non-colouring drugs; becauſe it yields no colour of itſelf. It ſerves for the making of their four waters, uſed in preparing ſtuffs to take the dye.

This water is made by boiling wheaten *bran*, and into the decoction putting a little leaven.

BRANC *urſine*, in *Botany*. See BEAR'S-*breech*.

BRANCA, in *Middle Age Writers*, the paw, or extreme part of the foot of a wild beaſt, or bird of prey. Du-Cange.

BRANCA, or **BRANCHIA**, alſo denotes a right of lopping, or cutting off branches of trees in the foreſt for firing. Du-Cange.

BRANCH, in *Botany*, an arm of a tree, or a part which, ſprouting out from the trunk, helps to form the head, or crown thereof.

The word, according to Salmaſius, comes from the Latin *branca*; in the lower Latin, they ſaid *barga*. Others derive it from *brachium, an arm*; and others, from *branchia, the gills of fiſhes*.

The *branches* of trees, ſome have obſerved almoſt conſtantly to ſhoot from the trunk at an angle of 45 degrees: the reaſon is, that the whole ſpreading being generally confined within an angle of 90 degrees, as the moſt becoming and uſeful diſpoſition; that ſpace could not be well filled up any other way, than by forming all the interſections which the ſhoots and *branches* make, with angles of 45 degrees only.

According to M. Dodart, however, the *branches* generally ſprout out of the trunk horizontally, or at right angles with the trunk: but, in their aſcent, they affect perpendicularity as much as poſſible, though not in the ſame degree with trunks.

Branches are diſtinguiſhed into various kinds:

BRANCH, *wood*, according to Quintiny, is ſuch an one as, ſhooting out from a cut of the preceding year, is naturally of a conſiderable thickneſs.

BRANCH, *fruit*, is that which ſhoots out, of a moderate length and breadth, from the ſame cut, or pruning.—*Fruit-branches*, he adds, have large eyes, and are very near each other.

BRANCH, *half wood*, is that which, being too ſlender for a *wood-branch*, and too big for a *fruit-branch*, is cut off, at the length of two or three inches, to make it produce a better ſhoot, whether wood, or fruit.

BRANCHES, *ſpurious wood*, are ſuch as come contrary to the order of nature; or otherwiſe than from cuts of the preceding year; or which, coming on ſuch cuts, are big in the place where they ſhould be ſmall.

To underſtand this order of nature, it muſt be obſerved, 1. That *branches* ſhould never come, except on thoſe of the laſt cut; ſuch, therefore, as ſhoot from other parts, are ſpurious. 2. The order of the new *branches* is, if there be more than one, that the extreme *branch* be thicker and longer than that immediately under it; and this bigger and longer, again, than the third, &c Hence, if any be big where it ſhould be ſmall, it is called *ſpurious*.

There are, however, ſome exceptions: in trees that are vigorous, and yet bear a handſome figure, there cannot well be too many *fruit-branches*, provided they make no confuſion; but for *wood-branches*, there ſhould not ordinarily be above one ſuffered to grow, of the ſeveral which ſhoot from each cut of the preceding year. See PRUNING.

BRANCHES, *engrafting of*. See ENGRAFTING.

Branches of trees bear a near analogy to limbs of animals; and, in certain caſes, the amputation of them is found neceſſary. A. D. S. an. 1707, p. 366.

Some conſider *branches* as a ſort of roots in the air: in reality, they are only prolongations of the roots; but, being united in the trunk, are redivided in the *branches*. What ſhews the conformity between the two ſpecies of roots, is, that the ends of *branches* being ſet in the ground, while yet adhering to the mother-tree, they will take root, grow on their own bottom; and what is more, there are divers trees, which, if planted upſide down, the roots turn to *branches*, with leaves and fruit, and the *branches* to roots and fibres: but whether the *branches*, while ſuch, do the office of roots, and receive any fine kind of nutriment from the air, Mr. De la Hire, Mr. Brotherſon, and others, have aſſerted, is a queſtion not yet fully decided. Mr. Perrault ſuppoſes the *branches* to convey a ſap for the nouriſhment of the root, as the root does for the reſt of the plant. Phil. Tranſ. Nº 43, and Nº 187.

Branches do not ſpring out of the mere ſurface of the trunk, but are profoundly rooted therein, ſo as not only to penetrate the cortical, but alſo the woody ſubſtance, and even the pith.

Anciently, *branches* were carried in the hands at the proceſſions and ceremonies of the gods; whence the *thallophori*, or *branch*-bearers.

The Theſpians adored a *branch*. The olive-*branch* was the ſymbol or enſign of peace. The natives of the iſlands in the South ſeas uſe green boughs, &c. for the ſame purpoſe at this day.

BRANCH is alſo applied to the parts or ramifications of divers other bodies, which, in reſpect hereof, are conſidered as ſtems. Thus chemiſts ſpeak of the *branches* of their metalline vegetation, *branches* of the *arbor Dianæ*, *arbor Martis*, &c. Phil. Tranſ. Nº 286. Mem. Acad. Sc. 1692. 1710.

BRANCH, in *Anatomy*, denotes a diviſion of a vein, artery, or nerve. All the veins in the body are only *branches* of the *vena cava*.

BRANCH is alſo uſed in the *Military Art*, in ſpeaking of trenches, mines, and their ſeveral ducts, ways, returns, and the like, between one well and another. See GALLERY.

BRANCH is alſo uſed in ſpeaking of the veins in mines of gold, ſilver, or other metals, which divide like the veins in the body.

BRANCH, in *Genealogy*, is applied to the ſeveral lines or ſucceſſions ariſing out of the ſame ſtock or origin.

In which ſenſe, *branches* amount to much the ſame with cadets.

BRANCH alſo denotes a complex metalline kind of candleſtick, contrived for the reception of a number of candles. Theſe, in ancient writers, are called *phari*, *cantharæ*, JESSE; when made of glaſs, *luſtres*; the richer ſort, *girandoles*.

BRANCH *of the trenches*, in *Fortification*. See BOYAU.

BRANCH-*ſtand*, in *Falconry*, ſignifies to make a hawk leap from tree to tree, till the dog ſprings the partridge.

BRANCH, in *Scripture*, is an appellation peculiarly given to the Meſſiah, as being of the *branch* or houſe of David.

BRANCHES *of vaults*, are ſometimes uſed to denote the ARCHES of them.

BRANCHES *of arches*, denote ſeveral portions of arches ſpringing all from the ſame ſummer.

BRANCHES *of ogives*, in *Architecture*, the reins or arches of Gothic vaults; which traverſing from one angle to another, diagonal-wiſe, form a croſs between the other arches which make the ſides of the ſquare, whereof thoſe arches are diagonals.

BRANCHES *of a bridle*, in the *Manege*, are two crooked pieces of iron which ſupport the mouth-bit, the chain, and the curb; and which are faſtened on one ſide to the head-ſtall, on the other to the reins; ſerving to keep the horſe's head under command.

What way ſoever the *branches* of the bit incline, the horſe's mouth goes to the contrary. The duke of Newcaſtle is very particular on the head of *branches*; explaining their ſeveral kinds, and their effects, which are reducible to thoſe of a lever.—The *branch* is always to be accommodated to the deſign, either of bringing in, or raiſing a horſe's head, and to the neceſſary degree: accordingly, we have ſtrong and hardy *branches*, gentle *branches*, rude *branches*, &c.

With regard to their form and ſtructure, *branches* are either ſtrait, in form of a piſtol, for young horſes to form their mouth; or, after the conſtable of France's faſhion, for horſes that already carry the head well: others are in form of a gigot, or leg; others of a bent knee; others in the French faſhion, &c.

Theſe are laws in the *Manege:* 1. That the farther the *branch* is from the horſe's neck, the more effect it will have. 2. That ſhort *branches, cæteris paribus,* are ruder, and their effects more ſudden, than thoſe of longer. 3. That the *branch* is to be proportioned to the length of the horſe's neck.

That part of the *branch* of a bridle, whereby we judge of its effects, and which diſcovers its ſtrength or weakneſs, is called the *line of the banquet.*

A ſtrong and hardy *branch,* is that whoſe ſevil hole, at the lower end of it, is placed on the outſide of the line of the banquet.

A gentle *branch* is that, the ſevil-hole of which is ſet on the inſide of the ſaid line.

A rude and hardy *branch* will bring in a horſe's head, proportionably as it is more or leſs hardy; whereas a gentle *branch,* by diminiſhing the effect of the bit-mouth, makes a horſe more eaſily to bear the preſſure thereof, who before could hardly endure it.

BRANCHED *velvet.* See VELVET.

BRANCHER, among *Fowlers* and *Falconers,* denotes a young bird well fledged, which having quitted the neſt, is not yet in a condition to fly far, or ſhift for itſelf, but ſtill keeps in the buſhes and branches about its native dwelling, where it is fed by the dam.

The *branchers* of hawks are alſo called *ramage falcons;* thoſe of nightingales, *puſhers;* becauſe, as ſome ſay, they are thruſt out of the neſt by the old ones. Canary birds of the firſt year are called *branchers;* when juſt flown, and unable to feed themſelves, *puſhers.*

BRANCHERY, in the *Anatomy of Vegetables,* denotes the vaſcular parts of divers fruits, as apples, pears, plums, and berries.

In which ſenſe, the *branchery* ſtands contradiſtinguiſhed from the acetary, ſkin, pulp, &c.

The *branchery* of an apple is only the ramifications of the ligneous body through all the parts of the *parenchyma;* the greater branches being likewiſe, by the inoſculations of the leſſer, united together. Grew. Anat. of Plants, lib. i. cap. 6. § 2.

BRANCHIA, βραγχια, a name given, by the *Ancient Naturaliſts,* to the GILLS of fiſhes; which are parts compoſed of cartilages and membranes, in form of leaves; and ſerving inſtead of lungs to perſpire by.—See *Tab. Anat. (Splanch.) fig.* 14.

The *branchia,* Galen obſerves, are full of little *foramina,* big enough to admit air and vapours, but too fine to give paſſage to water. Pliny held, that fiſhes reſpired by their gills; but he obſerves, that Ariſtotle was of another opinion: to whom we may add, among the moderns, Dr. Needham.

The cetaceous fiſhes, as they have lungs, have none of theſe apertures of the *branchiæ;* and in all thoſe fiſhes that have them, the larger they are, the ſooner the fiſh dies, on being taken out of the water. See GILLS.

BRANCHIALE, in *Natural Hiſtory,* a name given by Mr. Lhuyd to a peculiar ſpecies of FUNGITÆ, which being of a deeply ſtriated texture, is ſuppoſed to reſemble the gills of a fiſh.

BRANCHIDÆ, in *Antiquity,* prieſts of Apollo ſerving in his temple at Didyma in Miletus; which was famous for its oracle.

The denomination is taken from *Branchus,* or *Branchides,* an epithet given to Apollo as worſhipped here; though on what account the title was given, is not agreed on.

In the time of the Perſian war, the *branchidæ* betrayed the temple and its oracle into the hands of the Perſians, who pillaged it. They tranſported themſelves into the fartheſt parts of Aſia, to be out of the reach of puniſhment from the Greeks; which yet they are ſaid to have met with from Alexander, who demoliſhed their city, and put all the inhabitants to the ſword. Strabo, lib. xiv. Potter. Arch. Græc. lib. ii. cap. 9.

BRANCHING, the *ramification* or *ſprouting* of the HORNS of deer, &c. which bears an analogy with the vegetation of plants. Phil. Tranſ. N° 227.

The HAIR at the ends is apt to *branch,* or ſplit, and divide into whole bruſhes, which are eaſily viſible by a microſcope.

BRANCHIOSTEGI, in *Ichthyology,* a term uſed to expreſs one of the general claſſes of fiſhes; the characters of which are, that the rays of the fins are of a bony ſubſtance; but theſe fiſh have no bones or *oſſicula* at the *branchiæ,* as the malacopterygious and acanthopterygious fiſhes all have.

The word is derived from βραγχια, *gills,* and οστεον, *a bone.*

BRANCHUS, βραγχος, in *Medicine,* a ſpecies of CATARRH, affecting chiefly the jaws, throat, and *aſpera arteria.* *Branchus* amounts to the ſame with what is called, by the Latins, RAUCEDO, *raucitas,* ſometimes alſo *ravis.* See HOARSENESS.

BRANCHUS, or *branchæ,* alſo denotes a kind of glandular tumor in the *fauces,* reſembling two almonds, which render the breathing and hawking difficult.

BRAND-*herring,* a kind of herring caught by the Dutch.

BRAND-*Sunday, Dimanche des Brandons,* in *French Eccleſiaſtical Writers,* denotes the firſt Sunday in Lent; which is thus called on account of an ancient practice in the Lyonnois, where the peaſants, in the night of this day, walked about their orchards, gardens, &c. with torches lighted, or fire-*brands* in their hands; in which plight they viſited every tree, and addreſſing themſelves to them one after another, threatened that if they did not bear fruit well the enſuing ſeaſon, they ſhould be cut down to the ground, and burnt. This is evidently a relict of paganiſm; the like of which was practiſed by the ancient idolaters in the month of February; hence called *Februarius, à februando.* Meneſtr. Hiſt. de Lyon. p. 279. Menag. Orig. p. 126; & Du-Cange Gloſſ. Lat. tom. i. p. 610.

BRANDARIS, a ſpecies of the *ſtrombus* in the order of *teſtacea.*

BRANDEUM, in *Eccleſiaſtical Writers,* a linen cloth or veil put over the tombs of the apoſtles St. Peter and St. Paul, and left there for ſome time; by which it is ſuppoſed to acquire a degree of ſanctity, ſo as to be worſhipped as a relic; and for that purpoſe frequently ſent by the pope as a preſent to ſome prince. Fleur. Hiſt. Eccl. lib. xxxv. p. 93. Du-Cange Gloſſ. Lat. tom. i. p. 609.

In this ſenſe, *brandeum* amounts to the ſame with what was otherwiſe called *ſanctuarium, ſudarium, orarium,* and *velum.*

The uſe of *brandea* was introduced as a means of diffuſing and propagating the virtues and influences of RELICS, without moving, or any way impairing the ſubſtance of them; the tranſlation of RELICS in early days being forbidden.

BRANDING *in the face,* or *hand,* denotes a puniſhment inflicted by law on various offences, by burning with a hot iron, after the offender hath been once admitted to benefit of clergy. Blackſtone's Comm. vol. iv. p. 360.

BRANDRITH, denotes a trevet or other iron ſtand, whereon to ſet a veſſel over the fire.

BRANDRITH, among *Builders,* denotes a fence or rail about the mouth of a well.

BRANDY properly denotes a proof-ſpirit, obtained by ſimple diſtillation from real wines, or fermented juices of grapes. The veſſels uſed herein, are uſually of copper; and diſtillers, to cool the liquor more readily, make the neck of the mattraſs, which is very long, and winding like a ſerpent, paſs through a veſſel of cold water.

Brandy differs from wine ſpirit, in that the former is drawn from the poorer and thinner ſorts of wines, the latter from the richer and fuller bodied wines.

Brandy alſo differs from ſpirit of wine, as the former is only what they call proof high, or half pure ſpirit, half phlegm; whereas ſpirit of wine is raiſed higher, or carried by rectification to a further degree of purity.

Brandy alſo differs from ſtrong waters, as the latter is a compound, whereof the former, or pure ſpirit of wine, is only one ingredient.

The Portugueze are lately coming into the way of making *brandy.* The Greek *brandies* are the worſt, though made of the beſt wines.

The too free and frequent uſe of *brandy* is attended with ill effects, as it attenuates the body, and impairs the ſtrength, and ſtupifies the brain. In perſons who have died hereof, the blood has been found thick and coagulated; the *pancreas* dried; the liver ſchirrhous, and almoſt petrified; the glands tumefied beyond their natural bulk, &c. But what ſhall we ſay to the Pariſian woman, who was burnt to aſhes with a fire only kindled from the *brandy* in her body? Conringius even attributes the degeneracy of the modern from the ancient Germans, to the prevalency of drinking this liquor. Phil. Tranſ. N° 97.

In the hot climates of America, they are ſaid to make clyſters of *brandy.* A perſon who had experienced the uſe of one of theſe fiery *enemata,* made of a pint of *brandy,* aſſures us, it not only made him dead drunk, but raving mad. Phil. Tranſ. N° 37.

Brandy is alſo applied, in a leſs proper ſenſe, to all ſpiritous inflammable liquors, drawn from vegetables by diſtillation. In which ſenſe *brandy* includes all ardent, or inflammable ſpirits, uſed in the way of beverage. Dr. Shaw adds a further limitation to *brandy* ſpirits, viz. that they be proof high, or conſiſt of equal quantities of water and alcohol. On which footing, ſpirits, either above or below proof, do not come under the appellation of *brandies.* But in the popular uſe this diſtinction is not obſerved.

Arac, rum, malt and melaſſes ſpirit, in this ſenſe, are *brandies*, though under another denomination.

In the iſland of Andros, they make *brandies* from the fruits of the arbutus and mulberry-trees.

A patent was ſome time ago obtained for making *brandy* from carrots and parſneps; the latter of which is ſaid to have nearly reſembled French *brandy*. Of late we meet with frequent advertiſements of raiſin-*brandy*, which, if really made of that fruit, is neareſt akin to wine-*brandy*.

Apple, or cider-*brandy*, is alſo praiſed by ſome.

Cider is found to yield an eighth part of good ſpirits, and if cloſe kept a year or two in a cool place, much more.

Brandy is alſo uſed to denote certain compound liquors, whereof *brandies* are the baſis. Such are raſpberry-*brandy*, cherry-*brandy*, gooſeberry-*brandy*, &c.

The French method of diſtilling *brandies* is the ſame with that practiſed by our diſtillers, in working from waſh or wines; only that the former throws a little of the natural lee into the ſtill along with the wine, which gives the ſpirit a flavour, on which a great part of its merit depends.

When *brandies* prove foul, ſeedy, or retain the taſte of certain weeds apt to grow among the vines, they draw them over again, in order to cleanſe them of that adventitious flavour: in which operation they leave out the faints, or rather change the receiver, as ſoon as the ſtream begins to run proof. Then mixing together all that run off before, they call it *trois cinque*, that is, *brandy* conſiſting of five parts alcohol, and three of phlegm; beyond which the French *bruleurs*, or common diſtillers, rarely go.

The yearly export of *brandies* from France is ſaid to amount to 25000 tons; an article of itſelf ſufficient to enrich a moderate country. While the duty on French *brandy* continued at 9*l.* the ton, the Engliſh alone took ten or eleven thouſand tons off their hands; but now that the duty is raiſed to 52*l.* the ton, the importation is greatly reduced, to the advantage of the Engliſh diſtillery, except that ſmuggling ſtill intervenes.

The colour of their *brandies* is acquired from the caſk, and the length of time they uſually lie in them, which is ſometimes twelve or eighteen months, and often two or three years; during which, it is no wonder if they acquire a yellow or browniſh caſt. Their lying thus long, as it were, in a ſtate of ſlow digeſtion, wonderfully takes off from that hot, acrid, and foul taſte, peculiar to all ſpirits, or *brandies*, newly diſtilled; and gives them a coolneſs and a ſoftneſs, not eaſily introduced by art. And on theſe properties are founded ſeveral methods of trying their goodneſs, or diſcovering whether they are debaſed or adulterated by the admixture of coarſer ſpirits. Phil. Tranſ. N° 391.

Brandies are rarely adulterated in France, where they have no cheaper ſpirits with which to debaſe them; and the like holds, in great meaſure, in favour of the Dutch, though otherwiſe ſuſpected to be great adulterators. The chief temptations for adulterating are in England, where the duties are high, and where there are various kinds of ſpirits in plenty to mix with them, as malt, melaſſes, cider, and ſugar ſpirits, with all which they are often ſophiſticated, and ſo dextrouſly, as frequently to eſcape all the ways of detection. *Brandy* may be imitated, by adding to very pure malt ſpirits, ſome dulcified ſpirit of nitre.

The chief uſe of *brandy*, is as a drink; eſpecially in the cold northern countries; among the negroes in Guinea, who ſell one another for a few bottles of *brandy*; and among the ſavages of Canada, and other parts of North America, who are extremely fond of it. It is of ſome uſe too in medicine; being ſaid to ſtrengthen the nerves: and in dying, when raiſed into rectified ſpirit of wine, being one of the dyers non-colouring drugs.

BRANDY, *to diſtil*, they fill the cucurbit half full of the liquor from which it is to be drawn; and raiſe it, with a little fire, till about one ſixth part be diſtilled, or till they perceive, that what falls into the receiver is not at all inflammable.

For this operation they uſe ſtoves built with bricks or ſtone, which are made either round or ſquare: when they uſe bricks, they bind them with a ſtrong fine clay, mixed with horſe dung or cow's hair.

Theſe ſtoves muſt always have two bottoms, the uppermoſt to put the fuel on, and the lowermoſt to receive the aſhes. They have alſo the precaution to contrive three or four vents round the copper, which they open or ſhut, as they would forward or retard the diſtillation For want of a ſtove, they ſometimes uſe an iron trivet to ſet the copper on, and only put wood under it: but this method is very defective; nor can good diſtillations ever be made, if the operator is not maſter of the fire, to manage it with judgment and dexterity, which cannot be done in this laſt method in the open air.

In order to make good *brandy*, there muſt be uſed a large copper cucurbit, to which the head muſt be properly adapted; and having filled it half full with wine, which muſt be neither ſour, nor vented, nor corrupted, the cucurbit muſt be covered with its head, which muſt be exactly luted to it with paper and paſte, or rather with a wet bladder folded ſeveral times. Then the cucurbit muſt be put into the ſtove, and the branch or neck through which the *brandy* is to diſtil, muſt be made to paſs through a tun with one bottom only, filled with freſh water; for which purpoſe the neck muſt be three or four feet long, compoſed of a long tube which muſt paſs obliquely through the tun, and winding again, muſt meet a tube which iſſues out of the head of the cucurbit: theſe two tubes entering one into the other, muſt alſo be luted together with paper and paſte, or a wet bladder as above, to prevent the evaporation of the ſpirits during diſtillation. Care muſt alſo be taken to keep upon the head of the cucurbit a wet cloth, to make the ſpirit condenſe. As ſoon as you obſerve that ſome drops begin to fall at the end of the long tube, you muſt ſuffer about fifty to fall down, after which a recipient muſt be adapted to that end of the tube, capable of receiving the *brandy* which is going to diſtil. The diſtillation muſt not be haſtened by too fierce a fire.

The liquor, thus diſtilled the firſt time, is called *brandy*; which ſpirit, purified by another, or ſeveral more diſtillations, is what we call SPIRIT *of wine rectified*.—The ſecond diſtillation is made in *balneo mariæ*, and in a glaſs cucurbit; and the liquor put therein is diſtilled to about one half the quantity; which half is further rectified, as long as the operator thinks fit.

To abridge theſe ſeveral diſtillations, which are long and troubleſome, they have invented a chemical inſtrument, whereby the rectification of ſpirit of wine is performed, at one ſingle diſtillation: the deſcription and figure of which inſtrument may be ſeen in Glaſer's Chemiſtry.

To try the goodneſs of rectified ſpirit of wine, it muſt be lighted into a blaze: if then it conſumes wholly, without leaving any impurity behind; or, which is ſurer ſtill, if after putting a little gunpowder in the bottom of the ſpirit, the gunpowder take fire when the ſpirit is conſumed; the liquor is good.

Thoſe who deal in *brandy* (we ſpeak only of that made with wine), chooſe it white, clear, of a good taſte, and ſuch as will bear the teſt, or proof; i. e. ſuch as in pouring into a glaſs, forms on the top of it a little white lather, which, as it diminiſhes, makes a circle, called by the French *brandy* merchants the *chapelet*, by the Engliſh the *bead*, or *bubble*; there being no *brandy* but that which is well dephlegmated, and which retains no ſuperfluous humidity, wherein the bead will be entirely formed. For various methods of aſcertaining the ſtrength and goodneſs of *brandy* and other ſpirits, ſee *Proof* SPIRITS.

Before we finiſh this article, we ſhall give an account of the manner of extracting *brandy* from the huſks or ſkins of grapes, after the preſſing; becauſe the benefits that ariſe from this diſtillation, deſerve ſome attention.

After the grapes have been preſſed, what remains in the preſs is coarſely ſeparated into ſmall particles with the hand, and afterward thrown into large tubs, where they preſs it very hard, mix a little water with it, and cover it very cloſely with clay: in that condition they leave it to ferment during four or five weeks, obſerving however to ſhut the crevices which might happen to open in the clay, to prevent the evaporation.

After that time they fill a very large copper half full with that mixture, cover it with its head, lute it, and diſtil the whole after the ſame manner as they do *brandy*. By this work they make a great advantage of a matter which they were uſed to caſt on a dunghill. If this *brandy* be not ſo palatable as that which is made of wine, it is excellent for making ſpirit of wine. Both theſe liquors are a conſiderable branch of trade.

The greateſt part of the *brandies* in uſe, and thoſe too the beſt, are prepared in France: of the French *brandies*, thoſe of Nantes and Poictou are the moſt eſteemed; as being of a better taſte, finer and ſtronger, and enduring the bubble-proof longer than any of the reſt: thoſe of Anjou, Touraine, Orleans, Bourdeaux, Rochelle, Cognac, &c. claim the ſecond place. They are chiefly ſent to Paris and Flanders by the river Loire.

Brandy, in *Law-language*, is denominated either ſingle or double, when it is under or above *proof*. By the ſeveral acts 12 Car. II. c. 23. c. 24. 4 and 5 W. c. 3. 4 Ann, c. 6. 6 Geo. II. c. 17. every gallon of ſpirituous liquors imported is charged exciſe as follows: ſingle *brandy*, ſpirits, or *aqua vitæ*, 4*s.* 8*d.* double *brandy*, ſpirits, or *aqua vitæ*, 8*s.* 8*d.* And by the 32 Geo. II. c. 10. an additional duty of 12*d.* in the pound, according to the value in the BOOK *of rates*, is laid on all foreign *brandy* and ſpirits, rum from the produce of the Britiſh ſugar plantations excepted. And by the 33 Geo. II.

c. 9. and 6 Geo. III. c. 47, a duty of 1*s.* 6*d.* on every gallon of ſingle *brandy*, &c. and of 3*s.* on every gallon of double *brandy*, &c.

Of *brandy*, both plain and rectified, are prepared various kinds of ſtrong liquors, with the addition of other ingredients, ſugars, ſpices, flowers, fruits, &c. which are afterwards clarified, by paſſing them through a ſtraining-bag, or filtering them through brown paper.—Such are cinnamon waters, aniſeed waters, fennel waters, celery waters, citron waters, &c. A great part of theſe are brought from Montpelier; where they are ſuppoſed to be better prepared than any where elſe. Savar. Dict. Commerce.

Brandy, *Cherry.* See Cherry.

BRANK, the ſame with *buck-wheat.*

BRANLIN, an Engliſh name for a ſpecies of fiſh of the ſalmon kind, called alſo in ſome places *fingery*.

They obtained this laſt name from ſome ſingular marks they have, which are five or ſix tranſverſe black ſtreaks upon each ſide, appearing as if made by the impreſſion of ſo many fingers, and each marked with a ſingle red ſpot. The tail of this fiſh is forked like that of the common ſalmon, and it is ſuppoſed they are all males; they ſeem to impregnate the ſpawn of the common ſalmon, and are found in waters of ſo rapid a current, that ſcarce any other fiſh could live in them. They never grow to any great ſize. Willughby, Hiſt. Piſc. p. 193.

BRASEM, in *Zoology*, a name by which ſome have called an American fiſh of the Smaris kind, more commonly known among authors by its Braſilian name of *acaropeba*.

BRASIDIA, in *Antiquity*, anniverſary feaſts held at Sparta in honour of Braſidas, the ſon of Tellus, famous for his great atchievements in favour of that ſtate.

The *Braſidia* were celebrated with ſacrifices and games, at which none were allowed to contend but free-born Spartans. To be abſent from theſe ſolemnities, is ſaid by ſome to have been held criminal, and puniſhed with fines. Meurſ. Græc. Ferial. Potter. Arch. Græc. lib. ii. cap. 20.

BRASIL, and **BRAZILETTO**. See Brazil, and Cæsalpinia.

BRASMA, in the *Medical Writings of the Ancients*, a name given by Dioſcorides and others to a light, empty, and good for nothing kind of black pepper. This was no peculiar ſpecies of pepper, but, as John Bauhine has well obſerved, it was the ſame with the pepper we now frequently meet with, which has decayed upon the plant. Dioſc. lib. ii. cap. 189.

BRASS, a factitious metal, compoſed of copper fuſed with *lapis calaminaris*, which gives it a hardneſs, and yellowneſs. The manner of making *braſs* is ſaid to have been kept a ſecret in Germany for many ages.—The method of preparation among us is as follows. The *lapis* Calaminaris being calcined, and ground as fine as flour, is mixed with a third or fourth part of ground charcoal; and incorporated, by means of water, into a maſs. To this compoſition of calamine and coal, ſome manufacturers add common ſalt, by which the proceſs of making braſs is ſaid to be haſtened: thus prepared, about ſeven pounds of the calamine is put into a melting-pot of about a gallon; and over it, about five pounds of copper, either in plates or grains, which is let down into a *wind*-Furnace eight feet deep, remaining there about eleven hours; in which time it is converted into *braſs*.—After melting, it is caſt into plates, or lumps: forty-five pounds of crude calamine produce thirty pounds burnt, or calcined; and ſixty pounds of copper make, with calamine, an hundred pounds of *braſs*.

The proportion of calamine, and the increaſe which the copper receives from it, are different in different works; and hence ariſes the deeper or paler colour of *braſs*. The quantity of *braſs* obtained by the proceſs for making it, has been conſiderably augmented ſince the introduction of the method now commonly practiſed, of uſing granulated copper. See Granulation.

The finer and more malleable kinds of *braſs* are made of the pureſt calamine and copper, by cementing the *braſs* a ſecond time with calamine and charcoal, and ſometimes adding to it old *braſs*, by which the new is ſaid to be meliorated.

The word *braſs* ſeems to have been formed from *bracium*, a cant term among alchemiſts for *copper*.

They ſometimes uſe *braſs-ſhruff* inſtead of copper; but that is not always to be procured in quantities ſufficient; being no more than a collection of pieces of old *braſs*.

Braſs may be cleanſed, firſt, by rubbing it with a cloth dipped in equal quantities of *aqua fortis* and common water; then with an oily cloth, and laſtly with a dry one dipped in *lapis calaminaris*.

The beſt *braſs* guns are not made of pure copper and calamine alone; but it is neceſſary to add coarſer metals, to make it run cloſe and ſounder; ſuch as lead, and pot-metal. The beſt proportion for gun-metal, it is ſaid, is, for eleven or twelve thouſand weight of metal, to uſe ten thouſand pounds of copper, nine hundred pounds of tin, and ſix hundred pounds of *braſs*; but the proportion is variable, according to the quality and goodneſs of the copper.

Braſs is ſomewhat lighter, harder, and more ſonorous than pure copper. It melts more eaſily, and does not ſcorify ſo ſoon in a moderate red heat. It is ductile only whilſt cold; heated a little, it cracks; and ignited, it falls in pieces under the hammer. This imperfection it derives from the zinc of the calamine; pure copper being malleable when hot, as well as when cold. The beautiful colour of *braſs*, its hardneſs, its malleability, its fuſibility, and its quality of being leſs ſubject to ruſt or verdigris than copper, render it fit for the fabrication of many utenſils.

Braſs is tinged of a gold colour, firſt, by burning, then diſſolving it in *aqua fortis*, and, laſtly, reducing it to its metalline ſtate. It may be whitened by heating it red hot, and quenching it in water diſtilled from *ſal ammoniac*, and egg-ſhells. It is ſilvered, or coloured ſuperficially white, by rubbing it with balls made of ſilver diſſolved in *aqua fortis*, with powder of white tartar, ſufficient to abſorb all the moiſture thereof.

Brass, in *Antiquity*. See Æs.

Brass, in a more extenſive ſenſe, includes copper, and all the mixtures or alloys of copper with other minerals. In which ſenſe, *braſs* amounts nearly to the ſame with the Roman æs, and the French *airain*.

Brass, in the *Glaſs Trade*.—Thrice calcined *braſs* is a preparation which ſerves the glaſs-men to give many very beautiful colours to their metal. The manner of preparing it is this: place thin plates of *braſs* on tiles on the leet of the furnace near the occhio; let it ſtand to be calcined there for four days, and it will become a black powder ſticking together in lumps. Powder this, and ſift it fine, and recalcine it four or five days more; it will not then ſtick together, but remain a looſe powder, of a ruſſet colour. This is to be calcined a third time, in the ſame manner; but great care muſt be taken, in the third calcination, that it be not over-done, nor under-done; the way to be certain of making it right, is to try it ſeveral times in glaſs while melting. If it makes the glaſs, when well purified, to ſwell, boil, and riſe, it is properly calcined; if not, it requires longer time. This makes, according to the different proportions in which it is uſed, a ſea green, an emerald green, or a turquoiſe colour.

Braſs, by a long calcination alone, and without any mixture, affords a fine blue or green colour for glaſs; but they have a method of calcining it alſo with powdered brimſtone, ſo as to make it afford a red, a yellow, or a chalcedony colour, according to the quantity, and other variations in the uſing it. The method of making the calcination is this: cut thin plates of *braſs* into ſmall pieces with ſhears, and lay them *ſtratum ſuper ſtratum*, with alternate beds of powdered ſulphur, in a crucible; calcine this for twenty-four hours in a ſtrong fire, then powder and ſift the whole; and, finally, expoſe this powder upon tiles, for twelve days, to a reverberating furnace; at the end of this time, powder it fine, and keep it for uſe.

The glaſs-makers have alſo a method of procuring a red powder from *braſs*, by a more ſimple calcination, which ſerves them for many colours. The method of preparing it is this: they put ſmall and thin plates of *braſs* into the arches of the glaſs-furnaces, and leave them there till they are ſufficiently calcined, which the heat in that place, not being enough to melt them, does in great perfection. The calcined matter, powdered, is of a duſky red, and requires no farther preparation. Neri's Art of Glaſs.

Brass-*lumps*, in *Mineralogy*, a common name given by the miners and diggers of coal, &c. to the globular pyrites. This ſtone, when kept in the air, often ſends forth its efflorescences of ſalt, in form of ſmall and ſlender fibres, perfectly tranſparent, and ſometimes near an inch long. The place where theſe ſtones are expoſed to the air, will greatly alter the figures and colours of their efflorescences; if they are laid in a cellar, the ſhoots will be ſhorter, and green, like the common copperas; and if laid in the way of the ſunſhine, they will be white and duſty. Both are the ſame ſalt, which is true green vitriol or copperas, and both will, in the ſame manner, turn a decoction of galls into ink. The white ſalt is only the green powdered and calcined by the ſun's heat. The figure of the fibres of theſe efflorescences is not eaſy to be determined; ſometimes they ſeem round, ſometimes angular. Theſe, however, are the natural figures of the ſalts of theſe ſtones; and the other ſhoots into which they form themſelves after ſolution, and bringing them together in a body by water, are rather their accidental forms, though, under a like courſe of accidents, they generally appear the ſame. Phil. Tranſ. N° 110.

Brass-*wire*. See Wire.

BRASSATELLA, Brassadella, or Brassidella, in *Botany*, a name given by many authors to the plant more uſually known by that of OPHIOGLOSSUM, or ADDER'*s tongue*.

BRASSE. Seee Pearch.

BRASSICA, in *Botany*, the cabbage; a genus of the *tetradynamia ſiliquoſa* claſs of plants, the characters of which are theſe: the flower is croſs-ſhaped, having four petals, and four oval nectarious glands. It hath ſix ſtamina, which are erect, two of which are oppoſite, and the other four are longer. It hath a taper germen, of the length of the ſtamina, which afterward becomes a long taper pod depreſſed on each ſide, and is terminated by the apex of the intermediate partition, which divides it into two cells filled with round ſeeds. See Broccoli, Cabbage, Cauliflower, Savoy, &c.

BRASSIDELIC *art*, a term uſed by Paracelſus, to denote a method of curing wounds by the application of the herb *braſſidella*, or *ophiogloſſum*, on the freſh wound.

BRAVA *Pareira*. See Pareira *brava*.

BRAURONIA, in *Antiquity*, a feaſt held every fifth year in honour of Diana, ſurnamed *Brauronia*, from *Brauron*, a village near Athens, where the famous ſtatue of that goddeſs, brought from Scythia Taurica, was preſerved.

The ceremony of the *Brauronia* was managed by ten men, from their office called Ιεροποιοι; the victim offered was a goat, and it was cuſtomary for certain men to ſing one of Homer's Iliads, during the ſervice: other miniſters at the ſolemnity were young virgins, from five to ten years of age, habited in yellow, and conſecrated to Diana, under the denomination of Αρκτοι. Potter. Arch. Græc. lib. ii. cap. 20.

BRAWN, in the *Culinary Art*, ſignifies the fleſh of a boar, boned, rolled up, or collared, boiled, and, laſtly, pickled, for the winter's uſe.

Brawn is made only of the flitches, without the legs; the oldeſt boars are choſen for this uſe; it being a rule that the older the boar, the more horney the *brawn*.

There is alſo *brawn* of pig, which is made by ſcalding, drawing, and boning the beaſt whole, except the head; then cutting it in two collars, ſoaking it in brine, ſeaſoning, rolling, putting it into a cloth, binding it up, boiling it, and, when boiled, hooping it up in a frame.

BRAZED, in *Heraldry*, is uſed in ſpeaking of three cheverons claſping or folding each other.

The word is doubtleſs formed by corruption from the French word *bras*, *arm*.

BRAZEN *age*, is uſed by the poets to expreſs the third AGE of the world.

Brazen *diſh*, among *Miners*, is the ſtandard by which the other diſhes are gauged, and is kept in the king's hall.

BRAZIER, an artificer who makes and ſells pans, pots, kettles, and other kitchen utenſils and braſs ware.

Itinerant *braziers*, who go about with their tools and knapſacks, are called *tinkers*; by the French, *braziers of the whiſtle*, *chauderonniers au ſifflet*.

BRAZIL, or Brasil, an American wood, commonly ſuppoſed to have been thus denominated, becauſe firſt brought from Brazil: though Huet ſhews, it had been known by that name many years before the diſcovery of that country. Vide Huetiana, p. 268.

It is denominated variouſly, according to the places whence it is brought. Thus, we have *brazil* from Fernambuc, *brazil* of Japon, of Lamon, of St. Martha; and, laſtly, *braziletto*, or Jamaica wood, brought from the Antilles.

The *brazil* tree ordinarily grows in dry barren places, and in the middle of rocks; it is very thick and large, uſually crooked, and knotty: its flowers, which are of a beautiful red, exhale a very agreeable ſmell, which ſtrengthens the brain. Though the tree be very thick, it is covered with ſo groſs a bark, that when the ſavages have taken it off the wood, or trunk, which before was the thickneſs of a man, it is ſcarce left equal to that of his leg.

Brazil wood is very heavy and dry; it crackles much in the fire, and ſcarce raiſes any ſmoke, by reaſon of its extreme dryneſs. None of the ſeveral kinds have any pith, except that of Japon: that of Fernambuc is eſteemed the beſt. It muſt be choſen in thick pieces, cloſe, ſound, without any bark on it; and ſuch as, upon ſplitting, from pale becomes reddiſh; and, when chewed, has a ſaccharine taſte.—It is much uſed in turned works, and takes a good poliſh; but its chief uſe is in dying, where it ſerves for a red colour: it is a ſpurious colour, however, which it gives; and eaſily evaporates, and fades: nor is the wood to be uſed without alum and tartar. Red ink is made of it, boiled in beer, wine, or vinegar, and the colour fixed with alum.

Hellot has given a remarkable proceſs, by which both the beauty and permanency of the dye are improved. He likewiſe directs to fix the colour of *brazil* by aſtringents; for this purpoſe the ſtale decoction of *brazil* is diluted with twice its quantity of water; to which are added, for every pound of cloth, about one ounce of powdered galls, and half an ounce of gum Arabic. The cloth, prepared with alum and tartar, and kept moiſt for fifteen days, is boiled in this liquor for an hour or two, as the colour is wanted lighter or deeper, and ſuffered thoroughly to cool before it is waſhed. Dr. Lewis's edit. 4to. of Neumann's Works, p. 136.

From the *brazil* of Fernambuc is drawn a kind of carmine, by means of acids: there is alſo a liquid lacca made of it, for miniature.

Carnation is dyed with *brazil*, and violets are raiſed with *brazil*. Acids turn *brazil* yellow, but, by adding an alkali, it becomes purple; ſo that if we put lemon juice, or ſpirit of vinegar, in a decoction of *brazil* wood, it becomes yellow, and, if we add oil of tartar, violet.

Brazil wood differs very obviouſly from the SAUNDERS *wood*; the former gives out its red colour to water, the latter gives no red tinge to any aqueous liquor. Neumann.

Brazil wood is of ſome uſe in medicine; being reputed a ſpecies of the SAUNDERS, and poſſeſſed of the ſame phyſical virtues, though rarely preſcribed.

BRAZING, the ſoldering or joining of two pieces of iron by means of thin plates of braſs, melted between the two pieces to be joined.

If the work be very fine, as when the two leaves of broken ſaws are to be joined, it is to be covered with beaten borax, moiſtened with water, that it may incorporate with the braſs-duſt which is here added; and the piece is expoſed to the fire without touching the coals, till the braſs be obſerved to run. To *braze* with a ſtill greater degree of nicety, they uſe a ſolder made of braſs, with a tenth part of tin; or another, one third braſs, and two thirds ſilver; or borax and roſin: obſerving, in all theſe ways of *brazing*, that the pieces be joined cloſe throughout; the ſolder only holding in thoſe places that touch.

The method of *brazing*, among ſmiths, farriers, &c. is, by beating the two pieces, when hot, over one another: this is more properly called *welding*.

BREACH, in a general ſenſe, denotes a break or rupture in ſome part of a fence or incloſure, whether owing to time or violence.

The word is formed from the French *breche*, which ſignifies the ſame; formed of the German *brechen*, *to break*.

Inundations, or overflowings of lands, are frequently owing to *breaches* in the dikes, or ſea-banks. Dagenham *breach* is famous; it was made in 1707, by a failure of the Thames wall, in a very high tide. The force wherewith it burſt in upon the neighbouring level, tore up a large channel or paſſage for water an hundred yards wide, and in ſome places twenty feet deep, by which a multitude of ſubterranean trees, which had been buried many ages before, were laid bare. Phil. Tranſ. N° 335. p. 478.

Breach, in *Fortification*, is a hole, gap, or aperture, made in any part of the works of a town, either by playing cannon, or ſpringing mines; in order to ſtorm the place, or take it by aſſault.

They ſay, make good the *breach*; fortify the *breach*; make a lodgment on the *breach*: to clear the *breach*, is to remove the ruins, that it may be the better defended.

A practicable *breach*, is that where the men may mount, and make a lodgment.—A *breach* ought to be fifteen or twenty fathoms wide.—The aſſailants make their way to it, by covering themſelves with gabions, earth-bags, &c.

When a *breach* in the rampart is practicable, the governor uſually capitulates, to prevent the effects of a ſtorm.

Before they mount the *breach*, they frequently widen or enlarge it with fourneaux, and render the acceſs to it practicable, even for cannon, which it is ſometimes neceſſary to plant on the *breach*, in order to ruin the enemies retrenchments on the gorge and epaules of the baſtions.

Breach *of cloſe*, in *Law*. See Close.

Breach, *to batter in*, *battre en brêche*. See Batter.

Breach, *mounting the*. See Mounting.

BREAD ordinarily is made of the flour or meal of ſome farinaceous vegetable, ground, and kneaded with water and yeaſt.

Bread is uſually made of the ſeeds, ſometimes alſo of the roots, and even of the piths of plants. The Greeks attribute the invention of *bread* to Ceres, the Egyptians to Iſis, others to Menes. The firſt *bread* is ſuppoſed to have been made of the plant *lotus*. The poor Tartars, near

Sherazoul, ſtill live upon *acorn-bread.* Phil. Tranſ. Nº 300. and Nº 138. p. 2033, and 943.

In the iſlands of Banda and Amboyna, they make a kind of *bread* called *ſaegem*, or *ſagoe*, of the pith of a farinaceous tree, whoſe trunk is the thickneſs of a man's thigh, ten foot high, and having a round head a-top like a cabbage; in the middle whereof is a white mealy ſubſtance, which being kneaded with water, fermented and baked on the coals, ſerves the poorer ſort for *bread.* Phil. Tranſ. Nº 26. p. 485.

In the Caribbee iſlands, they make *bread* of the root of a poiſonous plant called *manioc*; probably the ſame with the CASSADA *bread*, which is made of the root of the *yucca Mexicana.* Phil. Tranſ. Nº 33. p. 635. and Nº 3,1. p. 2434.

In Benzoni's time, all the ſhips bound from Spain to Mexico, when they returned, were victualled with CASSADA *bread*, inſtead of biſcuit.

To the claſs of *breads* made of roots may alſo be added *potatoe-bread*, frequent in Ireland, and *turnep-bread*, uſed in ſome parts of England. It is made by boiling the roots, and expreſſing the juice, till they become dry, then beating them in a mortar, and adding wheat-flour, aniſeeds, and yeaſt, moulding up the dough in the uſual form, and baking it. It looks and taſtes like other *bread*, and is uſed by ſome againſt conſumptions. Phil. Tranſ. Nº 205. p. 970.

Among us, *bread* is chiefly divided into *white*, *wheaten*, and *houſhold*; differing only in degrees of purity. In the firſt, all the bran is ſeparated; in the ſecond, only the coarſer; in the third, none at all: ſo that *fine bread* is made only of flour; *wheaten bread*, of flour, with a mixture of the finer bran; and *houſhold*, of the whole ſubſtance of the grain, without taking out either the coarſe bran or fine flour. Stat. 8 Ann. cap. 18.

We alſo meet with *ſymnel bread*, manchet or roll *bread*, and French *bread*; which are only ſo many denominations of the fineſt or whiteſt *bread*, made of the pureſt flour; except that in roll *bread* there is an addition of milk, and, in French *bread*, of eggs and butter alſo. To which may be added, *ginger-bread*, made of white *bread*, with almonds, liquorice, aniſeed, roſe-water, and ſugar; and *maſlin-bread*, *panis mixtus*, made of wheat and rye, or ſometimes of wheat and barley.

The proceſs of making houſhold *bread* among us, is thus; to a peck of meal they add an handful of ſalt, a pint of yeaſt, and three quarts of water, cold in ſummer, hot in winter, and temperate between the two; the whole being kneaded in a bowl or trough by the fire in winter, from it in ſummer, will riſe in about an hour; they then mould it into loaves, and put it into an oven to bake.

For unleavened *bread*, part of the flour intended for it, being made into dough with warm water and a little ſalt, is laid in the reſt of the flour an hour or more, in which time it riſes to three times the bulk; then they mix and knead the whole with more water, till it be brought into a ſtiff dough; which being formed into loaves, is baked in the oven; though the more uſual way is to take a piece of dough kneaded, and leave it in the tub till next time, when they break it ſmall, and mix it with the meal, adding ſome yeaſt. Hought. Collect. tom. i. Nº 90. p. 241.

For French *bread*, they take half a buſhel of fine flour, ten eggs, and a pound and an half of freſh butter, into which they put as much yeaſt, with a manchet; and tempering the whole maſs with new milk, pretty hot, let it lie half an hour to riſe; which done, they make it into loaves or rolls, and waſh it over with an egg beaten with milk: care is taken, the oven be not too hot.

In Lancaſhire, and ſeveral other northern counties of England, the people have ſeveral ſorts of *oaten bread*; as, 1. The *bannock*, which is an oat-cake, kneaded only with water, and baked in the embers. 2. *Clap-bread*, which is made into thin hard cakes. 3. *Bitchineſs bread*, which is made of thin batter, and formed into thin ſoft oat-cakes. 4. *Riddle-cakes*, which are thick and ſour, and very little different from the band-hover *bread*, which has but little leaven, and kneaded ſtiff; and, 5. *Jannock*, which is oaten *bread* made up into loaves.

In the ſtatute of aſſize of *bread* and ale, 51 Hen. III. mention is made of *waſtel-bread*, *cocket-bread*, and *bread* of *treet*; which anſwers to the three ſorts of *bread* now in uſe, called *white*, *wheaten*, and *houſhold-bread.*

In religious houſes, they heretofore diſtinguiſhed *bread* by the names, *eſquires bread*, *monks bread*, *boys bread*, and *ſervants bread.*

A like diſtribution obtained in the houſholds of nobles and princes; where, however, we find ſome other denominations, as *meſſengers bread*, that given to meſſengers, as a reward of their labour; *court bread*, that allowed by the lord for the maintenance of his houſhold; *eleemoſynary bread*, that diſtributed to the poor in the way of alms. Du-Cange Gloſſ. Lat. tom. iv.

The quantity of *bread* allowed a ſoldier for his day's ſubſiſtence is called a RATION.

For armies the *bread* is either baked in the park of proviſions in the camp, or in the town neareſt the army; for the conveniency of ovens, an army ought always to have at leaſt four days *bread* before-hand. In ſome caſes, the diſtance of the places, from whence *bread* is to be had, or the army's march from one country to another, obliges the general to diſtribute *bread* for ſix or even for eight days; a thing never done without abſolute neceſſity, by reaſon of the abuſe which ſome ſoldiers make of it, who ſell their *bread* without regard to future ſubſiſtence. For long marches through an enemy's country, they ſometimes, inſtead of *bread*, make BISKET.

Bread, *horſe*, is made of wheat, oats, and beans; to which ſometimes are added aniſeed, gentian, liquorice, fenugreek, eggs, and ale; and ſometimes rye and white wine are uſed.

For race-horſes, three ſorts of *bread* are uſually given with ſucceſs, for the ſecond, third, and fourth fortnights feeding; they are all made of beans and wheat, worked with barm, the difference conſiſting chiefly in the proportion of the two former. In the firſt kind, three times the quantity of beans is uſed to one of wheat; in the ſecond, equal quantities of both; in the third, three times the quantity of wheat to one of beans.

Bread, *ſacramental*, in the proteſtant churches, is common leavened *bread*, agreeable to the ancient practice. In the Romiſh maſs, AZYMUS, or unleavened *bread*, is uſed, particularly in the Gallican church, where a ſort is provided for this purpoſe, called *pain a chanter*, made of the pureſt wheaten flour, preſſed between two iron plates, graven like wafer-moulds, being firſt rubbed with white wax, to prevent the paſte ſticking.

Eccleſiaſtical writers enumerate other ſpecies of *bread*, allotted for purpoſes of religion; as, 1. *Calendarius*, that anciently offered to the prieſts at the calends. 2. *Prebendarius*, the ſame with *capitularis*, that diſtributed daily to each prebendary or canon. 3. *Benedictus*, that anciently given to catechumens before baptiſm, in lieu of the euchariſtic *bread*, which they were incapable of partaking of. 4. Conſecrated *bread* is a piece of wax, paſte, or even earth, over which ſeveral ceremonies have been performed with benedictions, &c. to be ſet up in an *agnus dei*, or a relic box, and preſented for veneration. 5. Unleavened *bread*, AZYMUS. The Jews eat no other *bread* during their paſſover; and exact ſearch was made in every houſe, to ſee that no leavened *bread* was left. The uſage was introduced in memory of their haſty departure from Egypt, when they had not leiſure to bake leavened. 6. *Shew-bread* was that offered to God every Sabbath-day, being placed on the golden table, in the holy of holies.

Bread *of St. Hubert*, *St. Genevieve*, *St. Nicholas*, &c. denote cakes ſanctified with certain prayers and invocations of thoſe ſaints, held by the ſuperſtitious to be of great efficacy in the cure of hydrophobias, agues, and other diſeaſes.

Bread is alſo uſed to denote certain foods made of animal, or even mineral matters, ſerving to ſupply the place of *bread.*

In divers parts of the North we read of *fiſh-bread*, particularly in Iceland, where dried cod is uſed for *bread*, being firſt beaten to powder, and made up into cakes. The like obtains among the Laplanders, whoſe country affords no corn; and even among the Crim Tartars. Phil. Tranſ. Nº 102. p. 35. Sheff. Hiſt. of Lapl. chap. 14.

Bread, in a more extenſive ſenſe, includes all the neceſſaries of life, as food, raiment, lodging, &c.

Hence alſo the ſabbath is ſometimes called, in ancient writers, the *day of bread*, by reaſon the euchariſt was then adminiſtered every Lord's day.

Bread, *ſwine*, *panis porcinus*, a denomination given to TRUFFLES.

Bread, *ſow's*, is alſo applied to the herb CYCLAMEN.

Bread, *aſſize of.*—The price and weight of *bread* is regulated by the magiſtrates according to the price of wheat; and, in order to direct them in their allowance to the baker, they are to take notice, that the peck-loaf of each ſort of *bread* is to weigh, when well baked, 17lb. 6 oz. avoirdupois weight, and the reſt in proportion; and that every ſack of meal, or flour, is to weigh two hundred weight and two quarters, neat; and that from every ſack there ought to be made, at an average, twenty ſuch peck-loaves of bread.

We have divers tables of the weights of the loaves both of *wheaten* and *houſhold bread*, at every price of wheat. If *bread* wants one ounce in thirty-ſix, the baker formerly was to ſuffer the pillory; now to forfeit not more than five ſhillings, nor leſs than one, for every ounce wanting; and for every defect leſs than an ounce, not more than two ſhillings and ſix pence, nor leſs than ſix pence; ſuch *bread* being complained of and weighed before a magiſtrate within twenty-four hours after it is baked or expoſed to ſale, within the bills of mortality, or within three days in any other place. Bakers are obliged, under a penalty, to mark their *wheaten-bread* with a large Roman W, and their *houſhold-bread* with an H. See BAKING.

It is to be obſerved, *bread* loſes weight by keeping; in ſome experiments recited by Bartholin, the diminution was near one-fourth in ſix months.

By 13 Geo. III. cap. 62. a ſtandard *wheaten-bread* was ordered to be made of ſuch flour as is the whole produce of the grain, the hull only excepted, and to be marked SW, but it is little uſed.

TABLE of the Aſſize and Price of *Bread* made of WHEAT.

Note: The weight of loaves of any ſize may be eſtimated from thoſe of the penny loaf, by ſimple addition; e. g. the ſix-penny loaf weighs ſix times as much, &c. and the wheaten loaves are three-fourths of the weight of the houſhold loaves. See Burn's Juſtice, vol. i. p. 220.

BREAD, in *Medicine*.—Beſides alimentary, *bread* has alſo medical qualities; decoctions, creams, and gellies of *bread*, are directed in ſome diſpenſaries.

There are certain medicated *breads*, appropriated to the intentions of phyſic; as, aniſeed-*bread*, turnep-*bread*, and vipers-*bread*; which laſt is made of the fleſh of that animal, with wheat-flour, yolks of eggs, ſarſaparilla, yeaſt, and milk, commended in ſcorbutic habits. Some direct acorn-*bread*, dipped in red wine, to be thruſt up the *anus*, in prolapſuſes of that part.

Mr. Boyle aſſures us, he drew a *menſtruum* from *bread* ſtronger than *aqua fortis*, and which would act even upon glaſs itſelf. Phil. Works abr. tom. i. p. 34. 49.

Bread made of good wheat, well leavened, and thoroughly baked, with a little ſalt, is the beſt; that which is not thoroughly baked, ill kneaded, and without ſalt, is hurtful and unwholeſome, eſpecially in ſmoaky cities; ſo are unleavened *bread* and cakes baked under the aſhes.

In general, the lighter the *bread*, the better and more agreeable it is; coarſe and barley *bread* is deterſive, and gently purgative, at leaſt to thoſe not uſed to it. Some recommend it for perſons in the gout.

See further concerning *bread* in the writers on foods and cookery; eſpecially in Hen. Nicolaus, who has a treatiſe expreſs on *bread*. Hen. Nicolai Tract. de Pane Dantiſc. 1651. See alſo Fabr. Bibl. Antiq. cap. 19. § 6.

BREAD, in *Chemiſtry*.—The chemiſt's art can extract from ſo mild a ſubject as *bread*, an acid, which is a powerful *menſtruum*. It is done in this manner: put two pounds of coarſe *bread*, cut into ſmall pieces, into a glaſs retort; place this in a ſand-heat, and, luting on a receiver, diſtil with a gentle fire, and there will be produced a liquor appearing like water, with a ſmall quantity of oil; ſeparate the oil, and filtre and rectify the liquor by a ſecond diſtillation in *balneo mariæ*, and afterwards diſtil it again in a ſand-heat, and there will be produced a moderately ſtrong, clear, acid liquor. This is a *menſtruum* capable of extracting the red colour from coral, and even from garnets. Common *bread* affords it, but coarſe rye-*bread* yields the greateſt quantity. Shaw's Lect. p. 104. Oil of vitriol, poured upon crumbs of *bread*, will excite a ſurpriſing degree of heat. Boyle's Works abr. vol. i. p. 569.

BREAD, *bonpournichole*, or *bonpournickel*, the name of a very coarſe *bread* eaten in Weſtphalia, and many other places. This *bread* of the Weſtphalians ſtill retains the opprobrious name once given it by a French traveller, of *bonpournichole, good for his horſe Nichole*, but is by no means a contemptible kind.

It is far from being peculiar to this age or country; it has been known in diſtant places, and in different ages, and was called by the ancients *panis furfuraceus*, or *panis impurus*, from its not being ſo thoroughly cleanſed from the huſk or bran, as the fine ſorts of *bread* are.

The wreſtlers of old eat only this ſort of *bread*, to preſerve them in their ſtrength of limbs; and we may learn from Pliny, that the Romans for three hundred years knew no other *bread*: unqueſtionably, this coarſe *bread* nouriſhes more, aſſuages hunger better, and generates humours leſs ſubject to corruption, than the white.

The inhabitants of Weſtphalia, who are a hardy and robuſt people, and capable of enduring the greateſt fatigues, are a living teſtimony of the ſalutary effects of this ſort of *bread*; and it is remarkable, that they are very ſeldom attacked by acute fevers, and thoſe other diſeaſes which ariſe from an ebullition of the humours, and a malignant colliquation of the blood, and of the humours of which it is compoſed.

It is certain, that a leſs ſtrong diet is more proper to weakly conſtitutions, and people of ſedentary lives, than this; but for thoſe who will uſe the neceſſary exerciſe with it, it is eaſy to ſee that it is preferable to all other kinds of *bread*; ſince it remarkably reſtores ſtrength, and has another ſalutary effect, which is, that it renders the belly ſoluble: this was a quality remarked in coarſe *bread*, and highly commended in it, ſo early as in the days of Hippocrates.

The Germans make two ſorts of waters by diſtillation from this *bread*; the one with, the other without, the addition of a ſpirituous liquor: to both which great virtues are aſcribed. That without any thing ſpirituous, is made of the juice of craw-fiſh, may-dew, roſe-water, nutmegs, and ſaffron, diſtilled from a large quantity of this *bread*. This is eſteemed a great reſtorative, and given in hectic habits. The other is diſtilled from this *bread* and Rheniſh wine, with nutmegs and cinnamon. This is given in all the diſorders of the ſtomach, vomiting, and loſs of appetite, and other complaints of the ſame kind; and beſides theſe, there is a ſpirit diſtilled from it by the retort, in the dry way, which, when ſeparated from its fetid oil, is eſteemed a powerful ſudorific, and very valuable medicine, in removing impurities of the blood. Hoffman.

BREAD, *Indian*, or *Caſſada*. See CASSADA.

BREAD, *St John's*. See CAROB.

BREAD-*room*, in a ſhip, that in which the *bread* or BISKET is kept.

BREAD-*fruit*, at Otaheite, in the South-ſea, grows on a tree about the ſize of a middling oak: it is about the ſize and ſhape of a child's head; the ſurface is reticulated, and covered with a thin ſkin; the eatable part lies between the ſkin and the core; it is white as ſnow, and of the conſiſtence of new bread. It has an inſipid, ſweetiſh taſte, reſembling that of the crumb of wheaten bread, mixed with a Jeruſalem artichoke. It is roaſted and baked before it is eaten. Three different diſhes are prepared from this fruit, by beating it into a paſte with water, or the milk of the cocoa-nut, and mixing it with ripe plantains, bananas, or the ſour paſte which they call *mahie*. Hawkeſworth's Voyages, &c. vol. ii. p. 80, and 198.

BREADTH. See LATITUDE, DIMENSION, AREA, &c.

BREADTH, *hair's*. See HAIR.

BREADTH, *finger's*. See FINGER.

BREADTH, *hand's*. See HAND.

BREADTH *of a ſhip* is the meaſure of it from ſide to ſide in any particular place: accordingly the *main-breadth* is that part of every timber which incloſes the greateſt ſpace from the middle line of the ſhip's length; *top-timber breadth* is the diſtance between the upper part of the ſame timber, and the ſaid middle line; and the *extreme breadth* is the diſtance between her ſides in the *main-breadth* of the midſhip-frame.

Breadth-*ſweep*, in *Sea-language*, denotes the radius of the arch which forms part of the curve of a ſhip's timber in the horizontal plane.

BREAK, in Norfolk, denotes land ploughed or broke up the firſt year after it has lain fallow in the ſheep-walks.

In *Architecture*, it denotes a receſs, or giving back of a part behind its ordinary range or projecture.

In which ſenſe, they ſay, a *break* of a PEDIMENT; a *break* of ENTABLATURES, whereby it ſhrinks, as it were, between the columns, is reputed a fault.

Break-*in*, among *Carpenters*, is when they break a hole in brick-walls with their ripping-chiſſel.

Break-*neck*, *Briſe-cou*, in *Building*, a fault in a ſtair-caſe, as when a ſtep is made higher or lower than the reſt, and landing-place too narrow, or the like.

Break-*water*, the hulk or hull of ſome old ſhip, ſunk at the entrance of a ſmall harbour, to *break* the force of the waves in their paſſage to the veſſels moored within. It is alſo uſed for a ſmall buoy faſtened to a large one in the water, and deſigned to ſhew where it ſwims. See Buoy.

BREAKERS, in *Sea-language*, ſignify billows that break violently over rocks, lying under the ſurface of the ſea.

BREAKING, in *Agriculture*, denotes the ploughing up of grounds, eſpecially ſuch as have lain ſome time fallow.

Breaking *ground*, in the *Military Art*, the beginning of works for carrying on the SIEGE of a place; more eſpecially the beginning to dig TRENCHES, or approaches.

Breaking *the angles of a battalion*, denotes a military evolution, whereby the four angles turn, and make ſo many fronts towards the enemy; ſo that the battalion, which before was only a ſquare, becomes an octangle, and can fire on all ſides.

This is otherwiſe called *blunting the angles of a battalion*; by the French, *emouſſer les angles d'un bataillon.*

Breaking *of meaſure*, in *Fencing*, denotes a moderate retiring, or giving of ground, in order to avoid the adverſary's thruſt.

Breaking of meaſure differs much from going back, and loſing or yielding of ground; the latter being reputed a great reproach, the former a mark of judgment and adroitneſs. Some pretend, that a man retiring is obliged to forbear, if his adverſary call him to ſtand.

Breaking *of the ſea*, **Breaking** *of a wave*, or the like, on a rock, a bank, or the like, are a ſufficient indication to the pilots, that it is not ſafe mooring there.

Divers machines and ſtructures have been contrived for *breaking* the force of wind, the ſtream of water, and the like.

Breaking is alſo uſed for the taming of animals, or reducing them from a wild to a tractable ſtate.

Breaking *of a horſe to the ſaddle*. See Backing and Travice.

To *break* a horſe for hunting, is to make him acquire the diſpoſition and habit of running. It is a great fatigue to run horſes full ſpeed before they are *broken*.

Breaking *herd*, among *Sportſmen*, denotes a deer's quitting the herd, and running by itſelf.

In which ſenſe, the word ſtands oppoſed to *herding*.

A deer, when cloſe purſued, is loth to *break* herd. When a hart *breaks* herd, and draws to the thickets or coverts, he is ſaid to *harbour* or take hold.

Breaking *up a deer*, ſignifies the opening or cutting it up.

Breaking *of priſon*. See Prison.

Breaking *the legs*, *crurifragium*, was an appendage of cruciſixion, uſed no where but among the Jews. See Cross.

Breaking *bulk*, in the *Sea-language*, ſignifies taking part of the ſhip's loading or cargo out of the hold.

Breaking *of hemp*. See Brake.

Breaking *of bread*, is ſometimes uſed, in *Eccleſiaſtical Writers*, for celebrating the EUCHARIST.

Breaking *of wine*, among *Vintners*.—Wine is ſaid to *break*, when being left ſome time in the air, in an open glaſs, it changes colour; an indication that it will not keep.

This is the uſual method of trying the goodneſs of wine, among the merchants and vintners of Paris.

Breaking is alſo uſed in trade, for a perſon's failing or ſtopping payment.

In which ſenſe, *breaking* differs from becoming BANKRUPT.

Breaking betimes, while there is ſomething left to pay withal, is a mark of honeſty; and, generally, entitles the unhappy perſon to compaſſion and gentler uſage from his creditors, ſaves his credit, and facilitates his retrieving. A late ſenſible writer on trade takes great pains to inculcate this precept, Break early. Compl. Eng. Tradeſman, vol. i. p. 77. 80, &c.

BREAM, in *Ichthyology*, the Engliſh name of the CYPRINUS *latus*.

This is but a coarſe fiſh for the table, but it affords great ſport to the angler. The beſt time of angling for *bream* is from St. James's day to Bartholomew-tide; as being then exceeding fat; and the moſt proper bait is the largeſt red garden-worms that can be got. See Sparus.

BREAMING. See Brooming.

BREAST, *Mamma*, in *Anatomy*, a prominent fleſhy part of the human body, on the outſide of the *thorax*, ſerving to ſeparate the milk.

Anatomiſts ſometimes divide *breaſts* into perfect, which are compoſed of a multitude of glands, interwoven with veins, arteries, and nerves; ſuch as are thoſe of women; and imperfect *breaſts*, compoſed chiefly of fat, with a few glands; ſuch are thoſe of men.

The internal ſubſtance of the *breaſt* is compoſed of a great number of glands, of various ſizes, and an oval figure, intermixed with globules and veſſels of fat. Their excretory ducts, as they approach the nipple, join and unite together, till at laſt they form ſeven, eight, or more, ſmall pipes, called *tubuli lactiferi*, which have ſeveral croſs canals, by which they communicate with one another, to obviate the inconveniencies that might accrue from the caſual obſtruction of one or more of them.—Theſe tubes are not every where of equal capacity, but in ſome places more, in others leſs, dilated; ſo as to form cells, which ſeem contrived to hinder the ſpontaneous efflux, and to create a neceſſity of ſucking, to fetch out the contents.

Of the concurrence of theſe *tubuli*, or pipes, is the ſubſtance of the *papillæ*, in great meaſure, formed; among which is interſperſed a glandulous ſubſtance, ſerving to keep them from preſſing too cloſe on each other: and with it are intermixed abundance of fibres derived from the external teguments of the *papillæ*; by means whereof, the lacteal tubes are conſtringed, and the motion of the milk is modified.

Beſides theſe veſſels, are abundance of fatty globules, called *ductus adipoſi*, which ſome would have only to fill up the interſtices of the glands: but Dr. Drake, after Malpighi, thinks they contribute to the compoſition of the MILK; which ſeems nothing elſe but water and oil artfully united.

The office of the *breaſts* is to ſecrete the milk from the arteries in their glandulous ſubſtance, to collect it in their lacteal tubes, and, at proper ſeaſons, to yield it to the infant through the nipple.

Some, however, aſſert, that the milk is not formed from the blood, but from the chyle, which is immediately conveyed thither by the thoracic, or Pecquet's ducts. And what confirms the ſuggeſtion, is the quick ſupply of milk in nurſes, after a draught of cow's milk. The difficulty is to prove, that the thoracic duct reaches to the *breaſts*, which ſome abſolutely deny. Phil. Tranſ. Nº 65. and Nº 40. p. 1357, and 805.

Swelling *breaſts*, eſpecially if there be milk found in them, is generally judged a mark of the loſs of VIRGINITY, and a proof that a woman has been with child; though, it is ſaid, it does not hold univerſally.

The ſwelling of the *breaſts* during the time of geſtation, is owing to the conſent between the *breaſts* and the UTERUS; there being ſo near a communication between the mammary veſſels, and the hypogaſtric veſſels of the womb, that dilatation in the latter is attended with a ſimilar one in the former. See Pregnancy, &c.

In virgins, the tubes which compoſe the glands of the *breaſt*, like ſphincter-muſcles, contract ſo cloſely, that no part of the blood can enter them: but when the womb grows big with a FOETUS, and compreſſes the deſcending trunk of the great artery, the blood flows in greater quantity, and with a greater force, through the arteries of the *breaſts*, and forces a paſſage into their glands; which, being at firſt narrow, admits only of a thin water; but growing wider by degrees, as the womb grows bigger, the glands receive a thicker *ſerum*; and after birth they run with a thick milk; becauſe that blood which before flowed to the *fœtus*, and for three or four days afterwards by the *uterus*, beginning then to ſtop, does more dilate the mamillary glands.

The *breaſts*, eſpecially after delivery, are liable to divers diſeaſes; as inflammations, excoriations, indurations, tumefactions, nodes, abſceſſes, ſchirrhuſes, and cancers; to which may be added certain peculiar diſorders, as the *ſparganoſis*, *ſtrangalides*, and *gynæcomaſton*. See Cancer, Schirrhus, &c.

In men, the *breaſts* are very ſmall, and are chiefly for ornament; though phyſical hiſtories give inſtances of thoſe who have had milk in them.

The ancients repreſented Diana of Epheſus with many *breaſts*, as appears from ſeveral medals of that city;

whence ſhe had the epithet *Mammoſa*; q. d. having many *breaſts*; an appellation which is alſo given to Iſis and to Ceres.

BREAST, applied to the correſpondent parts of other animals, is more properly called *udders*, *dugs*, *ubera*, &c.

BREAST alſo denotes that cavity or region of the body, by anatomiſts more frequently called THORAX. Though, in propriety, the *breaſt* is rather reſtrained to the anterior part of the *thorax* where the ribs meet; called alſo *ſternum*, and *pectus*; in Engliſh, popularly, the *boſom*.

We ſay, a flat, a narrow, or ſtrait *breaſt*; a broad *breaſt*, not high, is ranked among the ſigns of longevity. Defluxions on the *breaſt* and lungs are dangerous.

Smiting the *breaſt* is one of the expreſſions of penitence. In the Romiſh church, the prieſt beats his *breaſt* in rehearſing the general confeſſion at the beginning of maſs. Coughs, catarrhs, aſthmas, phthiſes, peripneumonies, &c. are diſeaſes of the *breaſt*. See COUGH, and ASTHMA.

Phyſicians alſo ſpeak of a dropſy of the *breaſt*, *hydrops pectoris*. See DROPSY.

Medicines for diſorders of the *breaſt* are called *pectorals*. See PECTORAL.

BREAST-*bone*. See STERNUM.

BREAST *of a* CHIMNEY, denotes the fore-part under the mantle or chimney-piece, commonly made inclined.

BREAST-*faſt*, or **BREST-*faſt***, denotes a rope or hawſer employed to confine a ſhip ſideways to a wharf or key, or ſome other ſhip.

BREAST-*hooks*, the compaſſing timbers before, in a ſhip, which help to ſtrengthen her ſtem, and all her fore-part.

BREAST-*pain*, called by the Italians *grandezza di petto*, is a diſtemper in horſes proceeding from ſuperfluity of blood and other groſs humours, which being diſſolved by ſome extreme and diſorderly heat, reſort downward to the *breaſt*, and pain them extremely.

The ſigns of the *breaſt*-pain are, a ſtiff, ſtaggering, and weak-going with his fore-legs; beſides, that he can hardly, if at all, bow his head to the ground.

BREAST-*plate*, a piece of defenſive armour, wherewith to cover the *breaſt*.

The *breaſt*-plate is ſaid to be the invention of Jaſon. It was originally made of leather, afterwards of mail, and laſtly, of a brazen or iron-plate. When made of this laſt matter, it is more particularly called *clibanus*, by the moderns CUIRASS; when made of braſs, with a Gorgon's head in the middle, it is denominated ÆGIS.

The *breaſt*-plate, called alſo by the Romans *pectorale*, is frequently confounded with the *thorax* and *lorica*; from both which it ought to be diſtinguiſhed, as being properly a half-*thorax*, or half-*lorica*, covering only the breaſt; whereas the *thorax* inveſted the body.

As the whole *thorax* might be a temptation to the ſoldiery to turn their backs, when equally guarded with their *breaſts*, the *thorax* was thrown away, and the *hemi-thoracion*, or *breaſt*-plate, only retained. Polyæn. Stratag. lib. vii.

BREAST-*plate*, in the *Manege*, denotes a leathern ſtrap running from one ſide of the ſaddle, croſs the horſe's *breaſt*, to the other; intended to keep the ſaddle from ſlipping backwards in mounting up riſing-grounds. It is otherwiſe called *tee*; ſometimes the *poitrail*.

BREAST-*plate*, among *Artificers*, denotes a drill-plate, againſt which to ſet the blunt end of the drill.

BREAST-*plough*, in *Agriculture*, a ſmall plough, ſo conſtructed, that a man may puſh it before him. It conſiſts of a cutting-iron about eight or nine inches long, with one of its ſides turned up to cut the turf, which is fixed to a pole about five or ſix feet long, forked at the upper end, with a croſs handle. It is uſed in the operation called BURN-BAKING.

BREASTS *of a ſaddle*, are part of the BOW, being the two ſides of it down from the arch or upper part.

BREAST-*work*, in the *Military Art*. See LORICA, and PARAPET.

BREAST-*work of a ſhip*, is a ſort of baluſtrade or fence, compoſed of rails or mouldings, and often decorated with ſculpture; it terminates the quarter-deck and poop at the fore-ends, and incloſes the fore-caſtle both before and behind.

BREATH, the WIND or AIR which is received and expelled by the mouth and noſtrils, in the act of RESPIRATION.

In which ſenſe, the word amounts to the ſame with the Greek πνευμα, and Latin *ſpiritus*.

A ſtinking *breath*, is one of the ſymptoms uſually preceding the acceſs of an intermitting fever.

In ſome perſons, a ſtinking *breath* is an indication of the *menſes* being at hand.

It is diſputed among the civilians, whether a ſtinking *breath*, called *ſcabies*, owing to rotten teeth or gums, ſhould be reputed a diſeaſe. Calvin. Lex. Jur.

BREATH is more particularly uſed to denote a ſtrength of lungs, whereby a man is enabled to hold out without taking wind ſo often.

In this ſenſe, we ſay, a long, a ſhort *breath*. The ordinary term of holding the *breath* does not exceed one third of a minute. Bacon. Hiſt. of Life and Death. Ap. Works, tom. ii. p. 176.

For the pearl fiſhery, they chooſe ſlaves who have the beſt *breath*, or can continue the longeſt under water without fetching their *breath*. Pechlin has a diſſertation expreſs on living long without *breathing*. J. Nic. Pechlin De Aeris & Alimenti Defectu, & Vita ſub Aquis diuturna, Meditatio ad Joel Langelot, 1676.

The ancients were very watchful over the laſt *breath* of dying perſons; which the neareſt relations, as the mother, father, brother, or the like, received in their mouths. Pitiſc. Lex. Antiq. voc. *Spiritus*.

BREATH is alſo ſometimes extended to the odorous EFFLUVIA of plants, and even exhalations of minerals.

BREATHING. See RESPIRATION.

Fighting a cock to *breathe* him, is called SPARING.

To *breathe* a running-horſe, and bring him to his wind, they give him a HEAT.

BREATHING, *exſufflatio*, a ceremony in BAPTISM.

BREATHING, *difficulty of*, in *Medicine*, a diſeaſe called by phyſicians DYSPNOEA.

BREDEWITE, in *Ancient Law Writers*, an amercement ariſing from ſome default in the aſſiſe of bread.

BREECH *of a gun*, in *Artillery*, denotes the diſtance from the hind part of the baſe ring to the beginning of the bore, and is always equal to the thickneſs of the metal at the vent. See AC, *fig.* 1. *Tab. Gunnery.*

Engineers have contrived a ſort of cannons, which are charged by the *breech*.

BREECH-*mouldings*. See MOULDINGS.

BREECHES, a garment worn by males, reaching from the girdle to the knees, and ſerving to cover the hips, thighs, &c.

The ancient Romans had nothing in their dreſs anſwering to our *breeches* and ſtockings; inſtead of which, under their lower tunics and waiſtcoats, they ſometimes bound their thighs and legs round with ſilken ſcarves, or *faſciæ*, called *tibialia* and *femoralia*. Salmuth. ad Panciroll. p. i. p. 161. Kennet. Rom. Ant. Not. p. ii. lib. v. cap. 8.

Breeches appear to be a habit peculiar to the barbarous nations, eſpecially thoſe inhabiting the colder countries of the North; whence Tacitus calls them *barbarum tegmen*. We find mention made of them among the ancient Getæ, Sarmatæ, Gauls, Germans, and Britons; they alſo obtained among the Medes and Perſians, as being a people of Scythian origin: they alſo afterwards got footing in Italy, ſome pretend as early as the time of Auguſtus; but without much foundation, that emperor's *breeches*, mentioned by Suetonius, being apparently only ſwaths tied over his thighs. Tacit. Hiſt. lib. ii. cap. 20. Perſ. Sat. iii. ver. 51. Ovid. Triſt. lib. v. Eleg. 11. Suet. in Auguſt. cap. 82.

However this be, *breeches* were at length received into Italy, and grew ſo highly into faſhion, that it was thought neceſſary, under Honorius and Arcadius, to reſtrain them by law, and expel the *braccarii*, or *breeches*-makers, out of the city; it appearing a thing unworthy, that a nation, which commanded the world, ſhould wear the habit of barbarians.

We find frequent mention of *bracæ*, *braccæ*, or *bracchæ*, in claſſic writers; but the form of this habit is not agreed on: ſome will have it to have been a rough party-coloured coat.

BREECHINGS, in the *Sea-language*, thoſe ropes with which the great guns are laſhed, or faſtened to the ſhip's ſide.

They are thus called, becauſe brought about the *breech* of the piece; they prevent the cannon from recoiling too much in time of battle, and are employed for ſecuring it during the courſe of a voyage.

BREEDING is uſed for the care of rearing or bringing up the young of divers animals.

BREEDING, in a moral ſenſe, denotes a perſon's deportment or behaviour in the external offices and decorums of ſocial life.

In this ſenſe, we ſay, well-*bred*, ill-*bred*, a man of *breeding*, &c.

Good-*breeding* amounts to much the ſame with what is otherwiſe called *politeneſs*, among the ancient Romans, *urbanity*. Good-*breeding* is near to virtue, and will of itſelf lead a man a great part of the way towards the ſame; it teaches him to rejoice in acts of civility, to ſeek out objects of compaſſion, and be pleaſed with every occaſion of doing good offices.

Lord Shafteſbury compares the well-*bred* man with the real philoſopher: both characters aim at what is excellent, aſpire to a juſt taſte, and carry in view the model of what is beautiful and becoming. The conduct and manners of the one are formed according to the moſt perfect eaſe, and good entertainment of company; of the other, according to the ſtricteſt intereſt of mankind; the one according to his rank and quality in his private ſtation, the other according to his rank and dignity in nature. Horace ſeems to have united both characters.

Quid verum atque decens curo & rogo, & omnis in hoc ſum.

Shaftſ. Charact. vol. i. p. 64. vol. ii. p. 242. vol. iii. p. 161. Hor. lib. i. ep. i. ver. 11.

BREEDING-*ſtone*, in *Mineralogy*, a ſort of maſs of pebbles, joined by a ſparry cement; frequent in divers parts of Hertfordſhire. See PEBBLE.

BREEDING *of fiſh*. See FISH-*pond*.

BREEDING *of horſes, dogs, &c.* See HORSE, *&c.*

BREEF-*cards*, denote a kind of falſe cards, either longer or broader than the reſt, whereby they may be known and diſtinguiſhed.

BREEZE, a ſhifting wind, blowing from the ſea and land alternately, during certain hours of the day or night; only ſenſible near the coaſts.

The ſea-*breeze*, Dampier obſerves, commonly riſes in the morning about nine, proceeding ſlowly in a fine ſmall black curl on the water towards the ſhore: it increaſes gradually till twelve, and dies about five.—Upon its ceaſing, the land-*breeze* commences, which increaſes till twelve; and is ſucceeded in the morning by the ſea-*breeze* again.

The ſea-*breezes* rule by day, and the land-*breezes* by night; ſo that, dividing their empire, they remain as conſtant as the ſeaſons of the year, or courſe of the ſun, on which they ſeem alone to depend; not but that they appear ſooner or later, ſtronger or weaker, in ſome places than others, and vary the alternative according to the ſeveral latitudes, ſituations, ſoils, mountains, valleys, woods, and other circumſtances of the countries where they are found.

In ſome countries, the ſea-*breezes* appear only to be efforts of the general or trade-wind, as at Barbadoes, and in many places between the tropics, where the general wind, if not impeded by mountains or iſlands, blows freſh in the day time, but, after ſun-ſet, the terreſtrial exhalations becoming precipitated, beget a new wind, which is not only able to make head againſt the trade-wind, but to repel it from their coaſts.

The ſea-*breezes* do not all come from the ſame point of the compaſs, but from different points, as the land lies.

In Brazil, and many of the Caribbee iſlands, they have no land-*breeze*, eſpecially if the ſhores lie low, as at Barbadoes, where the general or eaſtern wind blows from one end of the iſle to the other, and ſerves inſtead of the land-*breeze*. In other places they want the ſea-*breeze*, eſpecially between the tropics, in coaſts which lie weſterly, as in the weſtern kingdoms of Africa.

If either the eaſterly or weſterly winds blow freſh, they hinder both the land and ſea-*breezes* in the Mediterranean; of which thoſe are always found the weakeſt which riſe lateſt. In England, in very hot days, and when no other winds are ſtirring, the like alternation of land and ſea-*breezes* may be obſerved on our coaſts, though with little certitude, any where to the northward of Portugal.

Breezes are more conſtant in ſummer than in winter, and more between the tropics than in the temperate zones.

The general cauſe of thoſe alternate *breezes* which ſet on and off the coaſts in hot countries, is the greater rarefaction of the air by reflected heat, and by fermenting exhalations over the land, than over the water: the denſer air from the water becomes a ſea-*breeze* in the day; but this air condenſed again by the cold of the night, may then occaſion a land-*breeze*.

Breezes differ from *eteſiæ*, or TRADE-WINDS, as the former are diurnal, or have their periods each day, and, beſides, they are only perceived near the ſhore or coaſt; whereas the latter are anniverſary, and blow at a diſtance from land. Phil. Tranſ. N° 183, p. 158.

BREEZE, in *Brick-making*, are ſmall aſhes and cinders ſometimes made uſe of, inſtead of coals, for the burning of bricks. But as this does not ſo well anſwer the end, the uſe of it was prohibited by 12 Geo. I. cap. 35; but allowed by 3 Geo. II. cap. 22. 10 Geo. III. cap. 49.

BREEZE-*fly*. See OESTRUM and GAD-*bee*.

BREGMA, in *Anatomy*, the ſame with SINCIPUT.

The *bregma* conſiſts chiefly of two bones, hence alſo called *bregma*, or *bregmatis oſſa*, which are two bones of the *cranium*, otherwiſe called *oſſa parietalia*.

Bregma properly denotes the middle and fore-part of the head, ſituate over the forehead, and extending on both ſides to the temples.

The origin of the word is obſcure, and has been much controverted between Hoffman and Lindenius.

BREHONS, the provincial judges among the ancient Iriſh, by whom juſtice was adminiſtered, and controverſies decided.

Theſe ſages were a diſtinct tribe or family, to whom competent lands were allowed in inheritance. In criminal caſes, the *brehon* had the eleventh part of all fines; which could not be but conſiderable, at a time when murders, rapes, robberies, and the like offences, were only ſubject to pecuniary commutations.

BREHON-*laws*, denote the general maxims, or rules of law, obſerved by the *brehons*, and having the force of laws throughout all the provinces of Ireland.

Several fragments of the *leges brehonicæ* are ſtill extant in public and private libraries. The moſt complete collection is that belonging to the duke of Chandos, containing twenty-two ſheets and an half cloſe written, full of abbreviated words, and not very legible. The publication of theſe laws has been much wiſhed for.

By the ſtatute of Kilkenny, 40 Edward III. it is enacted, that no Engliſh ſubject ſhall ſubmit to a trial by the *brehon* law, on the penalty of high treaſon. Notwithſtanding which, many were ſtill under a neceſſity of being concluded by the Iriſh laws and cuſtoms, till the whole kingdom was ſettled on an Engliſh foundation under king James I.

BRENNAGE, *Brennagium*, in *Middle Age Writers*, a kind of tribute paid, in lieu of bran, or bran itſelf, which the tenants were obliged to furniſh for ſupport of the lord's hounds.

The word is alſo written *brenage*, *brenagium*, and *brenaige*, *bernagium*, *brenaticum*, and *brennaticum*. Du-Cange Lat. Gloſſ.

BRENNING. See BURNING.

BRENTA, in *Zoology*, the name of a fowl of the gooſe-kind, known among us by that of the *Brent-gooſe*, and, by ſome, ſuppoſed to differ from the barnacle no other way than in ſex; but this is erroneous. It is ſomewhat larger than the barnacle, and is longer bodied. Ray. See *Tab. of Birds*, N° 49.

BREPHOTROPHIUM, from βρεφος, *infant*, and τρεφω, *I nouriſh*, an hoſpital for FOUNDLINGS, or a place wherein children, expoſed by their parents, are brought up at the public charge.

BRESILIA, in *Ornithology*, a ſpecies of *tanagra*, in the order of *paſſeres*.

BRESMA, in *Ichthyology*, a name given by Hildegard, and ſeveral other writers on fiſh, to the BREAM, a ſpecies of CYPRINUS.

BREST, or **BREAST**, in *Architecture*, a term uſed by ſome, for that member of a column otherwiſe called the *Tore*.

BREST-SUMMERS, or **BRESSUMERS**, in *Building*, are pieces of timber deſigned for the ſupport of the brick-work in the front or rear wall of a building, for carrying arches, &c.

In the inner parts of a building, the pieces into which the girders are framed are called SUMMERS.

BRET, a name which the people on the coaſts of Lincolnſhire give to the common turbot, a fiſh extremely plentiful with them, and taken in vaſt abundance. The way of catching them is in a net, trailed on the ground by two horſes; the one going up to the middle of his body in the water, the other on the ſhore.

BRETACHIÆ, in *Middle Age Writers*, denote wooden towers or caſtles, wherewith towns or camps were defended. Du-Cange Gloſſ. Lat.

BRETESSE, in *Heraldry*, a term uſed to expreſs a line in ſome coats of arms, of the ſame nature with what is uſually called the *crenelle*, or EMBATTLED *line*; except that this laſt is only embattled on one ſide, and the *breteſſe* or *crenelle* on both ſides. Some authors ſeem, however, to have underſtood the terms *breteſſe* and *crenelle* as ſynonymous words, and when they would expreſs ſuch a line, they call it, if embattled on both ſides, *contre-breteſſe*.

BRETHREN *and Siſters of the Free Spirit*, in *Eccleſiaſtical Hiſtory*, an appellation aſſumed by a new ſect which ſprung up towards the cloſe of the thirteenth century, and gained many adherents in Italy, France, and Germany. They took their denomination from the words of St. Paul, Rom. chap. viii. ver. 2, 14. and maintained, that the true children of God were inveſted with the privilege of a full and perfect freedom from the juriſdiction of the law. They were enthuſiaſts to a degree of diſtraction, both in their principles and practice. They reſembled the BEGHARDS, by which name they were ſometimes called, in their aſpect, apparel, and manner of living. Some of their profeſſed principles reſembled thoſe of the *Pantheiſts*; for they held, that all things flowed by emanation from God; that rational ſouls were portions of the Deity, and that the univerſe was God; and that, by the power of contemplation, they were united to the Deity, and acquired hereby a glorious and ſublime liberty, both from the ſinful luſts and the common inſtincts of nature: and hence they concluded, that the perſon, who was thus abſorbed in the abyſs of the Deity, became a part of the Godhead, and was the ſon of God in the ſame ſenſe and manner that Chriſt was, and that he was freed from the obligation of all laws human and divine. They treated with contempt all Chriſtian ordinances, and all external acts of religion, as unſuitable to the ſtate of perfection at which they were arrived. Some of them were honeſt but deluded enthuſiaſts; and they endured the torments inflicted upon them by the inquiſitors with aſtoniſhing calmneſs and triumph. Others proceeded to the moſt extravagant licentiouſneſs of conduct. They held their ſecret aſſemblies ſtark naked, and lay in the ſame beds with their ſpiritual ſiſters, and indiſcriminately with other women, without the leaſt ſcruple or heſitation: modeſty and decency being, according to their creed, marks of inward corruption. And ſome of them proceeded ſtill farther, and maintained, that the *divine man*, or believer, could not ſin, let his conduct be ever ſo horrible or atrocious. Many edicts were publiſhed againſt them; but, notwithſtanding the ſeverities they ſuffered, they continued till about the middle of the fifteenth century. They were called by ſeveral other names, ſuch as Schweſtriones, Picards, Adamites, and Turlupins. Moſheim's Eccl. Hiſt. vol. iii. p. 122, &c. 202, &c. 273, &c.

Brethren *and Clerks of the Common Life*, a denomination aſſumed by a religious fraternity towards the latter end of the fifteenth century. They lived under the rule of St. Auguſtin, and were eminently uſeful in promoting the cauſe of religion and learning. Their ſociety was firſt formed, in the preceding century, by Gerard de Groote, a native of Deventer; but did not flouriſh till about the period above mentioned, when it obtained the approbation of the council of Conſtance, and became very reſpectable in Holland, the Lower Germany, and the adjacent provinces. It was divided into two claſſes, the *lettered brethren* or *clerks*, and the *illiterate*: they lived in ſeparate habitations, but maintained the cloſeſt fraternal union. The former applied to the ſtudy of polite literature, and the education of youth; whilſt the latter were employed in manual labour, and the mechanic arts. They were frequently called *Beghards* and *Lollards*, by way of reproach. Moſheim, vol. iii. p. 253.

Brethren, *White*, *fratres albati*, were the followers of a leader about the beginning of the fifteenth century, who was arrayed in a white garment; and as they were alſo cloathed in white linen, they were diſtinguiſhed by this title. Their leader was a prieſt from the Alps, who carried about a croſs, like a ſtandard, and whoſe apparent ſanctity and devotion drew together a number of followers. This deluded enthuſiaſt practiſed many acts of mortification and penance, endeavoured to perſuade the European nations to renew the holy war, and pretended that he was favoured with divine viſions. Boniface IX. ordered him to be apprehended, and committed to the flames, upon which his followers diſperſed. Moſheim, vol. iii. p. 275.

Brethren *of the Obſervance.* See Observance.

BRETOYSE, or **Bretois**, the law of the marches of Wales; in uſe among the ancient Britons.

BREVE, **Brevis**, *ſhort*, in *Grammar.*—Syllables are diſtinguiſhed into *longæ* and *breves*, according as they are pronounced quicker or more ſlow: the time of a *breve* is half that of a *long*, or, as the grammarians expreſs it, a *breve* is one time, and a *long* two. See Accent.

Breve, in *Muſic*, is a note or character of time, formed ſquare, without any tail; and equivalent to two meaſures, or ſemibreves. See Characters *of muſic*, and Semibreve.

Breve is uſed in the *Civil Law* for a ſhort note or minute.

In which ſenſe, the word is alſo written *brevis* (ſubaude *libellus*) and in Engliſh brief or *breve*; amounting to much the ſame with what is otherwiſe called *ſchedula* and *brevicula.*

Breve more particularly denotes a liſt or regiſter of the names of the ſoldiers under the command of a general.

Breve is more particularly uſed in *Common Law* for a writ or brief. Hence

Breve *perquirere*, is to purchaſe a writ or licence of trial in the king's courts by the plaintiff; and on this depends the uſage of paying to the king in ſuits for money due on bond, 6*s.* 8*d.* when the debt is 40*l.* and 10*s.* when it is 100*l.*

Fitzherbert has given a new Natura Brevium; thus called by way of diſtinction from an old Natura Brevium, compoſed about the time of Henry III. There is a copy of this book of Fitzherbert's filled with manuſcript notes by Sir M. Hales, in Dr. Williams's Library in Red Croſs Street.

Breve *de recto.* See Recto.

Breve *vas.* See Vas *breve.*

BREVET, in the *French Laws*, denotes an act iſſued by a ſecretary of ſtate, importing a grant of ſome favour or donation from the king.

The word is formed from the middle age Latin, *brevettum*, of *breve*, *ſhort.*

In which ſenſe, *brevet* amounts to much the ſame with our warrant.

They ſay, a *brevet* of nomination, a duke by *brevet*; ſuch a perſon had a *brevet* of a marſhal of France.

Brevet more particularly denotes the commiſſion of a ſubaltern officer, being only written on parchment, and without ſeal.

Brevet, in the *Sea-language*, is ſometimes uſed for a bill of loading.

BREVIA *teſtata*, mentioned by *Feodal Writers*, were written memorandums, introduced to perpetuate the tenor of the conveyance and inveſtiture of lands, when grants by parol only became the occaſion of diſpute and uncertainty. To this end they regiſtered in the deed the perſons who attended as witneſſes, and heard it read without ſigning their names; the clerk adding their names in a ſort of memorandum. Modern *deeds* are an improvement and amplification of theſe. Blackſtone's Com. vol. ii. p. 307.

BREVIARE, to abbreviate or reduce a thing into a ſhorter compaſs.

This is otherwiſe called *abbreviare* and *inbreviare.*

BREVIARIUM is more particularly uſed among Roman writers, to denote a book introduced by Auguſtus, containing the accounts of the empire.

The deſign of it was for giving an account to the people how the monies levied on them were applied. The emperor Tiberius laid aſide the *breviarium*, but it was reſumed by Caligula.

BREVIARY, is an epitome, an abridgment, or ſhort ſtate of a thing.

The word is Latin, *breviarium*, though not pure, as appears from Seneca, who obſerves, that the ancients, in lieu of it, uſed *ſummarium.*

Breviary was alſo uſed among the ancients for the place where the briefs, or what was written abbreviately, were preſerved.

Breviary, among *Eccleſiaſtical Writers*, denotes the office, or ſervice both for day and night, as performed in the Romiſh churches.

Breviary is more frequently uſed for a church-book, containing the office of the *breviary*, that is, the prayers, and other parts of the ſervice, with the ſeveral variations to be made therein, according to the ſeveral days, canonical hours, feaſts, and the like.

D. Mege derives the name *breviary* from hence, that the ancient monks in their journeys, &c. had little books, wherein were the pſalms and leſſons, read in the choir, collected out of large volumes: and F. Mabillon tells us, he has ſeen two ſuch books in the archives of Ciſteaux; they were not above three fingers broad: their letter was exceedingly ſmall, and conſiſted moſtly in abbreviations, expreſſing a whole period in a few ſyllables: whence they had a good title to the appellation of *breviaries*, q. d. *abridgments.*

Some deduce the appellation *breviary* hence, that when the popes reſided in the Lateran palace, the office read in the papal palace was much ſhorter than that ſaid in the other churches of Rome; which office, thus abbreviated, was compiled by Innocent III. and called *officium capellare*, till ſuch time as the Franciſcan friars adopting the ſame, in conformity to the papal chapel, it became denominated *breviarium*, and ſhortly after was in general uſe. Magr. Vocab. Eccleſ. p. 38. Menag. Orig. Franc.

The firſt time the word *breviary* occurs, in the ſenſe of a church-book, is in a letter of the archbiſhop of Lyons to the biſhop of Langres, in 1099; or rather by Micrologus, who lived in 1080.

The Roman *breviary* is general, and may be uſed in every place: but on the model of this have been formed various others, peculiarly appropriated to each dioceſe, and each order of religious.

The *breviary* conſiſts of the ſervices of matins, lauds, prime, third, ſixth, nones, veſpers, and the complines, or *poſt-communio*; that is, of ſeven different hours: on account of that ſaying of David, *Septies in die laudem dixi tibi.*

The obligation of reciting the *breviary* every day, which was at firſt univerſal, by degrees was reduced to the beneficiary clergy alone, who are bound to do it on pain of mortal ſin, and of refunding their revenues, in proportion as they are delinquent herein. In the fourteenth century, there was a particular reſervation in favour of biſhops, for paſſing, on occaſion, three days without rehearſing the *breviary.*

The inſtitution of the *breviary* not being very ancient, the lives of the ſaints were inſerted in it, agreeable to the opinions of the times; i. e. full of ridiculous ill-atteſted facts; which gave a handle to ſeveral purgations, or reformations thereof, by ſeveral councils, particularly thoſe of Trent and Cologne; by ſeveral popes, as Pius V. Clement VIII. and Urban VIII. as alſo by ſeveral cardinals and biſhops, each of whom lopped off ſome of the extravagancies, and brought the work nearer to the ſimplicity of the primitive offices; as acknowledging, that in the ancient church there was nothing read, but ſcripture itſelf.—Cardinal Quignon carried the reformation the fartheſt; leaving out the little office of the Virgin, the verſes, reſponſes, and a great part of the lives of the ſaints.

The *breviaries* now in uſe are almoſt innumerable: the difference between them conſiſts principally in the number and order of the pſalms, hymns, pater-noſters, ave-mary's, credo's, magnificats, cantemus's, benedictus's, canticamus's, nunc dimittis's, miſerere's, halleluja's, gloria patri's, &c.

The moſt eminent, after the Roman *breviary*, are, that of the Benedictins, that of the Bernardines, of the Chartreux, of the Præmonſtratenſes, of the Dominicans, the Carmelites, the Franciſcans, and Jeſuits; alſo that of Cluny, of the church of Lyons, the church of Milan, and the Mozarabic *breviary* uſed in Spain.—But in reality there is ſcarce a church in the communion of Rome, in France, Flanders, Spain, Germany, &c. that has not ſomething particular in the form and manner of its *breviary:* though the differences are generally inconſiderable. See AMBROSIAN, GALLICAN, &c.

The *breviary* of the Greeks, which they call ὡρολογιον, *horolologium*, q. d. *dial*, is nearly the ſame, in almoſt all the churches and monaſteries that follow the Greek rite. The Greeks divide the pſalter into twenty parts, καθισματα; which are a kind of reſts, pauſes, or ſtations: and each pauſe is again ſubdivided into three parts.—In general, the Greek *breviary* conſiſts of two parts; the one containing the office for the evening, called μεσονυκτιον; the other that for the morning, conſiſting of matins, lauds, prime, tierce, ſixth, none, veſpers, and complines.—The *breviary* of the Maronites contains ſome more conſiderable variations.

Among the people who ſpeak the Sclavonic language, or any of its dialects, the *breviary* is rehearſed in the vulgar tongue; as among the Maronites in Syriac, among the Armenians in Armenian, &c.—Thoſe who rehearſe the *breviary* in the Sclavonic, are divided as to the rite: ſome following the Roman or Latin rite, as the inhabitants of Dalmatia, and the neighbouring coaſts: whereas thoſe who live farther within the continent, as in Hungary, Boſnia, Sclavonia, &c. and in Poland, Lithuania, and Muſcovy, follow the Greek rite.—The *breviaries* of the Cophts and Abyſſinians are much alike.

BREVIATE, is ſometimes uſed for an ABRIDGMENT, or ſhort extract of a book or paper. Phil. Tranſ. N° 37. p. 2212.

BREVIATOR, an officer under the eaſtern empire; whoſe buſineſs was to write and tranſcribe briefs.—At Rome, thoſe are ſtill called *breviators*, or ABBREVIATORS, who dictate, and draw up the pope's briefs.

BREVIER, among *Printers*, is the denomination of a ſmall ſpecies of letters between *minion* and *bourgeois*. See LETTER.

BREVIS *cubiti*, in *Anatomy*, one of the extenſor muſcles of the *cubitus*, ariſing from the external ſpine of the *humerus*.

BREVIS *radii*, one of the ſupinator muſcles of the *radius*, ariſing partly from the external condylus of the *humerus*, and partly from the upper and exterior part of the *ulna*; and inſerted into the ſuperior part of the *radius*, which it embraces wholly: and ſerves to turn the palm of the hand upwards.

BREVIS is alſo uſed by ſome for the third of the extenſors of the *carpus*, which, ariſing from the lower part of the *humerus*, and running along the *radius*, terminates in the bone of the *carpus*, which ſuſtains the middle finger. Some anatomiſts join this with the ſecond EXTENSOR, and call them *bicornis*, or *radialis externus:* others chooſe to diſtinguiſh them, becauſe they have different origins, and inſertions; and that their bellies are ſeparable.

BREVIS *extenſor pollicis pedis*. See EXTENSOR.

BREVIS *flexor pollicis pedis*. See FLEXOR.

BREVIS *peronæus*. See PERONÆUS.

BREVIS *pronator radii*. See PRONATOR.

BREVITY, in a general ſenſe, that which denominates a thing brief or ſhort.

BREVITY is more particularly uſed in ſpeaking of the ſtyle or compoſition of diſcourſe. *Brevity* of diſcourſe is by ſome called *brachylogia*, and *breviloquentia*; ſometimes *laconiſmus*. Tacitus and Perſius are remarkable for the *brevity* of their ſtyle. There are two kinds of *brevity*, one ariſing from dryneſs, poverty, and narrowneſs of genius; the other from judgment and reflexion; which latter alone is laudable. *Brevity* is ſo eſſential to a tale, a ſong, and an epigram, that, without it, they neceſſarily languiſh and become dull.

Rhetoricians make *brevity* one of the principal marks or conditions of eloquence; but the rules they preſcribe for attaining it, are difficult to apply, ſo as ſtill to keep the due medium between too much and too little.

A juſt *brevity* is attained by uſing all the words which are neceſſary, and none but thoſe which are neceſſary. Sometimes it may alſo be had, by chooſing a word which has the force of ſeveral. It is this laſt kind which Quintilian admires ſo much in Salluſt; and the imitation of which, by other writers, has cauſed ſo much OBSCURITY.

BREVIUM *cuſtos*. See CUSTOS.

BREVIUM *falſo retorno*. See FALSO.

BREWED *wine*. See WINE.

BREWER, an operator who profeſſes the art of BREWING.

Brewers are called, in *Middle Age Writers*, *braſiatores*, *braciatores*, *braxionarii*, *braſiatrices*, *braxatrices*, and *cambarii*. Du-Cange Gloſſ. Lat. tom. i.

The *brewers* of London make a COMPANY, incorporated by Henry VI. in 1438, conſiſting of a maſter, three wardens, twenty-eight aſſiſtants, and one hundred and eight liverymen.

At Paris, they have a company of *brewers*, which is one of the oldeſt in the city, having ſtatutes as early as 1268.

The apparatus and utenſils of a *brewer*, or a brewhouſe, are a furnace made cloſe and hollow for ſaving fuel, and with a vent for the paſſage of the ſmoke, leſt it taint the liquor; a copper, which is preferable to lead; a maſk-fat near the head, a cooler near the maſk-fat, and guile-fat under the cooler; adjoining to all, are ſeveral clean tubs, to receive the worts and liquors.

Brewers uſe BALLS for fining, feeding, preſerving, reliſhing, and colouring MALT-*drinks*, wines, and cyders. They are of two kinds, and denominated from their colours *brown* and *pale* BALLS.

The ingredients in the compoſition of theſe BALLS, of the brown kind, are as follow:

Alabaſter, or marble calcined into powder, two pounds; oyſter-ſhells a little calcined, and freed from their dirty-coloured outſide, one pound; pure fat chalk well dried, one pound; horſe-bean flour freed from the hulls, one pound; red ſaunders, four ounces; grains of paradiſe, half an ounce; Florentine orrice-root, half an ounce; coriander ſeed, one quarter of an ounce; ſix cloves; half an ounce of hops; two ounces of the beſt ſtaple inciſed iſinglaſs; and two pounds of the firſt runnings of melaſſes or treacle.

Pale *balls* are made after the ſame manner, and with the ſame quantities of all the ingredients; except that the ſaunders is left out, and a pound or two of fine ſugar made into a ſyrup is uſed in room of the melaſſes.

The powders are to be very fine, and the BALLS muſt be dried very gradually without heat for the firſt three or four days; afterwards they may be put into the ſun, or at a proper diſtance from the fire, in order to be thoroughly dried; the quantity of hops may be omitted or increaſed at diſcretion, as the liquor requires.

Put as much water to the iſinglaſs as will juſt cover it, in order to open its body, and ſo let it ſtand for twelve hours. Add then the following infuſion to it, and gradually diſſolve the whole over a gentle fire. It is then to be ſtrained off hot, upon ſome of the powder, the remainder of which is to be added by little and little, with ſome of the ſyrup or treacle alternately, till the whole be converted into a ſtiff maſs, of which the BALLS, weighing four ounces each, are to be formed.

To make the infuſion before ſpoken of, a pint of boiling water is to be poured on the coriander ſeed, and cloves bruiſed, and on the hops well rubbed. They are then to be cloſe covered, and ſuffered to ſtand ſo for twelve hours, when they may be ſtrained off for the purpoſe above mentioned.

What follows may ſerve for a direction with reſpect to the number of balls which are to be put into caſks of different ſizes.

Powder one of the balls, and put it into a half firkin; into a firkin, two; into a kilderkin, three; into a barrel, ſix; and ſo on, in proportion. It is to be ſtirred well into the liquor, which ſhould be racked off, if it be of age to bear racking.

BREWING, the operation of preparing ale, or beer, from malt.

The uſual proceſs of *brewing* is as follows.—A quantity of water being boiled, is left to cool, till the height of the ſteam be over; when ſo much is poured to a quantity of malt in the maſhing-tub, as makes it of a conſiſtence, ſtiff enough to be juſt well rowed up: after ſtanding thus a quarter of an hour, a ſecond quantity of the water is added, and rowed up as before. Laſtly, the full quantity of water is added; and that in proportion as the liquor is intended to be ſtrong or weak. This part of the operation is called *maſhing*. The whole now ſtands two or three hours, more or leſs, according to the ſtrength of the wort, or the difference of weather, and is then drawn off into a receiver; and the maſhing is repeated for a ſecond wort, in the ſame manner as for the firſt; only the water to be cooler than before, and not to ſtand above half the time.

The two worts are then to be mixed, the intended quantity of hops added, and the liquor cloſe covered up, gently boiled in a copper the ſpace of an hour or two; then let into the receiver, and the HOPS ſtrained from it into the coolers.—When cool, the barm or yeſt is applied; and it is left to work, or ferment, till it be fit to tun up.

For ſmall beer, there is a third maſhing, with the water near cold, and not left to ſtand above three quarters of an hour, to be hopped and boiled at diſcretion.—For double beer or ale, the two liquors reſulting from the two firſt maſhings, muſt be uſed as liquor for a third maſhing of freſh malt.—For fine ale, the liquor thus *brewed*, is further prepared with melaſſes; but liable to a forfeiture of 20*l.* by ſtat. 1 Ann, cap. 3.

Inſtead of YEST, ſome uſe Caſtile ſoap, others flour and eggs, others an eſſential oil of barley: others a quinteſſence of malt, others of wine, and others the *ſal panariſtus*.

For the properties of the liquors thus *brewed*, ſee MALT *liquor*. For duty on ale and beer, ſee ALE.

Brewing is an art depending on chemiſtry, and capable of being improved various ways, both with regard to the preparation of the malt, the uſe of hops, and the management of the working or fermentation. Some have introduced the uſe of vegetable ſaps, as birch and ſycamore waters, to good purpoſe into the art of *brewing*. Honey, treacle, and ſugar, are alſo capable of being applied to advantage in *brewing*. Phil. Tranſ. N° 68. p. 2071. N° 34. p. 917.

The ſap or juices of trees is a very valuable article in *brewing*, and not only improves malt liquor, but renders it much cheaper. The ſycamore is the beſt tree for tapping for this purpoſe; it yields a great quantity, and that without any other trouble than boring a hole properly, and placing a veſſel under it. One buſhel of malt *brewed* with this juice, will make as good beer as four buſhels in the ordinary way. The beſt way of procuring the ſap is this: take a large auger, and with it bore two holes on the oppoſite ſides of the tree, each ſo deep as to the pith. Each hole is to be bored ſloping upwards, and the beſt place for it is immediately under a large arm of the tree near the ground; and if the arm be pierced through with the auger in the way to the tree, it will be ſo much the better: in this manner, there needs no ſpigot or ſtone to keep open the hole, or to direct the courſe of the liquor, for it will of itſelf run down into a veſſel placed to receive it; and one tree will thus, in a few days, yield a ſufficient quantity of liquor to *brew* with.

In order to preſerve the ſap in a proper condition for *brewing*, what is firſt gathered muſt be inſolated by a conſtant expoſition of it to the ſun, in proper glaſſes, till the reſt be obtained; otherwiſe the firſt will contract an acidity that will ſpoil it. When a ſufficient quantity of the ſap is thus collected, as much rye-bread muſt be put into it, cut thin and well toaſted, but not burnt, as will ſerve to ferment it; when it works well, the bread is to be taken out, and, at a convenient time, it is to be bottled up, and will thus afford a pleaſant liquor, of conſiderable ſtrength, without malt or any other addition. Some people add ſage to this liquor, baking it in their cruſts of rye-bread, till thoroughly dry, and then adding it with the bread to the working liquor. If a few cloves be tied up in a rag, and put into the veſſels into which the ſap is received from the tree, they will preſerve it the year round, without any fermentation: they are very apt to give a taſte to the liquor; but if it be ſo contrived that they are taken out before they give this taſte, the liquor will keep as well without any flavour of them. The adding a few drops of oil of ſulphur, will have the ſame effect; and ſo will the fuming with ſulphur itſelf. A little ſpirit of wine, poured on the top of the juice in every bottle, will alſo be very inſtrumental in preſerving it.

Many people, inſtead of adding malt, and *brewing* the ſap of the ſycamore or birch into ale, uſe raiſins, and make a ſort of wine of it; and ſome add ſugar. Some have uſed the rye-toaſts with very good ſucceſs, though they were not put into the liquor, but only hung over it, at ſuch a diſtance as to give a warmth and motion to the ſurface. Common ale yeſt has been tried by ſome to ferment the juice of the birch; but it uſually ſpoils it, turning the liquor into a very bad ſmall beer. The Flemiſh wheat ferment would probably in time excellently mature the bottled juice of the birch or ſycamore; but it would require a conſiderable time for it. Cinnamon is worthy to be tried in the room of cloves, as of a much more agreeable flavour. Honey has no effect on cyder at all; for it will not mix with it, though boiled in it, to make mead; but, after a time, the cyder lets fall the honey, and becomes ſimple cyder again: it is a queſtion whether it would mix with theſe juices; but if it would, it might probably make a great improvement in them. The tops and young leaves of birch boiled in the ſap, are ſaid by ſome to preſerve it. Phil. Tranſ. N° 146.

BREWING, among *Diſtillers*, denotes the method of extracting the more ſoluble parts of vegetables with hot water, and thus procuring a ſolution or decoction fitted for vinous fermentation.

In which ſenſe, *brewing* is a neceſſary ſtep towards DISTILLATION.

A fermentable ſolution, fit for yielding a ſpirit, or brandy, is obtainable from any vegetable, under proper management; but the more readily and perfectly the ſubject diſſolves, the better it is diſpoſed for fermentation, and the production of brandies. Thus, ſugar, honey, treacle, manna, and other inſpiſſated vegetable juices, which totally unite with water, into a clear and uniform ſolution, are more immediate, more perfect, and better adapted ſubjects of fermentation, than roots, fruits, or herbs, in ſubſtance, the grains, or even malt itſelf; all which diſſolve but very imperfectly in hot water.

Yet MALT, for its cheapneſs, is generally preferred in England, and *brewed* for this purpoſe much after the common manner of *brewing* for beer; only the worſt malt will ſerve for diſtillation; and the tincture, without the addition of hops, and the trouble of boiling, is here directly cooled and fermented.

The grain intended for *brewing* is previouſly malted, to prepare it for diſſolving more eaſily and copiouſly in the water, ſo as to afford a richer tincture or ſolution, which, after due fermentation, will yield about one half more of proof ſpirit than the tincture of an equal weight of unmalted corn.

Brewing is alſo uſed, in an ill ſenſe, for the counterfeiting and compounding eſpecially of wines. Vintners and wine-coopers are ſuſpected of *brewing* wines, or mixing divers inferior ſorts, to imitate ſome better kind. The neceſſity of accommodating their liquors to the palates of their gueſts, is another cauſe of *brewing*; inſomuch that ſome have confeſſed they commonly draw out of two or three caſks for every pint.

BREWING, in *Sea-language*, the appearance of black tempeſtuous clouds, ariſing gradually from a particular part of the hemiſphere, and indicating an approaching ſtorm.

BREYNIA, in *Botany*, a genus of the *polyandria monogynia* claſs of plants, the characters of which are theſe: the flower hath four oval petals, which are a little longer than the empalement. It hath a great number of ſlender ſtamina. In the centre is ſituated a ſlender, oblong, obtuſe germen, which afterward becomes a long ſoft fleſhy pod, opening in two valves with one cell, encloſing a row of fleſhy kidney-ſhaped ſeeds. There are two ſpecies, which being natives of the Weſt Indies, are impatient of the cold, and therefore muſt be preſerved in ſtoves.

BRIAR, in *Botany*, a name given to ſeveral ſpecies of the ROSE.

BRIBE. See BRIBERY.

The word is French, *bribe*, which originally denotes a bit, fragment, or relic of meat taken off the table; on which footing, *bribe* imports as much as *panis mendicatus*, and ſtill keeps up the idea of the matter whereof *bribes* anciently conſiſted. Hence alſo the Spaniards uſe *bribar* and *brivar* for *begging*; and *brivia*, *brivoneria*, and *brivoniſmo*, for *beggary*. Menag. Orig. Franc. p. 131. Skinner Etym. in voc.

In *Middle Age Writers*, a *bribe* given a judge is called *quota litis*, and the receiver, *campi particeps*, or *cambi particeps*; becauſe the ſpoils of the field, i. e. the profits of the cauſe, were thus ſhared with the giver. Du-Cange, Gloſſ. Lat. tom. i.

BRIBERY, in *Common Law*, is when a perſon in judicial places takes a gift or reward of any perſon who has buſineſs before him, for doing his office, or by colour of his office, except the king only, unleſs it be meat and drink: and it is puniſhable by fine and impriſonment, and the loſs of office: and it was anciently deemed treaſon in a judge.

In a larger ſenſe, *bribery* denotes the receiving or offering any undue reward, to or by any perſon concerned in the adminiſtration of public juſtice, as an inducement for acting contrary to duty; and ſometimes it ſignifies the taking or giving a reward for a public office. Officers of the cuſtoms taking any *bribe*, whereby the crown may be defrauded, forfeit 100*l.* and are rendered incapable of any office. Candidates that *bribe* electors, after the date or *teſte* of the writs, or after the vacancy, are diſabled to ſerve in parliament; and he that takes, as well as he that offers a *bribe*, forfeits 500*l.* and is diſabled from voting, and holding any office in any corporation; unleſs, before conviction, he diſcovers ſome other offender of the ſame kind, whereby he is indemnified for his own offence. Blackſtone's Com. vol. i. p. 179. vol. iv. p. 139.

BRICIANI, *Knights of St. Bridget*, a military order, reſembling that of Malta, eſtabliſhed by St. Bridget, princeſs of Sweden, in 1366, and approved of by pope Urban V. who gave it the rule of St. Auguſtine.

The arms of the *Briciani* were a croſs azure, like that of the knights of Malta; under which was a tongue of fire, to expreſs the ardour of their zeal: their office was to fight againſt heretics, bury the dead, aſſiſt widows and orphans, &c.

BRICK, a kind of factitious ſtone, of a reddiſh or yellow colour, made of a fatty earth, formed into long ſquares, four inches in breadth, and eight or nine in length, by means of a wooden mould; and then baked or burnt in a kiln, to ſerve for the uſes of building.

There are alſo *bricks* of a whitiſh colour. Wulpit, in Suffolk, is famed for this ſort.

Bricks appear to be of a very ancient ſtanding; the tower of Babel, and the walls of Babylon being built thereof; as appears both from ſacred hiſtory, and from the remains thereof, ſtill ſaid to be in being. Under the firſt kings of Rome, they built with maſſive ſquared ſtones, which they learnt from the Tuſcans: towards the latter time of the republic, they began to uſe *brick*; borrowing the practice from the Greeks; and the greateſt, as well as the moſt durable buildings of the ſucceeding emperors, as the Pantheon, &c. were built therewith.—In the time of Gallienus, the buildings were compoſed of a row of *brick*, and a row of ſoft gritty ſtone, alternately. After him, they laid aſide the uſe of *bricks*, and reſumed that of flints.

In the Eaſt, they baked their *bricks* in the ſun: the Romans uſed them crude; only leaving them to dry in the air a long ſpace of time; viz. four or five years.

The *bricks* uſed by the Greeks were principally of three kinds: the firſt called διδωρον, i. e. of two palms; the ſecond τετραδωρον, of four palms; and the third πενταδωρον, of five palms.—They had other *bricks*, juſt half each of theſe, which they joined together to render their work more ſolid, as well as more agreeable to the eye, by the diverſity of figures and ſizes of the *bricks*.

Bricks, among us, acquire various names, according to their forms, dimenſions, uſes, method of making, place, &c. The principal are; *Compaſs bricks*, of a circular form, uſed in ſteening of walls. *Concave*, or *hollow bricks*, on one ſide flat, like a common *brick*, on the other hollowed, about three quarters of an inch deep, and half an inch broad; uſed for conveying water under ground: they are uſually a foot long, four inches and a half broad, and two and a quarter thick. *Cogging bricks*, uſed for making the indented work, under the coping of walls built with great *bricks*: they are about ten inches long, four broad, and two and a quarter thick. *Coping bricks*, formed on purpoſe for coping of walls, are about twelve inches ſquare, and four thick, flat underneath, one third above ſemicircular, and the two ends flat. *Dutch* or *Flemiſh bricks*, uſed to pave yards and ſtables, and for ſoap-boilers vats, and ciſterns. *Brique de Chantignole*, or *Demibrique*, is that only an inch thick, but otherwiſe of the ſame dimenſions as the whole *brick*; uſed in paving between borders of ſtones, and alſo for the making hearths and chimney-backs. *Clinkers*, ſuch *bricks* as are glazed by the heat of the fire in making: theſe lie in the middle of the kiln or clamps; and are the moſt durable. *Feather-edged bricks*, are made like the common ſtatute *bricks*, only thinner on one edge than on the other, and uſed to pen up the brick pannels in timber buildings. *Samel*, or *ſandal bricks*, are ſuch as lie outmoſt in a kiln or clamp, and conſequently are ſoft and liable to moulder; as not being thoroughly burnt. *Great bricks*, are thoſe which are twelve inches long, ſix broad, and three thick: the weight of one being about fifteen pounds: ſo that 100 weigh 1500, and 1000 of them 15000 pounds: their uſe is to build fence-walls; together with, *pilaſter*, or *buttreſs bricks*, which are of the ſame dimenſions with the great *bricks*, only they have a notch at one end, half the breadth of the *brick*: their uſe is to bind the work at the pilaſters of fence-walls, which are built of great *bricks*. *Paving bricks*, or *tyles*, are of ſeveral ſizes in ſeveral counties and places, from ſix to twelve inches ſquare, and one and a quarter, more or leſs, thick. See PAVEMENT, and TYLE. *Place-bricks*, ſuch as are made in a place prepared on purpoſe for them, near the building in which they are to be uſed. *Statute*, or *ſmall common bricks*, when burnt, by ſtat. 10 Geo. III. c. 49. ought to be eight inches and a half long, four broad, and two and a half thick: 100 of theſe uſually weigh about 550 pounds; and 1000, 5500 pounds; about 407 in number, make a ton weight. Theſe are commonly uſed in paving cellars, hearths, ſinks, &c. Thirty or thirty-two, if true meaſure, will pave a yard ſquare, and 330 will pave a ſquare of 100 feet laid flat; but if laid edgeways, there muſt be near double the number. *Stock-bricks* are to be of the ſame dimenſions; only one eighth of an inch thicker; and they are either marle or grey ſtocks. Theſe and the *ſamel bricks* are moſt uſed in building: *rubbing bricks* are for gauged work; *clinkers* for paving; Windſor and Welch *bricks* for furnaces, as being the fitteſt to bear intenſe heat.

Barbaro, in his commentary on Vitruvius, recommends another form of *bricks*; viz. *triangular* ones, every ſide a foot long, and only an inch and half thick. Theſe, he obſerves, would have many conveniences above others; as being more commodious in the management, of leſs expence, and of fairer ſhew; adding much beauty and ſtrength to the mural angles, where they fall gracefully into an indented work. Sir H. Wotton wonders they have never been taken into uſe, being recommended by ſo great an authority.

The earth whereof *bricks* are made, muſt not be ſandy, which will render them both heavy and brittle; nor muſt it be too fat, which will make them crack in drying. They ſhould be made either in the ſpring, or autumnal ſeaſon; and when made, they muſt be ſheltered from the ſun, if it be too hot, and yet be expoſed to the air to dry. If they be made in froſty weather, they are to be covered with ſand; if in hot weather, with wet ſtraw.

The ſeveral ſteps in the proceſs of our *brick*-making, are, caſting the clay or earth; treading or tempering the ſame with water; ſanding the *brick*, which is to riddle or caſt dry ſand on the wet *brick* lying on the ground; raiſing the *bricks* on one ſide, that they may dry the better and ſooner; walling the *brick*, which is to lay one upon another, after the manner of a wall, to keep them from foul weather, and that they may dry thoroughly; ſodding the *bricks*, which is to cover them up with turf; ſetting the *bricks* in the kiln, or the laying of ſlack or ſmall coal between every courſe or row of *bricks*; daubing the kiln, which is the claying of it all about the top, to keep the fire in, and ſecure the kiln from weather; firing, which is to ſet the fuel put into the arches on fire; earthing, which implies to put earth about it, to ſtop the arches, that the fire may take upwards to the top of the kiln; cooling the kiln after it has done burning; breaking the kiln; counting of the *bricks*; carrying the *brick*, which is to bring them to the place where they are to be uſed, either on horſeback or in tumbrels.

The burning of *bricks* is performed either in a kiln, or a clamp. In the former, the *bricks* being ſet in, and the kiln covered with pieces of *bricks*, they put in wood, to dry them with a gentle fire; and this they continue till they are pretty dry, which is known by the ſmoke's turning from a whitiſh to a thin black ſmoke. They then ceaſe to put in wood, and proceed to burn with bruſh, furze, ſtraw, heath, brake, or fern faggots; having firſt dammed up the mouth of the kiln with a ſhinlog, i. e. pieces of *bricks* piled upon one another, and cloſed with wet *brick* earth, inſtead of mortar: then they continue to put in more faggots, till the kiln and its arches look white, and the fire appears at the top of the kiln: upon which they ſlacken the fire for an hour, and let all cool by degrees. This they continue to do alternately heating and ſlacking, till the ware be thoroughly burnt; which is uſually effected in 48 hours.

About London, they chiefly burn in clamps, built of the *bricks* themſelves, after the manner of arches in kilns; with a vacancy between each brick's breadth, for the fire to play through: but with this difference, that inſtead of arching, they truſs or ſpan it over, by making the bricks project one over another, on both ſides of the place, for the wood and coals to lie in, till they meet and are bounded by the *bricks* at the top, which cloſe all up. The place for the fuel is carried up ſtrait on both ſides, till about three feet high: then they fill it almoſt with wood, and over that lay a covering of ſea-coal; and then over-ſpan the arch: but they ſtrew ſea-coal alſo over the clamp, betwixt all the rows of *bricks*; laſtly, they kindle the wood, which gives fire to the coal: and when all is burnt out, they conclude that the *bricks* are ſufficiently burnt.

The *arches* of a kiln of *bricks*, are the hollow places at the bottom where the fire is; *pigeon-holes* are apertures in the fire-arches; *checker-courſe*, denotes the lower row of *bricks* in the arch; *tying-courſe*, thoſe which cover the top of the arch; *binding-courſe*, is the laying of *bricks* over the joints of the under-courſe; *dividing-courſe*, is the diviſions or parts of a kiln; *flatting-courſe*, is the top of all the kiln; the *wheeler*, is he who carries the clay from the pit to the moulding-board foot, and there turns it off the wheelbarrow; *ſtaker*, he who puts the clay off the ground upon the board; *moulder*, he who works the clay into the *brick*-moulds, and ſtrikes the ſuperfluous clay off the top of the moulds; *breaker-off*, he who takes the mould, with the clay in it, from the moulder, and lays it on the ground to dry; *moulder*, he who parts off the clay from the mould; *off-bearer*, he who pulls off the empty mould into the tub of water or ſand; *taker-up* of the *brick* has his work alſo to dreſs and ſmooth them from irregular edges.

In burning *bricks*, much depends on the alternate raiſing and abating the fire. *Brick*-burners, who continue the heat without intermiſſion, uſually make their lower ware extremely hard and good, but the upper bad: and beſides, the lower ones will ſometimes run ſo with the exceſſive heat, as alſo to unite into one body. Then, for cooling kilns of ware, ſome unwiſe burners, as ſoon as the *bricks* are burnt, immediately ſtop up the reſt of the mouth of the kiln, which was left open above the ſhin-log, by which means the air being ſhut out, it is long in cooling; ſo that ſuch burners are commonly a fortnight, or almoſt three weeks, in ſetting, burning, and drawing of a kiln of ware; all which may be done in one week.

By ſtat. 12 Geo. I. cap. 35. earth or clay, deſigned for making *bricks* for ſale, ſhall be dug, and turned at leaſt once between the firſt of November, and the firſt of February, and not be made into *bricks* till after the firſt of March: and no *bricks* be made for ſale, but between the firſt of March and twenty-ninth of September. But by ſtat. 10 Geo. III. cap. 49. earth may be dug for making *bricks*, at any time in the year; provided ſuch earth be turned once before it be made into *bricks*. And by the former ſtatute, no Spaniſh is to be mixed with the earth; or breeze uſed in the burning of *bricks*. And all *bricks* are to be burnt either in kilns or diſtinct clamps, each ſort by itſelf.

By ſtat. 3 Geo. II. cap. 22. there may be mixed with the *brick* earth any quantity of ſea-coal aſhes, ſifted or ſcreened through a ſieve, or ſcreen half an inch wide, and not exceeding twenty loads, to the making one hundred thouſand *bricks*: each load not exceeding thirty-ſix buſhels. And breeze may be mixed with coal in the burning of *bricks* in clamps for ſale, &c. Stock-*bricks* and place-*bricks* may be burnt in one and the ſame clamp, ſo that the ſtock-*bricks* be ſet in one diſtinct parcel, and not mixed or ſurrounded with place-*bricks*.

For the more effectual ſecuring the obſervation of theſe laws, it was enacted, by 12 Geo. I. cap. 35. for the better diſcovering of offenders, that the maſter and wardens of the company of tylers and brick-layers ſhould have power to ſearch *brick*-kilns, &c. but they having permitted, and even encouraged divers perſons to make *bricks*, contrary to the directions in the ſaid act, by 2 Geo. II. cap. 15. they are diveſted of that power; and any two, three, or more perſons, appointed by the juſtices of peace, are impowered, within fifteen miles of London, to go, in the day-time, into any grounds, ſheds, or places, where any clay or earth ſhall be digged, or digging, for *bricks* or pantiles; or any *bricks* or pantiles ſhall be making, or made for ſale; and there to view, ſearch, and inſpect the ſame, &c.—Offenders to forfeit twenty ſhillings for every thouſand of unſtatutable *bricks*, and ten ſhillings for every thouſand of ſuch tyles: one moiety to the uſe of the proſecutor, the other to the poor of the pariſh, where the offence ſhall be committed.

Goldman obſerves, that *bricks* will have double the ſtrength, if, after one burning, they be ſteeped in water, and burnt afreſh. If the *brick* earth be too fat, it muſt be tempered with ſand; and that trodden out again, firſt by cattle, then by men. *Bricks* made of common earth, melt, nay vitrify, by too much heat: for which reaſon, the kilns are made of ſtones, that will themſelves calcine, that the vehemence of the fire may be broken by them: beſides which, they uſually place other *bricks*, made of an argillous earth, which will melt, next the fire.

Brick-work is found ſtronger and more durable than ſtone-work; and eſpecially better fitted to reſiſt the force of guns and engines of war. The Greeks are ſaid to have carried *brick*-makers with them in their armies, to be in readineſs for camp-works and fortifications. The Romans intermixed *brick* with their ſquare ſtone, in order to ſtrengthen it. In reality, *brick*-buildings were generally conſidered by the ancients as perpetual; ſo that, in Rome, abatement was always made for the age of ſtone-building, none for that of *bricks*. *Brick*-walls are alſo found warmer and wholeſomer than thoſe of free-ſtone and marble, as not being liable to ſweat, or collect humidities on their ſurface, which they rather imbibe. We may add, that *bricks* are found the beſt materials for vaults and edifices under ground, not only on account of their durableneſs, but the eaſineſs of their expence, and ſafety from fire. Phil. Tranſ. N° 93. N° 149.

Sir Henry Wotton ſpeaks of a ſort of *bricks* at Venice, of which ſtately columns were built; they were firſt formed in a circular mould, and cut before they were burnt, into four or more quarters or ſides; afterwards, in laying, they were jointed ſo cloſe, and the points concentered ſo exactly, that the pillars appeared one entire piece. Elem. Archit. lib. ii.

The ordinary Paris *brick* is eight inches long, four broad, and two thick, French meaſure, which makes ſomething more than others. But this ſmallneſs is an advantage to a building, the ſtrength and firmneſs of which conſiſts much in the multitude of angles and joints, at leaſt if well laid, and in good bond. The Romans were guilty of a great overſight in this reſpect; their *bricks* being above double of the French ones; though they had a better ſort, called *lateres beſſales*, only meaſuring eight inches in length: but theſe were properly only their half-*bricks*. In England, we alſo ſometimes make *bricks* of an unuſual length, meaſuring twenty-two inches long, and only ſix broad, ſerving to ſupply the office of laths or ſpars in malt-kilns.

Bricks may be made of any earth that is clear of ſtones, even ſea-owſe; but all earth will not burn red, a property peculiar to earths which contain ferruginous particles. In England, *bricks* are chiefly made of a hazely yellowiſh coloured fatty earth, ſomewhat reddiſh, vulgarly called *loam*, which is a mixture of clay and ſand. The earth, according to Leybourn, ought to be dug before winter, but not made into *bricks* till ſpring.

Worlidge, and others after him, have laboured to excite *brick*-makers to try their ſkill in making a new ſort of *brick*, or a compoſition of clay and ſand, whereof to form window-frames, chimney-pieces, door-caſes, and the like. It is to be made in pieces faſhioned in moulds, which, when burnt, may be ſet together with a fine red cement, and ſeem as one entire piece, by which may be imitated all manner of ſtone-work.

The thing ſhould ſeem feaſible by the earthen pipes made fine, thin, and durable, to carry water under ground at Portſmouth, and by the earthen backs and grates for chimneys, formerly made by Sir John Winter, of a great bigneſs and thickneſs.

In reality, much might be done towards making chimney-pieces, ſtone-mouldings, architraves, faſcias for fronts of buildings, and the like, if men of this profeſſion had a little tincture of chemiſtry, which would enable them to contrive ſome good compoſition of earth, and a proper way to manage it in the moulding, burning, &c.

Brick-making, among the Romans, was conducted with great care and choice; by which means their *bricks* were rendered of much longer duration than ours. In this reſpect moſt of our neighbours excel us; the *bricks* which we import from Holland, Denmark, &c. being better than our own. Phil. Tranſ. N° 351. Houghton Collect. tom. ii. N° 168. p. 26.

With reſpect to the poſition, or manner in which *bricks* are laid, we meet with

BRICKS *in bond*, *Briques en liaſon*, thoſe laid flatwiſe, and ſo as to over-reach each other by half their length.

BRICKS, *Floor*, *Briques de champ*, thoſe laid edgewiſe, to ſerve as a pavement.

BRICKS, *Spicated*, *Briques en epi*, thoſe placed diagonalwiſe, after the manner of Hungarian point. Such is the pavement of Venice.

BRICK *Walls*. See WALL.

BRICKS, in *Medicine* and *Chemiſtry*, are not only uſed in the preparation of the oil, which takes its denomination from them; but heated *bricks* are frequently added in diſtillation, to increaſe the fervour of bodies in boiling. Some adulterate the *ſoda*, or kali aſhes, for glaſs, with *brick*-duſt.

BRICKS, *Oil of*, is oil of olive, imbibed by the ſubſtance of *bricks*, and afterwards diſtilled from it.—The pieces of *bricks*, being heated red-hot in live-coals, are extinguiſhed in a trough half filled with oil of olives: being then ſeparated, and the *brick* thus ſaturated with oil, and groſsly pounded, it is put into a retort, and placed in a reverberatory furnace; and thus is drawn an oil, which the apothecaries call *oleum de lateribus*, and ſome chemiſts *oil of the philoſophers*: it is uſed for reſolving tumours in the ſpleen, alſo againſt palſies, epilepſies, &c. See OIL.

Some extol it as a ſeptic, excellent for taking away calluſes, cleanſing and removing ulcers, &c. It is now fallen much into diſuſe. Juncker Conſp. Chirurg.

BRICK-*duſt*.—It is a cuſtom with ſome perſons to reduce this ſubſtance to a very fine powder, and give it, inſtead of chalk, in the heart-burn. Many of the lozenges, ſo much famed for the cure of this diſorder, and ſold under the pompous names of coral lozenges, are only made of a mixture of this uncouth medicine and ſugar, made into the conſiſtence of a paſte, with gum tragacanth reduced to a mucilage with roſe-water. But it is to be obſerved, that this, as well as chalk, is a very dangerous remedy. It has grown into an opinion, that the ſole cauſe of this complaint was an acid humour in the ſtomach, and thence an abſorbent was judged alone ſufficient for a cure: chalk was the firſt ſubſtance pitched upon for this purpoſe; but ſome miſchievous events having happened from the taking it, recourſe was had by ſome to this odd medicine. But ſuch ſhould have obſerved, that as chalk did all its miſchief by being an aſtringent, this new medicine was qualified to do much more harm, on the ſame principle; it being a much more powerful one. Juncker Med. Conſp. p. 589.

BRICK is alſo uſed in ſpeaking of divers other matters made in the form of *bricks*.

In which ſenſe, we ſay a penny *brick*, or *brick*-BREAD. Some alſo mention *brick*-TIN, a ſort of tin in that ſhape brought from Germany; and *brick*-SOAP, made in oblong pieces, from a pound and a half to three pounds.

BRICKS, or **BRIQUES**, in *Heraldry*, are figures or bearings in arms, reſembling a building of *bricks*; being of a ſquare form, like billets and tablets; from which they only differ in this, that they ſhow their thickneſs, which the others do not.

BRICK, in *Zoology*, the name of a ſort of lamprey, called by the writers on theſe ſubjects, *lampetræ medium genus*; and diſtinguiſhed from the other lampreys, by having a number of black tranſverſe ſpots, very narrow and long.

BRICK-*earth*, in *Agriculture*. See *Brickiſh* SOIL.

BRICK-*kiln*, a place to burn bricks in.

BRICK-*layer*, an artificer whoſe buſineſs it is to build with bricks, or make brick-work.

Brick-layers work or buſineſs, in London, includes tyling, walling, chimney-work, and paving with bricks and tyles. In the country, it alſo includes the maſons and plaiſterers buſineſs.

The materials uſed by *brick-layers*, are bricks, tyles, mortar, laths, nails, and tyle-pins.

Their tools are, a brick-trowel, wherewith to take up mortar; a brick-ax, to cut bricks to the determined ſhape; a ſaw, for ſawing bricks; a rub-ſtone, on which to rub them; alſo a ſquare, wherewith to lay the bed or bottom, and face or ſurface of the brick, to ſee whether they be at right angles; a bevel, by which to cut the under-ſides of bricks to the angles required; a ſmall trannel of iron, wherewith to mark the bricks; a float-ſtone, with which to rub a moulding of brick to the pattern deſcribed; a banker, to cut the bricks on; line-pins, to lay their rows or courſes by; plumb-rule, whereby to carry their work upright; level, to conduct it horizontal; ſquare, to ſet off right angles; ten foot rod, wherewith to take dimenſions; jointer, wherewith to run the long joints; rammer, wherewith to beat the foundation; crow and pick-ax, wherewith to dig through walls.

The London *brick-layers* and TYLERS make a regular company, which was incorporated in 1568, and conſiſts of a maſter, two wardens, twenty-eight aſſiſtants, and one hundred and eight on the livery.

A *brick-layer* and his labourer will lay in a day about a thouſand bricks, in whole work on a ſolid plane, when the wall is but a brick and a half, or two bricks thick; and ſince a cubic yard contains 460 bricks, he will lay above two cubic yards in a day: and hence it may be eaſily computed how many *brick-layers* are required to finiſh a certain piece of work in a given time.

Brick-laying is one of the arts ſubſervient to architecture. Moxon has an exerciſe expreſs on the art of *brick-laying*, wherein he deſcribes the materials, tools, and methods of working uſed by *brick-layers*. See *Brick*-WALLS.

BRICKING popularly ſignifies building a thing up with brick; but, more properly, the act or art of counterfeiting of brick on plaiſter, by ſmeering it over with red oker colour, and marking the joints with an edged inſtrument.

This anſwers to what the French call *briqueter*, which is ſometimes alſo performed by uſing a layer of plaiſter, mixed with red oker, and, while it is freſh laid on, drawing deep lines for joints, and then filling them with fine plaiſter. Some even ſmear bricks themſelves with a red colour, and repair the joints with plaiſter, to make an antiquated building look freſh.

When bricks are rubbed to a particular dimenſion, and ſet with a neat joint, this is by way of eminence called *gauged work*.

BRIDE, a woman juſt married, or a wiſe in the firſt days of her matrimonial ſtate. See MARRIAGE.

Among the Romans, the maid eſpouſed remained a *bride*, *ſponſa*, till ſhe entered the huſband's houſe; from which time ſhe commenced a wife, *uxor*.

The bridegroom was attended by a brideman, *paranymphus*; the *bride* by a *pronuba*, or bridemaid, whoſe buſineſs was to inſtruct her young miſtreſs in the duties of the genial bed, and to prepare every thing for a proſperous copulation.

The ancient ceremonies practiſed in reſpect of a *bride* were numerous; moſt of them emblematical, or ſignificant of ſome part of her duty: as, dreſſing her hair after a peculiar manner, and parting it with a ſpear; putting on her a crown; girding her with a girdle, which the bridegroom was to looſen; putting a yoke on her neck; dreſſing her in yellow ſocks; and veiling her with the *flammeum*. She was to ſeem to be raviſhed or torn by force from her mother, in memory of the rape of the Sabines under Romulus; ſhe was to be carried home in the night-time to the bridegroom's houſe, accompanied by three boys, called *patrimi* and *matrimi*; one of whom carried a torch, and the other two, called *paranymphi*, led the *bride*; a ſpindle and a diſtaff being carried with her: ſhe brought three pieces of money, called *aſſes*, in her hand to the bridegroom, whoſe doors, on this occaſion, were adorned with flowers and branches of trees: being here interrogated who ſhe was, ſhe was to anſwer, *Caia*, in memory of Caia Cæcilia, wiſe of Tarquin the elder, who was an excellent *lanifica*, or ſpinſtreſs; for the like reaſon, before her entrance, ſhe lined the door-poſts with wool, and ſmeared them with greaſe.

Fire and water being ſet on the threſhold, ſhe touched both; but, ſtarting back from the door, refuſed to enter, till at length ſhe paſſed the threſhold, being careful to ſtep over, without touching it: here the keys were given her; a nuptial ſupper was prepared for her, and minſtrels to divert her; ſhe was ſeated on the figure of a Priapus, and here the *patrimi* and *matrimi* reſigned her to the *pronubæ*, who brought her into the nuptial chamber, and put her into the genial bed; this office was to be performed by matrons who had only been once married, to denote that the marriage was to be for perpetuity. When the bridegroom was brought to her, to drown the cries and ſqualling of a coy maid at the firſt conflict, epithalamia were ſung by the women, who were divided for that purpoſe into two bands, one whereof ſung in the evening, the other the next morning; and, for the like purpoſe, nuts were alſo thrown about for the boys to ſcramble for. Potter Archæol. lib. iv. cap. 11. tom. ii. Val. Max. 10. Plut. Quæſt. Rom. 30. Serv. ad Æn. lib. iv. ver. 450. Kenn. Rom. Ant. p. ii. lib. i. c. 9. Fabr. Bibl. Ant. cap. 10. § 5.

BRIDEGROOM, the ſpouſe or mate of a bride.

Among the Romans, the *bridegroom* was decked to receive his bride; his hair was combed and cut in a peculiar form; he had a coronet or chaplet on his head, and was dreſſed in a white garment. Pitiſc. Lex. Ant. tom. i.

By the ancient canons, the *bridegroom* was to forbear the enjoyment of his bride the firſt night, in honour of the nuptial benediction given by the prieſt on that day. Johnſ. Eccleſ. Law, ann. 740. § 88.

In Scotland, and perhaps alſo ſome parts of England, a cuſtom called *marchet*, obtained, by which the lord of the manor was entitled to the firſt night's habitation with his tenants brides. See BOROUGH-*Engliſh*, and MARCHET.

BRIDEMIF, in the *Perſian Tables*, the conſtellation LUPUS, or the wolf.

BRIDEWELL, in our *Cuſtoms*, denotes a work-houſe, partly for the correction of vagrants, and partly for the employment of the pariſh poor.

Bridewell, near Fleet-ſtreet, is a foundation of a mixt and ſingular nature, partaking of the hoſpital, the priſon, and work-houſe; it was founded in 1553, by Edward VI. who gave the place where king John had formerly kept his court, and which had been repaired by Henry VIII. to the city of London, with 700 merks of land, bedding, and other furniture.

Several youths are ſent to this hoſpital as apprentices to manufacturers, who reſide there; they are cloathed in blue doublets and breeches, with white hats. Having faithfully ſerved their time of ſeven years, they have their freedom, and a donation of ten pounds each, for carrying on their reſpective trades.

BRIDGE, an ediſice either of ſtone or timber, conſiſting of one or more arches, erected over a river, canal, or the like, for the conveniency of croſſing, or paſſing over from one ſide to the other.

A *bridge* may be conſidered as a ROAD over water.

Janus is made by ſome learned men, the firſt inventor of *bridges*, as well as of ſhips and crowns: their reaſon is, that in ſeveral ancient Greek, Sicilian, and Italian coins, there are repreſented on one ſide a Janus, with two faces, and on the other, a *bridge*, or a crown, or a ſhip.

The parts of a *bridge* are the *piers*, or legs, *pilæ*; the *arches*; the *pavement*, or way over for cattle and carriages; the *foot-banks* on each ſide for foot-paſſengers; the *rail* or parapet, which incloſes the whole; and the *butments*, or ends of the *bridge* on the banks.

Bridges are a ſort of edifices very difficult to execute, on account of the inconvenience of laying foundations, and walling under water. The earlieſt rules and inſtructions relating to the building of *bridges*, are given by Leon Baptiſta Alberti. Others were afterwards laid down by Palladio, and Scammozzi; all of which are collected by M. Blondel. The beſt of them are alſo given by Goldman, and Hawkſmoor. M. Gautier has a piece expreſs on *bridges*, ancient and modern. M. Belidor has likewiſe treated of this ſubject in his Architect. Hyd. Mr. Riou publiſhed a treatiſe in 1760, entitled, "Short Principles for the Architecture of Stone-Bridges, &c." Muller, Labelye, Hutton, and others, have written on this ſubject.

The conditions required in *bridges* are, that they be well deſigned, commodious, durable, and ſuitably decorated. The PIERS of ſtone-*bridges* are to be equal in number, that there may be one arch in the middle, where commonly the current is ſtrongeſt. Their thickneſs is not to be leſs than a ſixth part of the ſpan of the arch, nor more than a fourth. They are commonly guarded in front with an angular ſtarling, or ſpur, to break the force of the current; though this defence is ſometimes alſo turned ſemicircularly: in the ancient *bridges*, it is always a right angle; which has the advantage of being ſtronger and more durable than acute ones; though now ſeldom uſed but in *bridges* over ſmall rivers, whereby their height and the quantity of maſonry are conſiderably reduced. The ſtrongeſt arches, according to ſome, are thoſe whoſe ſweep is a whole ſemicircle; though others prefer elliptic arches. Others recommend thoſe in form of the CATENARIAN curve. For the rails, the height, ornaments, and the like, they are left to diſcretion. It is even complained, that no demonſtrative reaſons are given of the ſeveral proportions of the moſt eſſential parts of *bridges*: much of which is ſtill left to the diſcretion of the builder, to be regulated according to the circumſtances, deſign, place, magnitude, &c. of the deſigned edifice. M. Gautier wiſhes, that mathematical perſons would take the ſtructure and proportion of *bridges* into their conſideration, in order to bring things to more certainty and preciſion, founded on invariable geometrical truth. Something of which kind has been attempted by M. De la Hire, in Mem. Acad. R. Scienc. an. 1712. p. 70. and the Marquis De L'Hopital, in Act. Erud. Lipſ. 1695. p. 56.

The breadth of a *bridge*, according to Baptiſta Alberti, ought to be the ſame as that of the highway which abuts on it: the breadth of the piers is to be one third of the aperture of the arches; the ſtarlings to be one half the breadth of the piers, and to riſe above the greateſt height, to which the water ever mounts.

To ſecure the piers of *bridges*, they ſometimes diminiſh the current of the river, either by lengthening its courſe, by making it more winding (a method ſometimes uſed by the ancients in rendering their rivers navigable), or by ſtopping the bottom of a rapid river, with rows of banks, ſtakes, or piles, which break the current.

The piers of a *bridge* always diminiſh the bed of a river: ſuppoſe this diminution one fifth, it will follow, that in caſe of inundations, the bed muſt be ſunk or hollowed one fifth more than before, ſince the waters gain in depth what they have loſt in breadth. Add, that as the quantity of the water remains ſtill the ſame, it will paſs with greater velocity by one fifth in the place where ſuch contraction is: all which conduces to waſh away the foundation. The ſtream, thus augmented in velocity, will carry away flints and ſtones, which before it could not move.

The foundation of *bridges* is to be laid at the ſeaſon of the year when the waters are loweſt, as in autumn; and if the ground be rocky, hard gravel, or ſtony, the firſt ſtones of the foundation may be laid on the ſurface, without digging deeper; but if the ſoil be ſoft ſand, or gravel, it will be neceſſary to turn off the water, and dig till you come at a firm bottom; at leaſt, if this cannot be done, part of the water muſt be carried off, and the reſt kept dry, and piled: that ſide of the river where you are to work, is to be incloſed with coffer-dams, and the current to have its liberty on the other ſide. Palladio's directions are, firſt, to make choice of that place in a river, which has the leaſt depth of water, and where the ground is even and firm, eſpecially rock or gravel ſtone; ſecondly, to avoid thoſe places where there are vorago's, or whirlpools, and where the bottom is ſoft ſand, or gravel, in regard ſuch matters are eaſily carried away by the violence of water, which in time alters the bed of a river, and ſaps the foundation of the piers; thirdly, to pitch on a ſtrait part of a river, ſince otherwiſe, the turns and winding being worn away in time, the *bridge* is in danger of being left inſulate; beſides being liable to be choaked up with the filth and other matters commonly gathered in the turns of rivers.

The building and repairing of *bridges*, was one of thoſe ſervices to which all orders and ranks were ſubject; though the clergy have ſometimes got exemptions from it. See PONTAGE.

The ſtructure of the Roman *bridges* is beſt deſcribed by Bergier; they conſiſted of *pilæ*, or piers; *fornices*, or arches; *ſublices*, or butments; *pavimenta*, and *aggeres*; the roads over them in the middle for carriages; on each ſide whereof *decurſoria*, or banquettes, ſomewhat higher than the reſt, for foot-paſſengers, and ſeparated from it by a *ſponda*, or rail, and ſometimes even covered over, to ſhelter paſſengers from the rain, as in the Pons Ælius.

The Trajan *bridge* over the Danube, was the moſt magnificent of all the works of this kind in the world. It was erected by that emperor for the conveniency of ſending ſuccours to the Roman legions on the other ſide the Danube, in caſe they ſhould be ſuddenly attacked by the Daci; but demoliſhed by the next ſucceſſor Adrian, for fear the Barbarians, overpowering the guards ſet to defend it, ſhould, by means of it, pour into Mœſia, and cut off the garriſons there; or rather, as ſome think, out of envy, as deſpairing ever to do any thing like it himſelf. The arches were broken down by Adrian; but the ruins of it are ſtill ſeen in the middle of the Danube, near the city Warhel in Hungary. The piers were twenty in number, of ſquare ſtone; each of them 150 feet high above the foundation, 60 feet in breadth, and diſtant from one another 170 feet; ſo that the whole length of it was above 1530 yards. Dion Caſſius, lib. lxviii. cap. 13.

Modern architects are abſolutely at a loſs to conceive how the foundations of ſuch a *bridge* could be laid in ſo vaſt and rapid a river, and ſo deep a channel as the Danube. Scamozzi imagines that the river muſt have been turned out of its courſe. But to divert the Danube ſeems impoſſible. That author conjectures, that choice was made of ſome ſhort bend of the river, where it made almoſt a peninſula, and a canal was cut croſs the iſthmus or neck thereof, through which the river took its courſe; ſo that the *bridge* was built on dry land, and, when finiſhed, the river was returned to its ancient channel. Some writers have added, that this *bridge* was built in one ſummer, and that Apollodorus of Damaſcus was the architect.

The Trajan *bridge*, at Salamanca, over the river Formus, popularly attributed to the giants, by ſome to Hercules, appears rather to be a Roman work, though when and by whom erected, is not known; but it was repaired by Trajan, whoſe denomination it ſtill bears. It is 1500 feet long; conſiſts of 26 arches, each 72 feet wide; the piers that ſuſtain them being 23 feet thick, and 200 high.

Among the Romans, the building and repairing of *bridges* was firſt committed to the pontifices, or prieſts; then to the cenſors, and curators of the roads; laſtly, the emperors took the care of *bridges* into their own hands. Thus Antoninus Pius built the Pons Janiculenſis of marble; Gordian reſtored the Pons Ceſtius; and Adrian built a new one, denominated from him.

In the middle age, *bridge*-building was ranked in the number of acts of religion; and a regular order of hoſpitallers was founded by St. Benezet, towards the cloſe of the twelfth century, under the denomination of *Pontifices*, or *Bridge-builders*; whoſe chief object was to be aſſiſtant to travellers, by making *bridges*, ſettling ferries, and receiving ſtrangers in hoſpitals, or houſes built on the banks of rivers. But the order was too good to thrive. We read of one hoſpital of the kind at Avignon, where the hoſpitallers dwelt under the direction of their firſt ſuperior, St. Benezet. The Jeſuit Raynaldus has a treatiſe expreſs on St. John the *bridge*-builder.

In France, the Pont de Garde is a very bold work; the piers being only thirteen feet thick, yet ſerving to ſupport an immenſe weight of a triplicated arcade, and ſerves to join two mountains. It conſiſts of three *bridges* one over another; the uppermoſt of which is an aqueduct.

The *bridge* of Avignon was begun in the year 1176, and finiſhed in 1188; conſiſting of eighteen arches, meaſuring 1340 paces in length, or about 500 fathoms.

Divers of its arches have been ſince demoliſhed by the ice, &c. ſo that only part of it now ſubſiſts.

The *bridge* of St. Eſprit is the fineſt and boldeſt in France, conſiſting of nineteen great arches, beſides ſeven ſmaller ones, the apertures of the arches being from fifteen to twenty fathoms, which makes the length of the *bridge* upwards of 400 fathoms.

The famous *bridge* of Venice, called the Rialto, conſiſts but of a ſingle arch, and that a flat or low one; paſſing for a maſter-piece of art, being built in 1591, on the deſign of Michael Angelo: the ſpan of the arch is ninety-eight feet one half, and its height above the water only twenty-three feet.—Poulet alſo mentions a *bridge* with a ſingle arch, in the city of Munſter in Bothnia, much bolder than that of the Rialto at Venice. But theſe are nothing to a *bridge* in China, built from one mountain to another, conſiſting of one ſingle arch, 400 cubits long, and 500 cubits high, whence it is called the *flying bridge*: a figure of it is given in the Philoſophical Tranſactions. Kircher alſo ſpeaks of a *bridge* in the ſame country 360 perches long, without any arch; ſupported only by 300 pillars. The accounts given by ſome of the Popiſh miſſionaries of *bridges* in China, have much the air of fables.

We have many *bridges* of conſiderable note in our own country: ſuch is the *bridge* at York, whoſe maſter arch in the middle is 82 feet and a half in the clear wide, and 27 feet high. Rocheſter *bridge* is built in the ſame ſtyle with that of London; it is 550 feet long, and conſiſts of 11 arches, the biggeſt of which is more than 50 feet. It was erected at the charge of Sir Robert Knolles, who died in the midſt of the reign of king Henry IV. The *bridges* at Durham and Biſhop-Awkland may alſo be mentioned, whoſe largeſt arches are near 90 feet in the clear. The *bridge* at Berwick is an admirable work, begun under queen Elizabeth; it conſiſts of 17 arches, the largeſt upwards of 80 feet. That of Blenheim conſiſts of three arches, the chief of which ſpans 101 feet and a half.

There is a *bridge* over the river Don, near Old Aberdeen, very much celebrated, in the taſte, and on the plan of the Rialto at Venice. There is alſo in the ſame ſtyle a very remarkable *bridge* in Wales, built by William Edwards, a country maſon, over the river Taaf, near Caerphilly in Glamorganſhire. It is no more than eight feet broad, but it conſiſts of a ſingle arch no leſs than 140 feet wide, part of a circle of 175 feet diameter, ſo as to make the altitude 35 feet. The arch of this *bridge* is between 40 and 50 feet wider than the celebrated Rialto of Venice, and probably the wideſt arch in Europe, if not in the world. In order to leſſen the quantity of matter in the abutments preſſing upon the arch, and thereby to bring it to an equipoiſe with that in the crown, he contrived three circular arches in the abutments; which paſs through from ſide to ſide like round windows, and gradually decreaſe in the aſcent.

The longeſt *bridge* in England is that over the Trent at Burton, built by Bernard abbot of Burton, in the twelfth century; it is all of ſquared free-ſtone, ſtrong and lofty, 1545 feet in length, and conſiſting of 34 arches. Yet this comes far ſhort of the wooden *bridge* over the Drave, which, according to Dr. Brown, is at leaſt five miles long.

The triangular *bridge* at Crowland in Lincolnſhire, which was probably intended as an emblem of the Trinity, is the moſt ancient Gothic ſtructure remaining entire in the kingdom. It was erected about the year of our Lord 860.

London *bridge* conſiſts of 20 locks or arches, whereof 19 are open, and one filled up or obſcured; it is 900 feet long, 60 high, and 74 broad, and almoſt 20 feet aperture in each arch. It is ſupported by 18 piers or ſolids, from 34 to 25 feet thick; ſo that the greateſt water-way, when the tide is above the ſterlings, is 450 feet, ſcarce half the width of the river; and below the ſterlings, the water-way is reduced to 194 feet. Thus a river 900 feet wide, is here forced through a channel of 194 feet.

London *bridge* was firſt built with timber, in the reign of Ethelred, between the years 993 and 1016. It was repaired, or rather new-built of timber, in 1163. The ſtone-*bridge* was begun by king Henry II. in 1176, and finiſhed under king John in the year 1209. The architect was Peter of Colechurch, a prieſt; though he died before it was finiſhed.

For the charge of keeping it in repair, a large houſe is allotted, with a great number of offices, and a vaſt revenue in land, &c. The chief officers are two *bridge*-maſters, choſen yearly out of the body of the livery.

The foundation is ſaid to be on a ſoft oozy ground. Stow alleges, that, during the time of building, the river was turned from Batterſea to Rotherhithe; but this is not warranted. Some imagine, that the tide did not then riſe ſo high at the *bridge* as it does now, by which the work would be facilitated. However this be, the piers were erected on wooden piles driven under water, over which planks were laid, and the feet of the piers on the planks. The defects of this *bridge* are the narrowneſs and irregularity of the arches, and the largeneſs of the piers, which, together with the ſterlings, turn the current of the Thames into many frightful cataracts, which muſt obſtruct and endanger the navigation through the *bridge*.

It is pretty certain, there were no houſes on the *bridge* for upwards of 200 years; ſince we read of a tilt and tournament held on it in 1395. Houſes were built upon it afterwards, but being found a great inconveniency and nuiſance, they were removed in 1758, and the avenues to it enlarged and made more commodious, by ſtat. 29 Geo. II. c. 40. This act alſo directed, that there ſhould be a paſſage of 31 feet for carriages, and 7 feet on each ſide for foot-paſſengers, guarded with ſtone baluſtrades. Two of the middle arches were thrown into one ſemicircular arch, by taking up the pier between them. The repairs amounted to above 80,000*l*. The ſterlings have been added, to hinder the piers from being undermined by the rotting of the piles upon which they are built; for, by means of theſe ſterlings, the piles are kept conſtantly wet; and thus the timber is kept from decaying, which always happens when it is alternately wet and dry.

One of the nobleſt *bridges* known, is that at Weſtminſter, for the building of which an act of parliament was obtained in the year 1736, and it began to be erected in January, 1738; and it was opened the 18th of November, 1750. The whole amount of the neat expence that attended building this *bridge*, was 218,800*l*.

The breadth of the river Thames, between the Wool-ſtaple dock and the oppoſite ſhore, the place where the *bridge* is built, is about 1220 feet. This *bridge* conſiſts of thirteen large arches and two ſmaller ones, the fourteen intermediate piers, and two abutments.

The length of each abutment is 76 feet; the ſpan or opening of each of the ſmaller arches of the abutments is 25 feet; the opening or ſpan of the firſt of the large arches from each ſhore is 52 feet; the ſpan of the next arch is 56 feet, and ſo on, increaſing by four feet in every arch to the middle arch, the ſpan of which is 76 feet. The tranſverſe ſection, or breadth of the two firſt piers on each ſide, is 12 feet; of the next 13, and ſo on, to the piers ſupporting the middle arch, the ſection of each of which is 17 feet. Thus the length of the two abutments being 152 feet, the ſection of the fourteen piers 198 feet, and the ſpan or opening of the fifteen arches 870 feet, the whole length of the *bridge*, including abutments, is 1220 feet, which is the breadth of the river.

The arches are ſemicircular, and ſpring from about the height of two feet above low-water mark.

Theſe arches give, as has been ſaid, a water-way of 870 feet; the proportion of the water-way being ſo conſiderable with reſpect to the breadth of the piers, it follows, that the fall of water under this *bridge* muſt be very ſmall. And, in effect, thoſe who attempted to calculate it before the *bridge* was built, after making all poſſible allowances, could never find the perpendicular height of this fall to exceed three inches and three fourths; but, in truth, it now appears, by experience, that the height of the greateſt fall is ſcarce half an inch; whereas the height of the fall at London *bridge* is from four feet and nine inches to five feet.

The whole breadth of the *bridge* is 44 feet; which is divided into three walks; the middle one for carriages, &c. is 28 feet broad, and the ſide-walks near 7 feet each in the clear.

The foundations of the piers of Weſtminſter *bridge* are laid on a ſtrong grating of timber, planked underneath, and at leaſt five feet below the ſurface of the bed of the river. This grating was made of the bottom of a veſſel, ſuch as the French call *caiſſon*; the ſides of which were ſo contrived, that they might be taken off after a pier was finiſhed. The bed of the river was dug to a ſufficient depth, and made level, in order to lay the bottom of the *caiſſon*, and the bottom of the piers, out of all danger; the ground, by all trials that could be contrived, ſeemed ſo good, being every where a bed of gravel, that piling was thought unneceſſary. Whether there be any ſofter *ſtratum* under this or not, we cannot pretend to determine; neither does it appear from experience, that piling is an abſolute ſecurity againſt all accidents. By what Gautier ſays, it would ſeem otherwiſe; for he aſſures us, that let the architect of a *bridge* do his beſt, yet he can no more be ſure of the ſucceſs of his work than a phyſician is. And, in effect, we find, that notwithſtanding the care that was taken in examining the ground on which Weſtminſter *bridge* was built, yet one of the piers ſunk conſiderably. This damage was repaired, and its beauty and convenience is juſtly admired. See Labelye's Deſcription of Weſtminſter Bridge.

In the year 1756, an act was obtained for building a new *bridge* at Blackfryers, from the end of Fleet-ditch to the oppoſite ſhore in the county of Surry. It was begun in 1760, and completed in ten years and three quarters; the nett expence of building it amounted to 152,840*l*. This *bridge* conſiſts of nine elliptical arches; the central arch is 100 feet wide, and the four arches on each ſide, reckoning from the central one to the ſhores, are 98, 93, 83, and 70 feet reſpectively. The breadth of the carriage-way is 28 feet, and that of the raiſed foot-way on each ſide 7 feet: the height of the baluſtrade on the inſide is 4 feet 10 inches: and the whole length of the *bridge* from wharf to wharf is 995 feet. The upper ſurface of this *bridge* is a portion of a very large circle; over each pier is a receſs or balcony, ſupported by two Ionic pillars and two pilaſters, which ſtand on a ſemicircular projection of the pier, above high-water mark. The *bridge* is rounded off at each extremity to the right and left, in form of a quadrant of a circle, whereby the acceſs to it is rendered commodious and agreeable.

Bridges, *ſtone*, are compoſed of piers, arches, and butments, made of hewn ſtone, ſometimes alſo intermixed with brick; as, the *bridge* of Tholouſe, the plinths whereof are of ſtone, as alſo the quoins of the arches, and ſome bonding courſes, and copings; but the reſt, as the arches, walls, and butments, of brick.

Bridges, *wooden*, called by the Latins *pontes ſublicii*, conſiſt of beams and joiſts, ſuſtained by punchions, well cramped and bound together.

Sturmius has a diſſertation expreſs on the ſtructure of a wooden *bridge*.

Bridge, *ruſhen*, *point de jonc*, is made of large ſheaves of ruſhes growing in marſhy grounds, which they cover over with boards or planks. They ſerve for croſſing ground that is boggy, miry, or rotten.

The Romans had alſo a ſort of ſubitaneous *bridges* made by the ſoldiers, of boats, or ſometimes of caſks, leathern bottles, or bags, or even of bullocks bladders blown up, and faſtened together, called *aſcogephyri*. M. Couplet gives the ſtructure of a portable *bridge*, 200 feet long, eaſily taken aſunder and put together again, and which forty men may carry. Vid. Du Hamel Hiſt. Reg. Acad. Scien. lib. iii. ſect. 5. c. 4. p. 273.

Frezier ſpeaks of a wonderful kind of *bridge* at Apurima in Lima, made of ropes, formed of the bark of a tree.

Bridges, *pendent* or *hanging*, called alſo *Philoſophical* **Bridges**, are thoſe not ſupported either by poſts or pillars, but hung at large in the air, only ſuſtained at the two ends, or butments.—Inſtances of ſuch *bridges* are given by Palladio, and others.

Dr. Wallis gives the deſign of a timber-*bridge*, ſeventy feet long, without any pillars, which may be uſeful in ſome places where pillars cannot conveniently be erected. Phil. Tranſ. N° 163. p. 714.—Dr. Plott aſſures us, that there was formerly a large *bridge* over the caſtle-ditch at Tutbury in Staffordſhire, made of pieces of timber, none much above a yard long, and yet not ſupported underneath, either with pillars, or arch-work, or any other ſort of prop whatever.

Bridge, *draw*, *pons ſubductarius*, is ſuch an one as is made faſt only at one end, with hinges; ſo that the other end may be lifted up or let down by ſome eaſy contrivance: the moſt common way is by a kind of balance called PLYERS: in which caſe the *bridge* ſtands upright, to hinder the paſſage of a moat, or the like. The breadth of this *bridge* is uſually about nine or ten feet, and its length about fifteen feet.

There are others made to draw back, to hinder the paſſage, and to thruſt over again to afford a paſſage. And others, which open in the middle; half of which turns away to one ſide, and the other half to the other; being joined again at pleaſure: but theſe have this inconvenience, that one half of them remains on the enemy's ſide.

The Marquis De L'Hopital has given the conſtruction of a curve, in which a weight will always be a counterbalance to a *draw-bridge*; which the younger Bernoulli has ſhewn to be no other than the cycloid. Act. Erud. Lipſ. an. 1695.

Bridge, *flying*, *pont volant*, or *pons ductarius*, an appellation given to a *bridge* made of pontoons, leather boats, hollow beams, caſks, or the like, laid on a river, and covered with planks for the paſſage of an army.

Bridge, *flying*, *pont volant*, more particularly denotes a *bridge* compoſed of one or two boats joined together, by a ſort of flooring, and ſurrounded with a rail or baluſtrade; having alſo one or more maſts, to which is faſtened a cable, ſupported at proper diſtances by boats, and extended to an anchor, to which the other end is faſtened, in the middle of the water. By which contrivance, the *bridge* becomes moveable, like a pendulum, from one ſide of the river to the other, without other help than the rudder.—Such *bridges* ſometimes alſo conſiſt of two ſtories, for the quicker paſſage of a great number of men; or that both infantry and cavalry may paſs at the ſame time.

Bridge, *flying* or *floating*, is ordinarily made of two ſmall *bridges*, laid one over the other, in ſuch manner, as that the uppermoſt ſtretches and runs out, by the help of certain cords running through pullies placed along the ſides of the under-*bridge*, which puſh it forwards, till the end of it joins the place it is deſigned to be fixed on.

When theſe two *bridges* are ſtretched out at their full length, ſo that the two middle ends meet, they are not to be above four or five fathoms long, becauſe, if longer, they will break.

Their chief uſe is for ſurpriſing out-works, or poſts that have but narrow moats.

In the Memoirs of the Royal Academy of Sciences, we find a new contrivance of a *floating bridge*, which lays itſelf on the other ſide of the river. Vid. Hiſt. Acad. R. Scienc. an. 1713. p. 104.

Bridge *of communication*, is a *bridge* made over a river; by which two armies or forts, ſeparated by the river, have a free communication with one another.

Bridges *of boats* are either made of copper, or wooden boats faſtened with ſtakes, or anchors; and laid over with planks.

One of the moſt notable exploits of Julius Cæſar, was the expeditious making of a *bridge of boats* over the Rhine. Modern armies carry copper-boats, called *pontoons*, to be in readineſs for the making *bridges*: ſeveral of theſe being joined ſide by ſide, till they reach acroſs the river, and planks laid over them, make all plain for the men to march on.

There are fine *bridges of boats* at Beaucaire, and Rouen, which riſe and fall with the water; and that at Seville is ſaid to exceed them both.

The *bridge of boats* at Rouen, built in lieu of the ſtately ſtone-*bridge* erected there by the Romans, is repreſented by a modern writer, as the wonder of the preſent age; it always floats; and riſes and falls with the tide, or as land-waters fill the river; it is near 300 yards long, and is paved with ſtone, juſt as the ſtreets are: carriages with the greateſt burdens go over it with eaſe, and men and horſes with ſafety, though there are no rails on either hand. The boats are very firm, and well moored with ſtrong chains; and the whole well looked to, and conſtantly repaired, though now very old.

Bridge, in *Gunnery*, the two pieces of timber which go between the two tranſums of a gun-carriage, on which the bed reſts.

Bridge, in *Muſic*, that part of a ſtringed inſtrument over which the ſtrings are ſtretched.

BRIDLE *of an horſe*, is an aſſemblage of various members, or parts; as the *bit*, or *ſnaffle*; the *head-ſtall* or leathers, from the top of the head to the rings of the bit; the *fillet*, over the forehead, and under the fore-top; *throat-band*, which buttons from the head-band under the throat; *reins*, the part held in the hand; *noſe band*, going through loops at the back of the head-ſtall, and buckled under the cheeks: to which add the *trench*, the *cavezan*, *martingal*, and *chaff-halter*.

In lieu of a *bridle*, the maſters frequently uſe the word *hand*: thus, for *pull the bridle*, they ſay, *bear the hand*. To cleave to, or hold by the *bridle*, is the fault of a bad horſeman, who, when a horſe is diſorderly, inſtead of ſlacking his hand, clings to it, as if it were to the mane or pummel of the ſaddle; wanting the habit, or ſtrength, to keep himſelf faſt by clinging with his thighs.

Checks of the *bridle* are called EBRILLADES and SACCADES.

The firſt horſemen being unacquainted with the art of governing horſes by *bridles*, managed them only with a rope, or a ſwitch, and the accent of the voice. This was the practice of the Numidians, Getulians, Libyans, and Maſſilians.

The Roman youth alſo learned the art of fighting without *bridles*, which was an exerciſe or leſſon in the *Manege*; and hence it is, that, on the Trajan column, ſoldiers are repreſented riding at full ſpeed, without any *bridles* on. Phil. Tranſ. N° 322.

Bridle, in *Anatomy*. See FRÆNUM.

Bridle, among *Surgeons*, is a kind of BANDAGE contrived for retaining the lower jaw in its place.

Bridle, *ſcolding*.—In Staffordſhire, they have a *bridle* for correcting ſcolding women. It is put in the mouth, and takes particular hold of the tongue, which it effectually keeps from ſtirring: thus harnaſſed, the offender is led in triumph through the ſtreets. A figure and deſcription of this Staffordſhire *bridle* is given by Dr. Plott, who ſeems to wiſh the uſe of it more univerſal.

Bridle-*band* ſignifies the horſeman's left-hand, in reſpect of which the right-hand is called the ſpear or ſword-hand.

BRIDLE-*chain*, in *Huſbandry*, a name given by our farmers to a part of the ſtructure of their PLOUGH. This is an iron chain of ſeveral links, faſtened at one end to the beam of the plough, near that part where the collar receives the tow-chain, and faſtened at its other end to the ſtake of the plough, or to that upright piece which runs parallel to the left crowſtaff, and at its bottom pins in the tow-chain; this ſtake is faſtened to the crowſtaff, ſometimes by the end of this *bridle-chain*, and ſometimes by a wythe or cord.

BRIDLES, in *Sea-language*, denote the upper part of the moorings in the king's harbours, to ride ſhips of war.

BRIDLES *of the bow-line*. See BOW-*line*.

BRIDON, or BRIDOON, in the *Manege*, properly denotes a SNAFFLE, in contradiſtinction from a BIT or BRIDLE. The French ſay, that the Engliſh uſe no bridles, but only *bridoons*, except in the army: a horſe never goes ſo well nor ſo ſure with a *bridoon*, unleſs he has been firſt broke to the bit.

BRIEF, a thing of ſhort extent or duration.

The word is formed from the French *bref*, of the Latin *brevis*, which ſignifies the ſame.

BRIEF is more particularly uſed for a ſummary or ſhort ſtate of a thing.

BRIEF is alſo uſed for an act or writing drawn up by a notary.

BRIEF, *atteſted*, *Breve teſtatum*, a public inſtrument cloathed with the proper formalities.

BRIEF *of deviſing*, *Brevis diviſionalis*, denotes a laſt will or teſtament, or DEVISE.

BRIEF *of an oath*, *Breve ſacramenti*, an inſtrument made on oath, and authenticated by the ſubſcription of witneſſes.

BRIEF is alſo uſed for a judicial epiſtle, directed by a lord or other ſuperior, to his ſubjects or dependents, enjoining ſomething to be done or forborn.

In which ſenſe, we ſay, the lord's, king's, biſhop's, or pope's *brief*.

BRIEF alſo denotes the territory or diſtrict within which the lord's *brief* had courſe. In which ſenſe, we meet with the biſhop's *brief*, *breve epiſcopi*; the count's *brief*, *breve comitis*, &c.

BRIEF alſo denotes the yearly revenue ariſing out of the lands uſually deſcribed in *briefs*.

BRIEF, *Breve*, in *Common Law*, a writ whereby a man is ſummoned or attached to anſwer any action: or more largely, it is taken for a writing iſſued out of any of the king's courts of record at Weſtminſter, whereby ſomething is commanded to be done in order to juſtice, or the execution of the king's command.

It is called *brief*, *breve*, *quia breviter intentionem proferentis exponit*; becauſe couched in a few plain words, without preamble, &c.

BRIEF is alſo uſed for a letter patent, granting a licence to a ſubject, to make a collection for any public or private loſs.

BRIEFS, *apoſtolical*, denote letters which the pope diſpatches to princes, and other magiſtrates, touching any public affair.

They are thus called, as being very conciſe, and written on paper, without preface or preamble; by which they are diſtinguiſhed from *bulls*, which are more ample, and always written on parchment, and ſealed with lead or green wax; whereas *briefs* are ſealed with red wax, and with the ſeal of the fiſherman, or St. Peter in a boat; a ſeal never applied but in the pope's preſence.

The *brief* is headed with the name of the pope, apart; and commences with *Dilecto filio ſalutem*, *&* *apoſtolicam benedictionem*, &c. after which he proceeds directly to the matter in hand, without further preamble.

Briefs are not ſubſcribed by the pope, nor with his name, but with that of his ſecretary. Pope Alexander VI. inſtituted a college of ſecretaries for *briefs*; ſince which time, they have been made much longer, and more ample than before. See ABBREVIATOR.

Formerly *briefs* were only diſpatched about affairs of juſtice; but now they are likewiſe uſed in matters of benefices, expective graces, and diſpenſations.

BRIEFS *of the dead*, *Brevia mortuorum*, were letters ſent by the monks of one monaſtery to thoſe of another, with whom they were in fraternity, to inform them of the deaths or obits of their monks, for whom they were to ſay the ſtated and cuſtomary prayers and maſſes.

Theſe were alſo called *literæ currentes*, a formula of which we have in the book of the uſages of the Ciſtercian order.

BRIEF *of remembrance*, *Breve recordationis*, or *rememoratorium*, or *memorabile*, denotes a charter, otherwiſe called NOTITIA.

BRIG. See BRIGANTINE.

BRIG-*bote*, BRIGGE-*bote*, or BRIGH-*bote*, in *Ancient Law Writers*, ſignifies a being freed from contributing to the reparation of bridges. See PONTAGE.

The word is formed from the Saxon *brig*, *a bridge*, and *bote*, *compenſation*. It is ſometimes alſo written *brugh-bote*, or *bruch-bote*.

BRIGADE, in the *Military Art*, a party or diviſion of a body of ſoldiers, whether horſe or foot, under the command of a brigadier.

The word is French; ſome derive it from the Latin *briga*, *a brigue*, or *ſecret intrigue*: Du-Cange derives it from *brigand*, an ill diſciplined ſoldier, who ſcours the country, and plunders it of every thing, without waiting for the enemy: as the armies of Arabs, Tartars, &c. The origin of *brigand* is again deduced from *brigandine*, a ſort of armour uſed in the army raiſed by the Pariſians, during the captivity of their king John in England, notorious for their robberies.

There are two ſorts of *brigades*, according to the French way of accounting: 1. A *brigade of an army*, which is a body of horſe of ten or twelve ſquadrons: or of foot, of five or ſix battalions.—And in this way, an army is ſometimes divided into eight *brigades*; four of horſe, and four of foot.

2. A *brigade of a troop of guards*, which is a third part thereof, when the troop conſiſts of fifty ſoldiers; but only a ſixth, when it conſiſts of an hundred: that is, in the former caſe, the troop is divided into three *brigades*; in the latter, into ſix.

BRIGADE-*major*, in the *Military Art*, an officer choſen from among the moſt ingenious and expert captains. *Brigade-majors* are to wait, at proper times, to receive the word and orders, which they carry firſt to their brigadier, and afterwards to the adjutants of regiments at the head of the *brigade*, where they regulate together the guards, parties, detachments, and convoys, and appoint them the hour and place of rendezvous at the head of the *brigade*, where the *brigade-major* takes and marches them to the place of the general rendezvous. A *major of brigade* ought to keep a roll of the colonels, lieutenant-colonels, majors, and adjutants, belonging to the *brigade*. When a detachment is to be made, the major-general of the day regulates with the *brigade-majors*, how many men and officers each *brigade* ſhall furniſh; and they again with the adjutants of the regiments, how many each battalion is to ſend, which the adjutants divide among the companies. The complements each regiment is to furniſh, are taken by the adjutant at the head of each regiment, at the hour appointed, who delivers them to the *brigade-major* at the head of the *brigade*, who again delivers them to the major-general of the day, and he remits them to the officer who is to command the detachment.

BRIGADIER-*general*, an officer that commands a brigade of horſe, or foot, in an army.

The *brigadier* is an officer of importance; being the next in order below a major-general, or, in the French army, to the *mareſchal de camp*.

Brigadiers are only general officers in their reſpective corps. They have no particular command out of their brigades, nor any place or vote in councils of war; they have no aids de camp to carry their orders, but only a major of brigades, to ſee their orders executed, within the extent only of their own brigade.

Brigadiers of the horſe-guards command as youngeſt captains.

Sub-BRIGADIER of a troop of horſe-guards, an aſſiſtant of the *brigadier*.

BRIGANDINE, a coat of mail; a kind of ancient defenſive armour, conſiſting of thin-jointed ſcales or plates, pliant and eaſy to the body.

Some confound it with HABERGEON; and others with *brigantine*, a low long veſſel.

BRIGANDINI, BRIGANTINI, BRIGANDINARII, or BRIGANCII, in *Middle Age Writers*, military thieves, or highwaymen, who infeſted France and the Netherlands. See BRABANCIONES.

BRIGANTINE, a ſmall, light, flat, open veſſel, which goes both with ſails and oars, and is either for fighting, or giving chace.

It has uſually twelve or fifteen benches on a ſide for the rowers, a man and an oar to each bench. *Brigantines* are principally uſed by the Corſairs, all the hands aboard being ſoldiers, and each having his muſquet ready under his oar.

But the term is generally uſed for a merchant-ſhip with two maſts, though mariners of different nations apply it to a peculiar ſort of veſſel of their own marine. Among Engliſh ſeamen, the *brigantine* is diſtinguiſhed by having her main-ſail ſet nearly in the plane of her keel, the foremoſt edge of it being faſtened in different places to hoops which encircle the main-maſt, and ſlide up and down as the ſail is hoiſted or lowered.

BRIGG's *Logarithms.* See Logarithm.

BRIGITTINS, or Bridgetins, more properly Birgittins, a religious order, denominated from their foundreſs St. *Bridgit*, or *Birgit*, a Swediſh lady, in the fourteenth century, whom ſome repreſent as a queen; but Fabricius, on better grounds, as a princeſs, the daughter of king Birgerus, legiſlator of Upland: ſhe is famous for her revelations.

The *Brigittins* are ſometimes alſo called the *Order of our Saviour*; it being pretended that Chriſt himſelf dictated the rules and conſtitutions obſerved by them, to St. Bridget. In the main, the rule is that of St. Auguſtin; only with certain additions ſuppoſed to have been revealed by Chriſt; whence they alſo denominate it the *Rule of our Saviour*.

The firſt monaſtery of the *Brigittin* order was erected by the foundreſs, about the year 1344, in the dioceſe of Lincopen; on the model of which all the reſt were formed.

The *Brigittins* profeſs great mortification, poverty, and ſelf-denial, as well as devotion; and they are not to poſſeſs any thing they can call their own, not ſo much as a halfpenny, nor even to touch money on any account.

This order ſpread much through Sweden, Germany, the Netherlands, &c. In England we read but of one monaſtery of *Brigittins*, and this built by Henry V. in 1413, oppoſite to Richmond, now called Sion-houſe; the ancient inhabitants of which, ſince the diſſolution, are ſettled at Liſbon. The revenues were reckoned at 1945*l. per annum.*

BRIGNOTES, or Brugnotes, a kind of dried prunes, brought from Provence, chiefly from the town of Brugnote, from which the denomination is given to them all.

BRILLIANT *diamonds.* See Diamond.

BRIM, the utmoſt edge of a thing, as of a glaſs, plate, or the like.

The *brims* of veſſels are made to project a little over, to hinder liquors, in pouring out, from running down the ſide of the veſſel.

The *briming*, or *brimming* of veſſels, was contrived by the ancient potters, in imitation of the ſupercilium or drip of the cornices of columns; it is done by turning over ſome of the double matter when the work is on the wheel.

Among floriſts, the *brim* of a flower denotes the outward edge of the petala, or that part thereof which turns.

A ſow is ſaid to *brim*, or go to *brim*, when ſhe takes the boar.

The hart goes to *rut*, the roe to *tourn*, the boar to *brim.*

BRIMSTONE. See Sulphur.

Brimstone, *flower of.* See Flower.

Brimstone *marble*, a preparation of *brimſtone* in imitation of marble.

Brimstone *medals, figures*, &c. may be caſt in the following manner: melt half a pound of *brimſtone* over a gentle fire; with this mix half a pound of fine vermilion, and when you have cleared the top, take it off the fire, ſtir it well together, and it will diſſolve like oil; then caſt it into the mould, which muſt firſt be anointed with oil. When cool, the figure may be taken out; and, in caſe it ſhould change to a yellowiſh colour, you need only wipe it over with *aqua fortis*, and it will look like the fineſt coral.

Brimstone-*wort*, in *Botany.* See *Hog's*-Fennel.

BRINDONES, in *Natural Hiſtory*, the name of a fruit of the Eaſt Indies, called by John Bauhine, and ſome other botanical writers, *Indici fructus rubentes acidi.* It is by many accounted a delicious fruit, notwithſtanding its great ſharpneſs; and is uſed by the dyers, and in making vinegar.

BRINE, water replete with ſaline particles.

By ſtat. 1 Ann. cap. 21. are prohibited, *brine* taken out of *brine*-pits, or *brine*-pans, uſed by ſome for curing or pickling of fiſh, without boiling the ſame into salt; and rock-ſalt, without refining it into white-ſalt.

Brine is either native, as the ſea-water, which by coction turns to ſalt; or factitious, formed by diſſolving ſalt in water.

In the ſalt-works at Upwick in Worceſterſhire, there are found, at the ſame time, and in the ſame pit, three ſorts of *brine*, each of a different ſtrength. They are drawn by a pump, and that in the bottom, firſt brought up, is called *firſt man*; the next, *middle man*; and the third, *laſt man.* Phil. Tranſ. N° 140.

Brine, *leach*, a name given to what drops from the corned ſalt in draining and drying, which they preſerve and boil again; being ſtronger than any *brine* in the pit. Hought. Collect. tom. ii. N° 211. p. 81.

There is ſand found in all the Staffordſhire *brines* after coction; but naturaliſts obſerve, it did not pre-exiſt in the water, but rather is the product of the boiling. Phil. Tranſ. N° 145. p. 96.

The *brine* at Northwich is found to ſtink of ſulphur. *Brine* freezes with great difficulty. Some ſteep their ſeed-wheat in *brine*, to prevent the ſmut. *Brine* is alſo commended as of efficacy againſt gangrenes. Phil. Tranſ. N° 156.

Brine alſo denotes a pickle pregnant with ſalt, wherein things are ſteeped to keep.

Brine-*pans*, the pits wherein the ſalt-water is retained, and ſuffered to ſtand, to bear the action of the ſun, whereby it is converted into ſalt.

There are divers ſorts of ſalt-pans, as the water-pan, ſecond-pan, ſun-pan; the water being transferred orderly from one to another.

Brine-*pit*, in *Salt-making*, the ſalt ſpring from whence the water to be boiled into ſalt is taken. There are of theſe ſprings in many places; that at Namptwich, in Cheſhire, is alone ſufficient, according to the account of the people of the place, to yield ſalt for the whole kingdom; but it is under the government of certain lords and regulators, who, that the market may not be overſtocked, will not ſuffer more than a certain quantity of the ſalt to be made yearly. See Pit.

Brine-*ſalt.* See Salt.

Brine-*worms*, are red-coloured inſects, which breed both in ſummer and in winter, in the ſtrong *brine* of the ſalt-pans. They never become flies, but are of the claſs of apteræ, or *unwinged* inſects.

BRINEK, or Brineti, in *Aſtronomy*, the bright ſtar in the conſtellation Lyra; more frequently called *Lucida Lyræ.*

BRINGERS-UP, in a battalion, are the whole laſt rank of men in it, or the hindmoſt man in every file.

BRINGING-IN *a horſe*, in the *Manege*, is the keeping down his noſe, when he boars, and toſſes it up to the wind. A horſe is *brought-in* by a ſtrong hard branch.

BRING-TO, in *Sea-language*, ſignifies to check the courſe of a ſhip when ſhe is advancing, by arranging the ſails in ſuch a manner, as that they ſhall counteract each other, and prevent her either from retreating or moving forward. In this ſituation the ſhip is ſaid to *lie-by*, or to *lie-to.*

BRINING *of corn*, in *Huſbandry*, an operation performed on the wheat-ſeed, in order to prevent the *ſmut.* A liquor is to be prepared for this purpoſe, by putting 70 gallons of water into a tub (like a maſh-tub uſed for brewing), and a corn-buſhel of unſlaked lime-ſtone. This is to be well ſtirred till the whole is diſſolved, and left to ſtand for 30 hours; after which it is to be drained off into another tub, in the manner practiſed for beer. In this way about a hogſhead of ſtrong lime-water will be obtained, to which muſt be added three pecks of ſalt. The wheat muſt be ſteeped in this pickle, by running it gently, and in ſmall quantities, into a broad-bottomed baſket of about 24 inches in diameter, and 20 inches deep, and ſtirring it. The light ſeed that floats muſt be ſtrained off with a ſtrainer, and muſt not be ſown. When the baſket has been drawn up, and drained of the pickle, the wheat will be fit for ſowing in two hours after the *brining.*

Brining *of hay-ricks*, a practice common in America, of mixing ſalt with the hay as it is ſtacked.

BRIONY. See Bryony.

BRISKET, that part of a horſe extended from the two ſhoulders to the bottom of the cheſt.

BRISSOIDES, in *Natural Hiſtory*, the name of one of the genera of the echini *marini*; the diſtinguiſhing characters of theſe are, that they are of an oval figure, and have their backs ſtriated, not furrowed, and their rays ſmooth, not marked with ridges. Of this genus there are two known ſpecies: 1. A flat one, called by ſome the *cranium.* 2. A high one, called by ſome the *amygdala*, and uſually found foſſile, and immerſed in flint.

BRISSUS, in *Natural Hiſtory*, the name of a genus of the echini *marini*; the characters of which are, that they are of an oval figure, and have the aperture for the *anus* on one of the ſides of the ſuperficies; their back is ſmooth and even, nor furrowed, but on the *vertex* they have ſeveral very elegant crenated and dotted lines. Their baſe is as if cut off on the end neareſt the mouth, and is not flat as in the *ſpatangi*, but raiſed in the manner of a cuſhion.

BRISTLE, a thick gloſſy kind of hair, wherewith the ſwine kind more eſpecially are covered.

The name is ſometimes alſo applied to the quills of porcupines, and the muſtaches or whiſkers of cats.

Hogs *briſtles* are hard, tranſparent, horny ſubſtances, of a priſmatical figure, without any appearance of cavities or pores in them, diſcoverable even by the microſcope.

Cats *briſtles* have a large ſolid pith in the middle.

Bristle-*dice*, a ſort of falſe dice, furniſhed with a piece of hog's *briſtle* ſtuck in the corners, or other places, to hinder their falling on certain ſides, and make them run high or low at pleaſure.

BRISTOL *flower.* See Campion.

Bristol *water.* See Water.

BRITANNIC *plague*, a name given by ſome writers to the SWEATING *ſickneſs*, or *Anglicanus ſudor*.

BRITANNICA, in the *Materia Medica of the Ancients*, the name of a plant deſcribed as having leaves of a dark colour, very large, and in ſhape reſembling thoſe of the common wild-dock, but ſomewhat hairy and of an aſtringent taſte; the root ſmall and ſlender, and the ſtalk not large. This is the deſcription of Dioſcorides, who attributes to its inſpiſſated juice great virtues as an aſtringent, and a remedy for ulcers of the mouth and tonſils; and Pliny acquaints us of its prodigious efficacy in a diſtemper attending the army of Germanicus, who, when they had croſſed the Rhine, encamped in a place where there was only one ſpring of water, the drinking of which affected them in a terrible manner in their mouths, and made their teeth drop out; and that the phyſicians, who called the diſeaſe *ſtomacace* and *ſcelotyrbe*, were at length directed to a remedy by the Friſians who were in their camp, which was the herb *Britannica*.

The virtues attributed to this plant are obſerved, by the later phyſicians, to agree very well with thoſe of the *hydrolapathum majus*, or great water-dock, a plant produced very abundantly with us, but at preſent neglected in the practice of phyſic; and Muntingius, who has written profeſſedly of the *Britannica* of the ancients, is perſuaded that this is the true and genuine plant.

There is no doubt but that the real plant is our water-dock; but the commentators on the Greek phyſicians, and the authors who have written ſince, and have borrowed the greateſt part of their knowledge from them, have occaſioned great perplexities to their readers, by ſuppoſing that the *Britannica* and *betonica* were the ſame plant; whereas one was a dock, and the other the plant we call *ſerratula*, or ſaw-wort.

BRITE, or Bright, in *Huſbandry*.—Wheat, barley, or other grain, is ſaid to *brite*, when it grows over-ripe and ſhatters.

BRITISH *crown.* See Crown.

British *language*, the ſame with the Welch.

The ancient *Britiſh*, or *Cambro-Britiſh*, is a dialect of the Celtic. Some pretend, but with no proability, that the *Britiſh* is formed immediately from the Teutonic. Cooper abſurdly enough calls the Engliſh language the *Britiſh*.

BRITTLENESS, in *Natural Philoſophy*, that quality of bodies by which they are ſoon and eaſily broken by preſſure or percuſſion. It ſtands oppoſed to TENACITY.

Brittle bodies are extremely hard; the leaſt percuſſion exerts a force on them equivalent to the greateſt preſſure, and may conſequently eaſily break them. This effect is particularly remarkable in glaſs ſuddenly cooled, the *brittleneſs* of which is thereby much increaſed.

Tin, though in itſelf tough, gives a *brittleneſs* to all the other metals when mixed therewith.

The *brittleneſs* of GLASS ſeems to ariſe from the heterogeneity of the parts whereof it is compoſed, ſalt and ſand, which can never bind intimately together.

In TIMBER, *brittleneſs* ſeems to be connected with durableneſs; the more *brittle* any ſort of wood is, the more laſting it is found. Thus it is, oak is of ſo long duration, while beech and birch, as being tough, preſently rot, and are of little ſervice for building.

Brittleness *of the hoof*, in horſes. See Hoof.

BRIZA, in the Linnæan ſyſtem of *Botany*, the name of that kind of graſs called the *tremula*, or quaking-graſs. It belongs to the *triandria digynia* claſs.

Briza, in the *Materia Medica*, a name uſed for the grain of the *zea monococcos*, or St. Peter's corn.

BRIZE, in the *Country Language*, a ſort of ground which has lain long untilled.

Brize, or **Brise**, in *Navigation*. See Breeze.

Brize-*vents*, or **Brise**-*vents*, a kind of ſhelters uſed by gardiners, who have not walls on the north-ſide, to keep the cold winds from damaging their melon beds.

Brize-vents are incloſures ſix or ſeven feet high, and an inch thick, made of ſtraw, ſupported by ſtakes fixed into the ground, and props acroſs both inſide and outſide, faſtened together with willow-twigs or iron-wire.

BROACH, **Brocha**, in *Middle Age Writers*, denotes an awl or bodkin. Among us, *broach* is chiefly uſed for a ſteel inſtrument wherewith to open holes in metals. It is ſometimes alſo applied to a ſtick on which thread or yarn is wound; and, in the north, to a ſort of wooden needles uſed in knitting certain coarſe things.

See an account of the *broach* uſed in weaving tapeſtry, under Tapestry.

In ſome parts of England, a ſpit is called a *broach*.

Hence alſo to *broach* a barrel, is to tap it. The ancient lords received from their tenants a fee or tribute, called *pertuſagium*, for the liberty of *broaching* a cag of ale.

Broach-to, in *Sea-language*, is uſed for inclining ſuddenly to windward of the ſhip's courſe, when ſhe ſails with a large wind; or for deviating from the line of her courſe, when ſhe ſails directly before the wind, ſo as to bring her ſide to windward, and expoſe her to the danger of overſetting.

BROAD-*caſt*, as oppoſed to the *Drill Huſbandry*, denotes the method of cultivating corn, turneps, pulſe, clover, the foreign graſſes, and moſt other field-plants, that are not tranſplanted, by ſowing them with the hand at large; in which method they are ſown over the ground at large, and thence ſaid to be ſown in *broad-caſt*. This is called the *Old Huſbandry*, to diſtinguiſh it from the *Drill*, *Horſe-hoeing*, or *New Huſbandry*. See Drill, and Husbandry.

Broad-*piece*, a denomination given to certain gold PIECES *broader* than a guinea; particularly *Caroluſes* and *Jacobuſes*.

Broad-*ſide*, in the *Sea-language*, a diſcharge of all the guns on one ſide of a ſhip at the ſame time.

A *broad-ſide* is a kind of volley of cannon, and ought never to be given at a diſtance from the enemy above muſket-ſhot at point blank.

Broad-*ſtone*, in *Building*, a ſpecies of free-ſtone, thus denominated becauſe it is raiſed *broad* and thin out of the quarries; or not exceeding two or three inches in thickneſs; chiefly uſed for paving.

Broad-*worm*, *lumbricus latus*, a name given to the TÆNIA, or *tape*-WORM.

BROCADE, in *Commerce*, a ſort of ſtuff, or cloth of gold, ſilver, or ſilk, raiſed and enriched with flowers, foliages, or other figures, according to the fancy of the manufacturer.

Formerly, the term was reſtrained to cloths woven either wholly of gold, both woof and warp, or of ſilver, or of both together: but by degrees it came likewiſe to paſs for ſuch as had ſilk intermixed, to fill up, and terminate the flowers of gold and ſilver.

At preſent, any ſtuff of ſilk, ſatin, or even ſimple taffety, when wrought, and enriched with the flowers, &c. obtains the denomination of BROCADE.

Rich *brocades* may be cleaned, and the luſtre of them recovered, by waſhing them with a ſoft bruſh dipped in warm ſpirit of wine.

Brocade-*ſhell*, a name given to a ſpecies of the CYLINDRUS. It is of a ſilver colour, variegated with brown.

BROCARDICS, **Brocardica**, denote maxims or principles in *Law*; ſuch as thoſe publiſhed by Azo, under the title of *Brocardica Juris*.

Voſſius derives the word from the Greek ϖροταρχια, q. d. *firſt elements*. Others, with more probability, from *Burchard*, or *Brochard*, biſhop of Worms, who made a collection of canons, called from hence *Brocardica*; and as this work abounded much in ſentences and proverbs, the appellation *brocardica* became hence extended to every thing.

BROCATELL, called by the French *brocadel*, an ordinary kind of ſtuff made of cotton, or coarſe ſilk, in imitation of BROCADE; chiefly uſed for tapeſtry and other furniture. That manufactured at Venice is the moſt eſteemed.

BROCATELLO, a name given by lapidaries to the white and gold veined red MARBLE.

BROCCOLI, among *Gardeners*, the ſhoot of a ſort of cabbage. There are ſeveral ſorts of it, as the Roman, the Neapolitan, and the black; but the Roman is far the beſt, and is therefore the only ſort now in uſe.

The ſeeds of this ſhould be ſown about the middle of May, in a looſe moiſt ſoil; when the young plants have eight leaves, they are to be tranſplanted, and ſet at three inches diſtance; and when they have grown there till the middle of July, they will be fit to plant out for ſtanding. They muſt be now ſet in ſome well-ſheltered ground, but not under the drip of trees, and at a foot and a half diſtance from one another. The ſoil ſhould be light, and about the beginning of December they will begin to ſhew their heads, which look ſomewhat like a cauliflower; from this time they will continue eatable to the end of March. When the heads divide, and begin to run up, they are to be cut, with about four inches of the ſtem to them; and when theſe are cut off, about a month's time furniſhes a freſh crop from the ſame ſtock. They are to be ſtripped of their outer ſkin, and boiled; and when perfectly fine, they are very little inferior to aſparagus. The beſt way to have them fine, is to get freſh ſeed every year from Italy; for they are very apt to degenerate.

BROCHOS, in *Surgery*, a name uſed by ſome writers for bandages in general: in ſome of the old writers, the ſame word is alſo uſed to expreſs a perſon who has a very prominent upper lip, or very prominent teeth, and a thick mouth.

BROCK, among *Sportſmen*, ſometimes denotes a badger, otherwiſe called a grey *brock*. See BADGER.

BROCK, and **BROCKET**, is alſo uſed to denote a hart of the third year.

BRODIATORES, in the *Middle Age*, a kind of *librarii*, or copiſts, who did not write the words and letters plain, but variouſly flouriſhed and decorated, after the manner of embroidery. Du-Cange Gloſſ. Lat. tom. i.

BRODIUM, a term uſed by ſome writers in *Pharmacy*, for a liquor in which any ſolid ſubſtance has been boiled, is to be preſerved, or with which a medicine too ſtrong for uſe alone is to be diluted.

BROGLING, a method of fiſhing for eels, otherwiſe called SNIGGLING.

BROKEN-*backed*, in *Sea Language*, denotes the ſtate of a ſhip which is ſo impaired, and looſened in her frame, as to droop at each end; a diſorder to which the French ſhips are moſt expoſed, on account of their length, &c

BROKEN *knees*. Among *Horſe-jockies*, *broken knees* are a mark of a ſtumbler. A *broken* wind is diſcovered by a horſe's blowing at the noſe in the ſtable, and his flanks beating quick, double and irregular, eſpecially after motion. There are divers ways of concealing a *broken* wind. A quart of new milk given a horſe on an empty ſtomach will elude it for an hour. A bruſhing gallop diſcovers it; no medicine can prevent his coughing and wheezing in that caſe, if his wind be *broken*. This diſorder frequently happens to horſes which have ſtood long in the ſtable, without exerciſe; and it may be relieved by careful feeding, and moderate exerciſe. The following ball may be given once in a fortnight, or three weeks, with warm meal and water, whenever it is uſed, and it may be continued for two or three months, viz. ſix drams of Succotrine aloes; myrrh, galbanum, and ammoniacum, of each two drams; bay-berries, half an ounce; a ſpoonful of oil of amber; the whole is to be made into a ball, with a ſufficient quantity of ſyrup of black-thorn. Bartlet's Farriery, p. 68.

BROKEN *numbers*. See NUMBER and FRACTION.

Among *Painters*, a colour is ſaid to be *broken*, when it is taken down or degraded by the mixture of ſome other.

BROKEN *ray*, in *Dioptrics*, the ſame with *ray of refraction*.

BROKER. The origin of the word is conteſted; ſome derive it from the French *broier, to grind*; others from *brocarder, to cavil*, or *triggle*; others deduce *broker* from a trader *broken*, and that from the Saxon *broc*, *misfortune*; which is often the true reaſon of a man's breaking. In which view, a *broker* is a broken trader by misfortune; and it is ſaid none but ſuch were formerly admitted to that employment.

BROKERS are of three kinds; *exchange-brokers*, *ſtock-brokers*, and *pawn-brokers*.

BROKERS, *exchange*, are a ſort of negociators, who contrive, make, and conclude bargains between merchants and tradeſmen, in matters of money or merchandiſe, for which they have a fee, or *premium*. See EXCHANGE.

Theſe, in our old law-books, are called *broggers*, and in Scotland, *broccarii*, i. e. according to Skene, mediators or interceſſors in any contract, &c. See PROXENETA.

They make it their buſineſs to know the alteration of the courſe of exchange, to inform merchants how it goes, and to notify to thoſe who have money to receive or pay beyond ſea, who are proper perſons for negociating the exchange with; and when the matter is accompliſhed, that is, when the money is paid, they have for brokage, two ſhillings per 100 pounds ſterling.

Theſe, by the ſtatute of 8 and 9 William III. are to be licenſed in London by the lord-mayor; and any perſon acting without ſuch a licenſe, is liable to the forfeiture of 500*l.* and perſons employing them forfeit 50*l.* They are alſo to regiſter contracts, &c. under the like penalty; and not to deal for themſelves on pain of forfeiting 200*l.* They are likewiſe to carry about with them a ſilver medal, having the king's arms, and the arms of the city, &c. and to pay 40*s.* a year to the chamber of the city. 6 Ann. cap. 16.

In France, till the middle of the ſeventeenth century, their *exchange-brokers* were called *courtiers de change*; but by an arret of council in 1639, the name was changed for that more creditable one of *agent de change, banque, & finance*; and in the beginning of the eighteenth century, to render the office ſtill more honourable, the title of *king's counſellors* was added.

At Grand Cairo, and ſeveral places of the Levant, the Arabs, who do the office of *exchange-brokers*, are called *conſuls*: the manner of whoſe negociating with the European merchants has ſomething in it ſo very particular, that we have referred it to a diſtinct article.

The *exchange-brokers* at Amſterdam, called *makelaers*, are of two kinds; the one, like the Engliſh, called *ſworn brokers*, becauſe of the oath they take before the *burgomaſters*; but the others negociate without any commiſſion, and are called *walking brokers*.—The firſt are in number 395; whereof 375 are Chriſtians, and 20 Jews: the others are near double that number; ſo that in Amſterdam there are near 1000 *exchange-brokers*.—The difference between the two conſiſts in this; that the books and perſons of the former are allowed as evidence in the courts of juſtice; whereas in caſe of diſpute, the latter are diſowned, and their bargains diſannulled.

The fee of the ſworn *exchange-brokers* of Amſterdam is fixed by two regulations, of 1613, and 1623, with regard to matters of exchange, to eighteen ſols for 100 livres de gros, or 600 florins; i. e. three ſols for 100 florins; payable, half by the drawer, and half by the perſon who pays the money. But cuſtom has made conſiderable alterations herein.

The Jews, Armenians, and Banians, are the chief *brokers* throughout moſt parts of the Levant and the Indies. In Perſia, all affairs are tranſacted by a ſort of *brokers*, whom they call *delal*, i. e. *great talkers*. The manner of making their markets is very ſingular: after the *brokers* have launched out into long, and uſually impertinent diſcourſes, coming towards a concluſion, they only converſe with their fingers. The buyer and ſeller's *broker*, each take the other by the right hand, which they cover with their coat, or a handkerchief: the finger ſtretched out, ſtands for ſix; bent, for five; the tip of the finger for one; the whole hand for 100; and the hand clenched, for 1000. They will expreſs even pounds, ſhillings, and pence, by their hands. During all this myſtic commerce, the two *brokers* appear as cold and compoſed, as if there were nothing paſſing between them.

The French diſtinguiſh two kinds of *brokers*; one for the ſervice of merchants, the other of manufacturers, artificers, and workmen. The buſineſs of the former is to facilitate the ſale of goods in the wholeſale and mercantile way; that of the other, to procure the goods wanted for manufacturers, artificers, &c. or to ſell their goods when made. At Paris there is ſcarce a company of tradeſmen, or even mechanics, but have their *brokers*, who are uſually taken out of their body, and make it their ſole buſineſs to negociate in the particular kinds of goods to which ſuch company is by ſtatutes reſtrained. There are *brokers* for drapery, *brokers* for grocery, *brokers* for mercery, &c. There are even *brokers* for tanners, curriers, cutlers, and the like. Dict. of Commerce.

BROKER, *cloth*.—At Paris they have a regular company of theſe *brokers*, or *frippiers*, who are governed by ſtatutes firſt given them under Francis I. in 1544.

BROKERS, *piece*, a ſort of petty dealers in drapery, who ſell fragments or remnants of cloths, ſtuffs, ſilks, and the like, at under price.

BROKERS, *ſtock*, are thoſe employed to buy and ſell ſhares in the joint ſtock of a COMPANY or corporation. The negociations, &c. of theſe *brokers* are regulated by ſtat. 6 Geo. I. cap. 18. and 7 and 10 Geo. II. cap. 8. which, among other things, enact, that contracts in the nature of wagers, &c. incur a penalty of 500*l.* and by the ſale of ſtock, of which the ſeller is not poſſeſſed, a forfeit of 100*l.* and that *brokers* keep a book, in which all contracts, with their dates, and the names of the parties concerned, ſhall be entered, on pain of 50*l.* See SUBSCRIPTION and AGENT.

BROKERS *of houſhold furniture*. See APPRAISERS.

BROKERS, *pawn*, are perſons who keep ſhops, and let out money to neceſſitous people upon pledges, for the moſt part on uſurious conditions.

Theſe are more properly called *pawn-takers*, or *tally-men*, ſometimes *fripers*, or *friperers*.

Of theſe is to be underſtood the ſtatute of 1 Jac. I. cap. 21. by which it is enacted, that the ſale of goods, wrongfully gotten, to any *broker* in London, Weſtminſter, Southwark, or within two miles of London, ſhall not alter the property thereof.—If a *broker*, having received ſuch goods, ſhall not, upon the requeſt of the right owner, truly diſcover them, how and when he came by them, and to whom they are conveyed, he ſhall forfeit the double value thereof to the ſaid owner.

But there are ſeveral excellent regulations reſpecting *pawnbrokers*, of later date; for which, ſee 30 Geo. II. cap. 24, and 32 Geo. II. cap. 24.

In the cities of Italy, there are companies eſtabliſhed by authority for the letting out money in pawns; called *mounts of piety*; an honourable title, like that of the *charitable corporation*, but little becoming ſuch inſtitutions; inaſmuch as the loan is not *gratis*.

In ſome parts of Italy, they have likewiſe *mounts of piety* of another kind, wherein they only receive ready money, and return it again, with intereſt, at ſo much *per annum*.—At Bologna they have ſeveral ſuch *mounts*; which are diſtinguiſhed into *frank* and *perpetual*: the intereſt of the former is only four *per cent.* in the latter, ſeven.

BROKERAGE, the fee paid to a BROKER.

BROMELIA, in *Botany*, *Plum*; a genus of the *hexandria monogynia* claſs of plants. Its characters are theſe: the flower hath three long, narrow petals, each having a *nectarium* joined to it above the baſe, and hath ſix ſtamina; the germen is ſituated below the receptacle, which afterward becomes an oblong capſule, divided by a partition in the middle, to which the ſeeds are fixed quite round; theſe are ſmooth, and almoſt cylindrical. There are two ſpecies, which make a pretty variety in the hot-houſe.

BROMUS, in *Botany*, a name uſed by ſome authors for that kind of graſs, called by others *feſtuca* and ægilops, or *oat-graſs*.

BRONCHIA, in *Anatomy*, the little tubes into which the *trachea* is branched, at its entrance into the lungs; and which are diſtributed through every part thereof, ſerving for the conveyance of the air in reſpiration.

The *bronchia* conſiſt of cartilages like the *trachea*; only here the cartilages are perfectly circular, without any membranous hard part: they are joined together by the membranes that inveſt them, and are capable of being ſhot out lengthwiſe in inſpiration; and of being drawn into each other in expiration.

BRONCHIAL *artery* is an artery of the lungs, which ariſes from the deſcending trunk of the *aorta*, or intercoſtals; and, embracing the *trachea*, purſues the courſe of the *bronchia*, accompanying all the branches thereof through their whole progreſs. See *Tab. Anat.* (*Angeiol.*) *fig.* 1. *n.* 29.

BRONCHIAL *glands* are a ſoft, ſucculent, blackiſh ſort of glands, adhering externally to the lower part of the *trachea*, the greater diviſions of the *bronchia* and the *œſophagus*, ſome larger, ſome ſmaller; ſaid to be diſcovered by Verheyen.

Their uſe is uncertain; the generality hold them to furniſh an unctuous liquor, to moiſten and line the inſide of the *bronchia*. Verceillon will rather have them to ſecrete a juice for the ſervice of digeſtion, conveyed by minute ducts to the *œſophagus* and ſtomach; which, however, is called in queſtion by Heiſter.

Verheyen is of opinion, that the hoarſeneſs which ariſes from a cold, may proceed from an obſtruction of theſe glands; and that the benefit which accrues from taking oil of almonds, or other ſmooth medicaments, may proceed from their ſupplying the defect of this juice, and lubricating artificially the inſide of the *bronchia*. But it ſhould rather ſeem, that the humidity furniſhed the *trachea* and *bronchia*, comes from the miliary glands of thoſe parts, which are only lymphatics, and become tumid in morbid caſes, inſomuch that they frequently preſs the wind-pipe, or ſome of its branches, and cauſe an ASTHMA.

BRONCHIAL *vein* ariſes from the intercoſtals, or the azygos, accompanies the artery, and divides into the ſame number of branches with it.

The artery brings blood to the *bronchia*, for the nutrition thereof, and of the veſicles of the lungs; and the vein carries it off again to the *cava*, where it ſoon terminates.

The *bronchial* artery is ſometimes ſingle, but more frequently double; ſometimes triple.

BRONCHOCELE, a pendent tumour, with a large round neck, riſing on the bronchial part of the *trachea*.

The word is formed from βρογχος, *wind-pipe*, and κηλη, *ſwelling*.

The *bronchocele* is common in Lombardy, Savoy, and about the Alps; whence Horace,

Quis tumidum guttur miratur in Alpibus.

It is commonly ſuppoſed to derive its origin from the Alpine waters, which being impregnated and chilled with ice and ſnow, cauſes a *lentor* of the *lympha*, about the muſcles of the throat, whereby the veſſels are contracted, and the circulating humours thickened, whence an obſtruction, &c. Though there are ſome ſpecies of it ſuppoſed alſo to ariſe from ſtrains, bruiſes, and other accidents.

The *bronchocele* has been called by ſome *hernia gutturalis*, or *bronchialis*, *gutteria*, and *gongrona*. Some medical writers have confounded it with the *ſtruma*, *ſcrophula*, or king's evil, and others have made it only a ſpecies of STRUMA. It has been deſcribed by Celſus, Albucaſis, Heiſter, and many later writers. Some aſcribe it to a rupture of a lymphatic veſſel; others to ſome extravaſated, nutritious juice, converted into a fleſhy ſubſtance; and the tumor has been obſerved to conſiſt partly of a fluid, and partly of a more firm and glandular ſubſtance; but its conſiſtence is different in different caſes.

The Engliſh *bronchocele*, as Mr. Proſſer has termed it, or, as it is otherwiſe called, the *Derby-neck*, becauſe many of the women in the hills of Derbyſhire are ſubject to it, is a tumor ariſing on the fore-part of the neck, ſeated in the body of the neck, between the ſkin and wind-pipe, in the thyroid gland; and thus differs from the former, or Alpine *bronchocele*, which commonly hangs under the chin like dew-laps. Mr. Proſſer diſtinguiſhes it alſo from the ſimilar diſeaſe, which is cauſed by loud crying, coughing, or other means of ſtraining the neck; this, he ſays, is incurable; whereas the other, called the natural or ſpontaneous *bronchocele*, is eaſily cured by proper and timely application. Dr. Hunter has obſerved, that it appears two or three years before or after menſtruating; and Mr. Proſſer has made the ſame obſervation, that it commonly appears firſt between the age of eight or twelve years. When the menſtruation approaches kindly, it ſometimes ſpontaneouſly diſappears. This diſeaſe is almoſt peculiar to women; it is ſoft, or rather flabby to the touch, and moveable; but when it has continued for ſome years after the time of its growing, it becomes more firm. It is attended with a conſiderable difficulty of breathing, in ſome caſes, to ſuch a degree, as to occaſion a bad wheezing. The ſituation of this tumor is ſuch, that all attempts to extirpate it are extremely dangerous, and therefore the only method of cure is by diſcuſſion. The moſt celebrated remedy for this diſorder is one which is prepared and ſold at Coventry, and which Mr. Proſſer believes conſiſts of equal parts of ſponge, cork, and pumice-ſtone, calcined; half a dram of this is mixed with ſugar, and made into a bolus, and laid under the tongue every night. Mr. Proſſer recommends the following powders:

℞ Cinnab. Antimon. opt. levig. ℈j.
Milleped. pp. & pulv.
Spong. calcin. ā̄ā gr. xv. m. f. pulvis.

One of theſe is to be taken an hour or two before breakfaſt, for two or three weeks; and, after the interval of about a fortnight, they are to be again renewed; and three of the following pills are to be taken at bed-time, during the ſecond courſe of the powders:

℞ Pil. Mercurial. ph. nov. ℥ß.
Pil. N° 48. æquales.

The doſe is to be adjuſted to the age and conſtitution of the patient, who ſhould be prepared for this courſe by two or three previous purges, and avoid taking cold. If theſe means are uſed for about a month or ſix weeks, without any external application, he has no doubt of ſucceſs. However, the patient ſhould be under twenty-five years of age. At this age the cure is uncertain; but at a more advanced period of life much more improbable, and ſeldom or ever ſucceeds. Gooch, in his Medical Obſervations, mentions an *aqueous* BRONCHOCELE. Phil. Tranſ. N° 265. p. 631. Proſſer's Account and Method of Cure of the *Bronchocele*. 1771.

BRONCHOTOMY, in *Chirurgery*, the operation of cutting into the wind-pipe, to prevent ſuffocation, in the quinſy; or an inciſion made in the *trachea*, or wind-pipe, between two of its *annuli* or rings, in order to give paſſage for the breath, when there is danger of ſuffocation, from an inflammation of the *larynx*, &c.

The word comes from βρογχος, *wind-pipe*; and τεμνω, *I cut*.

Bronchotomy, called alſo *Laryngotomy*, is thus performed.—The body of the patient being prepared, an inciſion is made between the third and fourth *annuli*, or rings, of the *aſperia arteria*, an inch below the bottom of the *larynx*; the ſkin and integuments divided, and the muſcles removed; a ſilver tube is applied, and the cauſe of the diſeaſe removed, and the wound healed; nouriſhing clyſters being applied in the mean time, if deglutition be impracticable.

Dr. Muſgrave obſerves, that in all medicine there is not one method that works ſo great a change, for the better, in ſo ſhort a time.—However, it is ſeldom practiſed, becauſe that gap which appears on the cutting a throat (the divided parts being then drawn towards their more fixed ends), together with the great efflux of blood when the jugulars and carotid arteries are alſo wounded, create in moſt men a dread of the operation, and make many believe all wounds of the *trachea* mortal.—The ſame author makes no ſcruple, however, to ſay it ought to be practiſed in quinſies, and other dangers of ſuffocation from cauſes of a like nature with them; from an extraordinary cure which he himſelf had wrought in this way.

Bronchotomy is likewiſe recommended as the laſt thing to be done, in order to recover drowned people to life; and to this operation many have been indebted for their recovery.

In the Philoſophical Tranſactions, vol. lii. part ii N° 81. there is an account of the caſe of a *cut throat*, that may ſerve to make us ſomewhat more ready and reſolute in the operation of *bronchotomy*, when it is neceſſary; ſuch is the very inference that Dr. Huxham, who relates it, draws from it. P. 515.

BRONCHUS, in *Anatomy*, properly denotes the lower part of the *aſpera arteria*, dividing into *bronchiæ*, or branches. In which ſenſe, *bronchus* ſtands contradiſtinguiſhed from LARYNX.

The name *bronchus* is alſo extended to the whole *aſpera arteria*, or TRACHEA.

BRONCHUS alſo denotes a perſon afflicted with a BRONCHOCELE, or tumor of the throat, called by Ulpina *gutturoſus*.

BRONCINI, in *Zoology*, a name given by ſome to the *lupus*, or ſea-wolf, called in Engliſh the BASSE.

BRONTEUM, in *Antiquity*, that part of the theatre underneath its floor, wherein brazen veſſels, full of ſtones and other materials, to imitate the noiſe of thunder, were kept. Potter. Arch. Græc. lib. ii. cap. 8.

BRONTIÆ, among *Naturaliſts*, a kind of figured ſtones, commonly hemiſpherical, and divided by five pointed zones.

The word is formed from βροντη, *thunder*; alluding to the popular tradition, that thoſe ſtones fall in thunder-ſhowers: whence they are alſo denominated thunder-ſtones, ſometimes polar-ſtones, fairy-ſtones, and alſo *ombriæ*, by naturaliſts.

Some take the *brontiæ* for the petrified ſhells of the *echinus ſpatagus*, or *briſcus*, of Ariſtotle. Dr. Woodward rather ſuppoſes them to have been formed, and received their ſhape, in the ſhell of the *echinus ſpatagus*; on which footing they are alſo ranked in the number of ECHINITES. Dr. Plott conteſts both.

BRONTIÆ are ſometimes alſo uſed in England for a kind of figured ſtones, ſhaped like arrow-heads, leſs properly called BELEMNITES, and popularly *thunder-bolts*.

Dr. Woodward takes not theſe for natural ſtones, but ſuppoſes them to have been faſhioned thus by art, to ſerve as weapons before the invention of iron.

Some alſo give the denomination *brontia* to the BATRACHITES and CHELONITES.

BRONTOLOGY, books containing the doctrine of thunder, and of the preſages drawn therefrom. See THUNDER.

BRONZE, in *Chemiſtry*, a factitious metal, compounded of copper and tin, to which ſometimes other metallic ſubſtances are added, particularly *zinc*. It is brittle, hard, and ſonorous.

The word is French, in which language it has a very extenſive ſignification, including all the compoſitions of copper or braſs, as for guns, bells, pots, or the like.

It is formed from the Italian *bronzo*, which has the ſame ſignification. Copper medals are frequently called medals of *bronze*. Medaliſts diſtinguiſh the *large*, *middle*, and *little* BRONZE.

Bronze is employed for various uſes, as for making bells, cannons, and ſtatues; and the proportions of the component metals are varied, to ſuit the ſeveral uſes to which it is applied. For the fineſt ſtatues, the mixture in the compoſition of *bronze* is half *copper*, and half *braſs*, or LATTEN.

The Egyptians, who are ſaid by ſome to have invented the art of making it, uſe two thirds of *braſs*, and one third of *copper*.

The compound of *copper* and *tin*, it is obſerved in the Dictionary of Chemiſtry, has a greater than the intermediate ſpecific gravity: whence he infers, that in the union of *copper* and *tin* there is a penetration of parts; i. e. that one metal enters into the pores of the other, and perhaps even this effect is reciprocal. See on this ſubject Gellert's Metallurgic Chemiſtry.

Bronze is leſs apt to be covered with verdigriſe than pure *copper* is; for as *tin* is leſs liable to the action of ſalts, of moiſture, and of the air, than *copper*, it is alſo leſs liable to ruſt; hence ariſes one reaſon why this ALLAY of *bronze* is uſed for cannons, ſtatues, and works expoſed to the air and weather. The greater fuſibility of *bronze* than of *copper*, is alſo an advantageous property, and much facilitates the caſting of large works, as ſtatues, bells, and cannon. See BELL-*metal*.

The operation by which large works of *bronze* are caſt, is ſufficiently ſimple. For this purpoſe a brick-furnace is uſed nearly of the ſhape of an oven for baking bread. The floor of it is concave, and conſiſts of a compoſition of ſand and clay; in which the metals to be fuſed are put. The furnace has three openings; the firſt is a lateral mouth, at which enters the flame of wood, placed in a ſecond furnace on one ſide of the firſt; the ſecond opening is a chimney placed on the ſide oppoſite to the mouth, by means of which the flame is drawn over the metal; the third opening is a hole opened and ſhut at pleaſure, through which the inner part of the ſurface may be occaſionally inſpected, that the ſtate of the metal may be obſerved. When the metal is in the ſtate required, a fourth opening is then uncloſed, communicating with the hollow floor, and through which the melted metal flows by channels into the moulds prepared to receive it. Dict. of Chemiſtry.

BRONZE, in *Painting*, denotes a colour prepared by the colourmen of Paris, in imitation of *bronze*. There are two ſorts of it, the *red* and the *yellow*, or *golden*: the latter, the *yellow*, is made ſolely of the fineſt and brighteſt copper-duſt that can be had; and in the former there is only added a ſmall quantity of red ochre, well pulveriſed. They are both applied with varniſh, and, to prevent its turning greeniſh, the work is dried over a chaffing-diſh, as ſoon as *bronzed*.

BRONZES. Thus *Antiquarians* denominate figures of men or beaſts, urns, and every piece of ſculpture, which the ancients made of the above metal. Statues, buſts, &c. caſt of this metal, are called by this name, whether they be originals or copies.

BRONZING is the art of imitating *bronze*. See BRONZE, in *Painting*.

BROOD, the young of fiſh and fowls.

The word is derived from the Saxon *bredan*, *to breed*; which alludes to βρυω, *to be big with young*.

Malpighi had the curioſity to break ſeveral times all the eggs of a *brood*, one half an hour after another, and obſerve with a microſcope the ſucceſſive alterations produced therein, till the moment of hatching; of all which he has given figures, curiouſly engraven.

The word is alſo uſed for a ſet of any young. In which ſenſe we ſay, a *brood* of vipers, a *brood* of oyſters. A *brood* of pheaſants is more properly called an *eye*. Phil. Tranſ. N° 369.

BROOD of ſea-fiſh is ſpawned, and lies in ſtill waters, where it may have reſt to receive nouriſhment, and grow to perfection. And here it is often deſtroyed by weirs, draw-nets, and nets with canvas, or like engines in the bottoms of them; in harbours, havens, and creeks.—Every weir near the main ſea takes, in twelve hours, ſometimes five buſhels, ſometimes ten, ſometimes twenty or thirty.

For the preventing hereof, by 3 Jac. I. cap. 12. it is enacted, that none ſhall erect a weir, or weirs, along the ſea-ſhore, or in any haven, or creek, or within five miles of the mouth of any haven or creek, or ſhall willingly deſtroy the ſpawn, or fry of fiſh, on pain of 10*l.* to be divided betwixt the king and the proſecutor. Neither ſhall any one fiſh in any of the ſaid places, with any net of a leſs meaſh than three inches and an half betwixt knot and knot (except for the taking ſmoulds in Norfolk only), or with a canvas net, or other engine, whereby the ſpawn or fry of fiſh may be deſtroyed; on pain to forfeit the ſaid engine or net, and 10*s.* in money, to be divided betwixt the poor of the pariſh, and the proſecutor.

BROOD, or BROOD-*comb*, called by the French *couvain*, is that part of the comb of a bee-hive, which contains in its cells the future progeny of the hive, in the three different ſtates of eggs, worms, and nymphs. See BEE, and QUEEN-*bee*.

BROODING, the act of a hen, or other bird, ſitting on a number of eggs, to keep them warm, till they hatch, or produce young ones. See HATCHING.

In which ſenſe, the word amounts to the ſame with *incubation*.

Inſects have alſo a method of *brooding* on their *ova*. Some even pretend, that ſnakes lye on their eggs; which ſeems without foundation. Phil. Tranſ. N° 8.

There is a difference between the *brooding* of SNAKES and VIPERS; the former being oviparous, and the latter bringing forth their young alive.

BROOKLIME, in *Botany*, a ſpecies of SPEEDWELL.

Brooklime bears a reſemblance in its flowers to the *Paul's betony*, though its leaves are larger, and the ridges entire.

Its chief uſe is to abrade and clear away thoſe little viſcoſities which obſtruct the capillaries, and occaſion ſcabs and blotches, though it has alſo a diuretic virtue, and ſerves as a cleanſer of all the viſcera; whence it is frequently an ingredient in antiſcorbutic and deobſtruent compoſitions. Quincy. Diſp. p. ii. § 4.

BROOM, *ſingle-ſeeded*, *Geniſta*, in *Botany*, a genus of the *diadelphia decandria* claſs of plants. Its characters are theſe: the flower is of the butterfly kind; the ſtandard long, and wholly reflexed; the wings are a little ſhorter, and looſe; the keel erect, and longer than the ſtandard. It hath ten ſtamina joined, which are ſituated in the keel. In the centre is an oblong germen, which afterwards becomes a roundiſh, turgid pod, with one cell, opening with two valves, encloſing kidney-ſhaped ſeeds. There are ten ſpecies. It grows plentifully on heathy grounds. See *Tab. of Botany*, *Claſs* 22.

Among *Huſbandmen*, *broom* is conſidered as a weed very pernicious to the culture of lands; and, on that account, to be grubbed up and deſtroyed.

It roots deep, and, ſhedding no leaves, is continually ſucking the moiſture from the earth. The beſt method of deſtroying it, is the burning the land, then plowing it deep, and manuring it very well with dung and aſhes; the ſpreading on the land chalk or marle, or the manuring it with urine. If the ground be deſigned for paſture-land, it is beſt to cut it cloſe to the ground in May, when the ſap is ſtrong in it. By this artifice, the roots are deſtroyed; whereas, in the common way of pulling up the young plants, ſome ſtrings will be left, and the leaſt of theſe will grow. Foddering of cattle upon *broomy* land, is one very good way of deſtroying the *broom*, their urine killing the roots, and their treading the land making it leſs proper for the roots of this plant; for the *broom* is never obſerved to grow in trodden places. This troubleſome and pernicious plant is not, however, without its uſe to the farmer; for, when well laid, it will make an excellent and laſting kind of thatch for barns.

Broom-flowers make a principal ingredient in divers medicated ales. Their aſhes are extolled for purging off waters in dropſies; in which reſpect, however, Dr. Quincy aſſures us, they are no better than any other lixivious ASHES.

Some pickle the yellow buds with vinegar and ſalt, &c. after the manner of capers, from which they are then ſcarce to be diſtinguiſhed.

Broom is an attenuant, abſtergent, and aperient. The juice of the green ſhoots of *broom*, or a ſtrong infuſion of them in wine, is an excellent diuretic, and cleanſes the ureters and kidneys. If taken in large doſes it purges by ſtool, and therefore is doubly proper in dropſical caſes. The ſeed of *broom* is alſo a purge, and that of no weak kind, a dram and half of it being a ſufficient doſe. The *lixivium* of *broom* with white wine is a powerful diuretic, but muſt be taken with caution.

BROOM, *African.* See ASPALATHUS.

BROOM, *Butcher's*, in *Botany*. See BUTCHER'S *Broom.*

BROOM-*flower*, gives the denomination to an order of knights inſtituted by St. Lewis of France, on occaſion of his marriage. The motto was, *Exaltat humiles*, and the collar of the order made up of *broom-flowers* and huſks, enamelled and intermixed with fleurs-de-lys of gold, ſet in open lozenges, enamelled white, chained together, and at it hung a *croſs florence* of gold. This anſwers to what the French call *Ordre de la Geneſte*, from the name of a ſpecies of *broom* ſo called; different from the common *broom*, as being lower, the ſtalk ſmaller, and leaf narrow; the flower is yellow, and bears a long huſk.

Some alſo ſpeak of another order of the *Geneſte*, or *Broom*, eſtabliſhed by Charles Martel, or rather Charles VI.

BROOM alſo denotes a well known houſhold beſom, or implement wherewith to ſweep away dirt, duſt, and the like.

We ſay, a *birch-broom*, a *hair-broom*, a *ruſh-broom*, a *heath-broom.* The primitive kind of *brooms*, from whence the denomination is given to all the reſt, was made of the *geniſta*, or wild *broom*, growing on commons.

BROOM-*gall*, in *Natural Hiſtory*, a name given by authors to a remarkable ſpecies of galls found on the *geniſta vulgaris*, or common *broom.* This is occaſioned, like all other galls, by the puncture and eating of an inſect, and, when opened, is found to contain a ſmall oblong worm, of a red colour, but whoſe ſize requires the uſe of a glaſs in order to ſee it diſtinctly.

BROOM *rape*, in *Botany*. See *Broom* RAPE.

BROOM-*tree*, *Spartium*, *Cytiſo Geniſta*, in *Botany*, a genus of the *diadelphia decandria* claſs of plants. Its characters are theſe: the empalement of the flower is heart-ſhaped; the flower of the butterfly kind; the ſtandard almoſt heart-ſhaped, large, and wholly reflexed; the wings are oblong, ſhorter than the ſtandard, and annexed to the ſtamina; the keel is oblong, longer than the wings; the borders hairy, and connected together; to which the ſtamina are inſerted. It has ten unequal ſtamina, nine of which are joined together, and the under ſtands apart; with an oblong hairy germen, ſupporting a riſing awl-ſhaped ſtyle, to which is faſtened an oblong, hairy, inflexed ſtigma. The germen afterward becomes a long, cylindrical, obtuſe pod, of one cell, opening with two valves, including ſeveral globular kidney-ſhaped ſeeds. There are eleven ſpecies, natives of different parts; the beſt known of which is the Spaniſh *broom*, which is common in gardens, and flowers in June and July; the parts in uſe are the branches, flowers, and ſeeds, which agree in virtues with the common *broom*; only are more efficacious.

BROOMING, or BREAMING *of a ſhip*, the burning off the filth ſhe has contracted on her ſides with ſtraw, reeds, broom, or the like, when ſhe is on a careen, or on the ground. See CAREENING.

BROSSÆA, in *Botany*, the name of a genus of plants of the *pentandria monogynia* claſs, the characters of which are theſe: the cup is a one-leaved *perianthum*, divided into five ſegments, each of which terminates in a long point, of the ſame length with the petals; the flower is monopetalous, of the ſhape of a truncated cone, and undivided at the edge; the germen is divided into five parts; the ſtyle is pointed, not ſo long as the flower, and its ſtigma ſimple. The fruit is a roundiſh capſule, divided by five deep furrows into five cells; it is covered with a large cup, which cloſes over its top; it is ſucculent and fleſhy; and, finally, opening at the ſides, it diſcharges a great number of minute ſeeds.

BROTHEL. See STEWS.

BROTHER, *Frater*, a term of relation between two male children, ſprung from the ſame father, or mother, or both. Scaliger and Voſſius derive *frater* from φρατηρ, for φρατωρ, which properly ſignifies a perſon who draws water in the ſame well; φρεαρ, in Greek, ſignifying *well*, and φρωτρια, a company of people, who have a right to draw water out of the ſame well.—The word, it is ſaid, came originally from the city Argos, where there were only a few wells diſtributed in certain quarters of the city, to which thoſe of the ſame neighbourhood alone repaired.

By the civil law, *brothers* and ſiſters ſtand in the ſecond degree of conſanguinity; by the canon law, they are in the firſt degree.

By the Moſaic law, the *brother* of a man who died without iſſue was obliged to marry the widow of the deceaſed. Deuter. xxv. 7. See LEVIRATE.

The ancients applied the term *brother* indifferently to almoſt all who ſtood related in the collateral line, as uncles and nephews, couſin-germans, &c.—This we learn not only from a great many paſſages in the Old Teſtament, but alſo from profane authors: Cicero, in his Philippics, ſays, "Antonia was both wife and ſiſter of Mark Antony; "becauſe ſhe was daughter of his brother C. Antonius." And as to couſins, Tullius Hoſtilius, in Dionyſius Halicarneſſeus, calls the Horatii and Curatii, *brothers*; becauſe they were ſiſters children.

The language of the Jews, biſhop Pearſon obſerves, included in the name of *brethren* not only the ſtrict relation of fraternity, but alſo the larger of conſanguinity. We are brethren, ſays Abraham to Lot, Gen. xiii. 8. whereas Lot was only his nephew.—So Jacob told Rachel that he was her father's *brother*, Gen. xxix. 12. whereas he was only her father's nephew.—This conſideration has been urged with good advantage againſt the Antidicomarianites, who, from the mention made of the *brethren of Jeſus* (John ii. 12. Matth. xii. 46.) have impugned the perpetual virginity of the mother of Chriſt.

Among us, it is cuſtomary for kings to give the title *brother* to each other; the unction in coronation being eſteemed to create a kind of *brotherhood.* Nor is the cuſtom modern: Menander mentions a letter of Coſroes king of Perſia, to the emperor Juſtinian, beginning thus: Coſroes king of kings, &c. to the emperor Juſtinian *my brother.*

Kings now alſo give the ſame appellation to the electors of the empire; and the like was given, by the king of France, to the late king of Sardinia, while only duke of Savoy.

In the civil law, *brothers*, *fratres*, in the plural, ſometimes comprehends ſiſters: as *Lucius & Titia*, *fratres*; *tres fratres*, *Titius*, *Mævius*, *& Seia.*

BROTHERS, *foſter*, thoſe which ſucked the ſame nurſe. The French call them *fratres du lait*, or *brothers by milk*; which is moſt properly uſed in reſpect of a perſon who ſucked a nurſe at the ſame time with the nurſe's own child.

BROTHERS, *German*, *Fratres Germani.* See GERMAN.

BROTHER was alſo uſed, in *Middle Age Writers*, for a *comes*, or governor of a province.

BROTHER is applied, in a leſs proper ſenſe, to denote a perſon of the ſame profeſſion. In which ſenſe, judges, biſhops, prieſts, &c. call each other *brothers.*

BROTHER *in Chriſt*, *frater in Chriſto*, the ſame with *ſpiritual brother*, a perſon admitted into a monaſtic ſociety or fraternity.

BROTHER is more particularly uſed to denote the relation between monks of the ſame convent.

In which ſenſe they ſay, *brother* Zachary, *brother* Bonaventure, &c. In Engliſh, we more uſually ſay, *friar* Zachary, &c. from the French word *frere*, *brother.*

This appellation is borrowed from the primitive Chriſtians, who all called each other *brothers:* but it is principally uſed for ſuch of the religious as are not prieſts; thoſe in orders are generally honoured with the title of *fathers*, *patres*, *peres*; whereas the reſt are only ſimply *brothers.*

The monks of St. Dominic are particularly called *preaching brothers*, or *friars predicants:* thoſe of St. Francis, *minor brothers*; thoſe of charity, *ignorant brothers*, &c.

BROTHERS, *conſcript*, *fratres conſcripti*, denote laymen and others entered in the catalogue of the *brothers* of a monaſtery, or rather poſſeſſed of the fraternity thereof.

BROTHER, *outer*, *frater exterior*, ſometimes denotes a lay-*brother.*

BROTHER, *ſtrange*, *frater adveniens*, a hoſt or gueſt belonging to another monaſtery.

BROTHER, *foreign*, *frater externus*, either a monk, prieſt, or canon of ſome other monaſtery, to whom the prayers of the ſociety are granted.

BROTHER, *mature*, *frater maturus*, one diſtinguiſhed by his age, gravity, or probity, above the reſt.

BROTHERS, *ſpiritual*, laymen admitted into a monaſtic fraternity.

ternity. The name was alſo given to thoſe otherwiſe called *mature brothers*, and ſometimes alſo to a ſort of adopted *brothers*, or perſons who commenced a kind of *brotherhood*, with the ceremony of breaking bread together in the church before the prieſt.

Brother, *lay*, *frater laicus*, or *converſus*. See Lay *Brother*.

Brother, *given*, *frater donatus*, among the Carthuſians, denotes a young perſon dreſſed in minim cloth, and wearing a hat, whoſe office is to ſerve in the houſe, anſwering to what in other orders is called an *offered brother*, *frater oblatus*.

Brother is alſo an appellation more peculiarly given to certain orders of religious: thus, the

Brothers *of St. Alexis*, in the Low Countries, were an order of perſons who attend on thoſe who lay dying, and took care of the burial of the dead.

Brothers *of Ave Maria*. See Servites.

Brothers *of Charity*, a ſort of religious hoſpitallers, founded about the year 1297, ſince denominated *Billetins*. They took the third order of St. Francis, and the ſcapulary, making three uſual vows, but without begging.

Brothers *of Charity* alſo denote an order of hoſpitallers ſtill ſubſiſting in Romiſh countries, whoſe buſineſs is to attend the ſick, poor, and miniſter to them both ſpiritual and temporal ſuccour.

They are all laymen, except a few prieſts, for adminiſtering the ſacraments to the ſick in their hoſpitals. The *brothers of charity* uſually cultivate botany, pharmacy, ſurgery, and chemiſtry, which they practiſe with ſucceſs.

They were firſt founded at Granada, by St. John de Dieu; and a ſecond eſtabliſhment was made at Madrid, in the year 1553: the order was confirmed by Gregory XIII. in 1572: Gregory XIV. forbad them to take holy orders; but by leave of Paul V. in 1609, a few of the *brothers* might be admitted to orders. In 1619 they were exempted from the juriſdiction of the biſhop. Thoſe of Spain are ſeparated from the reſt, and they, as well as the *brothers* of France, Germany, Poland, and Italy, have their diſtinct generals, who reſide at Rome. They were firſt introduced into France by Mary of Medicis in 1601, and have ſince built a fine hoſpital in the Fauxbourg St. Germain.

Brothers *of charity of St. Hippolytus*, a religious congregation firſt ſet on foot by Alvarez, a citizen of Mexico, in 1585, who aſſociated with him ſeveral other pious perſons, to attend on the ſick, and founded an hoſpital without the wall of that city; which being approved of by the pope, and the number of like hoſpitals increaſing, a congregation was formed under the title of *the charity of St. Hippolytus*, becauſe the firſt hoſpital had been dedicated to that ſaint, on whoſe feaſt-day the city firſt fell into the hands of the Chriſtians. Clement VIII. in 1594, granted them all the privileges of the *brothers of the charity* of St. John de Dieu.

Brothers *of death*, a denomination uſually given to the religious of the order of St. Paul, the firſt Hermit.

They are called *brothers of death*, *fratres a morte*, on account of the figure of a death's head, which they were always to have with them, in order to keep perpetually before them the thoughts of death.

This order, by its conſtitutions made in 1620, does not ſeem to have been eſtabliſhed long before pope Paul V: Lewis XIII. in 1621, permitted them to ſettle in France. The order was probably ſuppreſſed by pope Urban VIII.

Brothers *of penitence*, or of *the penitence of Jeſus Chriſt*, a name given at Thoulouſe to the religious of the third order of St. Francis, called alſo *Beguini*; and to a fraternity of penitents held in the chapel of the church of the third order, under the direction of the Beguini. See Beguins.

Brothers, *pyed*, *fratres pii*, a denomination given to all monks, whoſe habit was partly white, partly black; they were otherwiſe called *Agaches*.

Brothers *of St. Gregory the Illuminator*, a religious order eſtabliſhed in Armenia, in the fourteenth century, which being much reduced and decayed by the conqueſts of the Turks and Perſians, was, in 1356, united to the order of St. Dominic.

Brothers, *joyful*, *fratres gaudentes*, in Italy, denote the knights of the order of the Virgin Mary, firſt inſtituted at Bologna in 1261, for whom a rule was preſcribed by pope Urban IV.

Brothers, *poor*, in the Charter-house, a denomination given to decayed gentlemen, to the number of 80, who are ſubſiſted with diet, clothing, and lodging, on the eſtabliſhment.

The *poor brothers* are to be gentlemen by deſcent, come to poverty, or decayed merchants, ſoldiers, or officers of the king's houſhold. The conditions of admiſſion are, that they have no eſtate for life worth 200*l.* nor coming in, *viis & modis*, 24*l.* *per annum*; and that they be fifty years old, unleſs they have been maimed in the public ſervice; in which caſe, the age of forty ſuffices. They wear a livery-gown within doors.

Brothers, *white*, the name of a ſect which appeared in Ruſſia towards the beginning of the fourteenth century; ſo called from their white cloaks, on which was a St. Andrew's croſs, of a green colour. See Brethren.

Brothers *of arms*, an appellation given thoſe who contract a kind of fraternity in war, obliging themſelves to the mutual ſervice and aſſiſtance of each other.

In the military orders, the knights are alſo called *brothers*. —In the order of Malta, there is a particular claſs, who are called *ſerving brothers*; conſiſting of ſuch as cannot give proof of their nobility. In Latin they are denominated *fratres clientes*.

Brothers *by adoption*. See Adoption.

Two *brothers*, who have only the ſame father, are called *fratres conſanguinei*; and thoſe who are only deſcended from the ſame mother, *fratres uterini*.

Brothers *of the roſy croſs*. See Rosycrusians.

Brothers, *ſworn*, *fratres conjurati*. See Fratres.

Brothers, in *Alchemy*, *lame or maimed*, denote the imperfect metals which are to be cured of their lameneſs by the perfect elixir; i. e. are to be purified and ſeparated from their droſs, &c. by the philoſopher's ſtone.

BROTHERHOOD. See Fraternity.

BROW-*antler*, the firſt branch of the horn of a hart or buck, ſhooting out from the beam, or main horn, next the head.

Brow-*poſt*, in *Carpentry*, a beam which goes acroſs or overthwart a building.

BROWALLIA, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Its characters are theſe: the flower is funnel-ſhaped, of one leaf, having a cylindrical tube, twice the length of the empalement; the upper part ſpread open, and divided into five parts. It hath four ſtamina included in the chaps of the petal; the two upper being very ſhort, and the two under broad and longer. In the centre is ſituated an oval germen; the empalement afterward becomes an oval, obtuſe veſſel, with one cell, opening at the top into four parts, and filled with ſmall compreſſed ſeeds. One ſpecies of this *genus* grows naturally at Panama; beſides which, Linnæus reckons two more.

BROWN, a duſky kind of colour, inclining ſomewhat towards redneſs.

Dyers diſtinguiſh divers ſhades and gradations of *brown*, a *ſad brown*, *London brown*, *clove brown*, *purple brown*, *walnut-tree brown*, &c.

Spaniſh brown is a dull red colour, uſed by houſe-painters, chiefly for priming, and by colourmen, in preparing cloths for pictures, and other coarſe work, as being cheap and eaſy to work.

It is obtained from a native earth, which is found in the ſtate and of the colour in which it is uſed. The name ſeems to import, that it was formerly brought from abroad, but that which is now uſed is dug up in ſeveral parts of England. The method of dying *browns* is by putting the cloth in a boiling bath of red wood ground, and nut-galls bruiſed; and when it has boiled for two hours and a half, and has been cooled and aired, it is put again into the ſame bath, to which a proportionable quantity of copperas has been previouſly added. Soot communicates a *brown* dye, and is ſometimes uſed by dyers for this purpoſe.

Brown *bay*, in the *Manege*, is underſtood of horſes of a very dark cheſnut colour.

Brown *ochre*. See Ochre.

Brown, *pink*. See Pink.

Brown *wort*, in *Botany*. See Self-*heal*, and Fig-*wort*.

BROWNÆA, in *Botany*, a genus of the *monadelphia enneandria* claſs of plants, ſo called in memory of Dr. Patrick Brown, the celebrated Engliſh botaniſt. There are only two ſpecies of this genus yet diſcovered, which are natives of America. It is doubtful whether this plant will vegetate in our ſtoves, or green-houſes; it makes a beautiful appearance with its aſſemblage of purple or blood-red flowers. Phil. Tranſ. vol. lxiii. part i. p. 173.

BROWNISTS, a religious ſect, which ſprung out of the Puritans, towards the cloſe of the ſixteenth century: their leader, Robert Brown, wrote divers books in their behalf, was a man of good parts, and ſome learning. He was born of a good family in Rutlandſhire, and related to the lord-treaſurer Burleigh. He had been educated at Cambridge; but firſt publiſhed his notions, and began to inveigh openly againſt the diſcipline and ceremonies of the church, at Norwich, in the year 1580, from which time he underwent divers perſecutions from the biſhops; inſomuch that he boaſted, he had been committed to no leſs than thirty-two priſons, in ſome of which he could not ſee his hand at noon day. At length, with his congregation, he left the kingdom, and ſettled at Middleburgh in Zealand; where they obtained leave of the States to worſhip God in their own way, and form a church according to their own model; which they had not long done, before this handful of men, juſt delivered from the ſeverities of the biſhops, began to differ among themſelves, and crumble into ſo many parties, that Brown, their paſtor, grew weary of his office; and, returning to England in 1589, renounced his principles of ſeparation; and was preferred to the rectory of a church in Northamptonſhire, and died, after leading a very idle and diſſolute life, in 1630.

The revolt of Brown was attended with the diſſolution of the church at Middleburgh; but the ſeeds of *Browniſm*, which he had ſown in England, were ſo far from being deſtroyed, that Sir Walter Raleigh, in a ſpeech in 1592, computes no leſs than twenty thouſand followers of it.

The occaſion of their ſeparation was not any fault they found with the faith, but only with the diſcipline and form of government of the other churches in England. They equally charged corruption on the epiſcopal form; and on that of the preſbyterians, by conſiſtories, claſſes, and ſynods: nor would they join with any other reformed church, becauſe they were not aſſured of the ſanctity and regeneration of the members that compoſed it; on account of the toleration of ſinners, with whom they maintained it an impiety to communicate. They condemned the ſolemn celebration of marriages in the church; maintaining, that matrimony being a political contract, the confirmation thereof ought to come from the civil magiſtrate. They would not allow any children to be baptized of ſuch as were not members of the church, or of ſuch as did not take ſufficient care of thoſe baptized before. They rejected all forms of prayer; and held, that the Lord's prayer was not to be recited as a prayer; being only given for a rule, or model, whereon all our prayers are to be formed.

The form of church-government which they eſtabliſhed was *democratical*. When a church was to be gathered, ſuch as deſired to be members of it made a confeſſion of it; and ſigned a covenant, by which they obliged themſelves to walk together in the order of the Goſpel. The whole power of admitting and excluding members, with the deciſion of all controverſies, was lodged in the brotherhood. Their church-officers were choſen from among themſelves, for preaching the word, and taking care of the poor, and ſeparated to their ſeveral offices by faſting, prayer, and impoſition of hands of ſome of the brethren. But they did not allow the prieſthood to be any diſtinct order, or to give any indelible character. As the vote of the brotherhood made a man a miniſter, and gave him authority to preach the word, and adminiſter the ſacraments among them; ſo the ſame power could diſcharge him from his office, and reduce him to a mere layman again. And as they maintained the bounds of a church to be no greater than what could meet together in one place, and join in one communion; ſo the power of theſe officers was preſcribed within the ſame limits. The miniſter or paſtor of one church could not adminiſter the Lord's ſupper to another, nor baptize the children of any but thoſe of his own ſociety. Any lay-brother was allowed the liberty of propheſying, or of giving a word of exhortation to the people; and it was uſual for ſome of them, after ſermon, to aſk queſtions, and reaſon upon the doctrines that had been preached. In a word, every church, on the *Browniſts* model, is a body-corporate, having full power to do every thing which the good of the ſociety requires, without being accountable to any claſſis, ſynod, convocation, or other juriſdiction, whatever. Moſt of their diſcipline has been adopted by the independents, a party which afterwards aroſe from among the *Browniſts*.

The laws were executed with great ſeverity on the *Browniſts*; their books were prohibited by queen Elizabeth, and their perſons impriſoned, and many of them were hanged. The eccleſiaſtical commiſſion, and the ſtar-chamber, in fine, diſtreſſed them to ſuch a degree, that they reſolved to quit their country. Accordingly, many families retired, and ſettled at Amſterdam, where they formed a church, and choſe Mr. Johnſon their paſtor; and after him Mr. Ainſworth, author of the learned commentary on the Pentateuch. Their church flouriſhed near an hundred years. See Neal. Hiſt. of New Eng. tom. i. cap. 2. p. 58; and Robinſon, Apologia juſta, &c. Browniſtarum & Barrowiſtarum. 12mo. 1619. See INDEPENDENTS.

BROWS, or EYE-BROWS, are two hairy arches above the orbits of the eyes, bunching out by means of ſome fat under the ſkin in this place.

That end next the noſe is called the head, *caput*, the other the tail, *cauda*, of the *eye-brow*.

The uſe of the *eye-brows* is partly to break the rays of light deſcending from above, that they may not dart too ſtrongly into the eyes; and partly to be a ſkreen to the eyes from ſweat, duſt, or other matters deſcending from the forehead.

BROWSE, the tops of the branches of trees, whereon beaſts feed. This is ſometimes alſo called brouce, and bruttle; probably from the French *brout*, which ſignifies the ſame.

BROWSE more properly denotes the food which deer find in young copſes, continually ſprouting anew.

BROWSE, *beaſts of*, or BROWSING *beaſts*, a denomination including all of the fallow-kind, as the deer, roe-buck, rupicapra, &c.

BROWSE-*wood*, the ſame with ſpray or bruſhwood.

BROWTING, *Brouter*, among the *French Gardeners*, ſignifies breaking off the tips of the ſlender branches of trees, when too long in proportion to their ſtrength.

BRUARIA *turbaria*. See TURBARY.

BRUCHUS, a genus of inſects of the order of *coleoptera*, with filiform *antennæ*. Linnæus enumerates ſeven ſpecies.

BRUISE, in *Surgery*. See CONTUSION.

BRUISER, in *Mechanics*, the name of a concave tool uſed for grinding and poliſhing the *ſpecula* of teleſcopes. It is made of braſs, about a quarter of an inch thick, and hammered as near to the *gage* as poſſible. It is tinned on the convex ſide, and made equally broad at bottom and top. This ſerves to reduce the figure of the HONES, when it is too convex, and to rub down any gritty matter that happens to be mixed with the putty, before the ſpeculum is applied to the POLISHER. See Phil. Tranſ. vol. lxvii. part i art. 16. and Smith's Optics, book iii. chap. 2.

BRUISING, in *Pharmacy*, ſignifies the operation of breaking or pounding a thing coarſely, or by halves; frequently practiſed on roots, woods, and other hard bodies, to make them yield their juice or virtue more freely than they would do whole.

BRUMALIA, or BROMALIA, a feaſt of Bacchus, celebrated among the ancient Romans, during the ſpace of thirty days; commencing on the twenty-fourth of November, and ending the twenty-ſixth of December. Some ſay this feaſt was celebrated twice a year, viz. on the twelfth of the calends of March, and on the eighteenth of the calends of September.

The word comes from *bruma*, the day of the winter ſolſtice; in regard of the time when the feaſt was held: though others derive it from *brumus*, or *bromius*, names of Bacchus.

The *brumalia* were inſtituted by Romulus, who uſed, during this time, to entertain the ſenate.

During this feaſt indications were taken of the felicity of the remaining part of the winter.

The *brumalia* were alſo called *hiemalia*.

BRUNELLA. See SELF-*heal*.

BRUNSFELSIA, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower is of one leaf, and funnel-ſhaped, having a long tube, but ſpreads open at the top; it hath five ſtamina of the length of the tube, which are inſerted in the petal. In the centre is placed a ſmall round germen; the empalement afterward becomes a globular berry, with one cell, encloſing a great number of ſmall ſeeds, which adhere to the ſkin of the fruit.

We know but one ſpecies, which is a native of the ſugar iſlands in America; but is at preſent very rare in the Engliſh gardens.

BRUNIA, in *Botany*, formerly reckoned a genus in the Linnæan ſyſtem, but ſince claſſed as a ſpecies of the PROTEA.

BRUSH, an aſſemblage of hairs or hogs briſtles, faſtened in the holes of a wooden handle or board, pierced for that purpoſe, and ſerving to cleanſe divers bodies by rubbing therewith.

We ſay a round, a flat, or a ſquare *bruſh*, clothes-*bruſh*, head-*bruſh*, horſe-*bruſh*, beard-*bruſh*, comb-*bruſh*, weavers-*bruſh*, and the like.

The manner of making *bruſhes* is by folding the hair or briſtle in two, and bringing it by means of a pack-thread, or wire, engaged in the fold, through the holes wherewith the wood is pierced all over, or faſtened therein with glue, or pitch. When the holes are thus all filled, they cut the ends of the hair, to make the ſurface even.

BRUSH, *Painter's*. See PENCIL.

BRUSH, *ſheermens*, is made of wild boars briſtles, and ſerves to lay the wool or nap of cloths, after ſheering it for the laſt time.

The *fleſh-bruſh* is of uſe in medicine, eſpecially in caſe of rheumatiſms, and certain cutaneous diſorders. See FRICTION.

The *bruſh* is alſo applied to the ſoles of the feet of new-born infants, when fainting, to find whether they be alive or dead.

BRUSH, *ſilver*, in *Botany*. See LADY'S FINGER.

BRUSH, in *Electricity*, denotes the luminous appearance of the electric matter, iſſuing in a parcel of diverging rays, from a point. Beccaria aſcribes this appearance to the force with which the electric fluid, going out of a point, divides the contiguous air, and paſſes through it, to that which is more remote. See *Tab. Electricity*, *fig.* 8, 9, 10, 11. See STAR.

Bruſhes, *wire*, are uſed by ſilver-ſmiths and gilders, for ſcrubbing ſilver, copper, or braſs pieces, in order to the gilding them.

There is a method of dying or colouring leather, performed by only rubbing the colour on the ſkin with a *bruſh*. This the French leather-gilders call *brouſſure*; being the loweſt of all the ſorts of dye allowed by their ſtatutes.

Bruſh *of a fox*, among *Sportſmen*, ſignifies his drag or tail, the tip or end of which is called the chape.

Bruſh *iron-ore*, ſignifies a kind of ORE full of *ſtriæ*, reſembling the hair of a bruſh.

Bruſh is alſo uſed in ſpeaking of a ſmall thicket, or COPPICE. In this ſenſe, the word is formed from the middle age Latin *bruſcia*, *bruſcus*, which ſignifies the ſame.

Bruſh-*wood* denotes ſmall ſlender wood or ſpray. See BROWSE.

BRUSHING. Among *Jockies*, a *bruſhing* gallop denotes a briſk one: a horſe ſhould have his *bruſhing* gallop in a morning before watering.

BRUTE, an ANIMAL deſtitute of the faculty and uſe of REASON.

In which ſenſe, *brute* amounts to the ſame with BEAST.

Brutes are the ſecond order of *mammalia* in the Linnæan ſyſtem; the character of which is, that they have no upper or under fore-teeth; their feet have ſtrong hoofs, not formed for ſwift or ſtately motion, and they maſticate their food.

Among *brutes*, the monkey-kind bear the neareſt reſemblance to man; and this, both in the external ſhape and internal ſtructure, though more in the former than the latter. In the monkey-kind, the higheſt and the neareſt approaching the likeneſs of man, is the ORANG OUTANG, or *homo ſylveſtris*. Phil. Tranſ. N° 189. N° 256. p. 339.

The ſtructure and œconomy of *brutes* make the object of what is called comparative ANATOMY.

Philoſophers are much divided about the eſſential characters of *brutes*. Some define *brute* as an animal not riſible, or a living creature incapable of laughter; others, a mute animal, or a living thing deſtitute of ſpeech; the Peripatetics, an animal endowed with a ſenſitive power, but without a rational one. The Platoniſts allow reaſon and underſtanding, as well as ſenſe, to *brutes*, though in a degree leſs pure and refined than that of men. Lactantius allows every thing to *brutes* which men have, except a ſenſe of religion. Some *ſceptics* have aſcribed religion and virtue to *brutes*; and they ſay that Solomon ſeems to aſſure us, that the ſouls of men have no pre-eminence over thoſe of *brutes*. Eccleſ iii. 18, 19. Lact. Inſt. Div. lib. iii cap. 10. Stanley Hiſt. of Phil. p. xii chap. 13. Budd de Error. Stoic. Exerc i. § 6.

There are different faculties and degrees of knowledge in different ſpecies. Some have only the motive and ſenſitive faculties, as worms; others have alſo memory, and ſome imagination and invention, as monkeys and elephants: beſides that in the ſame ſpecies, ſome in docility and ingenuity exceed others; and that the climate, air, and food, have their influence on the *brute* kind, as on men; ſo that thoſe of the ſame ſpecies, in different countries, are found to have different qualities; of which Engliſh horſes, dogs, cocks, &c. are a ſufficient proof. It is hard therefore to define any thing univerſally concerning *brutes*. What agrees to the oyſter or the ſtar-fiſh, which differ little from inanimate, will it agree to the ORANG-OUTANG, which ſcarce differs, except as to ſpeech, from ſome ſpecies of men?

They have ſenſible knowlege, but want intellectual knowlege; they have apprehenſion, but not reflexion; are capable of prudence, which is only a great pitch of experience, but not of ſapience, which can only be the fruit of evidence. Phil. Tranſ. N° 80. p. 4054, and 4071. Hobbes Diſc. of Hum. Nat. chap. v. § 4. chap. vi. § 4. and chap. ix. § 18.

The chief operation of a rational ſoul is judgment, by which we diſtinguiſh true from falſe; to which the memory and imagination are ſubſervient. But this cannot be aſcribed to *brutes*, ſince they do not make propoſitions. They are incapable of ſcience, for want of names and ſigns whereby to denote abſtract ideas: however, there is no talent peculiar to man, which we may not diſcover ſome reſemblance of in *brutes*, except ſpeech and curioſity.

As for ſpeech or enunciative reaſon, to many it does not ſeem ſo neceſſary, ſince many of the philoſophers condemn it as a vice, and enjoin abſolute ſilence: in reality, ſuppoſing a man naturally dumb, does it follow, that he is void of reaſon? Is it any objection then to the reaſoning of *brutes*, that they have not the uſe of ſpeech, though, as a late author expreſſes it, they have all the organs neceſſary for that purpoſe? Budd. Annal. Phil. p. 102.

Some have pretended, that they have a jargon intelligible to one another; and Porphyry relates, that Tireſias and Apollonius Tyanæus underſtood their language. There is at leaſt a ſimilitude of ſpeech in *brutes*, for they know each other by their voices, and have their ſigns whereby they expreſs anger, joy, and other paſſions: thus a dog aſſaults in one ſtrain, fawns in another, howls in another, and cries when beaten in another. It is true, their ſpeech to us appears rude and inarticulate; but perhaps ours is the ſame in their ears. And if the voice of *brutes* be unintelligible to us, does not the ſame hold of the language of our own kind, till we have been inſtructed in it? The language of foreigners, what does it appear to us, but a confuſed unmeaning heap of ſounds. In fine, if laughter be peculiar to men, we ſee the image of it in *brutes*, ſignified by the motion of their ears, eyes, mouth, tongue, &c. Laſtly, what is ſo peculiar to man as foreſight of futurity; but have not beaſts this, which lay up ſtores with great care in their cells, as the ant, bee, &c.

The generality of the ancient philoſophers thought that *brutes* reaſoned: this, among the heathens, was the opinion of Anaxagoras, Plato, Porphyry, Celſus, Galen, Plutarch, and others. Among Chriſtians, Lactantius, and the whole body of Manichees and Gnoſtics: among the moderns, Valla, Sonnertus, Arriaga, Tho. Campanella, Gaſſendus, F. Daniel, and others, aſſert the ſame. Plutarch has a dialogue under this title, that *brutes* uſe reaſon. All the ſect of Pythagoras ſhould be of the ſame ſentiment, becauſe the *metempſychoſis* imports that human ſouls paſs into the bodies of *brutes*. Can any perſon, ſays Lactantius, deny that *brutes* have reaſon, when they often outwit man himſelf? Inſt. Div. lib. iii. cap. 10.

The Stoics, holding that the Divine Being is diffuſed through all creatures, were neceſſitated to maintain the ſouls of *brutes* to be divine, and conſequently that they had reaſon.

The Sceptics paralleled *brutes* with men. Sextus, more particularly, gives a compariſon between dogs and the human kind. The former excels the latter as to ſenſe; it has a quicker ſcent, whereby to purſue beaſts unſeen; it diſcovers them ſooner by the eye, and is more acute of hearing. Sext. Empir. Pyrrhon. lib. i. cap. 13.

A dog is not deſtitute of logic, as appears from Chryſippus's famous inſtance, who obſerved, that a hound coming into a road which divides into three, makes choice of the third by virtue of an induction or ſyllogiſm: for that having ſcented the two ways by which the beaſt did not paſs, he runs ſtraight upon the third without ſcenting it: where the reaſoning is obvious: the beaſt paſſed either that way, or that way, or this way; but he neither paſſed that way, nor that way, and therefore this way. Stanley Hiſt. Phil. p. 780.

That a dog is poſſeſſed of what they call internal reaſon, appears from his chooſing things convenient, flying the hurtful, purſuing his food, and running away from the whip; and when wounded or ſick, acting prudently as the circumſtances of his caſe, and his abilities and opportunities dictate.

Of how many medicines, how many arts do we owe the invention to *brutes*? It was from the ſpider, that man learned the art of weaving; from the ſwallow he borrowed architecture, from the gooſe ſwimming, from fiſh navigation, from ſilk-worms ſowing; to omit many other inſtances of the like kind alleged by Plutarch, Voſſius, and others. Tab. Bib. Græc. lib. iv. cap. 29. tom. iv. Plut. de Solert. Animal. p. 974. Voſſ. de Orig. Idol. lib. iii. cap. 27.

How many actions are to be obſerved of *brutes*, not to be accounted for without reaſon and argumentation? If we ſay that dogs, by long habit, and by force of rewards and puniſhments, may be taught many things: do not this teaching, docility, and remembrance of blows, argue memory, fear, and deſire, which cannot ſubſiſt without knowledge, ſenſe, pleaſure, and pain?

And if *brutes* have knowledge, it is allowed they muſt alſo have judgment and reaſon, and a ſcience of univerſals. Tavern. Trav. Ind. ap. Phil. Tranſ. N° 326. p. 65. Chauvin Lex. Phil. p. 377, &c.

Some ſpeak as if they held *brutes* to be moral beings, and under the obligation of the law of nature. Ulpian, and other civil lawyers, are ſuppoſed to be of this opinion; as alſo the Stoics, from whoſe ſchool this tenet is ſaid to have been firſt borrowed. It is alleged on the other hand, that *brutes* cannot be ſubject to a law, unleſs they have a power of knowing him that made the law, judging whether we have a right to command them, and what is contained in the law, that they may direct themſelves accordingly; which ſeem all to be things out of the reach of *brutes*. But Ulpian's definition of the law of nature, *Jus naturale eſt quod natura omnia animalia docuit*, when fairly interpreted, does not imply, that *brutes* have reaſon and reflection, but may be underſtood of that natural inſtinct common to man and *brute*, by which they are impelled to ſelf-defence, propagation of their ſpecies, &c. Albertus and Schmidius have diſſertations expreſs on the divine honours paid to *brutes*.

Brutes, *mechaniſm of.*—The Carteſians, on the other hand, adopt that ſtrange paradox, of the mechaniſm of *brutes*; and aſſert them not only void of all reaſon and thought, but of all perception. This ſyſtem is much older than Des Cartes; it was borrowed by him from Gomez Pereira, a Spaniſh phyſician, who employed thirty years in compoſing a treatiſe, which he entitles Antoniana Margarita, from the Chriſtian names of his father and mother. It was publiſhed in 1554. See Voſſ. de Orig. Idol. lib. iii. cap. 41.

This was revived by Des Cartes, and further aſſerted by Le Grand, D'Armaſon, and others of his followers, who were led to adopt this doctrine, from that principle of his philoſophy, that the eſſence of the ſoul conſiſts in thinking; ſo that, ſuppoſing knowlege and thought in *brutes*, they muſt have ſouls like thoſe of men; the ſenſitive ſoul of the Ariſtotelians being held by him a mere chimera.

But Pereira does not appear to have been the firſt inventor of the doctrine; ſomething like it having been held by ſome of the ancients, as we find from Plutarch, and St. Auguſtin. Plut. de Plac. Phil. lib. v. cap. 20. Auguſt. de Quant. Animæ. Paſch. Invent. Nov. Antiq. c. 3.

Perhaps the beſt argument againſt the ſyſtem of machines is, that it is contrary to the common ſenſe and apprehenſions of all mankind. Ought not thoſe, who deny that *brutes* have ſenſe, to be combated with the ſame weapons that are uſed againſt the Sceptics, who deny all truth and certitude; and againſt the immaterialiſts, who deny the exiſtence of bodies?

Henry More, in his Enchiridicon Metaphyſicum, F. Daniel, in his Nouvelles Difficultés, publiſhed in 1693, and in his Voyage du Monde de Deſcartes, as alſo F. Pardies, in a treatiſe of the knowlege of *brutes*, have preſſed the Carteſians hard. Paſchius has alſo a diſputation on the ſenſe and knowlege of *brutes*, and Willis a treatiſe on the ſouls of *brutes*. De Anim. Brut. Oxon. 1672, 4to.

But to ſay the truth, we are not much wiſer for the labours of theſe learned gentlemen. The common opinion of the untaught and unprejudiced part of mankind ſeems to be, that *brutes* have ſenſe, imagination, memory, and paſſion, but that they are void of underſtanding and reaſon; that is, in the language of philoſophers, they have the inferior faculties of the ſoul, but not the ſuperior. Nor will the diſtinction appear groundleſs to thoſe who attend to the difference between the objects of the mind, and its acts about theſe objects; as alſo to the difference between the confuſed and the diſtinct comprehenſion of any thing. See Buffon's Hiſt. Natur. vol. ii. p. 443.

BRUTIA, in the *Medical Writings of the Ancients*, a word uſed to expreſs the fatteſt and moſt reſinous kinds of PITCH, and ſuch as was propereſt for making the oil of pitch, called *oleum picinum*.

The word *brutia* ſeems to have been an adjective of diſtinction given to this kind of PITCH by the ancients, from their common cuſtom of naming things from the places whence they were brought; *Brutia* being the name of a country in the extreme parts of Italy. Plin. lib xv. cap. 7.

BRYGMOS, a kind of convulſion, affecting the lower jaw, and ſtriking the teeth together; moſt frequently obſerved in children affected with worms.

The word is formed from βρυκειν, or βρυχειν, frequently uſed by Hippocrates for chattering of the teeth.

The *brygmos*, or chattering of the teeth, is a ſymptom of the acceſs of an ague, or intermitting fever.

BRYON, in the *Botanical Writings of the Ancient Greeks*, an abbreviation of the word *bryonia*.

BRYONY, in *Botany*, a name uſually made to take in two different *genera* of plants, under the names of *alba* and *nigra*, the *white* and *black* kind. Mr. Tournefort, however, has determined this word to expreſs only what we call the *white bryony*, making TAMUS the name of the black.

In the Linnæan ſyſtem it is a genus of the *monoecia ſyngeneſia* claſs of plants. Its characters are theſe: it hath male and female flowers on the ſame plant; the male flowers are bell-ſhaped, adhering to the empalement, cut into five ſegments, and have three ſhort ſtamina; the female flowers ſit upon the germen; and the petal is the ſame with thoſe of the male; the germen, which is under the flower, afterward becomes a ſmooth, globular berry, containing oval ſeeds adhering to the ſkin. There are ſix ſpecies.

The firſt ſort grows upon dry banks under hedges, in many parts of England. The roots of this plant have been formerly, by impoſtors, brought into a human ſhape, and ſhewn about the country for mandrakes, to the common people, who were eaſily impoſed on by their credulity, and the owners got good livings thereby. The method practiſed was, to find a young thriving *bryony* plant, and opening the earth all round it, ſo as not to diſturb the lower fibres, they faſtened a mould, ſuch as is uſed by the makers of plaſter figures, round the root, with wire; and then filling up the earth again, left it to grow to the ſhape of the mould, which it will do in a ſummer. The leaves of this plant are alſo often impoſed on the people in the market for *mandrake* leaves, although there is no reſemblance in figure, or agreement in quality, between them.

The other kinds muſt be raiſed in a bark ſtove, and when they begin to ſpread, their branches may be trailed againſt the wall, or againſt an eſpalier; and when they are full of fruit, they make a pretty variety among other exotics.

The root was anciently much uſed as a powerful purgative, eſpecially of ſeroſities; but now chiefly retained as an uterine detergent; in which quality it enters the compoſition of an officinal water, denominated, from it, *aqua bryoniæ*, generally preſcribed againſt hyſteric diſorders.

M. Boulduc found, by a chemical analyſis, that *bryony* conſiſts only of ſaline principles, without any reſin: wherein it differs from *mechoacan*, which, in other reſpects, it much reſembles. He adds, that it has more virtue taken in ſubſtance than in any other manner; which is common to this, with moſt other purgatives.

From two ounces of *bryony*, Neumann obtained by water ten drams of gummy extract, and from the ſame quantity he obtained by ſpirit, two drams, two ſcruples and an half of reſinous extract. It is a ſtrong purgative, and as ſuch has been ſtrongly recommended in hydropic caſes. It appears, however, ſays Neumann, not to be entirely ſafe. See his chemical hiſtory of this plant, in Dr. Lewis's edition of Neumann's Works, p. 351.

But as this is apt to be too rough in its operation, the ſeveral preparations of infuſions, decoctions, and extracts, are to be preferred to the ſubſtance.

It is, when freſh, full of an uſeleſs and redundant moiſture, and its doſe in infuſion in white wine, which is the beſt menſtruum, is a dram of the dried root, or half an ounce of the green, which is about equivalent in ſtrength. Hiſt. Acad. Par. 1712.

BRYTIA, among the *Ancient Naturaliſts*, denotes the maſk or ſolid part of grapes, which remain after expreſſing the juice.

BRYUM. See *Wall*-Moss.

Bryum *lactucæ folio*, a name given by ſome to the oyſter-green. See Tremella.

BUBALINUS, *ſerpens*, in *Zoology*, a name given by authors to the *Anacandaya* of the Ceyloneſe, a very terrible SERPENT, common in that part of the world, and very miſchievous among their cattle: whence its Indian name, which ſignifies as much.

BUBALUS, the *buffalo*, a ſort of wild bull, a ſpecies of the *bos* or *ox*, very common in many parts of Europe, and in the pope's territories, kept tame, for the ſake of the milk of the female, of which the famous cheeſes, called *caſe di cavallo*, are made. They are alſo commonly employed in the affairs of huſbandry, and have, for this purpoſe, a braſs or iron ring put through their noſes, and, by means of a rope, or thong of leather, put through this, they are managed at pleaſure; though if ever ſo well tamed, they uſually keep ſomething of their native fierceneſs. They were originally brought from India into Lombardy in the reign of king Agilulf, who reigned from 591 to 616.

The Italian *buffalo* is conſiderably larger than the common bull; his body alſo is thicker, and his horns very large, ſtrait for a great length from their baſe, then bending inwards, not round, but compreſſed, with one ſide ſharp, and of a black colour; the toughneſs of his ſkin, of which buff-leather is made, is well known.

Beſides this, there are other varieties of this ſpecies; as the *naked buffalo* of the Eaſt Indies, with briſtly thin hair, with the rump and thighs quite bare, the firſt marked with two duſky ſtripes pointing downward, the laſt with two tranſverſe ſtripes; and with horns compreſſed ſideways, taper, and ſharp at the point. The American *buffalo*, or the BOS BISON of Linnæus, has horns very cloſely united at the baſe, bending inwards and downwards, and turning outwards at their points; they are two feet round at the baſe, very prominent, ſharp at the point, and two feet long; the head and ſhoulders are covered with long hairs of a dark colour; the body is naked behind, the ſhoulders high, and the fleſh ſmells ſtrong of muſk. It lodges among the high reeds in the *ſavannas*, in the interior parts of North America; it is very fierce, but capable of being tamed, and will breed with the common kind. Its weight is from 1600 to 2400lb. See *Tab. Quadrupeds, fig.* 12. See Bison.

There is alſo the *dwarf buffalo*, with horns cloſe at their baſe, broad and flat at the beginning, receding in the middle, almoſt meeting at the points, and ſtanding erect. This animal is larger than a roe-buck, but leſs than a ſtag; it is compact and well made, with ſhining hair, of a tawny brown; ſhort legs, thick neck, elevated ſhoulders, and tail terminated with long hairs. Pennant.

BUBBLES, Bullæ, in *Phyſics*, little round drops or veſicles of any fluid filled with air, and formed either on its ſurface, upon the addition of more of the fluid, as in raining; or in its ſubſtance, upon a vigorous inteſtine commotion of its parts.

Bubbles are dilatable, or compreſſible, i. e. they take up more or leſs room, as the included air is more or leſs heated, or more or leſs preſſed, from without; and are round, becauſe the included aura acts equally from within all round. Their coat, or cover, is formed of the minute particles of the fluid, retained either by the velocity of the air, or by the briſk attraction between thoſe minute parts and the air. See Colour.

Theſe little *bubbles*, riſing up from fluids, or hanging on their ſurface, form the white ſcum at top; and theſe ſame *bubbles* form the ſteam, or vapour, flying up from liquors in boiling, &c. the manner of which ſee under Boiling, Vapour, &c.

Bubble, in *Commerce*, is a cant name given to a ſort of projects, for the raiſing of money on imaginary grounds; very frequent in the years 1720 and 1721.

The pretended deſign of theſe undertakings was, to raiſe a ſtock, for the retrieving, ſetting on foot, or carrying on, ſome promiſing and uſeful branch of trade, manufacture, machinery, or the like. In order to which, propoſals were given out, ſhewing the advantages of the deſign, and inviting perſons into it. The ſum neceſſary to carry on the affair, together with the profits expected from it, were divided into a certain number of ſhares, or ſubſcriptions, to be purchaſed by perſons diſpoſed to adventure therein.—The real deſign, in ſome, was to raiſe a ſum for the private advantage of the projectors, to be laid out by them in the South-ſea ſtock, &c. in hopes, by the riſe thereof, to be able to refund the ſubſcribers money, with profit to themſelves. In others, the deſign was abſolutely to defraud the adventurers of their ſubſcription-money, without any view to reſtitution.

There was a third kind ſomewhat different: the projectors of theſe, to proceed the more ſecurely, propoſed to have books opened, and ſubſcriptions taken at ſome time to come; and in the mean time took money, by way of *premium*, to intitle perſons to be admitted ſubſcribers, as ſoon as the affair ſhould be ripe for dividing into ſhares. Several thouſand ſhares were thus very frequently beſpoke in one day; and *premiums*, from one ſhilling, to ſome pounds, paid thereupon, to the profits of the projectors.

The number of *bubbles*, and their qualities, are very extraordinary; ſome of them, too, authorized by patents; and, in others, the projectors and their proprietors formed into corporations: ſome for fiſheries, ſome for inſurances, ſome for the digging of mines, &c.

BUBBLING *waters*. See Water.

BUBO, in *Zoology*. See Owl.

Bubo, in *Anatomy*, is ſometimes uſed to denote that part otherwiſe called inguen, or *groin*.

Bubo, in *Medicine* and *Surgery*, denotes a tumour, ſometimes inflammatory, and ſometimes ſchirrhous, gathering chiefly in the glands of the *inguen*, or groin.

The word comes from the Greek βȣϐων, *inguen*; the uſual place of ſuch tumours.

There are two kinds of *buboes*, the one called *benign*, or mild, the other *malignant*.—Mild *buboes* are thoſe which are preceded or attended with no manifeſt diſeaſe in the body; and they are eaſily cured by gentle mercurials, externally applied, and an occaſional purge; or by encouraging ſuppuration, and proceeding as in a common abſceſs.—Malignant *buboes* are divided into *peſtilential* and *venereal*: the former ariſe in peſtilential fevers, &c. The latter are the product of impure embraces; and frequently the forerunner of the pox.—When a *bubo* is encompaſſed with a circle of ſeveral colours, it is a ſign it is peſtilential; and it is generally mortal.

By *buboes* in *peſtilential* caſes, the writers in phyſic not only expreſs ſuch tumors as ariſe under the arms, under the ears, and in the groin; but comprehend under this term thoſe alſo which are ſituated in the neck, breaſt, arms, legs, and other fleſhy parts of the body, which ſwell and inflame in *peſtilential* fevers, and ſeem the conſequences of the endeavours of nature to throw out the peſtiferous matter which lay concealed in the body.

Peſtilential buboes are diſtinguiſhed from other tumors by their happening at a time, and in conjunction with the plague, and from their being accompanied by the ſymptoms proper to that diſeaſe. Theſe tumors appear ſometimes ſooner, ſometimes later, in the courſe of the diſeaſe; in ſome they appear before the patient knows he has the infection, and in others two or three days elapſe before their appearance: they are very ſeldom known to appear later than on the fourth day, and are ſometimes joined with carbuncles; but though the *buboes* frequently appear without theſe, yet the carbuncles never appear without tumors.

Perſons who have theſe tumors come on without any very bad ſymptoms, and have them maturate ſpeedily, are in general the ſooneſt freed from the diſtemper, inſomuch, that the beſt method of giving relief in this terrible diſeaſe, conſiſts in the carefully promoting and keeping up the *buboes* and tumors. All diſcutient or diſperſing medicines are carefully to be avoided, and the phyſician's buſineſs is to aſſiſt nature in the throwing out, and moſt ſpeedily bringing theſe tumors to ſuppuration.

The patient is to be confined to his bed on the firſt appearance of theſe, and with the help of internal medicines proper to haſten the ſuppuration of tumors, the parts affected are to be rubbed pretty ſtrongly with the hands or cloths, and external, maturating, and emollient cataplaſms, to be applied; of this kind is that of yeaſt, ſalt, and muſtard-ſeed, all mixed together, or of yeaſt alone: by means of theſe the tenſe parts are relaxed and ſtimulated, and the ſuppuration greatly promoted; as alſo by the cataplaſms of roaſted onions, with Venice treacle and butter; or of crumb of bread, with milk and ſaffron. Plaſters are alſo very uſeful on ſome occaſions, in theſe caſes, as the frequent renewal of the cataplaſms expoſes the patient too much to the external air, and theſe are not attended with that inconvenience.

The moſt famed plaſters on theſe occaſions are that of Barbet, made of the *diachylon*, with the gum and mucilage plaſter, of each half a pound; muſtard-ſeed in powder, three ounces; baſilicon, four ounces, all mixed and made into a plaſter; and that of Dr. Hodges, made of three ounces of *oxycroceum*, an ounce of *galbanum*, the ſame quantity of *gum caranna*, and two ounces of black pitch, reduced to the conſiſtence of a plaſter.

This may be uſed like the former; nor is that plaſter to be eſteemed a trifle, which is made of honey, flour, and the yolks of eggs.

In ſome caſes of this terrible diſtemper, the tumor comes to ſuppuration in a few days; in others it is ſome weeks before it can be brought to it, by all that can be done. When thoroughly ſuppurated, it is to be opened with the ſcalpel, if it does not break of itſelf; and after thus opening, when the matter has been diſcharged, it muſt be well cleanſed. The beſt digeſtive in this caſe is the common ointment uſed on that occaſion, mixed with a ſmall quantity of Venice treacle, and balſam of ſulphur made with oil of turpentine. At each dreſſing the matter is to be gently ſqueezed out of the abſceſs, and the ointment applied without tents, unleſs the opening prove very narrow; then applying over all a plaſter of the common diachylon, or of honey and flour, the whole may be bound on, and this dreſſing continued till it is a proper time to heal with ſome vulnerary balſam.

There has been much diſpute between the phyſicians of different ages about the proper time for opening *buboes* of this kind; ſome have been for making an immediate inciſion, and others even for extirpating the whole ſwelling, as ſoon as it appeared, by means of the knife; but the firſt of theſe methods has been found to be frequently attended with the ill conſequences of ill conditioned fiſtulæ, ſtiffneſs, and loſs of motion in the limb, and ſometimes even with mortifications and gangrene; and the other too harſh and dangerous in many parts of the body: and the preſent practice univerſally diſallows both methods, being always for bringing the ſwelling to ſuppurate. Heiſter's Surg. p. 200.

The poiſon of the matter of theſe ſores has been nicely and boldly enquired into, as to its nature and properties, by Dr. Alpranus of Prague, in the time of the plague there in 1680. This gentleman having launced a *peſtilential* boil, collected the matter from it, and put it into a retort, luting the junctures with the receiver very cloſely and exactly, and applying by proper gradation the ſeveral degrees of fire; at firſt there came over a water, then a more fat and viſcid liquor, of an oily nature; and laſtly, there appeared in the neck of the retort, a ſalt. The fire being taken away, and the veſſels cooled, the doctor prepared himſelf for the opening of them by ſtopping his ears with cotton, his noſtrils with peſſaries, and his mouth with pieces of ſpunge, all ſoaked in vinegar and Venice treacle. The moment the veſſels were opened, however, there proceeded out of them a ſtench more horrible than can be conceived, which ſtruck the doctor with an univerſal trembling, in ſpite of his defence. He proceeded, however, to break the neck of the retort, and ſeparating the fœtid ſalt from it, he ventured himſelf to taſte it, and deſired Mr. Reſhel, the perſon from whom the matter was obtained, to do the ſame: it was found to have a moſt dreadfully piercing acrid taſte, which the doctor compares to that of *aqua regia*.

Hence he infers, that the moſt terrible ſymptoms of this fatal diſeaſe are to be accounted for: the ſtomach, wounded by ſo acrid a juice as this mingled among the blood, nauſeates food, and is afflicted with continual vomitings; the guts, infeſted by the ſame unwelcome gueſt, are thrown into violent perturbations, whence ariſe thoſe diarrhœas which often accompany the patient to his death; and from the horribly acrid quality of this juice, it is no wonder that ſuch piercing pains are found in the *buboes*, and ſuch burnings in the carbuncles that attend this diſeaſe.

Hence, alſo, as he obſerves, it is, that ſudorifics are the beſt remedies, ſince they allay the acrimony, and tend to expel the venomous juices through the pores. In this ſickneſs at Prague this gentleman obſerved, that almoſt all who ſweat plentifully recovered, whereas thoſe who did not ſweat, were moſtly taken off. Hook's Philoſoph. Collect. N° ii. p. 18.

Buboes, *venereal*, are tumors ariſing principally in the groin, after contracting the venereal diſeaſe, and they are ſometimes attended with the other ſymptoms of that diſorder, ſometimes they are themſelves the only ſymptoms of it. Theſe ariſe ſometimes ſooner, ſometimes later, after contracting the infection. The tumor firſt appears with hardneſs, redneſs, and pain either in one or both the groins, and ſometimes in the arm-pits. Great care is to be taken to diſtinguiſh, in thoſe caſes, whether the *bubo* be of a benign kind, or be really from a venereal infection; for miſtakes of this matter are on both ſides very dangerous. If a benign *bubo* be miſtaken for a venereal one, the patient is uſually treated in too harſh a method, and has more trouble and pain than are neceſſary; and, on the other hand, if a venereal *bubo* be miſtaken for a benign one, he is uſually treated ſo improperly as to be brought into a confirmed lues.

The *buboes* are known to be venereal, when they are the conſequences of impure embraces, or are accompanied with, or preceded, by gonorrhœas, chancres, and other ſymptoms of the venereal diſeaſe. When from theſe attendant ſymptoms, and from the patient's confeſſion, the *bubo* is found to be venereal, a cure is immediately to be ſet about; for though there is no great difficulty or danger in theſe caſes when taken in time, yet there are few in which delays are of worſe conſequence; for, from theſe, from an irregular courſe of life, or from an improper method of treatment, the cure often becomes extremely difficult, and the patient too frequently gets into a confirmed lues.

It is much diſputed whether the cure of theſe tumors by diſcuſſion be ſafe; many are of opinion, it is by no means to be allowed in theſe any more than in peſtilential *buboes*, ſince in both caſes, by that means, the poiſon is driven back into the blood. But the caſe is not parallel, and the truth is, that in theſe tumors the cure by ſuppuration is ſlow, tedious, and attended with many inconveniences, and that much better effects may be produced, and with the greateſt ſafety, by purging and mercurial medicines, with the decoctions of the woods, and other purifiers and ſweeteners of the blood.

The beſt method, whether the *bubo* be attended with a gonorrhœa or not, is to purge frequently, and give proper doſes of calomel; for *buboes* can never be ſafely cured till the body is perfectly freed from the venereal venom; and, by this means, if there be a gonorrhœa in the caſe alſo, that is cured at the ſame time. When there is a great inflammation, and the patient is of a robuſt plethoric habit, it is always neceſſary to bleed; while this method is followed, diſcutient plaſters ſhould be applied externally to the tumor, as the mercurial plaſter or the like, and the patient ſhould be kept to a regular courſe of life, and a proper diet. By this method, venereal *buboes*, which are not become inveterate, may be cured with great eaſe and ſafety.

But if the ſurgeon be called in too late, if the *bubo* will not give way to theſe methods; or if, for any other reaſon, he determines to bring it to ſuppuration, the maturation is in this caſe to be promoted as faſt as poſſible; and one great method to bring on ſuppuration with ſpeed, is to order the part to be rubbed ſtrongly, and for a conſiderable time, either with the fingers wetted with a little oil, or with linen rags, till it look very red and inflamed; and this is to be often repeated, applying after each time a plaſter of diachylon, with the gums, or ſome other of the maturating kind. While the patient is able to go abroad, violent exerciſes of all ſorts, as dancing and the like, are extremely proper, and do ſervice in haſtening a ſuppuration. When the pain will not ſuffer him to walk any longer, then it is proper to keep to the uſe of cataplaſms, inſtead of the plaſter; theſe are indeed ever much more ſerviceable to promote ſuppuration than plaſters, and the beſt on this occaſion are thoſe made of onions, roaſted under the aſhes, or of flour, honey, and yeaſt, or that of crumbs of bread boiled in milk, with the addition of a little ſaffron; theſe are to be applied warm to the parts, and frequently renewed; and it is always beſt to rub the parts, till they look very red, before the application of them. During the uſe of theſe external remedies, the patient ſhould be continually taking decoctions of the woods, and ſmall doſes of calomel; for theſe greatly attenuate the blood, drive it toward the ſkin, and correct the venereal venom. When theſe methods have brought the ſwelling to a perfect ſuppuration, the ſcalpel is to be taken in hand, to make the opening. Great caution is to be uſed in making the inciſion, not to hurt the larger blood-veſſels, which might occaſion very dangerous hæmorrhages. To avoid theſe miſchiefs, the protuberant part of the *bubo* is to be preſſed outward by the fingers, before the ſcalpel is introduced to make the inciſion. Great caution is alſo neceſſary as to the time of opening theſe tumors; for the doing this either too ſoon, or too late, are of very bad conſequence; the firſt brings on violent pains and inflammations, and other bad ſymptoms, and, by the latter, the venom has time given it to mix itſelf with the blood, and bring on a confirmed lues.

If the patient dreads the knife, the *bubo* may be opened with a cauſtic; and by whatever means it is done, it muſt be afterwards well cleanſed. The proper dreſſing on this occaſion is the common digeſtive ointment, with a ſmall quantity of Venice treacle, and a little red precipitate mixed in it; over this is to be applied a plaſter of diachylon, with the gums, or the like; by which means the lips of the *bubo* will be ſufficiently ſoftened: and when ſufficiently deterged in this manner, it may be healed by ſome vulnerary balſam applied on lint. It ſometimes happens, that the ulcerated *bubo* becomes ſo ſtubborn, that it will neither incarn nor cicatrize by the help of any medicines, but always diſcharges a copious quantity of matter. If, in this caſe, burnt alum and red precipitate prove of no ſervice, the actual cautery ought to be applied, and the lymphatics will by this means have their commuuications for ever cut off. Heiſter's Surgery, p. 207.

BUBON, in *Botany*, *Macedonian* PARSLEY; a genus of the *pentandria digynia* claſs of plants. The characters are theſe. It hath an umbelliferous flower, and the ſmall umbels have twenty rays; the empalement of the flower is permanent; the flower is compoſed of five ſpear-ſhaped petals, which turn inward, and hath five ſtamina; the oval germen is ſituated below the flower, which afterward becomes an oval, channelled, hairy fruit, dividing in two parts, each having an oval ſeed, plain on one ſide, but convex on the other. There are four ſpecies. This plant in warm countries is biennial; but in England it ſeldom flowers until the third or fourth year: when the plant flowers it always dies. They make a pretty variety in the green-houſe.

The ſeeds of one ſpecies of this plant are ingredients in the mithridate and theriaca.

The *galbanum* of the ſhops is ſuppoſed to be procured from two other ſpecies indifferently; and upon breaking their leaves, the juice which flows from the wound hath a ſtrong odour of the *galbanum*, which is a confirmation of it.

BUBONIUM, in *Botany*, a name given by ſome authors to the *Aſter Atticus*, or golden STAR-*wort*.

BUBONIUS *lapis*, a figured ſtone, in ſhape reſembling an owl's head, of a flinty ſubſtance, black within, and cineritious without. It was thus denominated by Dr. Plott, having not been before named by naturaliſts. Hiſt. Oxford. chap. v. § 45.

BUBONOCELE, a tumor in the groin; occaſioned by the deſcent either of the *epiploon*, or the inteſtines, through the perforation of the *muſculus obliquus deſcendens*.

The word comes from the Greek βȣϐων, *inguen*, and κηλη, *tumor*.

The *bubonocele* is the ſame with what is otherwiſe alſo called *ramex*, and HERNIA *inguinalis*.

It is a ſpecies of rupture; though ſurgeons call it an *incomplete* one; and is common to women, as well as men.

Some make two kinds of *bubonoceles*; the one owing to a deſcent of ſome of the *viſcera*, as the *omentum*, or inteſtines, ſtopping in the groin, and not falling ſo far as to the *ſcrotum*; the other a collection or ſtagnation of excrementitious humours in the inguinal glands; which latter is more properly called *bubo*, and differs little, except in ſeat, from the bronchocele.

BUBULCA, in *Zoology*, a ſmall freſh-water fiſh, called by ſome *bouviera* and *petenſe*; it is ſmall, flat, and very ſhort, approaching to a round rather than a long ſhape, and of a fine ſilvery whiteneſs, ſeldom above two inches in length.

BUCA, in *Natural Hiſtory*, a name by which ſome authors call the *buccinum*.

BUCAO, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a ſpecies of *ſcreech* OWL, which is of the ſize of a peacock. It is very common in thoſe iſlands, but wholly unknown to us, and is a very beautiful bird, but makes a hideous noiſe in the night.

BUCARDITES, or BUCARDIA, in *Natural Hiſtory*, a name given by many authors to a ſtone, in ſome degree reſembling the figure of an ox's heart. See *Tab. of Foſſils*, *Claſs* 9.

It is uſually of the ſubſtance of the coarſer ſtones, and is no other than a quantity of the matter of ſuch ſtone received while moiſt into the cavity of a large cockle, and thence aſſuming the figure of the inſide of that ſhell, the depreſſion of the head of the cockle, where the *cardo* or hinge of this ſhell is, makes a long and large dent in the formed maſs, which gives it a heart-like ſhape. Plott mentions a *bucardites*, which he found at Stretfford in Staffordſhire, which weighed twenty pounds, though broken half away, curiouſly reticulated, with a white ſpar-coloured ſtone. Nat. Hiſt. Oxf. chap. v. § 145.

BUCARDIUM, in *Natural Hiſtory*, a name given by authors to a kind of HEART-SHELL, reſembling an ox's heart in ſhape; it is of the *genus* of the *cordiformes*, or heart-ſhells, and differs from the other kinds, in being of a more globular figure.

The cabinets of the curious afford us ſeven *ſpecies* of this ſhell: 1. A yellow-furrowed one. 2. A grey ſpinoſe one. 3. A white-furrowed one. 4. A thicker narrow one. 5. The thick one, with a *cardo* ſeparated from the *apex*. 6. The thick kind, with the *cardo* at the *apex*; and, 7. The baſtard Noah's ark-ſhell.

BUCCA FERREA, in *Botany*, a name given by Micheli to a genus of plants, called ſince by Linnæus RUPPIA.

BUCCÆ *muſculus*, in *Anatomy*, a name given by ſome to the muſcle more uſually called the *buccinator*, and *contrahens labiorum*.

BUCCALES *glandulæ* are ſmall glands diſperſed over the inner ſide of the cheeks and lips, which ſeparate a ſpittle, uſeful in maſtication and digeſtion.

Steno, and ſome other writers, confound the *buccal* with the maxillary glands; from which they are really diſtinct. Phil. Tranſ. Nº 304. p. 6.

BUCCANEERS, or BUCANEERS, a term frequent in the Weſt Indies, properly uſed for a kind of ſavages, who prepare their meat on a grate, or hurdle, made of Braſil-wood, placed in the ſmoke, at a good height from the fire, and called *buccan*.

Whence, alſo, the little lodges, raiſed for the preparation of their food, are called *buccans*; and the action of dreſſing it *buccaning*.

Meat *buccaned*, is ſaid to have an excellent taſte, the vermil colour of a roſe, and a charming ſmell; all which it retains many months. Oexmelia, from whom we have this, adds, that the neighbouring people ſend their ſick hither; that, by eating their *buccaned* meat, they may be recovered.

The origin of the word is referred to the people of the Caribbee iſlands, who uſed to cut their priſoners of war in pieces, and lay them on hurdles with fire underneath, which they call *buccaning*, i. e. roaſting and ſmoking together: hence our *buccaneers* took both their name, and their cuſtom; with this difference, that what the former did to men, theſe did to animals caught in hunting.

The Spaniards, Savary tells us, call the *buccaneers* in their territories *matadores*, that is, *killers*; and *monteros*, that is, *hunters*: the Engliſh call theirs, *cow-killers*.

The *buccaneers* are of two diſtinct profeſſions: the one only hunt bulls, for their ſkins; the other beaſts, for their fleſh.

The art of *buccaning*, Oexmelia deſcribes thus: the beaſt being flaid, and the bones ſtripped out, the fleſh is cut into pieces of the length of the arm, and ſalted, and the next day laid on the *buccan*; which conſiſts of twenty or thirty bars laid acroſs, half a foot from each other: under this they raiſe a thick ſmoke, adding the ſkin and bones of the beaſt, to heighten it.

This is found vaſtly better than any ſimple fewel: becauſe the volatile ſalts of thoſe parts are by this means communicated to the fleſh, and give it ſuch a reliſh, as that, after a little of this *buccaning*, the niceſt palate will eat it without further preparation.

Buccaneers are uſually confounded with freebooters, from whom, in ſtrictneſs, they ought to be diſtinguiſhed. The ancient inhabitants of Hiſpaniola, and the other Caribbee iſlands, after their conqueſt by the Europeans, conſiſted of four ranks or orders of perſons, viz. *buccaneers*, or bull-hunters, who ſcoured the woods; *freebooters*, who ſcoured the ſeas as pirates; *huſbandmen*, who tilled the lands; and *ſlaves*. Of theſe, the two firſt diſtinguiſhed themſelves moſt by their military diſpoſition, and the ravages they made, eſpecially among the Spaniards.

The name is particularly given to the French inhabitants of the iſland of St. Domingo, whoſe ſole employment is to hunt bulls or wild boars; in order to ſell the hides of the former, and the fleſh of the latter.

Sometimes the word *buccaneer* ſignifies alſo thoſe famous adventurers of all the nations in Europe, who joined together to make war againſt the Spaniards of America: and, under that name, their hiſtory has been publiſhed in the year 1686, by Alexander Oliver Oexemelia.

The *buccaneers* ſell their meat by the bundle or pack, weighing commonly ſixty pounds, at the rate of ſix pieces of eight per pack. The palmetto leaves ſerve to pack it up in, but their weight is deducted; ſo that there muſt be in each pack ſixty pounds of neat fleſh. Theſe *buccaneers* have alſo a great trade of the lard of boars, which they melt and gather in large pots, which they call *potiches*. This lard, which is called *mantegua*, is alſo ſold for about eight pieces of eight per pot.

There is a great conſumption and trade of each of theſe articles in the French ſettlements of the iſlands of St. Domingo, and in thoſe of Tortuga; beſide which they ſend great quantities of them to the Antilles, and even into the continent of French America. There is alſo a great deal of it ſold for the ſupport of the crews of the ſhips that come from France for trading, or which the privateers of Tortuga fit out, for cruiſing againſt the Spaniards.

BUCCEA, or BUCCELLA, in *Medicine*, a term uſed by ſome to expreſs a fragment of any thing, and others make it the name of what we uſually call a POLYPUS of the noſe.

BUCCELLARII, an order of ſoldiery under the Greek emperors, appointed to guard and diſtribute the ammunition-bread.

The word is formed from *buccellus*, a kind of loaf, or cake of a circular figure.

The *buccellarii* were alſo called, in reſpect of their country, *Gallogræci*, or *Helenogalatæ*, q. d. Greeks of Galatia; ſometimes *Maryandini*.

Authors are much divided as to the office and quality of the *buccellarii*: ſome give the denomination to paraſites in the courts of princes and great men, maintained at their table and expence. In reality, among the Viſigoths, *buccellarius* was a general name for all clients, or vaſſals, who lived at the expence of their lords. Spelman rather ſuppoſes them to anſwer to what among us are called *tenants by military ſervice*.—Others repreſent the *buccellarii* as ſtationary ſoldiers in the provinces, who, when the emperor commanded, marched before and behind him as his body guard.—According to others, they were men whom the emperors employed in putting perſons to death ſecretly.

BUCCELLATIO, in *Surgery*, a word uſed by ſome chirurgical writers for the ſtopping the bleeding of an artery or vein, by applying lint to it.

BUCCELLATION, in *Ancient Phyſic*, the name of a medicine, in which *ſcammony* was the principal ingredient.

BUCCELLATUM, in *Ancient Military Writers*, denotes *camp*-BREAD or BISKET baked hard and dry, both for lightneſs and keeping.

The word is formed from *buccea*, or *buccella*, a *morſel*, or *mouthful of meat*.

Soldiers always carried with them enough for a fortnight, and ſometimes much longer, during the time that military diſcipline was kept up.

BUCCINA, an ancient military, or rather muſical inſtrument, uſed in war; eſpecially for proclaiming the watches of the night, and giving notice to the ſoldiery when they were to mount, and when to quit the guard.

The word comes from *bucca*, *mouth*, and *cano*, *I ſing*; becauſe played on by the mouth: others ſuppoſe it formed from βȣκανη, or βυκανη, which ſignifies the ſame; formed from βȣς, *bullock*, and *cano*, *I ſing*; becauſe anciently made of bullocks horns: others from the Hebrew *buk*, a *trumpet*. Varro will have it to have been originally formed by *onomatopœia*, from *bou bou*, alluding to the ſound it gives. Others, with more probability, derive it from *buccinum*, the name of a ſhell-fiſh.

The *buccina* is uſually conſidered as a ſpecies of *tuba*, or trumpet; from which, however, in propriety, it appears to have differed, not only in reſpect of figure, which in the *tuba* was ſtrait, and in the *buccina* recurve, or crooked, but in ſound; that of the *buccina* being ſharper, and audible to a greater diſtance than the trumpet-ſound.

The *buccina* approached neareſt to the *cornu*, or horn: originally the two ſeem to have been the ſame; though in after-times a difference aroſe; the name *buccinum* being reſtrained to the leſſer ſorts, and the *cornu* to the larger. —Some alſo take the *buccina* to have been leſs crooked than the *cornu*, which made a full ſemicircle.

Varro aſſures, that the *buccinæ* were alſo called *cornua*, *horns*; becauſe originally made of the horns of cattle, as is ſtill done among ſome people. Servius intimates, that they were at firſt made of goats or rams horns; and accordingly, in Scripture, the like inſtruments uſed both in war, and in the temple, are called *rams-horns*, *keren-jobel*, and *ſopheroth haijobelim*, or *buccinæ* of rams.

This inſtrument was in uſe among the Jews, to proclaim their feaſt-days, new moons, jubilees, ſabbatic years, and the like. At Lacedæmon, notice was given by the *buccina* when it was ſupper-time; and the like was done at Rome, when the grandees had a *buccina* blown both before they ſat down to table, and after.

The ſound of the *buccina* was called *buccinus*, or *bucinus*, and the muſician who played on it, *buccinator*.

Buccina alſo denotes the ſpace or extent to which the ſound of the *buccina* may be heard.

Buccina *auris*, in *Middle Age Writers*, denotes the *tympanum* or *drum* of the ear.

BUCCINATOR, he that ſounds or winds the *buccina*.

Among the Romans there was a public ſlave, denominated *buccinator nominum*, whoſe office was to attend the public crier.

BUCCINATOR, in *Anatomy*, a muſcle on each ſide the face, common to the lips and cheeks; making the inner ſubſtance of the latter.—Its fibres run from the *proceſſus coronæ* of the lower jaw to the angle of the mouth, and adhere to the upper part of the gums of both jaws: through its middle paſs the upper *ductus ſalivales*. By this is contracted the cavity of the mouth, and the meat thruſt forward to the teeth in maſtication.

It has its name from *buccina*, *trumpet*; becauſe, when ſwelled, it enlarges the cheeks, as in blowing a trumpet.—See *Tab. Anat. (Myol.) fig.* 1. *n.* 10.

BUCCINUM, in *Botany*, a name given by ſome authors to the LARK-SPUR. Ger. Emac. Ind. 2.

Buccinum is alſo uſed for the TRUMPET-*ſhell*. It is a diſtinct genus of the univalve and ſpiral *teſtacea*, in the Linnæan ſyſtem.

BUCCO, in *Anatomy*, a name given by Riolanus, and ſome others, to the muſcle more uſually called *buccinata*, and *contrahens labiorum*.

Bucco, in *Ornithology*, a genus of birds of the order of *picæ*.

BUCCULA, in *Anatomy*, the fleſhy part under the chin

Some extend the name farther to the whole lower part of the face, comprehending the under part of the lower lip, with the chin and the fleſhy part under it.

Buccula, in *Antiquity*, denotes the *umbo* of a ſhield, or the part prominent in the middle thereof.

It is thus called, becauſe uſually made in the form of a mouth or face, either of a man or ſome animal. The like figures were ſometimes alſo found on other parts of armour, eſpecially on the *loricæ* and *thoraces*.

BUCENTAUR, the name of a large ſtate-veſſel, uſed by the Venetians in the ceremony of eſpouſing the ſea, performed each Aſcenſion-day with much pomp.

The word comes from βουκενταυρος; compoſed of βου, a particle of augmentation, uſed to denote an enormous greatneſs, and κενταυρος, *centaur*. Juſtiniani adds two other etymologies: the firſt from *bis*, and *taurus*, or rather *centaurus*, the name of one of Æneas's veſſels in Virgil: the other from *bucentaurus*, for *ducentaurus*, a word forged to ſignify a veſſel capable of holding two hundred men.

P. Juſtiniani gives a very preciſe deſcription of the *bucentaur*; and adds, that its origin is carried up as high as the year of Chriſt 1311, though others trace it higher, to the year 1177, when the emperor Frederic Barbaroſſa came to Venice, to make peace with the republic and the pope: at which time the pope, in conſideration of the ſervices the ſtate had done him, in ſheltering him in their city, when he had been driven out of his own, granted them ſeveral privileges; and made a preſent to the doge of a gold ring, which is the origin of that, yearly caſt by the doge, from the *bucentaur*, into the ſea.

It is on Aſcenſion-day, that the doge, being advanced in the *bucentaur* a little way into the gulph, throws a gold ring into the ſea, and ſays, "We marry thee, O ſea, in "token of that true and perpetual dominion which the "republick has over thee."

The archducheſs Maria Joſepha, married to the prince of Saxony, on the day of her entry into Dreſden, was received in a magnificent galley, finely rigged, and called a *bucentaur*, becauſe built after the model of that of Venice.

BUCEPHALON, in *Botany*. See TROPHIS.

BUCEPHALUS, βουκεφαλος. See HORSE.

BUCEROS, in *Ornithology*, the name of a ſpecies of raven found in the Eaſt Indies, China, and Tartary. Its head, neck, rump, and tail, are of a gloſſy black, without the leaſt tinge of any other colour. It is of the bigneſs of a well grown pullet: its head is remarkably large, as is its beak, which has a conſiderable gibboſity towards the baſe, riſing above the reſt of the ſurface.

Buceros, forms a genus of birds, of the order of *picæ*, in the Linnæan ſyſtem. The beak is convex, and bent backwards; the upper chap of the beak is longer than the under; the noſtrils are near the baſe of the beak; the tongue is acute and ſhort, and the feet are formed for walking.

BUCHNERA, in *Botany*, the name of a genus of the *didynamia angioſpermia* claſs of plants, the characters of which are theſe: the *perianthum* is tubular, conſiſting of one leaf, divided into five ſegments at the edge, and remaining after the flower is fallen. The flower conſiſts of one petal, which forms a very long and capillary arched tube; its verge is plain and ſhort, and is divided lightly into five ſegments, which are ſmall at the baſe, and broader, and figured like a heart at the top. The ſtamina are four very ſhort filaments; the *antheræ* are oblong and obtuſe; the germen of the piſtil is oblong and oval; the ſtyle is very ſlender, and of the length of the tube; and the ſtigma is obtuſe. The fruit is a capſule of an oblong oval figure, pointed at the end, containing two cells, and opening at the top into two parts. The ſeeds are numerous, and of an angular figure.

BUCIDA, in *Botany*, a genus of the *decandria monogynia* claſs of plants, the calyx of which is indented in five ſegments; it has no corolla; and the fruit is a ſingle ſeeded berry. There is only one ſpecies of this *genus*.

BUCK, a male horned beaſt of venery or chace, whoſe female is denominated a *doe*.

A *buck* the firſt year is called a *fawn*, the ſecond a *pricket*, the third a *ſorel*, the fourth a *ſore*, the fifth a *buck of the firſt head*, and the ſixth a *great buck*. See DEER and HUNTING.

Buck is alſo applied to the males of the hare and rabbet kind. Hares commonly go to *buck* in January, February, and March, and ſometimes all the warm months; ſometimes they ſeek the *buck* ſeven or eight miles from the place where they ſit.

The *buck* rabbet is ſaid to kill all the young he can come at; on which account the doe is careful to hide her offſpring in ſome remote corner, out of his way.

The doe coney goes to *buck* as ſoon as ſhe has kindned. She cannot ſuckle her young till ſhe has been with the *buck*. When he has bucked, he uſually falls backward, and lies as in a trance half dead, at which time he is eaſily taken.

Buck-*maſt*, is uſed by ſome for the maſt or fruit of the beech-tree.

Buck-*bean*. See TRIFOLIUM *paluſtre*.

This plant, though mentioned by ſeveral writers before Simon Pauli, yet was firſt recommended by him in ſcorbutic caſes. He ſays it is more ſubtle and penetrating than *naſturtium*, or creſſes.

It ſeems at preſent to be coming into great repute in many chronical diſtempers; and frequently preſcribed among alexipharmics.

Many have got it into uſe in their families in the form of tea, and experience its conſtant uſe to be very effectual againſt ſcrophulas, the king's evil, and obſtinate ſcorbutic diſtempers. Its taſte, at firſt, is not very grateful, but time wears off that diſlike; its uſe in ſhop compoſitions is not yet known.

Buck-bean ſerves in Hampſhire to a very remarkable uſe; the brewers uſing it in their beer in the place of hops. It is as good a preſerver of the drink, and is a bitter of as agreeable a flavour: it has this advantage alſo, that one eighth part of the quantity is ſufficient; it is a very harmleſs plant, and is given by many as an antiſcorbutic, and by ſome in rheumatiſms, and other chronic caſes. It might be extremely worth while to try this practice in other parts, as the plant might be eaſily cultivated in any quantity, and with this advantage, that it will grow on the worſt kind of boggy land, which will produce nothing elſe.

Buck-*ſkins*. See SKINS.

Buck-*ſtall*, in our *Ancient Law-books*, a toil wherein to take deer.

By an ancient ſtatute, no perſon is allowed to keep a *buck-ſtall*, who has not a park of his own. Stat. 19. Hen. VII.

BUCKET, in *Hydraulics*, a kind of veſſel or recipient chiefly of uſe for the raiſing and conveyance of water from wells, and other places.

The word is formed from the French *bacquet*, a *pail* or *tub*.

In an army, *buckets* are carried with the artillery, in the fire-workers ſtores.

Town *buckets*, for extinguiſhing fires, are made of thick leather, ſtrongly ſoaked and boiled.

One method of raiſing water, deſcribed by hydraulic writers, is by the means of a chain of *buckets*.

Bucket, *ſea-gage*. See *Sea*-GAGE.

BUCKING, among *Miners*. See ORE.

Bucking, an operation performed on linen cloth and yarn, to render them ſomewhat white, by working them with lie made of aſhes.

Bucking of cloth is the firſt ſtep or degree of whitening it. See BLEACHING.

To drive a buck of yarn, they firſt cover the bottom of the *bucking-tub* with fine aſhes of the aſh-tree, then ſpread the yarn thereon, then cover it again with aſhes, and thus *ſtratum ſuper ſtratum*, till the yarn is all in; when they cover the whole with a *bucking-cloth*, and lay on it more aſhes, and pour in warm water, till the tub be full, and let it ſtand all night. Next morning they let the lie run into another veſſel, and, as it waſtes, fill up the tub with warm water from a kettle, and, as this waſtes, fill it up with the lie that runs from the *bucking-tub*; ſtill obſerving

ſerving to make the lie hotter and hotter, till it boils. Thus are both the tub and kettle to be ſupplied for at leaſt four hours, which is called *driving a buck of yarn.*

BUCKLE, in *Matters of Trade*, a little metalline machine, whereby to retain and keep faſt certain parts of the habit, as well as of the harneſs of horſes, &c.

The word is formed from the French *boucle*, and that, according to Caſſeneuve, from the barbarous Latin *pluſcula*, which ſignified the ſame. According to Menage, from *bucula*, the *anſa*, or handle, of a buckler.

The *buckle* is a part of modern dreſs, correſponding to the *fibula*, among the ancients.

Buckles are of divers ſorts, as ſhoe and garter *buckles*; ſome round, others ſquare, or oval, or cut, each of which have their reſpective artificers by whom they are made.

The like may be ſaid of the great variety of *buckles* belonging to the pack and hackney-ſaddles.

Buckle, *girth*, among *Sadlers*, is a four ſquare hood, with a tongue, which is made ſteady, by going through a hole of leather, and faſtened with narrow thongs.

BUCKLER, a piece of defenſive armour, uſed by the ancients to ſkreen their bodies from the blows of their enemies.

The word comes from the barbarous Latin *bucularium*; of *buckula*, the umbo or middle point of this weapon, which had uſually a head, or mouth, repreſented prominent thereon.

The *buckler* of Achilles is deſcribed in Homer, that of Æneas in Virgil, that of Hercules in Heſiod: Ajax's *buckler* was lined with ſeven bulls hides.

The *buckler* is the ſame with what we otherwiſe call ſhield or target; and by the one or the other we indifferently render what among the ancients were denominated *clypeus*, *ſcutum*, and *parma*; though the three latter were different from each other. Phil. Tranſ. N° 241. p. 206.

The ancients were particularly ſolicitous to preſerve their *bucklers* in fight; it being highly infamous, and even penal, to return without them. It was on their *bucklers* that they carried off the bodies of their ſlain, eſpecially thoſe of diſtinction. Potter. Arch. lib. iii. cap. 4. & 13.

The Spaniards ſtill retain the *ſword* and *buckler* in their night-walks.

Buckler, on medals, are either uſed to ſignify public *vows*, rendered to the gods for the ſafety of a prince; or that he is eſteemed the defender and protector of his people.—Theſe were particularly called *votive bucklers*, and were hung at altars, &c.

Buckler *muſtard*, in *Botany*. See Mustard.

Buckler *of a caſk*, denotes a moveable head, whereby to compreſs the contents of it.

In this ſenſe we ſay, a *buckler* of PILCHARDS.

BUCKRAM, a thick ſort of linen or hempen cloth, ſtiffened with gum, chiefly uſed in the linings of cloaths, to ſuſtain and make them keep their form.

BUCKS-HORN. See Plantain.

Bucks-horn *creſſes*. See Cochlearia.

BUCKTHORN, *Rhamnus*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: it hath male and female flowers on different plants, which have no empalements according to ſome, or petals, according to others. The cover of the ſexes is funnel-ſhaped, cut into four parts at the top, which ſpread open; the male flowers have four ſtamina of the length of the tube, terminated by ſmall ſummits; the female flowers have a roundiſh germen, ſupporting a ſhort ſtyle, crowned by a quadrifid ſtigma; the germen afterward becomes a roundiſh berry, encloſing four hard ſeeds. There are nineteen ſpecies of the *rhamnus*.

The berries of *buckthorn* are larger than elder-berries, round and black, yielding a bitter purple juice, tinged with green, and holding three or four cornered ſeeds.

The tree grows in woods and hedges, having its branches ſet with long ſtiff thorns.

The ſyrup is the only preparation of thoſe berries now in phyſical uſe.

It is a ſtrong purgative, and effectual in evacuating watry and flatulent humours; on which account it is eſteemed in dropſies, rheumatiſms, and even the gout.

Of *buckthorn* berries are made three ſeveral ſorts of colours; being gathered green, and kept dry, they are called *ſap-berries*; which being ſteeped in alum-water, give a fair yellow colour, uſed by painters, book-binders, and leather-dreſſers; who alſo make a green colour, called SAP-*green*, taken from the berries when they are black. Theſe being bruiſed, and put into a braſs kettle, and there ſuffered to remain for three or four days, with ſome beaten alum put to them, are afterwards preſſed, and the liquor uſually put into bladders, and hung up till it be dry: this is afterwards diſſolved in water or wine, but Canary is the beſt, to preſerve the colour from ſtarving. The third is of a purpliſh colour, made of the berries, ſuffered to grow upon the buſhes till the middle or end of November, when they are ready to fall of themſelves. Vid. Boyle, Phil. Works abr. vol. ii. p. 76, 77.

Buckthorn, *ſea*, in *Botany*. See Sea *Buckthorn*.

BUCK-WHEAT. See Wheat.

BUCOLICA, is uſed by ſome for the art of managing, feeding, and breeding cattle.

BUCOLICS, *Paſtorals*; a kind of poems relating to ſhepherds, and their flocks.

The word is derived from βȣς, and κολον, *cibus*, *meat*; hence βȣκολεω, *to feed cattle*; and βȣκολος, *bubulcus*, a *herdſman*.

Bucolic poetry is the moſt ancient of all the kinds of poetry; and is ſuppoſed to have had its origin in Sicily, amidſt the mirth and diverſions of the ſhepherds; and to have been inſpired by love and idleneſs: by degrees, their rural gallantries were brought under rules, and became an art. The concerns of the flocks, the beauties of nature, and the pleaſures of a country life, were their principal ſubjects. Moſchus, Bion, and Theocritus, were the moſt agreeable among the ancient *bucolic* poets.

Fontenelle obſerves, that Theocritus's ſtyle is ſometimes a little too *bucolic*. Some authors attribute the invention of *bucolic poetry* to a ſhepherd called *Daphnis*; and others to *Bucolius*, ſon of Laomedon: but this appears all fiction.

Some aſcribe the invention of *bucolic poetry* to the herdſmen of Laconia, who, not being able to hold the cuſtomary feaſt of virgins in honour of Diana Caryatis, by reaſon of the war with Xerxes, inſtituted βȣκολιασμοι, or *bucolic* exerciſes, in lieu thereof.

Hence alſo the origin of a ſort of poetical champions, called βȣκολιαϛαι, by the Latins *luctiones*, who went about the country contending for the prizes frequently propoſed for the conquerors in this kind of combat. Of which rank Daphnis was the moſt diſtinguiſhed. They not only rehearſed their verſes, but played on a kind of *fiſtula*, or pipe, called *ſyrinx*. Scal. Poet. lib. i. cap. 4. Pott. Arch. lib. ii. cap. 20. Hiſt. Acad. Inſcr. tom. iii. p. 123, & 131, &c.

Bucolic poetry is by ſome called *Aſtrabic*, as being ſuppoſed to have firſt commenced among the ancient herdſmen in riding a ſort of waggons called *aſtrabes*.

It is uſually divided into *monoproſopium*, wherein only a ſingle perſon ſpeaks, and *amœbæum*, or dialogue, wherein are ſeveral interlocutors.

Theocritus's Idyllia, and Virgil's Eclogues, are the chief of the ancient *bucolics* now extant.

BUCTON, a word uſed by Severinus, and ſome others, as a name for that part of the *pudendum muliebre*, commonly called the HYMEN.

BUD primarily denotes that part of a SEED which firſt begins to ſprout or germinate.

In which ſenſe, *bud* amounts to the ſame with germ, *germen*, gem, or *gemma*.

In moſt ſeeds is found a true *bud*, conſiſting of perfect leaves, only differing in bigneſs from thoſe which grow on the ſtalk. In many ſeeds this *bud* is very apparent, in others it lies ſo deep between the lobes, as to be almoſt indiſcernible. In ſome plants the leaves of the *buds* are but two, in others four, in others ſix, and in ſome more.

Bud is alſo uſed to denote the beginning of a bloſſom, or young ſprout, whether of a branch, foliage, or flower.

The *buds* of flowers and fruits are formed at the ſame time as the branches themſelves on which they ariſe. Mem. Acad. Scienc. ann. 1711. p. 59, ſeq.

The *bud* of a branch has its origin from the inner part of the ligneous body next the pith; by which it differs from a thorn, which has its origin from the outer and leſs fruitful part, and ſo produces no leaves, being as it were only the male of a *bud*.

Every *bud*, beſides its proper leaves, wherein it is couched or folded up, is covered with divers leafy pannicles or ſurfoils, which ſerve as a defence to the leaves themſelves. Grew. Anat. Veget. lib. i. cap. 4. lib. iv. cap. 1. § 2. & cap. 5. § 3.

The *buds* or knots on branches ariſe from the inmoſt part of the branches, the ſtructure of the ligneous fibres and little bladders of the branch being ranged ſo nicely in this form, that, upon the putting out of the branch, the *bud*, which is compoſed of the ſame parts, may likewiſe ſhoot with it. Phil. Tranſ. N° 118. p. 404.

Leewenhoeck aſſures us, that in the *bud* of a currant-tree, even in winter, he could diſcover not only the ligneous part, but even the berries themſelves, appearing like ſmall grapes.

Bud is uſed in the country language for a weaned calf of the firſt year; ſo called, becauſe the horns are then in the *bud*.

BUDDING, in *Gardening*. See Engrafting.

BUDDLE, in *Mineralogy*, a name given by the Engliſh dreſſers of the ores of metals, to a ſort of frame made to receive the ore after its firſt ſeparation from its groſſeſt foulneſs.

The ore is firſt beaten to powder in wooden troughs, through which there runs a continual ſtream of water, which carries away ſuch of it as is fine enough to paſs a grating, which is placed at one end of the trough; this falls into a long ſquare receiver of wood, called the *launder*: the heavieſt and pureſt of the ore falling at the head of the launder, is taken out ſeparately, and requires little more care or trouble; but the other part, which ſpreads over the middle and lower end of the launder, is thrown into the *buddle*, which is a long ſquare frame of boards, about four feet deep, ſix long, and three wide; in this there ſtands a man bare-footed, with a trampling ſhovel in his hand, to caſt up the ore about an inch thick, upon a ſquare board placed before him as high as his middle; this is termed the *buddle-head*; and the man dexterouſly, with one edge of his ſhovel, cuts and divides it longwiſe, in reſpect of himſelf, about half an inch aſunder, in theſe little cuts; the water coming gently from the edge of an upper plain board, carries away the filth and lighter part of the prepared ore firſt, and then the metalline part immediately after; all falling down in the *buddle*, where, with his bare feet, he ſtrokes it and ſmooths it, that the water and other heterogeneous matter may the ſooner paſs off from it.

When the *buddle* by this means grows full, the ore is taken out; that at the head part, being the fineſt and pureſt, is taken out ſeparate from the reſt, as from the launder. The reſt is again trampled in the ſame *buddle*; but the head, or, as it is called, the forehead, of this *buddle*, and of the launder, are mixed together, and carried to another *buddle*, and trampled as at firſt. The foreheads of this laſt *buddle*, that is, that part of the ore which has fallen at the head, is carried to what they call a drawing *buddle*, whoſe difference from the reſt is only this, that it has no tye, but only a plain ſloping board, on which it is once more waſhed with the trampling ſhovel. Tin-ore, when it is taken from this, is called black tin, and this is found to be completely ready for the blowing-houſe. Phil. Tranſ. N° 69. See *Dreſſing of* ORE.

BUDDLING *of calamine*, denotes the operation of cleanſing it from filth, by waſhing and picking it, preparatory to the baking it in the oven. Phil. Tranſ. N°. 198. p. 675. See CALAMINE.

BUDDLING-*diſh*, a ſmall, ſhallow veſſel, like the baſons of a pair of ſcales, for the waſhing of ores of metals by the hand.

BUDGE. See BOUCHE.

BUDGE-*barrels*, are ſmall barrels well hooped, with only one head, the other end having nailed on it a piece of leather, to draw together upon ſtrings, like a purſe.

Budge-barrels are uſed for carrying powder along with a gun or mortar; as being leſs dangerous, and alſo eaſier than whole barrels. They are alſo uſed upon batteries of mortars, for holding meal-powder.

BUDHURS, in *Ichthyology*, a name given by the Iriſh to a large ſpecies of TROUT, reſembling outwardly the red GILLAROO. See Phil. Tranſ. vol. lxiv. N° 14, and N° 15.

BUDLEIA, in *Botany*, a genus of the *tetandria monogynia* claſs of plants. Its characters are theſe: the flower is of one leaf, bell-ſhaped, and quadrifid; and hath four ſhort ſtamina, which are placed at the diviſions of the petal; the oblong germen is ſituated in the centre, which afterward becomes an oblong capſule, having two cells filled with ſmall ſeeds. There are two ſpecies, which grow naturally in gullies, or other low-ſheltered ſpots in the Weſt Indies; their branches being too tender to reſiſt the force of ſtrong winds, they are rarely ſeen in open ſituations.

BUDNÆANS, in *Eccleſiaſtical Hiſtory*, ſo called from the name of their leader, Simon Budnæus. They not only denied all kind of religious worſhip to Jeſus Chriſt, but aſſerted, that he was not begotten by any extraordinary act of divine power; being born, like other men, in a natural way. Budnæus was depoſed from his miniſterial functions in the year 1584, and publicly excommunicated, with all his diſciples; but afterwards abandoning his peculiar ſentiments, he was readmitted to the communion of the Socinian ſect. Crellius aſcribes the origin of the above opinion to Adam Neuſer. Moſh. Eccl. Hiſt. vol. iv. p. 199.

BUDUN is the name of one of the Ceyloneſe gods: he is ſuppoſed to have arrived at ſupremacy, after ſucceſſive tranſmigration from the loweſt ſtate of an inſect, through the various ſpecies of living animals. There have been three deities of this name, each of which is ſuppoſed to reign as long as a bird removes a hill of ſand, half a mile high, and ſix miles round, by a ſingle grain in a thouſand years. See SAKRADAWENDRA.

BUFETAGE, *buſetagium*, or *buſetaria*, a duty paid to the lord for the drinking, or rather ſelling of wine in taverns.

The word is formed from *buvetage*, or *buveterie*, of the French *boire*, *to drink*. Du-Cange Gloſſ. Lat. tom. i.

BUFF, in *Commerce*, a ſort of leather prepared from the ſkin of the buffalo, or BUBALUS.

The ſkin of the buffalo being dreſſed in oil, after the manner of ſhammy, or chamois, makes what we call *buff-ſkin*; anciently much uſed among the military men for a kind of coats or doublets; and ſtill retained by ſome of our grenadiers, as well as the French *gen d'armes*, on account of its exceeding thickneſs and firmneſs. It is alſo uſed for waiſt-belts, pouches, &c.

Buff-ſkins, or *buff-leather*, makes a very conſiderable article in the Engliſh, French, and Dutch commerce, at Conſtantinople, Smyrna, and along the coaſt of Africa. The ſkins of elks, oxen, and other like animals, when dreſſed in oil, and prepared after the ſame manner as that of the buffalo, are likewiſe denominated *buff*, and uſed for the ſame purpoſes.—In France there are a good number of conſiderable manufactories employed in the preparation of ſuch ſkins; particularly at Corbeil, Paris, and Rouen: their firſt eſtabliſhment is owing to the Sieur Jabas, a native of Cologne. The manner of preparation ſee under SHAMMY.

The SKIN of the American mooſe deer, when well dreſſed, makes excellent *buff*. The Indians make their ſnow-ſhoes of them. Their way of dreſſing it, which is reckoned very good, is thus: after they have haired and grained the hide, they make a lather of the mooſe's brains in warm water, and, after they have ſoaked the hide for ſome time, they ſtretch and ſupple it. Phil. Tranſ. N° 368.

BUFF, in *Medicine*, is uſed to ſignify that ſizy, viſcid, tough maſs, which forms on the upper ſurface of the blood; it is what phyſicians call the *coagulable lymph*, which Dr. Fordyce, in his very excellent Elements of the Practice of Phyſic, ſays, is not ſo eaſily coagulable when the arteries of the perſon from whom the blood is drawn, act more ſtrongly than they uſually do. See BLOOD.

BUFFET. See BEAUFET.

BUFFALO, *Bubalus*, in *Zoology*. See BUBALUS.

BUFFOON, a droll, or mimic, who diverts the public by his pleaſantries and follies.

Menage, after Salmaſius, derives the word from *buffo*; a name given to thoſe who appeared on the Roman theatre with their cheeks blown up; that, receiving blows thereon, they might make the greater noiſe, and ſet the people a laughing. Others, as Rhodiginus, makes the origin of *buffoonery* more venerable; deriving it from a feaſt inſtituted in Attica, by K. Erictheus, called BUPHONIA.

Buffoons are the ſame with what we otherwiſe find denominated *ſcurræ*, *gelaſiani*, *mimilogi*, *miniſtelli*, *goliardi*, *joculatores*, &c whoſe chief ſcene is laid at the tables of great men.

Gallienus never ſat down to meat without a ſecond table of *buffoons* by him; Tillemont alſo renders PANTOMIMES by *buffoons*. In which ſenſe he obſerves, the ſhews of the *buffoons* were taken away by Domitian, reſtored by Nerva, and finally aboliſhed by Trajan. Hiſt. des Emper. tom. ii. p. 144.

BUFO, in *Zoology*, the name by which many authors call the common TOAD, denominated by others RUBETA.

BUFONIA, in *Botany*, a genus of the *tetandria digynia* claſs of plants, the calyx of which is a permanent *perianthium*, conſiſting of four erect, ſubulated, carinated leaves; the corolla conſiſts of four oval, linear, entire, erect, equal petals, ſhorter than the cup; the fruit is an oval, compreſſed capſule, conſiſting of two valves, and containing one cell, in which are two oval compreſſed ſeeds.

BUFONITA, in *Natural Hiſtory*, the TOAD-*ſtone*. This is a foſſil that has been received not only among the liſt of native ſtones by the generality of authors, but even has held a place among the gems, and is ſtill worn in rings by ſome people: it is, however, as much an extraneous foſſil, as any animal remaining of that kind. There has been a ſtrong opinion in the world, that it was found in the head of an old toad; and that this animal voided it at the mouth, on being put on a red cloth. See *Tab. Foſſils, Claſs* 8.

The general colour of the *bufonitæ* is a deep, duſky brown; but it varies greatly in this reſpect in ſeveral ſpecimens, ſome of which are quite black, others of an extremely pale, ſimple brown, a cheſnut colour, liver colour, black, grey, or whitiſh.

The *bufonitæ* are uſually found immerſed in beds of ſtone; and ſo little doubt is there of what they have originally been, viz. the petrified teeth of the *lupus piſcis*, or wolf-fiſh, that part of the jaw of the fiſh has ſometimes been found, with the teeth petrified in it. See Grondeur.

The *bufonitæ* are ſaid to be cordial and aſtringent: many other fanciful virtues are aſcribed to them, which the preſent practice has rejected.

Dr. Kramer ſays, *pulvis bufonum*, when applied by way of poultice, with barley-flour and urine, is an excellent remedy for ripening *peſtilential* Bubces, but that it has no ſuch effect in *venereal*, or any other than *peſtilential* Buboes.

BUG, in *Zoology*. See Chermes, and Cimex.

BUGA *marble*, in *Natural Hiſtory*, a name given by the Spaniards to a ſpecies of black marble, called by our artificers the Namur-marble, and known among the ancient Romans by the name of *marmor Luculleum*. It is common in many parts of Europe, and is uſed by the Spaniards in medicine as well as in building; the powder of it being ſaid to be an excellent ſtyptic, applied to freſh wounds.

BUGEE, in *Zoology*, a ſpecies of monkey, which we ſee ſometimes brought over for a ſhew. It is an Indian animal, and a very rare one even there. It is about the ſize of a beaver, and much of the ſame colour, but its tail and claws wholly of the monkey-kind.

BUGELUGEY, in *Zoology*, the name of a large ſpecies of lizard, called by Cluſius, and ſome other authors, by the indeterminate name of *Lacertus Indicus*. It grows to four feet long, and will then meaſure nine inches round; the tail is very long, and ends in an extremely ſlender point.

BUGG-*caterpillar*, in *Natural Hiſtory*, a name given by Mr. Bonnet to a ſmall ſpecies of caterpillar, which ſmells exactly like a bug. This is not the only ſpecies which yields a ſenſible ſmell, for there is one of the middle-ſized ſmooth kinds, which, at the time of the change into the chryſalis ſtate, yields a very pleaſant roſe-like ſcent; and their caſes, which are made of earth and ſilk, retain that ſmell for a long time together, even for ſeveral years. There is another, which ſmells ſtrongly of muſk. Phil. Tranſ. Nº 469.

BUGGERS, *Bulgarii*, anciently ſignified a kind of heretics, otherwiſe called *Paterini*, *Cathari*, and *Albigenſes*.

The word is formed of the French *Bougres*, which ſignified the ſame, and that from *Bougria* or *Bulgaria*, the country where they chiefly appeared.

The *Buggers* are mentioned by Matthew Paris, in the reign of Henry III. under the name of *Bugares*. *Circa dies autem illos invaluit hæretica pravitas eorum qui vulgariter dicuntur* Paterini & Bugares, *de quorum erroribus malo tacere quam loqui.*

Bugger, or Buggerer, came afterwards to be uſed for a Sodomite; it being one of the imputations laid, right or wrong, on the Bulgarian heretics, that they taught, or at leaſt practiſed, this abominable crime. Caſen. Orig. p. 27. Menag. Orig. p. 114. Trev. Dict. Univ. tom. i. p. 1149. voc. *Bougre*. Du-Cange, Gloſſ. Lat. tom. i. p. 637. voc. *Bulgari*.

Bugger, *Bulgarius*, is alſo a denomination given to uſurers, a vice to which the ſame heretics are ſaid to have been much addicted. Du-Cange, Gloſſ. Lat. tom. i. p. 637.

BUGGERY, in our laws, ſignifies the crime of ſodomy.

Sir Edward Coke defines *buggery*, *carnalis copula contra naturam, & hæc per confuſionem ſpecierum* (viz. by a man's or woman's coupling with a brute beaſt) *vel ſexuum*, by a man's having to do with a man, or a woman with a woman.—Each of which is felony, without benefit of clergy. 25 Hen. VIII. cap. 6. and 5 Eliz. cap. 17. In ancient times, ſuch offenders were burnt by the common law.

Buggery is uſually excepted out of a general pardon. The practice is ſaid to have been introduced into England by the Lombards; by whom it is uſually ſuppoſed to have been borrowed from the *Bougres*, or *Bulgarians*.

BUGLE, *Ajuga*, in *Botany*, a genus of the *didynamia gymnoſpermia* claſs. The characters are theſe: the flower is one leaf, of the lip kind, having an incurved cylindrical tube; the upper lip is very ſmall, erect, and bifid; the under lip is large, open, and divided into three ſegments. It hath four erect ſtamina, two of which are longer than the upper lip, and two ſhorter. In the centre is ſituated four *germina*, which afterward become four naked ſeeds encloſed in the empalement.

Bugle is a noted vulnerary, much uſed in potions of that intention, and alſo in plaſters, eſpecially among the French, with whom it is a proverb, that the perſon who has *bugle* and ſanicle, has no occaſion for a ſurgeon.

It is uſed both internally and externally for all bruiſes, wounds, and contuſions; for ſores and ulcers, ſpitting of blood, and hæmorrhages from any part; alſo for the dyſentery, *fluor albus*, diſeaſes of the throat, and thruſhes in the mouth.

BUGLOSS, in *Botany*. For the characters, ſee Anchusa.

Bugloſs is uſually planted in gardens, and flowers in June and July. The leaves, flowers, and ſometimes the root are uſed.

The flowers of the common *bugloſs* ſtand recommended for the ſame virtues with thoſe of borrage; they are ſuppoſed to be cordials of the very firſt rank, and to be of great uſe in hypochondriac and melancholic caſes. But theſe virtues are not well warranted. Tournefort, Hiſt. Plant, p. 133.

Bugloss, *viper's*, in *Botany*. See Viper's *Bugloſs*.

Bugloss, *ſmall wild*. See Asperugo.

BUGLOSSUS, in *Zoology*, a name uſed by many authors for the ſoal-fiſh.

BUILDING, a fabric, or place erected by art, of ſtone, or timber, either for ſhelter from the weather, or for ſecurity, magnificence, or devotion.

Building, *regular*, is that whoſe plan is ſquare, its oppoſite ſides equal, and the parts diſpoſed with ſymmetry.

Building, *irregular*, is that, on the contrary, whoſe plan is not contained within equal or parallel lines, either by the nature of its ſituation, or the artifice of the *builder*; and whoſe parts have not any juſt relation to one another in the elevation.

Building, *inſulated*, is that which is not attached, joined, or contiguous to any other; but is encompaſſed with ſtreets, or ſome open ſquare, or the like; as St. Paul's, the Monument, &c.

A Building is ſaid to be *engaged*, when it is encompaſſed with others, and has no front towards any ſtreet or public place, nor any communication without, but by a back paſſage.

Building, *an interred*, or *ſunk*, is that whoſe *area* is below the adjacent ſtreet, court, or garden, &c. and whoſe loweſt courſes of ſtone are hidden.

Buildings are either public, or private.

Buildings, *public*, according to Daviler, include thoſe belonging to religion, as temples, churches, hoſpitals, moſques, tombs, &c. thoſe erected for ſecurity, as walls, towers, baſtions, and other parts of fortification; thoſe ſerving for utility or convenience, as bridges, cauſeways, ports, aquæducts, courts, markets, bazars, caravanſeras; and laſtly, thoſe erected for magnificence, as triumphal arches, obeliſks, amphitheatres, porticos, &c. Phil. Tranſ. Nº 200.

Buildings, *private*, thoſe intended for habitation, ſuitable to the ſtate and condition of perſons, as places, hotels, ſeats, convents, houſes of citizens, &c.

Buildings, *ruſtic or country*, are thoſe which compoſe farm-houſes, granges, menageries, mills, baſſecours, ſtables, &c.

Buildings, *hydraulic*, thoſe wherein are encloſed machines for the moving or raiſing of water, either for uſe or entertainment, as pumps, fountains, reſervoirs, caſcades, &c.

Buildings, *marine*, thoſe wherein ſhips and other veſſels are made or preſerved; ſuch are arſenals, docks, ſtorehouſes, and the like.

Buildings, *ſubterraneous*, thoſe framed under ground, as labyrinths, grottos, caves, temples cut out of rocks, &c. Some take theſe to be of the greateſt antiquity, and to have given occaſion to the firſt erecting of ſuperterranean edifices: the primitive *buildings* ſeem rather to have been intended as ſhelter againſt the ſcorching heats of the climate and ſeaſons in Æthiopia, where the midday was ſcarce tolerable without ſome defence. Phil. Tranſ. Nº 144. p. 344.

Building is alſo uſed for the art or act of conſtructing, or raiſing an edifice.—In which ſenſe it comprehends, as well the expences, as the invention and execution of the deſign thereof.

In *building* there are three things chiefly in view, viz. conveniency, firmneſs, and delight.—To attain theſe ends, Sir Henry Wotton conſiders the whole ſubject under two heads, viz. the *ſeat* or *ſituation*, and the *work* or *ſtructure*.

Building, *for the ſituation of a*, either that of the whole is to be conſidered, or that of its parts.—As to the *firſt*, regard is to be had to the quality, temperature, and ſalubrity of the air; the conveniency of water, fuel, carriage, &c. and the agreeableneſs of the proſpect.

For the *ſecond*, the chief rooms, ſtudies, libraries, &c. are to lie towards the eaſt; offices that require heat, as kitchens, diſtillatories, brew-houſes, &c. to the ſouth: thoſe that require a cool freſh air, as cellars, pantries, granaries, &c. to the north: as alſo galleries for painting, muſeums, &c. which require a ſteady light.—He adds, that the ancient Greeks and Romans generally ſituated the front of their houſes to the ſouth: but that the modern Italians vary from this rule.—Indeed, in this matter, regard muſt ſtill be had to the country; each being obliged to provide againſt its reſpective inconveniencies; ſo that a good parlour in Egypt might make a good cellar in England.—The ſituation being fixed on, the next thing to be conſidered is the

BUILDING, *work* or *ſtructure of the*, under which come firſt the *principal* parts, then the *acceſſories* or ornaments. —To the principals belong, firſt, the materials; then the form, or diſpoſition.

There are three ſorts of draughts or repreſentations of a *building* neceſſary to be made before the conſtruction be begun, viz. an ichnography or plan, an orthography or profile, and a ſcenography or perſpective. See ICHNOGRAPHY, ORTHOGRAPHY, and SCENOGRAPHY.

BUILDING, *the materials of a*, are either ſtone, as marble, free-ſtone, brick, for the walls, &c. or wood, as fir, cypreſs, cedar, for poſts and pillars of upright uſe; oak for beams, ſummers, and for joining and connexion.

BUILDING, *for the form or diſpoſition of a*, it muſt either be *ſimple* or *mixed*.—The ſimple forms are either *circular* or *angular*: and the circular ones either *complete*, as juſt ſpheres; or deficient, as ovals.

The circular form is very commodious, of the greateſt capacity of any; ſtrong, durable beyond the reſt, and very beautiful: but then it is found of all others the moſt chargeable; much room is loſt in the bending of the walls, when it comes to be divided; beſides an ill diſtribution of light, except from the center of the roof; on theſe conſiderations it was, that the ancients only uſed the circular form in temples and amphitheatres, which needed no compartition.—Oval forms have the ſame inconveniences, without the ſame conveniences; being of leſs capacity.

As for angular figures, Sir Henry Wotton obſerves, that *building* neither loves many nor few angles; the triangle, v. gr. is condemned above all others, as wanting capacity and firmneſs; as alſo, becauſe incapable of being reſolved into any other regular figure in the inward partitions, beſides its own.—As for figures of five, ſix, ſeven, or more angles, they are fitter for fortifications than civil *buildings*. There is, indeed, a celebrated *building* of Vignola, at Caprarola, in form of a *pentagon*; but the architect had prodigious difficulties to encounter with, in diſpoſing the lights, and ſaving the vacuities. Such *buildings*, then, ſeem rather for curioſity than conveniency; and for this reaſon, rectangles are pitched on, as being a medium between the two extremes. But again, whether the rectangle is to be juſt a ſquare, or an oblong, is diſputed: Sir Henry Wotton prefers the latter, provided the length doth not exceed the breadth by above one third.

Mixed figures, partly circular, and partly angular, may be judged of from the rules of the ſimple ones; only they have this particular defect, that they offend againſt uniformity. Indeed uniformity and variety may ſeem to be oppoſite to each other: but Sir Henry Wotton obſerves, that they may be reconciled; and for an inſtance, he mentions the ſtructure of the human body, where they both meet.—Thus much for the firſt grand diviſion, viz. the whole of a *building*.

BUILDING, *the parts of a*, Baptiſta Alberti compriſes under five heads; viz. the *foundation*, *walls*, *apertures*, *compartition*, and *cover*.

For the foundation; to examine its firmneſs, Vitruvius orders the ground to be dug up; an apparent ſolidity not to be truſted to, unleſs the whole mould, cut through, be found ſolid: he does not indeed limit the depth of the digging; Palladio limits it to a ſixth part of the height of the *building*. This Sir Harry Wotton calls the *natural foundation*, whereon is to ſtand the ſubſtruction, or ground-work, to ſupport the walls, which he calls the *artificial foundation*: this then is to be its level; its loweſt edge, or row, of ſtone only, cloſe laid with mortar, and the broader the better; at the leaſt, twice as broad as the wall: laſtly, ſome add, that the materials below ſhould be laid juſt as they grew in the quarry; as ſuppoſing them to have the greateſt ſtrength in their natural poſture. De Lorme enforces this, by obſerving, that the breaking or yielding of a ſtone in this part, for the breadth of the back of a knife, will make a cleft of above half a foot in the fabric above.—For pallification, or piling the ground-plot, ſo much commended by Vitruvius, we ſay nothing; that being required only in a moiſt marſhy ground, which ſhould never be choſen: nor, perhaps, are there any inſtances of this kind, where it was not neceſſity that drove them to it.

For the walls, they are either entire and continued, or intermitted; and the intermiſſions are either columns, or pilaſters. Entire, or continued walls, are variouſly diſtinguiſhed; by ſome, according to the quality of the materials, as they are either ſtone, brick, &c. others only conſider the poſition of the materials; as when brick, or ſquare ſtones, are laid in their lengths, with ſides and heads together, or the points conjoined, like a network, &c.

The great laws of muring are, that the walls ſtand perpendicular to the ground-work; the right angle being the cauſe of all ſtability: that the maſſieſt and heavieſt materials be loweſt, as fitter to bear than be borne: that the work diminiſh in thickneſs, as it riſes; both for eaſe of weight, and expence: that certain courſes, or ledges of more ſtrength than the reſt, be interlaid, like bones, to ſuſtain the fabric from total ruin, if the under parts chance to decay: and, laſtly, that the angles be firmly bound; theſe being the nerves of the whole fabric, and commonly fortified, by the Italians, on each ſide the corners, even in brick *buildings*, with ſquared ſtones; which add both beauty and ſtrength.

The intermiſſions, as before obſerved, are either columns, or pilaſters: whereof there are five orders, viz. *Tuſcan*, *Doric*, *Ionic*, *Corinthian*, *Compoſite*; each of which ſee diſtinctly conſidered under its reſpective head. See alſo COLUMN, ORDER, and PILASTER.

Columns, and pilaſters, are frequently, both for beauty and majeſty, formed archwiſe; the doctrine of which ſee under ARCH.

For the apertures; they are either doors, windows, ſtair-caſes, chimneys, or conduits for the ſuillage, &c. which ſee under their heads, DOOR, WINDOW, &c. Only, with regard to the laſt, it may be obſerved, that art ſhould imitate nature in theſe ignoble conveyances, and ſeparate them from ſight, where a running water is wanting, into the moſt remote, loweſt, and thickeſt part of the foundation; with ſecret vents, paſſing up through the walls like tunnels to the open air; which the Italians all commend for the diſcharge of noiſome vapours. See SEWERS, &c.

For the compartition, or diſtribution of the ground-plot into apartments, &c. Sir H. Wotton lays down theſe preliminaries; that the architect never fix his fancy on a paper-draught, how exactly ſoever ſet off in perſpective; much leſs on a mere plan, without a model, or type of the whole ſtructure, and every part thereof, in paſteboard, or wood; that this model be as plain, and unadorned, as poſſible, to prevent the eye's being impoſed on; and that the bigger this model, the better.

In the compartition itſelf, there are two general views, viz. the *graceſulneſs*, and *uſefulneſs* of the diſtribution, for rooms of office, and entertainment; as far as the capacity thereof, and the nature of the country, will allow. The graceſulneſs will conſiſt in a double analogy, or correſpondency; firſt, between the parts and the whole, whereby a large fabric ſhould have large partitions, entrances, doors, columns, and, in brief, all the members large: the ſecond, between the parts themſelves, with regard to length, breadth, and height. The ancients determined the length of their rooms, that were to be oblongs, by double their breadth; and the height by half their breadth, and length, added together. When the room was to be preciſely ſquare, they made the height half as much more as the breadth: which rules the moderns take occaſion to diſpenſe with; ſometimes ſquaring the breadth, and making the diagonal thereof the meaſure of the height; and ſometimes more. This deviating from the rules of the ancients is aſcribed to M. Angelo.

The ſecond conſideration in the compartition is, the uſefulneſs; which conſiſts in the having a ſufficient number of rooms of all kinds, with their proper communications, and without diſtraction. Here the chief difficulty will lie in the lights, and ſtair-caſes: the ancients were pretty eaſy on both theſe heads, having generally two cloiſtered open courts, one for the women's ſide, the other for the men: thus the reception of light into the body of the *building* was eaſy, which among us muſt be ſupplied, either by the open form of the *building*, or by graceful refuges or breaks, by terraſſing a ſtory in danger of darkneſs, and by abajours, or ſky-lights.—For caſting the ſtair-caſes, it may be obſerved, that the Italians frequently diſtribute the kitchen, bake-houſe, buttery, &c. under ground, next above the foundation, and ſometimes level with the floor of the cellar, raiſing the firſt aſcent into the houſe fifteen feet or more: which, beſide the removing of annoyances out of the ſight, and gaining ſo much room above, does, by elevating the front, add a majeſty to the whole. Indeed, Sir H. Wotton obſerves, that, in England, the natural hoſpitality thereof will not allow the buttery to be ſo far out of ſight; beſides, that a more luminous kitchen, and a ſhorter diſtance between that and the dining-room is required, than that compartition will well bear.

In the diſtribution of lodging-rooms, it is a popular and ancient fault, eſpecially among the Italians, to caſt the partitions ſo, that, when the doors are all open, a man may ſee through the whole houſe: this is grounded on the ambition of ſhewing a ſtranger all the furniture at once; an intolerable hardſhip on all the chambers, except the inmoſt, where none can arrive but through all the reſt, unleſs the walls be extremely thick for ſecret paſſages: nor will this anſwer the purpoſe, without at leaſt three doors to each chamber; a thing inexcuſable, except in hot countries; beſides it being a weakening to the *building*.

In the compartition, the architect will have occaſion for frequent ſhifts; through many of which his own ſagacity, more than any rules, muſt conduct him.

For the covering of the *building*; this is the laſt in the execution, but the firſt in the intention: for who would *build*, but to ſhelter? In the covering, or roof, there are two extremes to be avoided; the making it too heavy, or too light: the firſt will preſs too much on the under-work; the latter has a more ſecret inconvenience; for the cover is not only a bare defence, but a band, or ligature, to the whole *building*; and as ſuch requires a reaſonable weight. Indeed, of the two extremes, a houſe top-heavy is the worſt. Care is likewiſe to be taken, that the preſſure be equal on each ſide; and Palladio wiſhes, that the whole burden might not be laid on the outward walls, but that the inner might likewiſe bear their ſhare.—The Italians are very curious in the proportion and gracefulneſs of the pentice or ſlopeneſs of the roof; dividing the whole breadth into nine parts, whereof two ſerve for the height of the higheſt top, or ridge, from the loweſt: but, in this point, regard muſt be had to the quality of the region; for, as Palladio inſinuates, thoſe climates which fear the falling of much ſnow, ought to have more inclining pentices than others.

Thus much for the principal or eſſential parts of a *building*. For the *acceſſories*, or *ornaments*; they are derived from painting and ſculpture. The chief things to be regarded in the firſt are, that no room have too much, which will occaſion a ſurfeit; except in galleries, or the like: that the beſt pieces be placed where there are the feweſt lights: rooms with ſeveral windows are enemies to painters, nor can any pictures be ſeen in perfection, unleſs illuminated, like nature, with a ſingle light: that in the diſpoſition regard be had to the poſture of the painter in working, which is the moſt natural for the poſture of the ſpectator; and that they be accommodated to the intentions of the room they are uſed in. For ſculpture, it muſt be obſerved, that it be not too abundant; eſpecially at the firſt approach of a *building*, or at the entrance, where a Doric ornament is much preferable to a Corinthian one: that the niches, if they contain figures of white ſtone, be not coloured in their concavity too black, but rather duſky; the ſight being diſpleaſed with too ſudden departures from one extreme to another: that fine ſculptures have the advantage of nearneſs, and coarſer of diſtance.

As to the ſtone and ſtucco uſed in *buildings*, which are freſh and white at firſt, and are commonly ſuppoſed to be diſcoloured with the air, moiſture, ſmoke, &c. the true cauſe thereof is, that they become covered with a minute ſpecies of plants, which alter their colour. A ſort of lichens, yellowiſh, browniſh, or greeniſh, which commonly grow on the barks of trees, do grow alſo on ſtones, mortar, plaiſter, and even on the ſlates of houſes, being propagated by little light ſeeds, diſperſed by the wind, rain, &c. The beſt preſervative known, is lime.

Building, *to judge of a*, Sir H. Wotton lays down the following rules. That before fixing any judgment, a perſon be informed of its age; ſince, if apparent decays be found to exceed the proportion of time, it may be concluded, without further inquiſition, either that the ſituation is bad, or the materials or workmanſhip too ſlight. If it be found to bear its years well, let him run back, from the ornaments and things which ſtrike the eye firſt, to the more eſſential members; till he be able to form a concluſion, that the work is commodious, firm, and delightful; the three conditions, in a good *building*, laid down at firſt, and agreed on by all authors.

This, our author eſteems the ſcientifical way of judging. Vaſſari propoſes another; viz. by paſſing a curſory examination over the whole edifice, compared to the ſtructure of a well-made man; as, whether the walls ſtand upright on a clean footing and foundation; whether the *building* be of a beautiful ſtature; whether, for the breadth, it appear well burniſhed; whether the principal entrance be on the middle line of the front, or face, like our mouths; the windows, as our eyes, ſet in equal number and diſtance on both ſides; the offices, like the veins, uſefully diſtributed, &c.

The perfection of *building* conſiſts in its adequate agreement with the intention of the founder; its decoration, in the aſſemblage of ſuch things as are proper to attract the attention of perſons paſſing by; its ſtrength or firmneſs, in being free from the danger of coming ſhortly to ruin or decay; its utility or conveniency, that diſpoſition of the whole, and each part, which renders its uſe to the owner moſt perfect; its beauty, in the true or apparent perfection of it, conſidered as ſeen.

Vitruvius gives a third method of judging; ſumming up the whole art under theſe ſix heads: *ordination*, or ſetting the model and ſcale of the work; *diſpoſition*, the juſt expreſſion of the firſt deſign thereof (which two, Sir H. Wotton thinks, he might have ſpared, as belonging rather to the artificer than the cenſurer); *eurythmy*, the agreeable harmony between the length, breadth, and height of the ſeveral rooms, &c. *ſymmetry*, or the agreement between the parts and the whole; *decor*, the due relation between the *building* and the inhabitant; whence Palladio concludes, the principal entrance ought never to be limited by any rule, but the dignity and generoſity of the maſter; and laſtly, *diſtribution*, the uſeful caſting of the ſeveral rooms, for office, entertainment, or pleaſure. Theſe laſt four are ever to be run over, before a man paſs any determinate cenſure: and theſe alone, Sir Henry obſerves, are ſufficient to condemn or acquit any *building* whatever.

Dr. Fuller gives us two or three good aphoriſms in *building*; as, 1. Let not the common rooms be ſeveral, nor the ſeveral rooms common; i. e. the common rooms not to be private or retired, as the hall, galleries, &c. which are to be open; and the chambers, &c. to be retired. 2. A houſe had better be too little for a day, than too big for a year. Houſes therefore to be proportioned to ordinary occaſions, not extraordinary. 3. Country houſes muſt be ſubſtantives, able to ſtand of themſelves: not like city *buildings*, ſupported and ſheltered on each ſide by their neighbours. 4. Let not the front look aſquint on a ſtranger; but accoſt him right, at his entrance. 5. Let the offices keep their due diſtance from the manſion-houſe; thoſe are too familiar, which are of the ſame pile with it.

The method of *building*, both in Barbary and the Levant, ſeems to have continued the ſame from the earlieſt ages, without the leaſt alteration or improvement.

The modern *buildings* are much more commodious, as well as beautiful, than thoſe of former times. Of old they uſed to dwell in houſes, moſt of them with a blind ſtair-caſe, low ceilings, and dark windows; the rooms built at random, without any thing of contrivance, and often with ſteps from one to another; ſo that one would think the people of former ages were afraid of light and freſh air: whereas the genius of our times is altogether for light ſtair-caſes, fine ſaſh-windows, and lofty ceilings. And ſuch has been our builders induſtry in point of compactneſs and uniformity, that a houſe after the new way will afford, on the ſame quantity of ground, almoſt double the conveniencies which could be had from an old one.

By acts 11 Geo. I. and 4 Geo. III. for the regulation of *building* within the weekly bills of mortality, and in other places therein ſpecified, party walls are required to be erected of brick or ſtone, which ſhall be two bricks and a half thick in the cellar, two bricks thick upwards to the garret floor, &c. and other limitations are enacted reſpecting the diſpoſition of the timbers, &c. And every *building* is to be ſurveyed; and the perſon who offends againſt the ſtatute in any of the particulars recited, is liable to a forfeit of 250*l.* to be levied by warrant of juſtices of the peace. The other principal ſtatutes relating to *building* are 19 Car. II. c. 3. 22 Car. II. c. 11. 5 Eliz. c. 4. 35 Eliz. c. 6. 6 Ann. c. 31. 7 Ann. c. 17. 33 Geo. II. c. 30. and 6 Geo. III. c. 37.

For the method of ſecuring *buildings* from lightning, ſee Conductor.

Building, *ſection of a*. See Section.

Building, Ship. See Ship.

BUILT, in *Sea-language*, is an epithet applied to ſhips, denoting their peculiar form and ſtructure, and diſtinguiſhing ſome from others of a different claſs or nation. Thus we uſe frigate-*built*, galley-*built*, &c. Engliſh-*built*, French-*built*, &c.

BUL, in the *Hebrew Calendar*, the eighth month of the eccleſiaſtical, and ſecond of the civil year, ſince called *Marſhevan*; it anſwers to our October, and has nine and twenty days.

Bul, in *Ichthyology*, an Engliſh name for the common flounder.

BULAFO, a muſical inſtrument, much uſed by the Negroes of Guinea, &c.

It conſiſts of ſeveral pipes made of hard wood, ſet in order; which diminiſh by little and little in length, and are tied together with thongs of thin leather twiſted about ſmall round wands, put between each of the pipes, ſo as to form a ſmall interſtice. They play on it with ſticks, the ends of which are covered with leather, to make the ſound leſs harſh.

BULATWÆLA, in *Botany*, a name by which ſome authors have called the betel, an herb the people of the Eaſt Indies are fond of chewing.

BULB, Bulbus, in *Botany*, a thick root, nearly round, compoſed of ſeveral ſkins, or coats, laid one over another;

other; ſending forth from its lower part a great number of fibres. Such are the roots of the common onion, the daffodil, the hyacinth, &c.

The ſame denomination is ſometimes alſo, though improperly, given to tuberous roots, compoſed of one ſolid continuous ſubſtance, without any ſkins laid over one another.

Dr. Grew obſerves, that in *bulbous* plants, as well as many other perennial ones, the root is annually renewed, or repaired, out of the trunk or ſtalk itſelf: that is, the baſis of the ſtalk continually and inſenſibly deſcends below the ſurface of the earth; and hiding itſelf therein, is, both in nature, place, and office, changed into a true root. Thus, in brownwort, the baſe, ſinking by degrees, becomes the upper part of the root; the next year, the lower part; and the next it rots away, a freſh ſupply coming.

The ancients divided *bulbs* into eſculent, as the onion and leek; emetic, as the narciſſus; and wild, as the hermodactyl. Nothing, Pliny obſerves, is more prolific than the lily, a ſingle root often producing no leſs than fifty *bulbs*. Nat. Hiſt. lib. ii. cap. 5.

Modern botaniſts diſtinguiſh two kinds of *bulbs*, *tunicated* and *ſquamous*.

Bulbs, *tunicated*, are thoſe compoſed of ſeveral coats or tunics laid over each other; ſuch are the roots of onion, tulip, and jonquil.

Bulbs, *ſquamous*, are thoſe compoſed of ſeveral ſcales, laid in like manner over each other; ſuch is that of the white lily. To which are added, the *ſolid bulb*, compoſed of an uniform ſolid ſubſtance; the *articulate bulb*, conſiſting of *lamellæ* linked together; the *duplicate*, when there are two to each plant; and *aggregate*, when each plant has a congeries of ſuch roots.

Some conſider the *bulb* as a real plant, out of which a new ſtalk is yearly produced; the ſtalk itſelf withering and falling away with the flower and leaves. In reality, as the leaves which fall yearly, are not neceſſary to the integrity of the plant; ſo neither does the ſtalk ſeem to be, which ſprings out of the *bulb*, and withers away, the *bulb* itſelf ſtill remaining entire. We may add, that the very leaves and flowers, e. gr. of a tulip, have been diſtinctly perceived to be contained in its *bulb*. Du Hamel, Acad. Sc. lib. ii. § 2. cap. 1.

Bulbs are alſo taken for the round ſpired beards of flowers.

BULBINE, in *Botany*. See Spider-*wort*.

BULBOCASTANUM. See Pig-*nut*.

BULBOCODIUM, in *Botany*, a genus of the *hexandria monogynia* claſs of plants. The flower is funnel-ſhaped, and compoſed of ſix petals: the fruit is a triangular acuminated capſule, with three cells, containing ſeveral angular ſeeds. There are two ſpecies; one of which grows naturally on the Alps, and upon Snowdon in Wales; the other is a native of Spain, and has been long cultivated in our gardens. The root of this plant, according to Lemery, is purgative: Ray ſays it is emetic, and hurtful to the nerves. Herman recommends the bruiſed leaves for an eryſipelas.

Bulbocodium is alſo a name uſed by ſome authors for *pſeudo narciſſus anglicus*, or common wild yellow daffodil.

BULBONACK, in *Botany*, the name by which ſeveral authors call the *viola lunaris*, known in our gardens by the names of *ſatin* and HONESTY.

BULBOUS, or Bulbose *plants*, thoſe which have a BULB.

Bulbous *plants, flowering of*. See Flowering.

BULBUS *vepiſtorius*, in the *Materia Medica*, the name uſed for the root of the *muſcari*, or muſk grape plant.

BULCARD, an Engliſh name for the *galeetta*, or *alauda non criſtata*, of Rondeletius; a ſmall ſea-fiſh caught among the rocks on the Corniſh and other ſhores. Willughby.

BULEF, in *Botany*, a name by which ſome authors call the willow.

BULEPHORUS, in the court of the eaſtern emperors, was the ſame officer with *ſummæi rei* RATIONALIS.

BULEUTÆ, in the cities of Greece and Aſia, were the ſame with the DECURIONES at Rome. Calv. Lex. Jur. p. 128.

The word has been ſometimes alſo uſed to denote SENATORS.

BULGARIAN *language*, the ſame with the *lingua Heneta*, or Sclavonic.

BULGOLDA *lapis*, the name of the ſtone taken out of the head of an animal in America, called by the natives *bulgoldalf*. We have no account of this, but that it poſſeſſes the virtue of the bezoar, as a cordial and reſiſter of poiſons.

BULIMY, an enormous appetite, attended with fainting, and coldneſs of the extremities.

The word is formed of βȣς, *ox*, and λιμὸς, *hunger*; as importing that the patient has the ſtomach of an ox; or, as others term it, ſufficient to eat up an ox. Varro and Suidas derive it from the particle βȣ, which is prefixed by the Greeks to divers words, only as an intenſive; and λιμὸς, *hunger*, q. d. *a great hunger*.

The perpetual craving of food is ſometimes owing to a defect of nouriſhment on account of exceſſive evacuations, by an hæmorrhage, flux of the belly, vomiting, ſweating, or the like: or from too great a conſumption of the alimentary ſubſtance, from various cauſes, whence the food is hurried out of the ſtomach with greater ſpeed than it ought to be. Sometimes this affection is owing to worms conſuming the chyle.

The diagnoſtic ſigns of this diſorder are ſufficiently evident, as well to the patients as to the attendants, who cannot but obſerve a depraved and exceſſive appetite, which compels them to receive into their ſtomachs an immoderate quantity of victuals, which afterward proving burdenſome and oppreſſive to nature, are thrown up again by vomiting; in which caſe the diſtemper is the *fames canina*; or if there be no vomiting, the patient is ſeiſed with a lipothymy, and then it is a *bulimus*.

The different cauſes of this diſtemper, are diſtinguiſhable by the circumſtances which are antecedent, attendant, and conſequent to it. Acid evacuations and vomitings, crude ſtools and want of thirſt, are ſigns of an acid abounding in the ſtomach. In defect of nutrition, the patients are emaciated: and laſtly, the ſigns of worms are to be taken from their proper ſymptoms.

As to the prognoſtics of this diſorder, if it depends wholly on external cauſes, there is no danger, provided theſe are ſpeedily removed; and what proceeds from worms carries but little danger in it, becauſe the effects ceaſe on their being deſtroyed. In pregnancy, where an inordinate appetite is frequent, there is no danger to be apprehended from it.

But the diſtemper is very dangerous, when followed by large evacuations or colliquations of the body: and eſpecially when after receiving food, while the ſtomach is yet full, the patient is ſeized with fainting fits: for when thoſe things which ought to give moſt relief, prove of none, or of ill effect, it is a ſign of a great diſorder in the tone of the ſtomach.

So alſo the CANINE appetite, when the vomiting or flux is obſtinate, is not void of danger: for it commonly degenerates into a cachexy, dropſy, lientery, atrophy, and other fatal diſtempers.

For the methods of cure, while the patient is under the fainting fit, it is uſual to have recourſe to ſuch things as remarkably affect the ſenſe of ſmelling: as, bread ſopped in wine, roaſted ſwine's fleſh, or kid, and in general all ſuch things as have a nidorous and well-favoured ſmell. It is ſometimes the practice likewiſe to compreſs the extremities of the patients, to prick them in every part, rub their ears, pull them by the cheeks, and by the hair. When they are come to themſelves from the lipothymy, the moſt proper thing to give them in the firſt place, is wine, and after that other food. In our future management, they are to be reſtored by ſuch meats, as are of good and quick nutrition, but difficult of alteration and digeſtion: they are alſo to be treated with ſuch things as refrigerate and ſtrengthen. By this method they are greatly benefited, and in proceſs of time are reſtored to a good temperament.

Evacuation is to be performed, either by vomit or purge; and that by means of ſuch remedies as are proper for thoſe who labour under a want of appetite. For though theſe affections are contrary to each other, yet they are uſually produced by the ſame humours, differing only in degrees of frigidity, and ſome very different ſecondary qualities which affect the ſtomach after a very different manner. A remedy of this kind, which is very much commended by Galen, is *hiera* made into pills.

Pure wine alone, drank in ſufficient plenty, is a moſt powerful reliever of HUNGER, according to the aphoriſms of Hippocrates, xxi. ſect. 2. and the ſpirit of wine commonly called *aqua vitæ*, has a ſtill more powerful effect that way.

In the Philoſophical Tranſactions, we have an account of a perſon affected with a *bulimy*, to ſuch a degree that he would eat up an ordinary leg of veal at a common meal, and would feed on ſowthiſtle, &c. he was cured by throwing up ſeveral worms, of the length and thickneſs of a tobacco-pipe.

BULITHOS, *lapis bovinus*, a calculus or ſtone found in the gall-bladder, kidneys, or urinary bladder of oxen.

Inſtances hereof are given by Bromell, the Academy Naturæ Curioſorum, and other naturaliſts; by which it appears that Ariſtotle was miſtaken in aſſerting, that man alone is ſubject to the ſtone, and inquiring ſolicitouſly into the reaſons hereof. Ariſt. Probl. § x. n. 42.

BULK *of a ſhip*, denotes her whole content in the hold for ſtowage of goods.

Bulk, *to break*. See Breaking.

Bulk-*heads*, are partitions made acroſs a ſhip, or lengthways, with boards of timber, whereby one part is divided from another.

The *bulk-head afore*, is the partition between the fore-caſtle and gratings in the head, and in which are the chaſe-ports. See *Tab. Ship. fig.* 2. *n.* 11. 24. 48. 85. 95. 99. 102. 115.

BULL, in *Eccleſiaſtical Writers*, denotes an inſtrument diſpatched out of the Roman chancery, ſealed with lead; anſwering to the edicts, letters patent, and proviſions, of ſecular princes.

The word *bull* is derived from *bulla, a ſeal*; and that from *bulla, a drop*, or *bubble:* or, according to others, from the Greek, *βουλη*, *council*; according to Pezron, from the Celtic *buil*, or *bul, a bubble.*

We meet with four kinds of theſe *bulli*, or *bullæ*; golden, ſilver, waxen, and leaden; all in uſe among the emperors and kings of the middle and barbarous ages. In ſome, the impreſſion is made on the ſolid metal itſelf; in others on wax, and only incloſed in a metalline box, or caſe.

Sealing with metals is an illuſtrious privilege, belonging only to princes, though aſſumed alſo by prelates, as princes of the church. The doges of Venice durſt not arrogate this honour, till leave was given them by pope Alexander III. about the year 1170, to ſeal their diplomata with lead.

The *bull* is the third kind of apoſtolical reſcript, and the moſt in uſe, both in affairs of juſtice, and of grace. It is wrote on parchment; by which it is diſtinguiſhed from a *brief*, or ſimple *ſignature*, which is on paper. A *bull* is properly a ſignature enlarged: what the latter comprehends in a few words, the former dilates and amplifies.

If the *bulls* be letters of grace, the lead is hung on ſilken threads; if they be letters of juſtice, and executory, the lead is hung by a hempen cord. They are all wrote in an old round Gothic letter.

The *bull*, in the form wherein it is to be diſpatched, is divided into five parts; viz. the narrative of the fact; the conception; the clauſe; the date; and the ſalutation, in which the pope takes on himſelf the quality of *ſervant of the ſervants of God, ſervus ſervorum Dei.*

Properly ſpeaking, it is the ſeal, or pendant lead alone that is the *bull:* it being that which gives it both the title, and authority. The ſeal preſents, on one ſide, the heads of St. Peter and St. Paul; on the other, the name of the pope, and the year of his pontificate.

By *bulls*, jubilees are granted: without them no biſhops, in the Romiſh church, are allowed to be conſecrated.

In Spain, *bulls* are required for all kinds of benefices; but in France, &c. ſimple ſignatures are ſufficient; excepting for biſhopricks, abbeys, dignities, and priories conventual. According to the laws of the Roman chancery, no benefice exceeding twenty-four ducats per annum, ſhould be conferred without *bulls:* but the French would never ſubmit to this rule, except for ſuch benefices as are taxed in the apoſtolical chamber: for the reſt, they reſerve the right of diſſembling the value, expreſſing it in general terms: *Cujus & illi forſan annexorum fructus 24 ducatorum auri de camera, ſecundum communem æſtimationem, valorem annuum non excedunt.*

The *bulls* brought into France are limited and moderated by the laws and cuſtoms of the land, before they are regiſtered; nor is any thing admitted till it hath been well examined, and found to contain nothing contrary to the liberties of the Gallican church: thoſe words, *proprio motu*, in a *bull*, are ſufficient to make the whole be rejected in France.

Nor do the Spaniards admit the papal *bulls* implicitly; but, having been examined by the king's council, if there appear any reaſon for not executing them, notice thereof is given to the pope by a ſupplication; and the *bull*, by this means, remains without effect: and the like method of proceeding with the court of Rome is obſerved by moſt of the other courts of Europe, in the papal communion.

To *fulminate bulls*, is, to make publication thereof, by one of the three commiſſaries to whom they are directed; whether he be the biſhop or official. This publication is ſometimes oppoſed; but when it is, the fault is not charged on the pope who iſſued the *bull*; but an appeal is brought to him againſt the perſon who is ſuppoſed to make it: thus the fault is laid, where it is known not to be juſt, to evade affronting the pontiff. See Fulmination.

The *bull in cœna Domini*, is a *bull* read every year on Maundy-Thurſday, in the pope's preſence; containing various excommunications and execrations, againſt heretics, thoſe who diſobey the ſee, who diſturb or oppoſe the exerciſe of eccleſiaſtical juriſdiction, &c.

After the death of the pope, no *bulls* are diſpatched during the vacancy of the ſee, to prevent any abuſes; therefore, as ſoon as the pope is dead, the vice-chancellor of the Roman church takes the ſeal of the *bulls*; and in the preſence of ſeveral perſons, orders the name of the deceaſed pope to be eraſed; and covers the other ſide, on which are the heads of St. Peter and St. Paul, with a linen cloth; ſealing it up with his own ſeal, and giving it, thus covered, to the chamberlain, to be preſerved, that no *bulls* may be ſealed with it in the mean time.

By ſtat. 28 Hen. VIII. c. 16. all *bulls*, &c. obtained from the biſhop of Rome, are void; and by 13 Eliz. c. 2. (ſee alſo 23 Eliz. c. 1.) the procuring, publiſhing, or uſing any of them, is high treaſon.

Bull, *golden*, is a denomination peculiarly given to an ordinance, or ſtatute, made by the emperor Charles IV. in 1356, ſaid to have been drawn up by that celebrated lawyer, Bartoli, and ſtill reputed the *magna charta*, or fundamental law of the empire.

It is thus called from a golden ſeal fixed to it, ſuch as were uſed by the emperors of Conſtantinople, annexed to their edicts.

Till the publication of the *golden bull*, the form and ceremony of the election of an emperor were dubious, and undetermined; and the number of electors was not fixed: this ſolemn edict regulating the functions, rights, privileges, and pre-eminences of the electors.

The original, which is in Latin, on vellum, is kept at Frankfort. On the back-ſide of it there are ſeveral knots of black and yellow ſilk; to which hangs a *bull*, or ſeal of gold.

This ordinance, containing thirty articles, was approved of by all the princes of the empire, and remains ſtill in force. The election of the empire is by it declared to belong to ſeven electors; three of them eccleſiaſtics, viz. the archbiſhops of Mentz, Treves, and Cologn; and four ſeculars, viz. the king of Bohemia, prince Palatine, duke of Saxony, and marquis of Brandenburg.

Bulls, *golden*, were in uſe among the eaſtern emperors for a conſiderable time, leaden ones being confined to matters of a ſmaller moment. Spelman mentions a *golden bull*, in a treaty of alliance between our Henry VIII. and Francis I. of France; the ſame author relates, that the inſtrument, whereby Clement VII. gave king Henry VIII. the title of Defender of the Faith, had a golden *bulla* affixed to it; and there are other inſtances in Du-Cange and Altaſerra.

Bulls, *ſilver*, were not in ſo frequent uſe, though we do not want inſtances of them.

Bulls, *leaden*, were ſent by the emperors of Conſtantinople to deſpots, patriarchs, and princes; and the like were alſo uſed by the grandees of the imperial court, as well as by the kings of France, Sicily, &c. and by biſhops, patriarchs, and popes.

Polydore Virgil makes pope Stephen III. the firſt who uſed leaden *bulls*, about the year 772. But others find inſtances of them as early as Silveſter, Leo I. and Gregory the Great. The later popes, beſides their own names, ſtrike the figures of St. Peter and St. Paul on their *bulls*; a practice firſt introduced by pope Paſchal II.

Bulls, *waxen*, are ſaid to have been firſt brought into England by the Normans. They were in frequent uſe among the Greek emperors, who thus ſealed letters to their wives, mothers, and ſons. Of theſe there were two ſorts, one red, the other green. Du-Cange Gloſſ. Lat. tom. i. & Gloſſ. Græc. Montfaucon, Palæog. lib. 6.

Bull, a ſpecies of the ox or bos.

One *bull* ſuffices for fifty cows, ſome ſay ſixty. His beſt age is about two, or from one to three, before he arrives at his full growth, when he grows heavy and ſluggiſh. Hence that old rule among countrymen:

He that will have his farm full,
Muſt have an old cock and a young bull.

From that time, being of no further uſe in breeding, he is uſually gelt, and makes what they call a *bull-ſtag*, in the North corruptly a *bull-ſeg*, to be fatted for the market. When theſe creatures are intended to breed, the better the land is, the larger ſort of beaſts are to be choſen, and the greater will be the profit. But of whatever ſort the breed is, the *bull* ſhould always be of the ſame country with the cow, otherwiſe it never ſucceeds ſo well. The *bull* ſhould be choſen of a ſharp quick countenance, his forehead broad and curled, his eyes black and large, his horns long, his neck fleſhy, his belly long and large, and his hair ſmooth and like velvet; his breaſt ſhould be large, his back ſtrait and flat, his buttocks ſquare, his thighs round, his legs ſtrait, and his joints ſhort. This ſort of *bull* is the beſt for breed, and makes the beſt oxen for draught as well as for fattening.

The cow ought to have a broad forehead, black eyes, great clean horns, the neck long and thin, the belly large and deep, the thighs thick, the legs round, and the joints ſhort; a white large and deep udder with four teats, and large feet. The ſize muſt be proportioned to the goodneſs of the land.

Among the ancients, thoſe who triumphed, ſacrificed a *bull*, when they arrived at the Capitol. *Bulls* were offered to Apollo and Neptune. It was held a crime to ſacrifice them to Jupiter, though we do not want inſtances of that practice.

Bulls were ranked by the Romans in the number of military rewards.

Bull, *African*, in *Natural Hiſtory*, a ſmall wild *bull*, common in that part of the world, and ſuppoſed to be the true *bubalus* of the ancients.

Bull, *Perillus's*, was a hollow brazen engine of torture, in the ſhape of that quadruped; wherein perſons being ſhut up, and fire applied, their cries imitated the roaring of a *bull*.

Bulls *blood*, freſh drawn, is a powerful poiſon, as coagulating in the ſtomach. This is related on the authority of Pliny, xxviii. 9. and xi. 38. and many perſons among the ancients, ſuch as Æſon, Midas, Hannibal, and Themiſtocles, are ſaid to have been poiſoned by it. But the fact has been queſtioned by ſome, and denied by others. See Apollodorus, lib. i. cap. 27. Strabo, lib. i. p. 106. Plutarch in Flaminio; and Valer. Maxim. vol. vi. ext. 3.

Bulls *gall*, is an intenſe bitter, more pungent and acrimonious than that of any other animal; whence it is ſometimes uſed to deſtroy worms.

Bull, *bannal*, denotes a *bull* kept by a lord, who has a right to demand all his tenants to bring their cows to be ſerved by him. See Bannalis.

Bull, *free*, according to Du-Cange, ſignifies the ſame with *bannal bull.* Hence *tauri liberi libertas*; which, however, ſhould rather ſeem to denote a privilege of keeping a *bull* independent of the lord.

Bulls, *wild.* The *wild bulls*, now ſo numerous on the continent of America, are ſaid to have ſprung from one *bull* and ſeven cows, which were carried thither by ſome of the firſt conquerors.

In the iſland of Hiſpaniola, the French buccaneers purſue *bulls* with dogs, and kill them with fire-arms. At Buenos Ayres, the Spaniſh toradors chaſe them on horſeback, armed with a long lance, at the end of which is a half-moon of ſharp ſteel. Having drawn a number of the horned kind together, they let the cows eſcape, but dextrouſly take the *bulls* with their half-moons on the hind-legs, by which, diſabling them from flight, they are eaſily diſpatched.

Bull-*fighting*, a ſport or exerciſe much in vogue among the Spaniards and Portugueſe, conſiſting in a kind of combat of a cavalier or *torador* againſt a wild *bull*, either on foot or on horſeback, by riding at him with a lance.

The Spaniards have *bull-fights*, i. e. feaſts, attended with ſhews, in honour of St. John, the Virgin Mary, &c.

This ſport the Spaniards received from the Moors, among whom it was celebrated with great eclat. Some think, that the Moors might have received the cuſtom from the Romans, and they from the Greeks. Dr. Plott is of opinion, that the Ταυροκαθαψιων ἡμεραι amongſt the Theſſalians, who firſt inſtituted this game, and of whom Julius Cæſar learned and brought it to Rome, were the origin both of the Spaniſh and Portugueſe *bull-fighting*, and of the Engliſh *bull-running*. Nat. Hiſt. Staff. chap. x. § 76.

The practice was prohibited by pope Pius V. under pain of excommunication, incurred *ipſo facto*. But ſucceeding popes have granted ſeveral mitigations in behalf of the toradors.

Bull-*running*, denotes a feudal cuſtom obtaining in the honour of Tudbury in Staffordſhire, where anciently, on the day of the Aſſumption of our Lady, a *bull* was turned looſe by the lord to the minſtrels, who, if they could catch him before he paſſed the river Dove, were to have him for their own, or, in lieu thereof, to receive each forty pence; in conſideration of which cuſtom, they pay twenty pence yearly to the ſaid lord. Plot. ubi ſupra.

Bull *and boar*.—By the cuſtom of ſome places, the parſon is obliged to keep a *bull* and *boar* for the uſe of his pariſhioners, in conſideration of his having tithes of calves and pigs, &c. Rol. Abr. 559. 4 Med. 241.

Bull, in *Aſtronomy*, the conſtellation taurus.

Bull's *eye*, in *Aſtronomy*. See Aldebaran.

Bull's *eye*, in *Meteorology*, a little dark cloud, reddiſh in the middle, chiefly appearing about the Cape of Good Hope; thus denominated by the Portugueſe, who, on the appearance of it, inſtantly take down their ſails, as knowing that a terrible ſtorm of thunder, lightning, and whirlwind, is at hand.

Bull's *eye*, in *Sea-language*, denotes a ſort of ſmall pulley in the form of a ring, having a rope ſpliced round the outer edge of it, and a large hole in the middle for another rope to ſlide in. It is more commonly uſed by Dutch than by Engliſh ſeamen.

Bull-*finch*, a ſpecies of the loxia. This is a very pernicious bird in gardens and orchards. They feed on the young buds of trees in ſpring, which contain the bloſſoms for the ſummer's fruit. The black-thorn, or ſloe-tree, is the great favourite of the *bull-finch*, and keeps him employed in the hedges in mild weather; but if the latter end of the winter hath been ſevere, and theſe ſhrubs are backward with their buds in February, he then comes into the gardens, the trees growing there being forwarder than thoſe in the field in a cold ſpring; they will ſometimes come in ſuch numbers, as to take off all the buds from the currants, plumbs, &c. in the gardens of a whole town in a few days. Theſe birds are ſo bold, that no ſcarecrow, or other means that can be deviſed, can deter them; their great favourite in the garden is the damſon-tree, and they will feed upon this while a perſon comes almoſt cloſe up to them. It is very eaſy to ſhoot theſe birds; but the buds and young branches are uſually much injured by this method, and the beſt way ſeems to be to dawb over the twigs in many places with bird-lime.

The wild note of this bird is not in the leaſt muſical; but when tamed, it may be taught any tune after a pipe, or to whiſtle any notes; and it ſeldom forgets what it has learned. Theſe birds may be taught to ſpeak, and ſome thus inſtructed are annually brought to London from Germany.

Bull-*frog*, a ſpecies of the *frog*, common in Sweden, and the northern parts of America, with four divided toes on the fore-feet, and five webbed ones on the hinder. When the limbs are extended, it meaſures near two feet: it is very voracious, and will frequently ſwallow young ducks and other fowl: its croaking is ſo loud, as to reſemble the roaring of a *bull*; whence its name. See Frog.

Bull-*head*, the Engliſh name given to a ſmall fiſh of the cottus kind, found very frequently in ſhallow running waters, and called by the ancients *bœtus* and *cœtus*; called alſo Miller's *thumb*.

Bull-*trout*, an Engliſh name for a fiſh of the ſalmon kind, caught in many of the rivers of England, and more uſually called the scurff.

Bull-*weed*. See Centaury.

BULLA, in *Antiquity*, a golden ornament, of a globular figure, and hollow within, wherein was contained ſome amulet, to ſerve as a preſervative from witchcraft and envy, hung about the neck by thoſe who triumphed among the Romans; and alſo by the children of the patricians, and even *ingenui*, as a badge of their hereditary nobility and freedom, by which they might be animated to behave themſelves worthy of their birth. Rom. Ant. p. ii. lib. v. cap. 8.

The *bulla* was not allowed to the children of ſlaves, or even of *liberti*, who, in lieu thereof, wore a leather collar round the neck, much after the manner of the purple ſtring to which the *bulla* was hung. But the great veſtal, and the Roman ladies, wore a *bulla*; the former by way of diſtinction, the latter as a piece of dreſs. We may add, that *bullæ* were ſometimes allowed to ſtatues; whence the phraſe, *ſtatuæ bullatæ*. M. Lepidus, having killed an enemy, and ſaved a citizen, even when a boy, had a *bullated* ſtatue erected to him in the Capitol, in memory of the exploit. The Roman youth laid aſide the *bulla*, together with the *prætexta*, and conſecrated it to the *Lares*, when they arrived at their fifteenth year; as appears from the ſatyriſt:

> *Cum primum pavido cuſtos mihi purpura ceſſit,*
> *Bullaque ſuccinctis Laribus donata pependit.*

Perſ. Sat. v. ver. 20. Hiſt. Acad. Inſcr. tom. ii. Valer. Max. lib. iii. cap. 1.

Bulla was alſo a denomination given to divers other metalline ornaments made after the form of *bullæ*.

In which ſenſe, *bullæ* ſeem to include all golden and ſilver ornaments of a roundiſh form, whether worn on the habits of men, the trappings of horſes, or the like. Such were thoſe decorations uſed by the ancients on their belts and doors. Virgil, ſpeaking of Pallas's belt or girdle, ſays:

> *Notis fulſerunt cingula bullis*
> *Pallantis pueri.* Æneid lib. xii. ver. 942.

The *bullæ* of doors were a kind of large-headed nails faſtened on the doors of the rich, and kept bright with great care. The doors of temples were ſometimes adorned with golden *bullæ*.

Bulla alſo denoted a table hung up in the public courts, to diſtinguiſh which days were *faſti*, and which *nefaſti*; anſwering in ſome meaſure to our calendar.

Bulla, in *Natural Hiſtory*, a genus of worms of the order of *teſtacea*.

BULLACE-*tree*, in *Botany*, a ſpecies of plum-*tree*.

BULLARII, in the court of Rome, the makers or drawers of bulls or conſtitutions.

BULLARY, *Bullarium*, a collection of papal bulls.

We have extant divers kinds of *bullaries*; ſome containing only the bulls of particular popes; ſuch are the *bullaries* of Innocent XII. and Clement XI. Others contain the bulls granted to particular communities; ſuch is the *bullary* of the order of Cluny, &c.

A general *bullary* of all the papal conſtitutions from

Gregory VII. to Sixtus Quintus, was compiled by order of pope Sixtus Quintus, in 1586; ſince which has been publiſhed a great *bullary*, by Laert. Cherubin, containing the bulls of all the popes from Leo in 440, to Paul V. in 1559; ſince continued by Ang. Cherubin to the year 1644, and by Ang. a Lantuſca and Jo. Paulus to the year 1676; and, laſtly, by an anonymous editor to the time of Benedict XIII. under the title of *Bullarium magnum Romanum*. We have the ſame digeſted in a new method by Bouchardus; a commentary on it begun by Vinc. Petra, and a ſummary of it by Novarias. Fabr. Bibl. Med. Ævi. Lat. lib. ii. tom. i. p. 816. 822.

BULLET, an iron or leaden ball, or ſhot, wherewith fire-arms are loaded.

Some derive the word from the Latin *botellus*, others from the Greek *βαλλειν*, *to throw*.

According to Merſenne, a *bullet*, ſhot out of a great gun, flies 92 fathoms in a ſecond of time, which is equal to 589½ Engliſh feet; and, according to Huygens, it would be 25 years in paſſing from the earth to the ſun: but, according to ſome very accurate experiments of Mr. Derham, it flies, at its firſt diſcharge, 510 yards in five half-ſeconds; or about ſeven miles in a minute: allowing therefore the ſun's diſtance 95000000 Engliſh miles, a *bullet* would be near 26 years in its paſſage at the full ſpeed.

Bullets are of various kinds, viz. *red-hot bullets*, made hot in a forge; intended to ſet fire to places where combuſtible matters are found.

BULLETS *hollow*, ſhells made cylindrical, with an aperture and a fuſee at one end, which giving fire to the inſide, when in the ground, burſts, and has the ſame effect with a mine.

Chain-bullets, conſiſting of two balls, joined by a chain three or four feet apart.

Branch-bullets, two balls joined by a bar of iron five or ſix inches apart.

Two-headed bullets, called alſo *angels*, being two halves of a *bullet* joined by a bar, or chain: theſe are chiefly uſed at ſea, for cutting of cords, cables, ſails, &c.

The diameter of a leaden *bullet*, weighing 1 pound, is 1.69 inches, according to Sir Jonas Moor; and the diameter of any other *bullet* is found by dividing 1.69 inches by the cube-root of the number, which expreſſes how many of them make a pound; or by ſubtracting the third part of the logarithm of the number of bullets in the pound from the logarithm of 1.69, and the difference will be the logarithm of the diameter required.

Thus may be calculated the following table, ſhewing the diameters of leaden *bullets*, from 1 to 39 in the pound.

	0	1	2	3	4	5	6	7	8	9
0	0	1.69	1.341	1.172	1.064	0.988	0.93	0.883	0.845	0.812
1	0.784	0.760	0.738	0.719	0.701	0.685	0.671	0.657	0.645	0.633
2	0.623	0.612	0.603	0.594	0.586	0.578	0.570	0.563	0.556	0.550
3	0.544	0.537	0.532	0.527	0.521	0.517	0.512	0.507	0.503	0.498

N. B. The upper horizontal column ſhews the number of bullets to a pound; the ſecond, their diameters; the third, the diameters of thoſe of 10, 11, 12, &c. and the fourth, thoſe of 20, 21, 22, &c. and the laſt, thoſe of 30, 31, 32, &c.

The government allows 11 *bullets* in the pound for the proof of muſkets, and 14 in the pound, or 29 in two pounds, for ſervice; 17 for the proof of carabines, and 20 for ſervice; and 28 in the pound for proof of piſtols, and 34 for ſervice. Canon *bullets* or balls are of different diameters and weights, according to the nature of the piece. See **CALIBER**.

BULLET, *quarter*. See **QUARTER**.

Bullets ſhot into the water undergo a refraction; ſeveral experiments concerning which are given by Mr. Carré. Vide Mem. Acad Scienc. ann. 1705. p. 277.

The extraction of *bullets* from wounds is an operation deſcribed by chirurgical writers. *Bullets* ſometimes remain eaſy in the body during many years.

Swallowing of muſket-*bullets* is ſometimes practiſed to remove iliac and colic pains. Mr. Young gives a caſe wherein this had a terrible effect: the *bullet* happening to miſs its way down, instead of the *œſophagus*, got into the *trachea*. Mr. Chirac has a diſſertation on the queſtion, which of the two is ſafer in **ILIAC** caſes, to ſwallow leaden *bullets*, or crude mercury? He gives the preference to the *bullets*. Phil. Tranſ. Nº 263.

BULLET-*moulds* conſiſt of two concave hemiſpheres, with a handle whereby to hold them; and between the hemiſpheres is a hole, called a gate, at which to pour in the melted metal. The chaps or hemiſpheres of *bullet-moulds* are firſt punched, being blood-red hot, with a round-ended punch, of the ſhape and ſize of the intended bullets. To cleanſe the inſides, they make uſe of a *bullet-bore*.

BULLET-*bore*, is a ſteel-ſhank, having a globe at one end, wherewith to bore the inſide of a mould clean, of the ſize intended.

BULLET-*iron*, a denomination given by ſome to Spaniſh or Swediſh bars of **IRON**.

BULLIMENTA, is uſed by ſome *Chemiſts* for the waſhings and ſcourings of gold or ſilver veſſels, in proper liquors, to render them brighter.

BULLIMONY, or **BOLLIMONG**, denotes a mixture of ſeveral ſorts of grain, as oats, peaſe, and vetches, called alſo *maſlin* or *mong-corn*.

BULLION, denotes gold or ſilver in the maſs, or billet.

Silver and gold, whether coined or uncoined (though uſed for a common meaſure of other things), are no leſs a commodity than wine, tobacco, or cloth; and may, in many caſes, be exported as much to national advantage, as any other commodity.—No nation can ever be conſiderable in trade, that prohibits the exportation of *bullion*.

And it is more for the public advantage to export gold or ſilver coined, than uncoined: ſince, in the former, we have the advantage of the manufacture.

The word is apparently formed from the French *billon*, a maſs of gold or ſilver below ſtandard, which Du-Cange derives further from *bi a*, as being *aurum aut argentum in maſſam ſeu billam*, i. e. *baculum conflatum*.

Silver *bullion* is ſometimes alſo denominated **PLATE**.

By the Scottiſh laws, the cuſtoms in the exportation of goods were to be paid in *bullion*.

BULLION is alſo uſed for the place where the king's exchange is kept: or where gold and ſilver is brought in the lump to be tried, or exchanged.

BULLITION is uſed for the effect ariſing upon the mixture of different liquors, which often is a quantity of bubbles, or froth.

BULLOCK'*s eye*, in *Architecture*. See **EYE**.

BULLY-*tree*, in *Botany*. See *Star*-**APPLE**.

BULTEL, the bran or refuſe of meal after dreſſing.

The word is derived from the barbarous Latin, *bultellus*, or *bultelium*, *a ſearce* or *boulter*.

BULTEL alſo denotes a bag wherein meal is dreſſed, called alſo a *bulter*, or rather *boulter*.

BULTER-*cloth*, a linen or hair-cloth for ſifting or ſearcing of meal or flour.

BULTERS, are ſtrong lines five hundred feet long, with ſixty hooks, eight feet aſunder, and baited with pilchards or mackrel, which are uſed on the coaſt of Cornwall in the fiſhery of **CONGERS**. They are ſunk to the ground by a ſtone faſtened to them; and ſometimes ſuch a number of theſe are tied together, as to reach a mile.

BULWARK, *Propugnaculum*, in the *Ancient Fortification*, amounts to much the ſame with **BASTION** in the modern. See alſo **RAMPART**.

BUMBUNNY, in *Botany*, a name given by the people of Guinea to a plant common in that place, which ſerves them as an emetic; they boil a few of the leaves in water, and drink this liquor, which works very eaſily. Phil. Tranſ. Nº 232.

BUMICILLI, a ſect of Mahometans in Africa, ſaid to be great ſorcerers: they fight againſt the devil, as they ſay; and frequently run about covered with blood and bruiſes, in a great fright: they ſometimes counterfeit combats with him at noon-day, and in the preſence of numbers of people, for the ſpace of two or three hours, with darts, javelins, ſcimitars, &c. laying deſperately about them, till they fall down on the ground oppreſſed with blows: after reſting a moment, they recover their ſpirits, and walk off.

What their rule is, is not well known; but they are ſaid to be an order of religious.

BUMKIN, or **BOOMKIN**, in *Sea-language*, is a ſhort *boom* or bar of timber, projecting from each bow of a ſhip, to extend the lower edge of the fore-ſail to windward. It is ſecured by a ſtrong rope, which confines it to the ſhip's bow.

BUN, the dry ſtalk of **HEMP**, ſtripped of its rind.

BUNCH, a cluſter or aſſemblage of certain things, as of grapes.

BUNCH alſo denotes a **TUMOUR**, or protuberance, natural or preternatural, either on an animal or vegetable body. The *bunch* growing about the **GRAFT** of a plant is a ſort of *callus* formed by the extravaſated ſap.

BUNCH *of Camels*. See **CAMELS**.

BUNCH, in *Chirurgery*, denotes an elevation of the back, ariſing from an exterior luxation of the *vertebræ* thereof. The cure is begun by keeping emollients a long time on the *vertebræ*, whereby to looſen the ligaments, and finiſhed by wearing an iron boddice, which, compreſſing the *vertebræ*, by degrees drives them back to their natural ſituation.

BUNCHES in horſes, called alſo *knobs*, *warts*, and *wens*, are diſeaſes ariſing from foul meat, bruiſes, hard labour, or the like; whereby the blood becoming putrefied and foul, occaſions ſuch excreſcencies.

BUNCHED *cods*, among *Floriſts*, are thoſe which ſtand out, and wherein the ſeed is lodged.

BUNCHED *roots*, thoſe round roots which have knobs or knots in them. See **BULB** and **ROOT**.

BUNG, the ſtopple of a CASK, barrel, or the like.

The *bung* is a wooden plug, ſerving to ſtop the hole left in the top of a veſſel to be filled by. It anſwers to what, among the ancients, was called *epiſtomium*, and in the middle age *ſigillus*, *the ſeal of a veſſel*, becauſe in thoſe days it was uſually ſealed.

After tunning new wine, or cyder, the *bung* is uſually left open for ſome time, that when the liquor comes to work, there may be vent for the froth or ſcum, and that the hoops may not be in danger of being burſt by the violence of the fermentation. Yet, in ſome caſes, they leave wines to ferment, without giving them vent by the *bung*, in order to render them more briſk and ſpirituous: in which caſe, it is neceſſary the veſſel be hooped with iron, and other precautions taken that the *bung* may not fly.

BUNIAS, in *Botany*, *corn* or *ſquare-podded rocket*, a genus of the *tetradynamia ſiliquoſa* claſs of plants. Its characters are theſe: the flower hath four petals, placed in form of a croſs, joined at their baſe, and erect. It hath ſix ſtamina, two of which are oppoſite, and ſhorter than the other. In the centre is ſituated an oblong germen, which afterward becomes an irregular ſhort oval pod with four angles, one or other of which is prominent and pointed; incloſing one or two roundiſh ſeeds.

Bunias, or *navew*, is ſown in gardens, and flowers in April: the root is uſed in food, and the ſeed in phyſic. Theſe ſeeds are ſaid to be heating, drying, abſterging, aperitive, and digeſtive: and to be enemies to venery.

BUNIUM. See PIG-NUT.

BUNK, or BUNKEN, a word frequently occurring in the writings of the Arabian phyſicians. We do not at this time certainly know what it was; but it was evidently an aromatic root uſed in cardiac, ſtomachic, and carminative compoſitions. See LEUCACANTHA.

BUNT *of a ſail*, is the middle part of it, purpoſely formed into a kind of bag, or pouch, that it may catch and receive the more wind.

The *bunt* is chiefly uſed in topſails; for courſes are for the moſt part cut ſquare, or at leaſt with a ſmall allowance for *bunt* or compaſs.—They ſay, *the bunt holds much leeward wind*; that is, it hangs too much to leeward.

Seamen all agree, that a bellying or *bunting* ſail carries a veſſel faſter to the windward than a ſtrait or faſt ſail: the contrary of which is aſſerted by Dr. Hooke, who has a diſcourſe to ſhew the preference of ſtrait to *bunting* ſails. Vide Hooke's Poſthum. Works, p. 563, ſeq.

BUNT-*lines*, are ſmall lines made faſt to the bottom of the ſquare ſails, in the middle part of the bolt-rope to a crengle; and ſo are reeved through a ſmall block, ſeized to the yard: their uſe is to trice up the *bunt* of the ſail, for the better furling it up.—See *Tab. Ship. fig.* 1. *n.* 48. 74. 91. 116.

BUNTINE, a thin woollen ſtuff, of which the colours and ſignals of a ſhip are uſually made.

BUNTING, in *Zoology*, the common Engliſh name of the EMBERIZA *alba*, called by others *calandra*, *cenchramus alaudæ congener*, and *ſtrozello*, or *ſtrillozzo*.

The bill of this bird is ſingularly conſtructed; the ſides of the upper mandible form a ſharp angle, bending towards the lower; and in the roof of the former is a hard knob, adapted to bruiſe corn or other ſeeds.

BUONACCORDO, a ſmall ſtringed muſical inſtrument, reſembling a ſpinet, uſed by children to learn to play on, becauſe of the ſhortneſs of their fingers.

The word is Italian, and properly denotes a HARPSICHORD.

BUOY, at ſea, a block of wood, or cork, ſometimes an empty caſk well cloſed, ſwimming on the ſurface of the water, and faſtened by a chain, or cord, to a large ſtone, piece of broken cannon, or the like; ſerving to mark the dangerous places near a coaſt, as rocks, ſhoals, wrecks of veſſels, anchors, &c.

In lieu of *buoys*, are ſometimes placed pieces of wood, in form of maſts, in the conſpicuous places: ſometimes large trees are planted in a particular manner; in number, two at the leaſt, to be taken in a right line, the one hiding the other; ſo that the two may appear to the eye no more than one.

BUOY is alſo uſed for a piece of wood, or a barrel at ſea, faſtened ſo as to float directly over the anchor; that the men who go in the boat to weigh the anchor, may certainly know where the anchor lies.

BUOYS are of various kinds, differing in their conſtruction and uſe, and bearing different names. *Cone-buoys*, are thoſe in the form of a cone, floating over dangerous banks and ſhallow places. *Nun-buoys*, are ſhaped like the middle fruſtum of two cones, abutting upon a common baſe tapering at each end. *Wooden-buoys*, are ſolid pieces of timber, ſometimes in the ſhape of a cylinder, and ſometimes of a *nun-buoy*. *Cable-buoys*, are common caſks employed to *buoy* up the cable from rocky ground.

BUOY-*rope*, the rope which faſtens the *buoy* to the anchor. Its length ſhould be little more than the depth of the water where the anchor lies; and it ſhould be ſtrong enough to draw up the anchor when the cable is broke.

BUOY, *ſlings of*, ropes faſtened to the *buoy*, by which it is hung, and ſpliced round it in a manner reſembling the braces of a drum.

BUOY, *to ſtream the*, is to let it fall from the ſhip's ſide into the water; which is always done before they let go the anchor.

BUOYANT, denotes a thing floating, or apt to float.

BUPHAGA, in *Ornithology*, a genus of the order of *picæ*, of which there is one ſpecies in Senegal.

BUPHONIA, from βȣς, *ox*, and φωνη, *ſlaughter*, in *Antiquity*, an Athenian feaſt or ceremony, denominated from a bullock ſlain therein, with quaint formalities.

The *buphonia* was properly a part or appendage of the ceremony of the DIIPOLIA.

For the origin of the *buphonia*, we are told it was forbidden by the laws of Attica to kill an ox: but it once happened, at the feaſt of the *diipolia*, that an ox eat the corn, others ſay the cakes, which had been dreſſed for the ſacrifice. Thaulon the prieſt, enraged at this, preſently killed him, and fled for it. On which the Athenians, fearing the reſentment of the gods, and feigning themſelves ignorant who had committed the fact, brought the bloody axe before the judges, where it was ſolemnly arraigned, tried, found guilty, and condemned. And, in memory of this event, a feaſt was inſtituted under the denomination of *buphonia*. In which it was ſtill cuſtomary for the prieſt to fly, and judgment to be given about the ſlaughter of the ox.

BUPHTHALMUM, from βȣς, *ox*, and οφθαλμος, *eye*, in *Botany*. See OX-*eye*.

BUPHTHALMUS, in *Botany*, a name given by ſome of the ancients to the common great houſe-leek, or SEDUM *majus*, from the manner of its growing in cluſters, reſembling the eyes of large animals.

BUPLEURUM. See HARE'*s-ear*.

BUPRESTES, a ſort of oblong cantharides, of a ſtinking ſmell, and very ſevere bite. It is of the ſame nature with the common cantharides, or Spaniſh fly, and is ſaid to do great injury to the cattle, which, feeding, chance to eat it. They form, in the Linnæan ſyſtem, a genus of inſects, different from the CANTHARIDES, but belonging to the ſame order of *coleoptera*, and comprehending ſeveral ſpecies.

BURACO *de velta*, in *Zoology*, the name of a fiſh caught on the ſhores of the Braſils, and more uſually known among authors by its Braſilian name, GUAIBI-*coara*.

BURBARUS, in *Ichthyology*, a name given by Paul Jovius, and ſome other writers on fiſhes, to the common CARP. See CYPRINUS.

BURBER, an Egyptian piece of money. It is a thick piece of copper, about as broad as a ſixpence; twelve of theſe make a *medine* there.

BURBOT, the Engliſh name of the *muſtela fluviatilis*; a fiſh common in the Trent, and many other of our rivers, and called in other places the eel-pout; the *gadus lota* of Linnæus. See Phil. Tranſ. vol. lxiii. pt. ii. Nº 18.

BURCA, among the Turks, the name of the rich covering of the door of the houſe at Mecca; it is ten feet long, and five wide; and there are ſeveral figures and Arabic letters on it, very richly embroidered in gold, on a ground of red and green. This is carried about in their ſolemn proceſſions, and is often made to ſtop, that the people may touch it.

BURDA, in ſome *Middle Age Writers*, denotes a garment made of ruſhes.

BURDACK, an Ægyptian veſſel, which ſheep uſually drink out of at Cairo. They are made of a peculiar ſort of earth, which is ſuppoſed to cool the water, and are always ſet out to the north, to keep the cooler, and covered with a ſtrainer, to prevent any thing falling into the water; they are of ſo porous a ſtructure, that the water put into them will get through them in a few days.

BURDEN properly ſignifies a heavy weight or load.

Ringelberg recommends the bearing *burdens* as the beſt ſort of exerciſe; eſpecially to ſtrengthen men of ſtudy. To this end, he had a gown lined with plates of lead, which he could juſt lift with both his hands. This load he bore ſix or ſeven days together, either increaſing or diminiſhing it as he found occaſion; by which means he could both write and exerciſe at the ſame time.

BURDEN alſo denotes a fixed quantity of certain commodities. A *burden* of gad-ſteel is two ſcore, or 120 pounds.

BURDEN *of a ſhip*, is its content, or the number of tons it will carry.

The uſual rule whereby a ſhip's *burden* is eſtimated, is, that it will commodiouſly bear a weight equal to that of half the water which would fill its capacity. But this rule is not demonſtrative, and ſome depart from it as unexact, allowing only two fifths, or even one third of the water, for the ſhip's *burden*.

To determine the *burden* of a ſhip, multiply the length of the keel, taken within board, by the breadth of the ſhip, within board, taken from the midſhip beam from plank to plank, and the product by the depth of the hold, taken from the plank below the keelſon, to the under part of the upper deck plank; and divide the laſt product by 94, and the quotient is the content of the tonnage required. See FREIGHT.

BURDEN, *ſhips of*, denote thoſe of a larger and heavier ſort, carrying 500 tons, or upwards.

BURDEN, or rather BURDON, in *Muſic*, denotes the drone or deepeſt ſound of an organ; being that produced by the thickeſt pipe.

The word is French, *bourdon*; formed, according to ſome, from the law Saxon *burden*, *crepitum emittere*, *to break wind backwards*. Others will have *bourdon* originally to ſignify *buz*, or *hum*, as that of bees; anſwering to the Latin *bombus*; and formed by *onomatopæia*.

The modern *bourdon* anſwers to the note which the Greeks called προσλαμϐανομενος.

BURDEN alſo denotes the pipe, or ſtring itſelf, by which ſuch ſound is given.

Matth. Paris will have the name *burden* to have been originally given this pipe, on account of its reſemblance to a pilgrim's ſtaff, anciently called alſo *burdo*.

BURDO, in *Phyſiology*, a mongrel beaſt of burden, produced by a horſe and ſhe-aſs, by which it is diſtinguiſhed from the MULE, which is that produced of a male aſs by a mare.

The liver and teſticles of the *burdo* are greatly commended by Aldrovand, and ſome other authors, as medicines, but now never uſed.

BURDO, or BURDON, in *Middle Age Writers*, denotes a pilgrim's long ſtaff, as doing the office on that occaſion of a MULE, or other vehicle.

BURDOCK, *Arctium*, in *Botany*, a genus of the *ſyngeneſia polygamia æqualis* claſs of plants. Its characters are theſe: the flower is compoſed of many florets, which are tubulous and uniform, and cut into five narrow ſegments at the top. The germen is ſituated at the bottom of the tube, which afterward becomes a ſingle pyramidal angular ſeed, crowned with down. There are three ſpecies; the two firſt of which are common weeds, growing on the ſides of roads and foot-paths in moſt parts of England; ſo are not admitted into gardens. The firſt is ordered for medicinal uſe by the college of phyſicians.

As theſe plants are ſeldom cultivated, it is needleſs to give any inſtructions for that purpoſe: but where they are troubleſome weeds, it may not be amiſs to mention that their roots laſt but two years; they may therefore be deſtroyed with much leſs trouble than ſuch as have abiding roots; for the plants which come up from ſeed do not flower until the ſecond year, and when their ſeeds are perfected their roots decay.

The root of the common *burdock* is a very powerful diuretic and diaphoretic. It is given with great ſucceſs, in decoction, in obſtructions of the ſpleen, and in dropſies. It is alſo recommended by ſome in all diſeaſes of the breaſt and lungs, in aſthmas, in the ſtone, and in the ſciatica. The ſeed of it is eſteemed by many to be one of the greateſt lithontriptics known; and, by the inſtances that have been produced of its doing ſervice in nephritic complaints, it ſeems to merit a fair trial. The freſh leaves are by ſome recommended as a dreſſing for old ulcers, and for burns and luxations. They are alſo applied by the good women to the ſoles of the feet, as a remedy in hyſteric complaints.

The ſection of a *burdock* root, viewed with a microſcope, has the appearance repreſented in *Tab. of Microſcopical Objects*, *Claſs* 2.

BURDOCK, *leſſer*, *Xanthium*, in *Botany*, a genus of the *monoecia pentandria* claſs. Its characters are theſe: it hath male and female flowers on the ſame plant. The male flowers have a common ſcaly empalement; they are compoſed of ſeveral tubulous, funnel-ſhaped florets, which are equal, and diſpoſed in a hemiſphere, cut into five ſegments at the top, and have each five very ſmall ſtamina, terminated by erect parallel ſummits. The female flowers are ſituated under the male by pairs; they have no petals or ſtamina, but are ſucceeded by oblong oval prickly fruit, having two cells, each including one oblong ſeed, convex on one ſide, and plain on the other. There are four ſpecies.

The roots of this plant are of a bitter and acrid taſte, and are recommended as of great ſervice in ſcrophulous caſes, taken in decoction. Matthiolus gives great praiſe to the roots dried and powdered, and given in mixture with rhubarb for the leproſy: but they are now rarely uſed

BURDONARII, an appellation ſometimes given to pilgrims, or thoſe who went out of devotion to the holy land.

The word is formed from BURDO, an appellation given to the ſtaff wherewith they travelled.

BURDUNCULUS, in *Botany*, a name given by ſome to the plant known among moſt of the botanical writers by the name of *bugloſſum echioides capitulis cardui benedicti*.

BURFORD *ſaddle*. See SADDLE.

BURGAGE, a tenure proper to boroughs and towns, whereby the inhabitants hold their lands and tenements of the king, or other lord, at a certain yearly rate. See BOROUGH *Engliſh*.

BURGAGE is ſometimes uſed to denote the rent, or quitrent paid to the chief lord for the houſes and tenements in a town or borough.

BURGAGE alſo obtains in the laws of Normandy; ſome imagine, that it had its firſt riſe here, and was brought into England by William the Conqueror; others are of opinion, that Rollo, when driven out of England, carried it thence into Normandy.

BURGAGE, *free*, *Burgagium liberum*, denotes a tenure, whereby the tenants, after having paid their rent to the ſuperior lord, were exempted from the ſervice.

BURGAU, in *Natural Hiſtory*, the name of a large ſpecies of ſea-ſnail, of the lunar or round-mouthed kind. It is very beautifully lined with a coat, of the nature of the mother of pearl; and the artificers take this out, to uſe under the name of mother of pearl, though ſome call it after the name of the ſhell they take it from, *burgaudine*.

BURGAUDINE, the name given by the French artificers to what we call mother of pearl. In their works, they do not uſe the common nacre-ſhell for this, but the lining of the American burgau. Hence ſome call the mother of pearl *burgaudine*, and others the *burgaudine* mother of pearl.

BURGEON, in *Gardening*, a knot or button put forth by the branch of a tree in the ſpring.

The word is formed from the French *bourgeon*, which ſignifies the ſame, formed from the Latin *burrio*, of *burra*. *Bourgeon* amounts to the ſame with what is otherwiſe called *eye*, *bud*, or *germ*.

Froſts are chiefly dangerous when the *burgeons* begin to appear.

The *burgeons* have the ſame ſkin, ſame pith, ſame ligneous body, and the ſame inſertions as the ſtalk; that is, all the parts are the ſame in both, only more contracted in the former.

BURGESS, an inhabitant of a borough, or walled town, or one who poſſeſſes a tenement therein.

In other countries, *burgeſs* and citizen are confounded together; but with us they are diſtinguiſhed. See BOROUGH.

The word is alſo applied to the magiſtrates of ſome towns; as the bailiff and *burgeſſes* of Leominſter.

Anciently, *burgeſſes* were held in great contempt; being reputed ſervile, baſe, and unfit for war; ſo that the gentry were not allowed to intermarry in their families, or fight with them; but, in lieu thereof, were to appoint champions. A *burgeſs's* ſon was reputed of age, when he could diſtinctly count money, meaſure cloth, &c. Spelm. Gloſſ. Glanvil. lib. vii. cap. 9.

BURGESS, *king's*, *Burgenſis regis*, was he who, though reſiding in another's juriſdiction, was exempt therefrom, and only ſubject to the juriſdiction of the king, unleſs the lord alſo enjoyed royal juriſdiction.

In ſtatute 5 Rich II. c. 4. where the ſeveral claſſes of perſons in the commonwealth are enumerated, we meet with count, baron, banneret, *chivaleer de countee*, *citizein de citie*, and *burgeſs de bourg*.

BURGESS is now ordinarily uſed for the repreſentative of a borough-town in parliament.

Burgeſſes are ſuppoſed to repreſent the mercantile part or trading intereſt of the nation. They were formerly allowed, by a rate eſtabliſhed in the reign of Edward III. two ſhillings a day as wages. It is much to be regretted, that the members for boroughs bear above a quadruple proportion to thoſe for counties. The right of election of *burgeſſes* depends on ſeveral local charters and cuſtoms: though, by 2 Geo. II. c. 24. the right for the future ſhall be allowed according to the laſt determination of the houſe of commons concerning it: and by 3 Geo. III. c. 15. no freeman, except ſuch as claim by birth, ſervitude, or marriage, ſhall be intitled to vote, unleſs he hath been admitted to his freedom twelve months before. No perſon is eligible as a *burgeſs*, who hath not a clear eſtate of 300*l*. a year. Stat. 9 Ann. c. 7. See PARLIAMENT.

BURGGRAVE, properly denotes the hereditary governor of a caſtle, or fortified town, chiefly in Germany.

The word is compounded of *bourg*, *town*, and *graf*, or *grave*, *count*.

The *burggraves* were originally the ſame with what we otherwiſe call *caſtellans*, or *comites caſtellani*; but their dignity was conſiderably advanced under Rudolph of Hapſburgh; before his time they were ranked only as counts, and below the princes, but under him began to be eſteemed on a footing with princes.

In ſome parts, the dignity is much degenerated, eſpecially in the Palatinate. There were formerly, according to Leti, fifteen families who enjoyed the title of *burggraves*, thirteen of which are now extinct. But this is differently repreſented by others.

In Bohemia, the title *burggrave* is given to the chief officer, or to him that commands in quality of viceroy.

In Pruſſia, the *burggrave* is one of the four chief officers of the province.

In Guelderland, the *burggrave* of Nimeguen is preſident of the ſtates of the province.

BURGH, the ſame with BOROUGH.

BURGH-*bote*, is chiefly uſed for an aid or contribution levied for the repairing of a town or caſtle.

By the law of king Athelſtan, the caſtles and walls of towns were to be repaired, and *burgh-bote* levied every year, within a fortnight after Rogation days. No perſon whatever was exempt from this ſervice; the king himſelf could not releaſe a man from *burgh-bote*: yet, in after-times, exemptions appear to have been frequently granted; inſomuch that, according to Cowel, the word *burgh-bote* came to be chiefly uſed to denote, not the ſervice, but the liberty or exemption from it.

BURGH-*breche*, or *brech*, a fine impoſed on the community of a town, or *burgh*, for the breach of peace among them.

BURGH-*mails*, were yearly payments to the crown of Scotland, introduced by Malcolm III. and reſembling the FEE-*farm* rents of *burghs* in England. See MAIL.

BURGH-*maſter*, an officer in the TIN mines, who directs and lays out the meers for the workmen, &c. otherwiſe denominated *bailiff* and BAR-MASTER.

BURGHERMASTERS, BOURGERMESTERS, or BURGMESTERS, chief magiſtrates in the cities of Germany, Holland, and Flanders; to whom belong the giving of orders for the government, adminiſtration of juſtice, policy, and finances of the place: though the authority and office is not every where alike; each city having its particular laws and ſtatutes.

The word is formed from the two Flemiſh words, *borger*, *burgeſs*, or *citizen*; and *meſter*, *maſter*. Some expreſs it in Latin by *conſul*, others by *ſenator*.—M. Bruneau obſerves, that *burghermaſter*, in Holland, anſwers to what is called *alderman* and *ſheriff* in England; *attorney* at Compeigne, *capitoul* at Tholouſe, *conſul* at Languedoc, &c.

BURGLARY, an unlawful entering into another man's dwelling, wherein ſome perſon is, or into a church in the night-time; in order to commit ſome felony, or to kill ſome perſon, or to ſteal ſomething thence, or do ſome other felonious act: whether the ſame be executed, or not. The like offence, by day, we call *houſe-breaking*, &c.

It is felony at common law; but within benefit of clergy: however, this is taken away from the principals by 18 Eliz. c. 7. and from all acceſſories before the fact, by 3 and 4 W. and M. c. 9.

BURGMOTE, a borough-court; or court held for a town or borough. See COURT, and MOTE.

The word is alſo written *burgemotus*, *burgimotus*, *burgmotus*, and *burgemote*, from *burgh*, *oppidum*, and *mote*, or *gemote*, *conventus*.

The *burgmote*, by the laws of king Edgar, was to be held thrice in the year. By thoſe of Henry I. twelve times.

BURGOMASTER *of Greenland*, in *Zoology*, a whimſical name given by the Dutch ſailors to a ſpecies of *larus* or ſea-gull, common on that and many other coaſts. It is known among authors by the name of MARTINAZZO.

BURGOO, or BURGOUT, a ſea-faring diſh, made of whole oatmeal, or greets, boiled in water, till they burſt; then mixed with butter. It is made in Scotland and in Wales, by mixing oatmeal and water, and boiling it into a moderate conſiſtence. It is a cheap and ſtrengthening diet.

Burgoo, otherwiſe called *loblolly*, is held by Cockburn very proper to correct that thickneſs of humours and coſtiveneſs to which the other diet of ſailors much diſpoſes them. Yet the *burgoo* victualling is the leaſt liked of all their proviſions, becauſe of the ſcanty allowance of butter to it. The ſame author thinks it might be worth the conſideration of thoſe to whom the care of the ſeamen is committed, to contrive to render this food more agreeable to them.

BURGWARD, *Burgwardus*, or *Burgwardium*, in *Middle Age Writers*, the ſame with BULWARK.

The name is alſo extended to the town, and even the country about ſuch a fortreſs. It is formed from the Teutonic *burg*, *town*, and *ward*, *cuſtody*, *keeping*.

BURIAL, the act of interring a dead body, and depoſiting it in the ground.

Burial and baptiſm are parochial rights, and belong not to chapels of eaſe, unleſs by uſurpation.

Weſtminſter abbey is the *burial*-place of moſt of our Engliſh kings.

The deſire of *burial* has been ſtrong in moſt ages, and the denial of it reputed the laſt and ſevereſt of puniſhments: yet the Cynics appear to have deſpiſed it; and Pliny ranks the concern for it in the number of weakneſſes peculiar to man. Pott. Anh. Græc. tom. ii. lib. iv. cap. 1. Plin. Hiſt. Nat. lib. vii. Cic. Tuſc. Quæſt.

Burial is an office or a debt of humanity. Some found this obligation on the law of nature, others on the law of nations, and others on the divine law. It is certain it is warranted by them all. One of the ſeven corporal works of mercy, recited by ancient divines, is *burying* the dead. The primitive chriſtians ventured on it at the hazard of their lives: they never ſcrupled it either in times of perſecution, or of the plague, when the greateſt dangers attended it. They were always tenacious of the plain way of *burying* by inhumation, and could never be brought to uſe any other; reckoning it a great piece of barbarity in their perſecutors whenever they denied them this decent interment after death, as they ſometimes did, either by expoſing their bodies to the fury of wild beaſts and birds of prey, or burning them in ſcorn and deriſion of their doctrine of a future reſurrection. They ſeem to have had a particular averſion to burning; their method was to put the body whole in the ground, or, if there was occaſion for any other way of *burying*, they embalmed the body, and laid it in a CATACOMB.

The heathens believed, that the ſouls of thoſe who lay unburied, remained in a wandering ſtate during the ſpace of an hundred years.

The invention of *burial* among the Greeks is aſcribed to Pluto, who, on this account, was deified, and made to preſide over the world of ſhades. The Rabbins pretend, that the firſt hint was taken from birds: Adam and Eve, ſay they, being utterly at a loſs what to do with the body of Abel killed by his brother, were relieved under this perplexity, by obſerving a crow to throw earth and leaves over the body of one of his dead companions. This was enough for the patriarch: he went preſently and did the ſame to his ſon. The Egyptians carried their dead for *burial* over a certain lake; for the paſſage of which, one Charon, a farmer under one of the Pharaohs, procured a toll to be impoſed, by which he was ſpeedily enriched. Whence the whole tradition of the ferryman of hell. Cicero refers the origin of the vulgar opinion concerning hell to the ancient manner of *burying* the dead by interment: for from hence the earth was conſidered as the laſt habitation of mankind, who were here ſuppoſed to lead a new life under ground. Diod. Sic. lib. v. cap. 15. Fab. Cod. Pſeud. Vet. Teſt. tom. i. § 38. Hiſt. Acad. Inſcrip. tom. ii. p. x. p. 38.

Among the Greeks, drowning was no *burial*; for which reaſon, it was a cuſtom to faſten to ſome part of their bodies a reward for him that ſhould take them up, and *bury* them in caſe they were caſt aſhore. Among us, however, thoſe who die at ſea are uſually *buried* there, unleſs they be near land: the ceremony is ſhort; the corpſe being ſewed up in its hammock, or quilt, is thrown over from the ſtarboard, under the diſcharge of a gun. It is a great diſgrace to be thrown over the larboard.

The Arwaces, a people of Guiana, pulveriſe the bones of their great men, and drink them in their liquor.

Some nations among the Braſilians are ſaid to eat their dead, not out of hunger, much leſs deſpight, but affection and reverence.

At the ſame time that the Romans uſed to burn the bodies of their dead, the cuſtom was, to avoid expence, to throw thoſe of the ſlaves to rot in holes dug perpendicularly, called *puticuli*. Phil. Tranſ. N° 265.

They who thought human bodies were compounded of earth, inclined to have them committed to the earth: Heraclitus and his followers, imagining fire the firſt principle of all things, preferred burning.

The ancients *buried* by day, as deeming the night of ill omen, on account of the evil ſpirits then abroad: only perſons who died in the flower of their days, were *buried* in the morning before ſun-riſe.

Among the Romans, we find two kinds of *burial*, mentioned in the Theodoſian code; one, the *burying* of whole bodies in coffins under ground; the other, *burying* the bones and aſhes in urns above ground. Both appear to have been uſed at the ſame time; though interring appears to be the older practice.

Mr. Monro takes the catacombs about Rome to have been the *burial*-place of the ancient Romans, before burning came into faſhion; and which, on the new mode's taking place, fell into diſuſe, till they were revived by the primitive Chriſtians. See CATACOMB, and Phil. Tranſ. N° 265.

The Romans in Britain *buried* their warriors near the *via ſtrata*, or military way, to put their bodies out of danger of inſult; and, to prevent the ſcattering of their aſhes in haſte, the whole army caſt on them graſſy turfs; which is the origin of many of the *tumuli* ſtill found among us. As it was the greateſt diſhonour to lie unburied, it was moſt glorious to be covered with a large *tumulus*: which might be one reaſon of the Romans *burying* their generals near public ways, that paſſengers might be continually adding to the heap, which it was judged a work of piety to do.

The ancient Saxons laid the bodies of thoſe that were ſlain in the field on the ſurface of the ground, and covered them with clods of earth; which were raiſed in proportion to their dignity. See BARROW.

Though burning was the ordinary uſage among the Romans, yet ſome ſtill retained the ancient one of *burying*. The family of the Cornelii conſtantly interred their dead till the time of Sylla the dictator, who, in his will, gave particular order to have his body burnt, probably to avoid the indignities which might have been offered it after *burial*, by the Marian faction, in return for the violence ſhewn by Sylla's ſoldiers to the tomb and relics of Marius.

Burial was denied by the ancients to traitors, proſcribed perſons, ſuicides, and even frequently to enemies killed in war; though this was reputed by the more moral and civilized nations, a violation of the laws of nature. Among the Greeks, ſpendthrifts and inſolvent debtors were alſo refuſed the rights of *burial*. By the laws of the church, this penalty has been carried further, to perſons unbaptized and excommunicated, to thoſe who could not ſay their creed and pater-noſter, to ſtrikers of eccleſiaſtics, and to thoſe who ſhould omit communicating at Eaſter. But the prohibition of *burial* is now reſtricted to perſons excommunicate, unbaptized, and that have laid violent hands on themſelves, ideots, lunatics, and, in ſome perſons excepted, to heretics, to perſons killed in duels, tilts or tournaments. Potter. Arch. Græc. lib. iv. cap. 1. Grot. de Jure Belli, lib. ii. cap. 19. § 2, 3. Seld. de Leg. Nat. lib. vi. cap. 16. Johnſ. Eccl. Law. Ann. 960. § 22. Ann. 1138. § 10. Ann. 1378. § 4.

Among the ancient Egyptians, kings themſelves were to undergo a trial after their death; and, if their behaviour had been ill, were refuſed the privilege of Charon's boat, that is, to be carried to *burial*.

The Danes and northern nations, in their ſecond age, *buried* their dead under earthen hillocks. Sometimes huge pyramids of ſtone were raiſed over their bodies, many of which are ſtill remaining in divers parts of England.

In Japan, Peru, Pegu, Mexico, Tartary, Siam, and the Great Mogul's dominions, they burn their dead. For the great ones, the fires are made with aromatic woods, gums, balſams, and oils. The like method obtained among the Jews as early as Saul's time, whoſe body was burnt at Jabeſh, and his bones afterwards *buried*. Aſa was burnt in the bed which he had made for himſelf, filled with ſweet odours, and divers kinds of ſpices.

The ancients buried out of cities and towns; an uſage which we find equally among Jews, Greeks, and Romans. Among the laſt, *burying* within the walls was expreſsly prohibited by a law of the Twelve Tables: *Hominem mortuum in urbe ne ſepelito, neve urito.* The uſual places of interment were in the ſuburbs and fields, but eſpecially by the way-ſides: partly, ſays Kennet, to put paſſengers in mind of their mortality, and partly alſo to ſave the beſt of their land.

Two reaſons are alleged, why the ancients buried out of cities; the firſt, an opinion, that the touch, ſight, or even neighbourhood of a corpſe, defiled a man, eſpecially a prieſt: whence the rule in A. Gellius, that the *flamen dialis* might not, on any account, enter a place where there was a grave: the ſecond, to prevent the air from being corrupted by the ſtench of putrefied bodies, and the buildings from being endangered by the frequency of funeral fires. We have inſtances, however, of perſons *buried* in the city; but it was a favour only allowed to a few of ſingular merit to the commonwealth. Plutarch ſays, thoſe who had triumphed were indulged in it. Be this as it will, Val. Publicola, and C. Fabricius, are ſaid to have had tombs in the Forum; and Cicero adds Tubertus to the number.

Lycurgus allowed his Lacedæmonians to *bury* their dead within the city, and around their temples, that the youth being inured to ſuch ſpectacles, might be the leſs terrified with the apprehenſion of death.

Burying in churches was allowed for the firſt three hundred years after Chriſt; but it was ſeverely prohibited by the Chriſtian emperors for many ages after. The firſt ſtep towards it appears to have been the practice of erecting churches over the graves of ſome martyrs in the country, and tranſlating the relics of others into churches in the city: the next was, allowing kings and emperors to be *buried* in the atrium or church-porch. The reaſon alleged by Gregory the Great for *burying* in churches, or in places adjoining to them, was, that their relations and friends, remembering thoſe whoſe ſepulchres they beheld, might hereby be led to offer up prayers for them. And this reaſon was afterwards transferred into the body of the canon law. To this ſuperſtition, and the profit ariſing from it, we may aſcribe the original of church-yards. In the eighth century, the people began to be admitted into the church-yards, and ſome princes, founders, and biſhops, into the church. The practice firſt introduced into the Romiſh church by Gregory the Great, was brought over into England by Cuthbert archbiſhop of Canterbury, about the year 750: and the practice of erecting vaults in chancels, and under the altars, was begun by Lanfranc archbiſhop of Canterbury, when he had rebuilt the church in this city, about the year 1075. From that time, the matter ſeems to have been left to the diſcretion of the biſhop. By our common law, no perſon can be *buried* within the church, without conſent of the incumbent, excluſively of the biſhop; becauſe the freehold of the church belongs to him, and he is deemed the beſt judge, who are entitled to the favour of being *buried* in the church.

Burying in any ſhroud, &c. that is not made of ſheep's wool only, is by the Engliſh law, 30 Car. II. ſtat. 1. c. 3. ſubject to a penalty of 5 *l.* and an affidavit ſhall be made to this purpoſe, either to a magiſtrate, or the officiating miniſter. See CEMETERY, FUNERAL, &c.

Burying alive, was the puniſhment of a VESTAL who had violated her vow of virginity. The unhappy prieſteſs was let down into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed to lie on: but this proviſion was but ſhow, for the moment ſhe was at the bottom, they began to caſt in the earth upon her, till the pit was filled up. Mem. Acad. Inſcr. tom. iii. p. 278.

Lord Bacon gives inſtances of the reſurrection of perſons who had been accidentally *buried* alive.

BURIAL, *Chriſtian*, is often uſed to denote that which is performed in holy ground, and with the uſual ſervice or ceremonies of the church.

BURIAL is alſo uſed to denote the dues paid for interment, eſpecially to the miniſter.

The *burial*-fee paid to the prieſt on opening the grave, was called by our Saxon anceſtors *ſoul-ſcot*. Phil. Tranſ. Nº 189.

BURIAL *of an aſs*, *Aſini ſepultura*, an ignominious kind of *burial* out of holy ground, under the gallows, or in a highway, where ſeveral roads meet, and performed by public hangmen, or the like. Such is that of ſuicides, excommunicated perſons, &c. ſometimes denominated CANINE *burial*, or *burial* of a dog.

In the middle age we alſo find mention of a peculiar kind of *burial*, called IMBLOCATION, practiſed on the bodies of perſons excommunicated. Du-Cange.

BURIAL *of the crucifix*, *Sepultura crucifixi*, denoted a repreſentation of the *burial* of Chriſt, anciently performed annually in churches on the day of the Paraſceue. Du-Cange.

BURIALS, in computations of mortality, denote deaths, and ſtand oppoſed to births.

In this ſenſe, we have eſtimates of the *burials* in Brandenburg, in Francfort, Breſlaw, &c. Phil. Tranſ. Nº 261. 229. and 176.

By a ſtatute under king Charles II. a regiſter is to be kept in every pariſh, of all perſons *buried* within the ſame, or at the common *burial*-places thereof. Stat. 30 Car. II. c. 3. See MORTALITY.

BURIAL is alſo uſed for the incloſing of vegetable or mineral bodies in the ground, for divers purpoſes. Lord Bacon gives divers experiments of *burying* fruits, &c. for preſervation and condenſation, and to give nouriſhment to their reſpective trees. Works. tom. iii. p. 80.

Some commend *burials* in the earth, others in wheat, to ſeaſon TIMBER when firſt felled, and make it of more durable uſe. Chemiſts ſometimes *bury* their cements. The Chineſe are ſaid to *bury* their porcelain, to give it the greater beauty.

BURIS, a name given by Avicenna, and ſome other old authors, to a ſchirrhous hernia, cauſed by a hard abſceſs.

BURLAW, or BYRLAW, *Burlawa*, in *Middle Age Writers*, denotes country laws, or the laws concerning country affairs. Du-Cange.

BURLESQUE, a jocoſe kind of poetry, chiefly uſed in the way of drollery, either to excite laughter merely, or to provoke deriſion and ridicule.

F. Vavaſſor maintains, in his book *De Ludicra Dictione*, that *burleſque* was abſolutely unknown to the ancients; againſt the opinion of ſome others, that one Raintovius, in the time of Ptolemy Lagus, turned the ſerious ſubjects of tragedy into ridicule; which, perhaps, is a better plea for the antiquity of farce, than of *burleſque*.

The Italians ſeem to have the juſteſt claim to the invention of *burleſque*. The firſt author in this kind was Bernia; he was followed by Lalli, Caporalli, &c. From Italy it paſſed into France, and became there ſo much the mode, that in 1649 appeared a book under the title of "The Paſſion of our Saviour in Burleſque Verſe." Thence it came into England; but the good ſenſe of the Engliſh never adopted, or owned it, notwithſtanding one or two have excelled in it.

BURLING *of cloth*. See CLOTH.

BURMANNIA, in *Botany*, a genus of the *hexandria monogynia* claſs of plants. The flower is ſmall, and conſiſts of three minute, ovated, oblong petals, ſituated at the mouth of the cup: the fruit is an involuted capſule, of a cylindraceo-trigonal figure, formed of three valves, with three cells, containing many ſmall ſeeds.

BURN, in a medicinal ſenſe, denotes a ſolution of the continuity of a part of the body, by the force of fire.

Of *burns*, phyſicians uſually make ſeveral degrees: the firſt, when there are only a few puſtules raiſed on the ſkin, with a redneſs, and a ſeparation of the *epidermis* from the genuine ſkin. The ſecond, when the ſkin is burnt, dried, and ſhrunk, but without any cruſt, or ſcab. The third is, when the fleſh, veins, nerves, &c. are ſhrunk, and form a ſcab.

Luſitanus recommends an unguent, made of the aſhes of laurel leaves burnt, with hog's fat dropped on them, for a *burn*; or, on occaſion, the *unguentum populeum*, with vine leaves laid over it. Panarole obſerves, that clay laid on a *burn* abates the pain; and that the brewers in Holland uſe a decoction of ivy for the cure of *burns*.

Burns are likewiſe divided into dry and humid, from the cauſes that produce them.

BURNS, *dry*, are thoſe occaſioned by the application of a naked fire, or ignited body, as coals, flame, red-hot metals, gunpowder, lightning, and the like, which are attended with a corrugation or ſhrivelling of the part.

BURNS, *humid*, more uſually among us called *ſcalds*, are thoſe occaſioned by fluid ſubſtances, as hot water, oil, wax, or the like.

Dry *burns* are of a worſe kind than moiſt ones. Of the dry, the worſt and moſt penetrating of all is that of lightning; the next are thoſe cauſed by melted metals and gunpowder; the next, by fats and oily ſubſtances; the ſlighteſt of all *burns* is that by hot water.

As *burns* nearly reſemble inflammatory diſorders in their ſeveral degrees, ſo they alſo do in their method of cure. In the ſlighter degree of *burns*, the beſt method is to have recourſe to emollients and aſtringents. The beſt ſlight aſtringent is either common proof ſpirit, or rectified ſpirit of wine, or, when it is neceſſary, ſpirit of wine camphorated: theſe may be applied to the part with linen rags, as may alſo oxycrate, or the pickle of cabbages, or litharge vinegar; and theſe applications muſt be repeated as there is occaſion. Oil of turpentine has alſo very good effects, if applied in time, and repeated frequently. And the vulgar method of holding the injured part, when that is the hand or a finger, to the fire, as long and as near as can be borne, is often attended with ſucceſs; for the ſtagnating fluids are, by this degree of heat, driven back into their proper channels, and, by that means, the veſication, and other troubleſome ſymptoms, which naturally ſucceed, are often prevented. Another remedy, however, there is, very efficacious on the ſame occaſions, though founded on a contrary intention. This is by emollient remedies, which remove the tenſion of the fibres or veſſels, and reſtore the blood to its natural courſe before any bad ſymptoms come on, as the injured part may be fomented with water, made as warm as the patient can bear, till all the pain and heat entirely diſappear. Sydenham very highly, and with great reaſon, extols this method. It is eaſy, however, to add to the efficacy of it, by giving the virtues of a fomentation to the water before it is uſed, by boiling in it marſhmallows, mallows, mullein, linſeed, fenugreek-ſeed, or quince-ſeed. Cataplaſms made of the ſame ingredients, are alſo of great ſervice, as are alſo the emollient oils of linſeed, and the like. Whatever remedies are uſed in this caſe, ſhould be very frequently repeated; and when it is the face that is *burnt*, they ſhould be ſpread on a linen maſk, to be kept conſtantly moiſt by the application of the ſame remedy.

When the *burn* is ſomething greater than this, and attended with veſication, or puſtules, the puſtules are by no means to be opened, which always brings on great pain; ſome of the remedies before mentioned will always prove of more ſervice, applied while the bliſters are whole; and, by the uſe of them, the heat and pain will quickly go off, and the cuticle will ſeparate from the cutis, without either deformity or pain. But if theſe remedies do not abate the pain, the part is to be dreſſed with linſeed oil, or the litharge ointment, or the *unguentum diopompholigos*, or ſomething of a like kind. Theſe are to be applied either by rubbing them frequently on the parts, or ſpreading them on a linen rag, and applying that, and often renewing it. After theſe, a plaſter of the *emplaſtrum de minio*, or any of a like kind, will keep the ſkin ſmooth, and forward the renovation of the cuticle. If the *burn* or ſcald, whichever it be, be very conſiderable in extent, and great part of the body be burnt, it is neceſſary to bleed plentifully, even till the patient faints, and to give a briſk purge. This method will often prevent ill conſequences, that too frequently elſe attend large *burns*; ſuch as foul ulcers, large cicatrices, and ſometimes even gangrenes. When infants are the ſubjects of theſe accidents, bleeding being not ſo convenient, the revulſion is to be made by repeated purges; and, in grown perſons, a regularity of diet is above all things to be obſerved.

In the yet greater degree of *burns*, where the burnt part is covered by a cruſt or eſchar, the cure cannot be performed without ſuppuration. When this accident happens to the face, great caution is neceſſary, to avoid making a deformed cicatrix: for this reaſon, all ointments and plaſters whatever are to be forbidden, even though they are the moſt valuable ſecrets, as there are in almoſt all families many ſuch; for the miſchief of theſe remedies is, that they all dry up the wound too faſt, and contract the fibres and the ſkin, and by ſuch means leave an uneven cicatrix. The forwarding the caſting off the eſchar, is by all means to be attempted, and the diſcharge of the matter that is contained under it. The eaſieſt and moſt ſucceſsful method of doing this, is by the repeated application of emollients. Three or four times every day the dreſſings are to be changed; and if, at any of theſe times, any part of the eſchar is found to be looſe, it muſt be raiſed with the *forceps*, and removed, if that conveniently may be; at the ſame time, the reſt of the eſchar muſt be anointed with butter, and warm fomentations, made of emollient herbs, &c. applied. Two, three, or four days employed in this manner, generally afford a ſeparation of all the cruſt or eſchar; and the next intention is then to heal the wound. It is firſt therefore to be thoroughly cleanſed, by means of ſome mild digeſtive mixed with honey of roſes, and afterwards healed up with any of the lead or litharge ointments. If the eſchar in theſe caſes ſhould not ſeparate in a proper time, it will be neceſſary to make a deep inciſion through the middle of it, to let out the included ſanies. *Burns* of the moſt extreme and worſt kind, where the burn has penetrated ſo deep as to deſtroy all the parts quite down to the bone, can have no relief from medicines; nor is there any thing in the ſurgeon's power, but amputating the limb. Heiſter.

Burns, however, are not only diſeaſes, but in ſome caſes remedies: M. Homberg obſerves, that in the iſle of Java the natives cure themſelves of a colic, otherwiſe mortal, by burning the ſoles of their feet; and cure themſelves of a *panaris*, by dipping their finger in boiling water ſeveral times. In the country of the Mogul, the colic is cured by an iron ring applied red-hot about the patient's navel.

Travellers relate many other caſes of other diſeaſes cured by *burning*; and we ſee the effects of it ourſelves, in horſes, hounds, birds of prey, &c.

A kind of downy matter, called *moxa*, brought from the Indies, has been likewiſe uſed for the gout; applied, by *burning* it on the part affected. Many of the Japaneſe are covered with ſcars, ariſing from the uſe of the MOXA. And among theſe people, the whole art of phyſic conſiſts in the choice of proper places to be *burnt*; which are varied according to the nature of the diſeaſe. *Burning* has been particularly recommended in the gout, as a ſevere but adequate cure of that ſtubborn diſeaſe.

M. Homberg gives us inſtances of two women cured, the one of a violent diſeaſe in the head and eyes, and the other of a diſeaſe in the legs and thighs, by the accidental *burning* of thoſe parts. He adds, that *burning* may cure in three ways; either by putting the peccant humours into a greater motion, and making them take new routes; or by diſſolving and breaking their viſcidity; or by deſtroying the canals which brought them in too great quantities.

Burning pyramidal pieces of tow or cotton on the joints, is an ancient practice revived in Europe, chiefly by Fab. ab Aquapendente, and Severinus, againſt pains of the joints ariſing from cold and viſcous humours impacted in them. The operation is alſo ſpoke of by Hippocrates and Celſus; the former of whom recommends the uſe of raw flax. Severinus calls it the Arabian *burning*, becauſe moſt frequently uſed among that people, though common enough alſo among the Egyptians. Hippocr. App. ult. lib. vi. & de Affat. Text. 30. and 32. Celſ. lib. iv. cap. 22. Alpin. de Med. Egypt. lib. iii.

BURN, *heart*. See HEART.

BURNET, **BURNETA**, or **BURNETUS**, in *Middle Age Writers*, denotes brown cloth made of dyed wool.

In which ſenſe, the word ſtands contradiſtinguiſhed from *brunus*, which was applied to the wool undyed.

BURNET, in *Botany*. See POTERIUM, and SANGUISOREA.

BURNET *ſaxifrage*. See *Burnet* SAXIFRAGE.

BURNING, the action of fire on ſome pabulum, or fewel, whereby the minute parts thereof are torn from each other, and put into a violent motion; and ſome of them aſſuming the nature of fire themſelves, fly off *in orbem*, while the reſt are diſſipated in form of vapour, or reduced to aſhes.

The appearances of *burning* ariſe ſucceſſively, and in a certain order: a heat muſt precede greater than what ſuffices to boil oil; the lighteſt and moſt volatile parts of the body burn the firſt; the heavier are ſlower in taking fire, but burn the longeſt.

Burning is a ſeparation of the parts of bodies made by means of fire. Some conſider it as a ſpecies of ſolution, and ſuppoſe it effected by a diſſolvent power inherent in fire, which acts as a menſtruum in reſpect of the ſulphureous parts of bodies.

Dr. Hooke, conſidering the neceſſity of air to *burning*, and that heat, however great, does not alone ſuffice to burn a body, does indeed take *burning* for a ſolution of the ſulphureous parts of bodies; but ſuppoſes the menſtruum, by which it is done, to be the air, or at leaſt ſome ſubtile, ſaline, nitrous ſubſtance diffuſed in the air. See AIR, CALCINATION, CALX, FIRE, and PHLOGISTON.

BURNING is alſo applied to the action of divers things which are cold to the touch, or do not contain fire.

In this ſenſe, *aqua fortis* is ſaid to *burn* cloth. There are certain fogs which *burn* or ſcorch the corn. Virgil obſerves, that ſevere cold itſelf wlll *burn*, that is, have much the ſame effects on the parts of the body, as fire itſelf in cauſing gangrenes.

BURNING, *extraordinary caſes of*.—We have inſtances of perſons *burnt* by fire kindled with their own bodies. A woman at Paris, who uſed to drink brandy in exceſs, was one night reduced to aſhes by a fire from within, all but her head and the ends of her fingers. Novum Lumen Phoſphor. accenſ. Amſt. 1717.

Signora Corn. Zangari, or, as others call her, Corn. Bandi, an aged lady, of unblemiſhed life, near Ceſena in Romagna, underwent the ſame fate in March, 1731. She had retired in the evening into her chamber ſomewhat indiſpoſed, and in the morning was found in the middle of the room, reduced to aſhes, all except her face, ſkull, three fingers, and legs, which remained entire with the ſhoes and ſtockings on. The aſhes were light, and, on preſſing between the fingers, vaniſhed, leaving a groſs ſtinking moiſture behind, with which the floor was ſmeared; the walls, and furniture of the room, being covered with a moiſt cineritious ſoot, which had not only ſtained the linen in the cheſts, but had penetrated into the cloſet, as well as into the room overhead, the walls of which were moiſtened with the ſame viſcous humour. Mem. de Trev. an. 1731. p. 1293.

Sig. Mondini, Bianchini, and Maffei, have written diſcourſes expreſs, to account for the cauſe of ſo extraordinary an event: common fire it could not be, ſince this would likewiſe have burnt the bed and the room; beſides that it would have required many hours, and a large quantity of fuel, to reduce a human body to aſhes; and, after all, a conſiderable part of the bones would have been left entire, as they were anciently found after the fierceſt funeral fires. Sign. Mondini attributes this effect to lightning. A philoſopher of Verona maintains, that ſuch a conflagration might have ariſen from the inflammable matters wherewith the human body naturally abounds. Sig. Bianchini accounts for it from an internal fire, occaſioned by ſpirit of wine camphorated, which the lady uſed by way of bath or lotion, when ſhe found herſelf out of order. Maffei's ſyſtem is a combination of the three laſt: he ſuppoſes it owing to lightning, but lightning generated in her own body; agreeable to his doctrine, which is, that lightning does not come from the clouds, but is always produced in the place where it is ſeen, and its effects perceived. The humours of her body, naturally inflammable enough, were become preternaturally ſo, by her putrid indiſpoſition; and theſe, by perſpiration, had enveloped her body with an atmoſphere of the ſame kind, replete likewiſe with mineral matters, whereby its activity was heightened. She had probably riſen in the night to uſe her lotion, and, by the friction of her hand, had helped to kindle the flame.

We have various relations of ſeveral other perſons being *burnt* to death in this unaccountable manner; as Grace Pet of Ipſwich, in 1744; and Mary Clues of Coventry, in 1772. An attempt has been made to eſtabliſh the opinion, that theſe deſtroying internal fires are cauſed in the entrails of the body, by inflamed effluvia of the blood, by juices and fermentations in the ſtomach, by the many combuſtible matters which abound in living bodies, for the uſes of life, and, finally, by the fiery evaporations which exhale from the ſettlings of ſpirit of wine, brandies, and other hot liquors, in the *tunica villoſa* of the ſtomach, and other adipoſe or fat membranes; within which thoſe ſpirits engender a kind of camphor, which in the night-time, in ſleep, by a full reſpiration, are put in a ſtronger motion, and are more apt to be ſet on fire. See Phil. Tranſ. N° 476. p. 453, ſeq. Ibid. vol. lxiv. pt. ii. p. 340.

Others aſcribe the cauſe of ſuch perſons being ſet on fire, to lightning; and their *burning* ſo entirely, to the greater quantity of PHOSPHORUS, and other combuſtible matter they contained.

It is well known, that flaſhes of light have been often produced from the bodies of men, as well as other animals, by a briſk motion. Fortunius Licetus mentions a perſon, who, by only rubbing his body with his hand, could make fire iſſue; and Maffei relates the ſame of Signora Caſſandra Buri Rambalda of Verona, who needed only rub her fleſh with a linen cloth, to produce flaſhes of light. See ELECTRICITY, LIGHT, PHLOGISTON, PHOSPHORUS, &c.

BURNING is alſo a denomination given by phyſicians to divers diſorders, on account of a ſenſation of heat that attends them. In which ſenſe we ſay, a *burning* FEVER. See CAUSUS.

Among the divers ſpecies of madneſs incident to dogs, one is called the *burning* madneſs. If a mare which has been covered, and the colt knit within her, be covered by another horſe, he is ſaid to *burn* her.

BURNING is more particularly uſed for the herpes, or *ignis ſacer*, called ERYSIPELAS and *arſura*.

BURNING, among *Surgeons*, denotes the application of an actual cautery, that is, a red-hot iron inſtrument, to the part affected; otherwiſe denominated cauterization. See CAUTERY.

BURNING, in *Antiquity*, was a practice much uſed by the Greeks, Romans, and northern nations; and ſtill retained by many people in both Indies, with reſpect to their dead. Phil. Tranſ. N° 126. See BURIAL.

In this ſenſe, *burning* ſtands oppoſed to burying; though, after *burning*, the BONES remaining, and aſhes, have been uſually collected into urns, and depoſited in the earth. Phil. Tranſ. N° 285.

Kings were burnt in cloth made of the ASBESTOS ſtone, that their aſhes might be preſerved pure from any mixture with the fewel, and other matters thrown on the funeral pile. And the like uſage is ſtill retained for the princes in Tartary.

Burning is not ſo ancient among the Greeks as interring; though we find it obtained in the time of the Trojan war. Potter. Arch. lib. iv. cap. 6. tom. ii.

For the manner of *burning* among the Greeks: the body was placed on the top of a pile, on which were alſo thrown divers animals, and even ſlaves and captives, beſides unguents and perfumes. In the funeral of Patroclus, we find a number of ſheep and oxen thrown in, then four horſes, followed by two dogs, and, laſtly, by twelve Trojan priſoners. Hom. Il. xxiii.

Euſtathius aſſigns two reaſons for the prevalency of *burning* in Greece; the firſt, that bodies being thought to be unclean after the ſoul's departure, were to be purified by fire: that the ſoul, or purer part, being ſeparated by the flames from the groſs inactive matter, might take its flight to the heavenly manſions with more freedom. This latter opinion obtained ſo much, that the Indian philoſophers had not patience to wait for *burning* till after death; they had recourſe to it in their life-time; erecting themſelves piles for the purpoſe, to looſen their ſouls from confinement. Calanus, who followed Alexander out of India, finding himſelf indiſpoſed, obtained that prince's leave to prevent the growth of his diſtemper, by committing himſelf to the flames; and Hercules, before his reception into heaven, was purified from the dregs of earth by the ſame means. Quintil. Declam. x. Potter. ubi ſupra.

Soldiers uſually had their arms burnt with them. The garments worn by the living, were alſo thrown on the pile, with other ornaments and preſents; a piece of extravagance, which the Athenians carried to ſo great a length, that ſome of their law-givers were forced to reſtrain them, by ſevere penalties, from defrauding the living by their liberality to the dead. Virgil. Æn. lib. vi. Potter lib. cit.

Pliny aſſures us, that *burning* was firſt brought into uſe among the Romans, on occaſion of the cruel uſage which the bodies of the dead Romans underwent in enemies countries. But this muſt only be underſtood in regard of the common uſage; ſince we find mention of *burning* as practiſed by ſome even in the earlieſt ages of Rome: Numa forbad his own body to be *burned*, commanding it to be laid entire in a ſtone coffin, which ſhews, that the practice of *burning* was not then unknown at Rome. Plin. Hiſt. Nat. lib. viii. cap. 54. Kenn. Rom. Ant. p. ii. lib. v. cap. 10.

In ſome caſes, *burning* was expreſsly forbid, and looked upon as the higheſt impiety. Thus infants, who died before the breeding of teeth, were intombed, unburnt, in the ground, in a particular place ſet apart for this uſe, called *ſuggrundarium*. The like was practiſed with regard to thoſe who had been ſtruck dead with lightning, who were never to be *burnt* again.

Some ſay, that *burning* was denied to ſuicides as a puniſhment.

The manner of *burning* among the Romans, was not unlike that of the Greeks: the corpſe being brought without cylindraceo-trigonal figure, formed of three valves, with three cells, containing many ſmall ſeeds.

BURN, in a medicinal ſenſe, denotes a ſolution of the continuity of a part of the body, by the force of fire.

Of *burns*, phyſicians uſually make ſeveral degrees: the firſt, when there are only a few puſtules raiſed on the ſkin, with a redneſs, and a ſeparation of the *epidermis* from the genuine ſkin. The ſecond, when the ſkin is burnt, dried, and ſhrunk, but without any cruſt, or ſcab. The third is, when the fleſh, veins, nerves, &c. are ſhrunk, and form a ſcab.

Luſitanus recommends an unguent, made of the aſhes of laurel leaves burnt, with hog's fat dropped on them, for a *burn*; or, on occaſion, the *unguentum populeum*, with vine leaves laid over it. Panarole obſerves, that clay laid on a *burn* abates the pain; and that the brewers in Holland uſe a decoction of ivy for the cure of *burns*.

Burns are likewiſe divided into dry and humid, from the cauſes that produce them.

Burns, *dry*, are thoſe occaſioned by the application of a naked fire, or ignited body, as coals, flame, red-hot metals, gunpowder, lightning, and the like, which are attended with a corrugation or ſhrivelling of the part.

Burns, *humid*, more uſually among us called *ſcalds*, are thoſe occaſioned by fluid ſubſtances, as hot water, oil, wax, or the like.

Dry *burns* are of a worſe kind than moiſt ones. Of the dry, the worſt and moſt penetrating of all is that of lightning; the next are thoſe cauſed by melted metals and gunpowder; the next, by fats and oily ſubſtances; the ſlighteſt of all *burns* is that by hot water.

As *burns* nearly reſemble inflammatory diſorders in their ſeveral degrees, ſo they alſo do in their method of cure.

In the ſlighter degree of *burns*, the beſt method is to have recourſe to emollients and aſtringents. The beſt ſlight aſtringent is either common proof ſpirit, or rectified ſpirit of wine, or, when it is neceſſary, ſpirit of wine camphorated: theſe may be applied to the part with linen rags, as may alſo oxycrate, or the pickle of cabbages, or litharge vinegar; and theſe applications muſt be repeated as there is occaſion. Oil of turpentine has alſo very good effects, if applied in time, and repeated frequently. And the vulgar method of holding the injured part, when that is the hand or a finger, to the fire, as long and as near as can be borne, is often attended with ſucceſs; for the ſtagnating fluids are, by this degree of heat, driven back into their proper channels, and, by that means, the veſication, and other troubleſome ſymptoms, which naturally ſucceed, are often prevented. Another remedy, however, there is, very efficacious on the ſame occaſions, though founded on a contrary intention. This is by emollient remedies, which remove the tenſion of the fibres or veſſels, and reſtore the blood to its natural courſe before any bad ſymptoms come on, as the injured part may be fomented with water, made as warm as the patient can bear, till all the pain and heat entirely diſappear. Sydenham very highly, and with great reaſon, extols this method. It is eaſy, however, to add to the efficacy of it, by giving the virtues of a fomentation to the water before it is uſed, by boiling in it marſhmallows, mallows, mullein, linſeed, fenugreek-ſeed, or quince-ſeed. Cataplaſms made of the ſame ingredients, are alſo of great ſervice, as are alſo the emollient oils of linſeed, and the like. Whatever remedies are uſed in this caſe, ſhould be very frequently repeated; and when it is the face that is *burnt*, they ſhould be ſpread on a linen maſk, to be kept conſtantly moiſt by the application of the ſame remedy.

When the *burn* is ſomething greater than this, and attended with veſication, or puſtules, the puſtules are by no means to be opened, which always brings on great pain; ſome of the remedies before mentioned will always prove of more ſervice, applied while the bliſters are whole; and, by the uſe of them, the heat and pain will quickly go off, and the cuticle will ſeparate from the cutis, without either deformity or pain. But if theſe remedies do not abate the pain, the part is to be dreſſed with linſeed oil, or the litharge ointment, or the *unguentum diopompholigos*, or ſomething of a like kind. Theſe are to be applied either by rubbing them frequently on the parts, or ſpreading them on a linen rag, and applying that, and often renewing it. After theſe, a plaſter of the *emplaſtrum de minio*, or any of a like kind, will keep the ſkin ſmooth, and forward the renovation of the cuticle. If the *burn* or ſcald, whichever it be, be very conſiderable in extent, and great part of the body be burnt, it is neceſſary to bleed plentifully, even till the patient faints, and to give a briſk purge. This method will often prevent ill conſequences, that too frequently elſe attend large *burns*; ſuch as foul ulcers, large cicatrices, and ſometimes even gangrenes. When infants are the ſubjects of theſe accidents, bleeding being not ſo convenient, the revulſion is to be made by repeated purges; and, in grown perſons, a regularity of diet is above all things to be obſerved.

In the yet greater degree of *burns*, where the burnt part is covered by a cruſt or eſchar, the cure cannot be performed without ſuppuration. When this accident happens to the face, great caution is neceſſary, to avoid making a deformed cicatrix: for this reaſon, all ointments and plaſters whatever are to be forbidden, even though they are the moſt valuable ſecrets, as there are in almoſt all families many ſuch; for the miſchief of theſe remedies is, that they all dry up the wound too faſt, and contract the fibres and the ſkin, and by ſuch means leave an uneven cicatrix. The forwarding the caſting off the eſchar, is by all means to be attempted, and the diſcharge of the matter that is contained under it. The eaſieſt and moſt ſucceſsful method of doing this, is by the repeated application of emollients. Three or four times every day the dreſſings are to be changed; and if, at any of theſe times, any part of the eſchar is found to be looſe, it muſt be raiſed with the *forceps*, and removed, if that conveniently may be; at the ſame time, the reſt of the eſchar muſt be anointed with butter, and warm fomentations, made of emollient herbs, &c. applied. Two, three, or four days employed in this manner, generally afford a ſeparation of all the cruſt or eſchar; and the next intention is then to heal the wound. It is firſt therefore to be thoroughly cleanſed, by means of ſome mild digeſtive mixed with honey of roſes, and afterwards healed up with any of the lead or litharge ointments. If the eſchar in theſe caſes ſhould not ſeparate in a proper time, it will be neceſſary to make a deep inciſion through the middle of it, to let out the included ſanies. *Burns* of the moſt extreme and worſt kind, where the burn has penetrated ſo deep as to deſtroy all the parts quite down to the bone, can have no relief from medicines; nor is there any thing in the ſurgeon's power, but amputating the limb. Heiſter.

Burns, however, are not only diſeaſes, but in ſome caſes remedies: M. Homberg obſerves, that in the iſle of Java the natives cure themſelves of a colic, otherwiſe mortal, by burning the ſoles of their feet; and cure themſelves of a *panaris*, by dipping their finger in boiling water ſeveral times. In the country of the Mogul, the colic is cured by an iron ring applied red-hot about the patient's navel.

Travellers relate many other caſes of other diſeaſes cured by *burning*; and we ſee the effects of it ourſelves, in horſes, hounds, birds of prey, &c.

A kind of downy matter, called *moxa*, brought from the Indies, has been likewiſe uſed for the gout; applied, by *burning* it on the part affected. Many of the Japaneſe are covered with ſcars, ariſing from the uſe of the Moxa. And among theſe people, the whole art of phyſic conſiſts in the choice of proper places to be *burnt*; which are varied according to the nature of the diſeaſe. *Burning* has been particularly recommended in the gout, as a ſevere but adequate cure of that ſtubborn diſeaſe.

M. Homberg gives us inſtances of two women cured, the one of a violent diſeaſe in the head and eyes, and the other of a diſeaſe in the legs and thighs, by the accidental *burning* of thoſe parts. He adds, that *burning* may cure in three ways; either by putting the peccant humours into a greater motion, and making them take new routes; or by diſſolving and breaking their viſcidity; or by deſtroying the canals which brought them in too great quantities.

Burning pyramidal pieces of tow or cotton on the joints, is an ancient practice revived in Europe, chiefly by Fab. ab Aquapendente, and Severinus, againſt pains of the joints ariſing from cold and viſcous humours impacted in them. The operation is alſo ſpoke of by Hippocrates and Celſus; the former of whom recommends the uſe of raw flax. Severinus calls it the Arabian *burning*, becauſe moſt frequently uſed among that people, though common enough alſo among the Egyptians. Hippocr. App. ult. lib. vi. & de Affat. Text. 30. and 32. Celſ. lib. iv. cap. 22. Alpin. de Med. Egypt. lib. iii.

Burn, *heart*. See Heart.

BURNET, **Burneta**, or **Burnetus**, in *Middle Age Writers*, denotes brown cloth made of dyed wool.

In which ſenſe, the word ſtands contradiſtinguiſhed from *brunus*, which was applied to the wool undyed.

Burnet, in *Botany*. See Poterium, and Sanguisorba.

Burnet *ſaxifrage*. See *Burnet* Saxifrage.

BURNING, the action of fire on ſome pabulum, or fewel, whereby the minute parts thereof are torn from each other, and put into a violent motion; and ſome of them aſſuming the nature of fire themſelves, fly off *in orbem*, while the reſt are diſſipated in form of vapour, or reduced to aſhes.

The appearances of *burning* ariſe ſucceſſively, and in a certain order: a heat muſt precede greater than what ſuffices to boil oil; the lighteſt and moſt volatile parts of the body burn the firſt; the heavier are ſlower in taking fire, but burn the longeſt.

Burning is a ſeparation of the parts of bodies made by means of fire. Some conſider it as a ſpecies of ſolution, and ſuppoſe it effected by a diſſolvent power inherent in fire, which acts as a menſtruum in reſpect of the ſulphureous parts of bodies.

Dr. Hooke, conſidering the neceſſity of air to *burning*, and that heat, however great, does not alone ſuffice to burn a body, does indeed take *burning* for a ſolution of the ſulphureous parts of bodies; but ſuppoſes the menſtruum, by which it is done, to be the air, or at leaſt ſome ſubtile, ſaline, nitrous ſubſtance diffuſed in the air. See AIR, CALCINATION, CALX, FIRE, and PHLOGISTON.

BURNING is alſo applied to the action of divers things which are cold to the touch, or do not contain fire.

In this ſenſe, *aqua fortis* is ſaid to *burn* cloth. There are certain fogs which *burn* or ſcorch the corn. Virgil obſerves, that ſevere cold itſelf wlll *burn*, that is, have much the ſame effects on the parts of the body, as fire itſelf in cauſing gangrenes.

BURNING, *extraordinary caſes of*.—We have inſtances of perſons *burnt* by fire kindled with their own bodies. A woman at Paris, who uſed to drink brandy in exceſs, was one night reduced to aſhes by a fire from within, all but her head and the ends of her fingers. Novum Lumen Phoſphor. accenſ. Amſt. 1717.

Signora Corn. Zangari, or, as others call her, Corn. Bandi, an aged lady, of unblemiſhed life, near Ceſena in Romagna, underwent the ſame fate in March, 1731. She had retired in the evening into her chamber ſomewhat indiſpoſed, and in the morning was found in the middle of the room, reduced to aſhes, all except her face, ſkull, three fingers, and legs, which remained entire with the ſhoes and ſtockings on. The aſhes were light, and, on preſſing between the fingers, vaniſhed, leaving a groſs ſtinking moiſture behind, with which the floor was ſmeared; the walls, and furniture of the room, being covered with a moiſt cineritious ſoot, which had not only ſtained the linen in the cheſts, but had penetrated into the cloſet, as well as into the room overhead, the walls of which were moiſtened with the ſame viſcous humour. Mem. de Trev. an. 1731. p. 1293.

Sig. Mondini, Bianchini, and Maffei, have written diſcourſes expreſs, to account for the cauſe of ſo extraordinary an event: common fire it could not be, ſince this would likewiſe have burnt the bed and the room; beſides that it would have required many hours, and a large quantity of fuel, to reduce a human body to aſhes; and, after all, a conſiderable part of the bones would have been left entire, as they were anciently found after the fierceſt funeral fires. Sign. Mondini attributes this effect to lightning. A philoſopher of Verona maintains, that ſuch a conflagration might have ariſen from the inflammable matters wherewith the human body naturally abounds. Sig. Bianchini accounts for it from an internal fire, occaſioned by ſpirit of wine camphorated, which the lady uſed by way of bath or lotion, when ſhe found herſelf out of order. Maffei's ſyſtem is a combination of the three laſt: he ſuppoſes it owing to lightning, but lightning generated in her own body; agreeable to his doctrine, which is, that lightning does not come from the clouds, but is always produced in the place where it is ſeen, and its effects perceived. The humours of her body, naturally inflammable enough, were become preternaturally ſo, by her putrid indiſpoſition; and theſe, by perſpiration, had enveloped her body with an atmoſphere of the ſame kind, replete likewiſe with mineral matters, whereby its activity was heightened. She had probably riſen in the night to uſe her lotion, and, by the friction of her hand, had helped to kindle the flame.

We have various relations of ſeveral other perſons being *burnt* to death in this unaccountable manner; as Grace Pet of Ipſwich, in 1744; and Mary Clues of Coventry, in 1772. An attempt has been made to eſtabliſh the opinion, that theſe deſtroying internal fires are cauſed in the entrails of the body, by inflamed effluvia of the blood, by juices and fermentations in the ſtomach, by the many combuſtible matters which abound in living bodies, for the uſes of life, and, finally, by the fiery evaporations which exhale from the ſettlings of ſpirit of wine, brandies, and other hot liquors, in the *tunica villoſa* of the ſtomach, and other adipoſe or fat membranes; within which thoſe ſpirits engender a kind of camphor, which in the night-time, in ſleep, by a full reſpiration, are put in a ſtronger motion, and are more apt to be ſet on fire. See Phil. Tranſ. N° 476. p. 453, ſeq. Ibid. vol. lxiv. pt. ii. p. 340.

Others aſcribe the cauſe of ſuch perſons being ſet on fire, to lightning; and their *burning* ſo entirely, to the greater quantity of PHOSPHORUS, and other combuſtible matter they contained.

It is well known, that flaſhes of light have been often produced from the bodies of men, as well as other animals, by a briſk motion. Fortunius Licetus mentions a perſon, who, by only rubbing his body with his hand, could make fire iſſue; and Maffei relates the ſame of Signora Caſſandra Buri Rambalda of Verona, who needed only rub her fleſh with a linen cloth, to produce flaſhes of light. See ELECTRICITY, LIGHT, PHLOGISTON, PHOSPHORUS, &c.

BURNING is alſo a denomination given by phyſicians to divers diſorders, on account of a ſenſation of heat that attends them. In which ſenſe we ſay, a *burning* FEVER. See CAUSUS.

Among the divers ſpecies of madneſs incident to dogs, one is called the *burning* madneſs. If a mare which has been covered, and the colt knit within her, be covered by another horſe, he is ſaid to *burn* her.

BURNING is more particularly uſed for the herpes, or *ignis ſacer*, called ERYSIPELAS and *arſura*.

BURNING, among *Surgeons*, denotes the application of an actual cautery, that is, a red-hot iron inſtrument, to the part affected; otherwiſe denominated cauterization. See CAUTERY.

BURNING, in *Antiquity*, was a practice much uſed by the Greeks, Romans, and northern nations; and ſtill retained by many people in both Indies, with reſpect to their dead. Phil. Tranſ. N° 126. See BURIAL.

In this ſenſe, *burning* ſtands oppoſed to burying; though, after *burning*, the BONES remaining, and aſhes, have been uſually collected into urns, and depoſited in the earth. Phil. Tranſ. N° 285.

Kings were burnt in cloth made of the ASBESTOS ſtone, that their aſhes might be preſerved pure from any mixture with the fewel, and other matters thrown on the funeral pile. And the like uſage is ſtill retained for the princes in Tartary.

Burning is not ſo ancient among the Greeks as interring; though we find it obtained in the time of the Trojan war. Potter. Arch. lib. iv. cap. 6. tom. ii.

For the manner of *burning* among the Greeks: the body was placed on the top of a pile, on which were alſo thrown divers animals, and even ſlaves and captives, beſides unguents and perfumes. In the funeral of Patroclus, we find a number of ſheep and oxen thrown in, then four horſes, followed by two dogs, and, laſtly, by twelve Trojan priſoners. Hom. Il. xxiii.

Euſtathius aſſigns two reaſons for the prevalency of *burning* in Greece; the firſt, that bodies being thought to be unclean after the ſoul's departure, were to be purified by fire: that the ſoul, or purer part, being ſeparated by the flames from the groſs inactive matter, might take its flight to the heavenly manſions with more freedom. This latter opinion obtained ſo much, that the Indian philoſophers had not patience to wait for *burning* till after death; they had recourſe to it in their life-time; erecting themſelves piles for the purpoſe, to looſen their ſouls from confinement. Calanus, who followed Alexander out of India, finding himſelf indiſpoſed, obtained that prince's leave to prevent the growth of his diſtemper, by committing himſelf to the flames; and Hercules, before his reception into heaven, was purified from the dregs of earth by the ſame means. Quintil. Declam. x. Potter. ubi ſupra.

Soldiers uſually had their arms burnt with them. The garments worn by the living, were alſo thrown on the pile, with other ornaments and preſents; a piece of extravagance, which the Athenians carried to ſo great a length, that ſome of their law-givers were forced to reſtrain them, by ſevere penalties, from defrauding the living by their liberality to the dead. Virgil. Æn. lib. vi. Potter lib. cit.

Pliny aſſures us, that *burning* was firſt brought into uſe among the Romans, on occaſion of the cruel uſage which the bodies of the dead Romans underwent in enemies countries. But this muſt only be underſtood in regard of the common uſage; ſince we find mention of *burning* as practiſed by ſome even in the earlieſt ages of Rome: Numa forbad his own body to be *burned*, commanding it to be laid entire in a ſtone coffin, which ſhews, that the practice of *burning* was not then unknown at Rome. Plin. Hiſt. Nat. lib. viii. cap. 54. Kenn. Rom. Ant. p. ii. lib. v. cap. 10.

In ſome caſes, *burning* was expreſly forbid, and looked upon as the higheſt impiety. Thus infants, who died before the breeding of teeth, were intombed, unburnt, in the ground, in a particular place ſet apart for this uſe, called *ſuggrundarium*. The like was practiſed with regard to thoſe who had been ſtruck dead with lightning, who were never to be *burnt* again.

Some ſay, that *burning* was denied to ſuicides as a puniſhment.

The manner of *burning* among the Romans, was not unlike that of the Greeks: the corpſe being brought without the city, if they deſigned to burn it, was carried directly to the place appointed for that purpoſe; which, if it joined to the ſepulchre, was called *buſtum*, if ſeparate from it, *uſtrina*, and there laid on the *rogus*, a pile of wood prepared to burn it on, built in ſhape of an altar, but of different height, according to the quality of the deceaſed. The wood uſed was commonly from ſuch trees as contained moſt pitch or roſin; and if any other were uſed, they ſplit it for the more eaſy catching fire: round the pile they ſet cypreſs trees, probably to hinder the noiſome ſmell of the corpſe. The body was not placed on the bare pile, but on the couch or bed where it lay on. This done, the next of blood performed the ceremony of lighting the pile, which they did with a torch, turning their face all the while the other way, as if it were done with reluctance. During the ceremony, decurſions and games were celebrated; after which came the *oſſilegium*, or gathering the bones and aſhes; alſo waſhing and anointing them, and repoſiting them in urns; which were common to both nations. Tibull. lib. i. Eleg. i. Virg. Æn. lib. vi. Kennet & Potter. lib. cit.

It is commonly ſuppoſed the practice of *burning* ceaſed at Rome under the empire of the Antonines.

BURNING *alive*, among the Romans, a puniſhment inflicted on deſerters, betrayers of the public councils, incendiaries, coiners, and even Chriſtians: it was called *crematio*.

The Jews had two ways of *burning*; one called *burning* of the body, performed with wood and faggots; the other, *burning* of the ſoul, *combuſtio animæ*, performed by pouring ſcalding-hot lead down their throats. The prieſt's daughter, who committed whoredom, he that lay with his own daughter, or grand-daughter, or his mother-in-law, were *burnt* alive. Phil. Tranſ. N° 230. Godw. Moſes & Aaron. lib. v. cap. 7.

BURNING, *Uſtio*, in *Chemiſtry*, is diſtinguiſhed from CALCINING; as the former is performed in cloſe veſſels, and terminates in charring, or reducing the body to a blackneſs; whereas the latter turns them white, being performed in the open air.

It alſo differs from ROASTING, *toſtio*, as, in *burning*, the fire is applied in contact with the body; in roaſting, at a diſtance from it.

A dextrous *burning* volatilizes ſalts, as common ſalt, *ſal alkali*. *Burning* alſo produces ſomewhat of a mineral ſulphur out of tartar, &c.

BURNING, or **BRENNING**, in our *Ancient Cuſtoms*, denotes an infectious diſeaſe, got in the ſtews, by converſing with lewd women; ſuppoſed to be the ſame that we now call the *venereal diſeaſe*. Whence that diſeaſe is argued to be much more ancient than the common epocha of the ſiege of Naples.

The chief objection againſt *burning* being the ſame with the venereal diſeaſe is, that the remedies preſcribed againſt the former, would be ineffectual in the latter: but it is not to be expected, the meaſures of the ancient phyſicians ſhould be calculated for the removing of any malignity in the maſs of blood or other juices, as in the modern practice; inaſmuch as they looked on the diſeaſe as merely local, and the whole of the cure to depend on the removal of the ſymptoms: beſides this, it is matter of frequent obſervation, that ſome diſeaſes grow more violent, and others more remiſs in courſe of time: ſo that the remedies which might have availed for the ancient *brenning*, may now fail as to the modern *pox*.

The proceſs for the cure, as delivered by J. Arden, chirurgeon to king Henry IV. is thus: *Contra* incendium *virgæ virilis interius ex calore & excoriatione, fiat talis ſyringa* (i. e. *injectio*) *lenitiva. Accipe lac mulieris maſculum nutrientis, & parum zacarium, oleum violæ & ptiſanæ: quibus commixtis per ſyringum infundatur.*

In an ancient MS. written about the year 1300, is a receipt for *brenning of the pyntyl yat men clepe the apegalle*; *galle* being an old word for a running ſore. And in another MS. written fifty years after, is a receipt for *burning in that part by a woman*. Simon Fiſh, a zealous promoter of the Reformation, in his Supplication of Beggars, preſented to king Henry VIII. 1530, ſpeaking of the Romiſh prieſts, ſays, "They catch the pocks of one "woman, and bare them to another; they be burnt with "one woman, and bare it to another; they catch the "lepry of one woman, and bare it to another." And Boord, a prieſt and phyſician in the ſame reign, begins one of his chapters of his Breviary of Health, thus: "The 19th chapter doth ſhew of the *burning* of an "harlot." The ſame author adds, that if a man be *burnt* with an harlot, and do meddle with another woman within a day, he ſhall *burn* the woman he ſhall meddle withal: and, as an immediate remedy againſt the *burning*, he recommends the waſhing the *pudenda* two or three times with white wine, or elſe with ſack and water.

BURNING *of diamonds*, is uſed among the jewellers for putting the DIAMONDS into a fierce fire, in order to diveſt them of a yellow or brown colour.

BURNING *on the forehead*, *Frontis inuſtio*, was anciently the penalty of a calumniator. In the middle age, we find frequent inſtances of *burning* in the cheek; a puniſhment allotted to bondmen, or villains guilty of theft.

BURNING-*glaſs*, or *burning-mirror*, a machine whereby the ſun's rays are collected into a point; and by that means their force and effect extremely heightened, ſo as to burn objects placed therein.

Burning-glaſſes are of two kinds: the firſt convex, called *lentes cauſticæ*; which tranſmit the rays of light, and in their paſſage refract, or incline them towards the axis; having the property of lenſes, and acting according to the laws of refraction.

The ſecond, which are the more uſual, are concave; very improperly called *burning-glaſſes*, being uſually made of metal: theſe reflect the rays of light, and, in that reflection, incline them to a point in their axis; having the properties of *ſpecula* or MIRRORS; and acting according to the laws of REFLEXION.

The firſt, or convex kind, authors ſuppoſe to have been unknown to the ancients; but the latter they are generally allowed to have been acquainted with. Their magnifying power is taken notice of both by Seneca and Pliny; and their *burning* power is mentioned in a treatiſe of Optics, aſcribed to Euclid, theorem 31. It is probable that the Romans had a method of lighting their ſacred fire by means of reflecting concave *ſpecula*. But Porta, and many others, ſuppoſe, that the *burning* mirrors of the ancients were made of metal, in the form of a ſection of a parabola, having the vertex cut off; it being the well-known property of this curve, to reflect all rays that fall upon it parallel to the axis into the focus. Hiſtorians tell us, that Archimedes, by means of reflecting mirrors, burnt a whole fleet; and though the effect related be very improbable, yet does it ſufficiently prove ſuch things were then known. The machines then uſed, nobody doubts, were metallic and concave, and had their focus by reflexion: it being agreed, that the ancients were unacquainted with the refracted *foci* of convex glaſſes. Yet M. de la Hire has diſcovered even theſe in the Clouds of Ariſtophanes; where Strepſiades tells Socrates of an expedient he had to pay his debts, by means of a round tranſparent ſtone or glaſs, uſed in lighting of fires, by which he intended to melt the bond; which in thoſe days was written on wax. The glaſs here uſed to light the fire, and melt the wax, M. de la Hire obſerves, could not be concave; ſince a reflected *focus* coming from below upwards, would have been exceedingly improper for that purpoſe: and the old ſcholiaſt of Ariſtophanes confirms the ſentiment. Pliny makes mention of globes of glaſs and cryſtal, which being expoſed to the ſun, burnt the cloaths and fleſh on people's backs; and Lactantius adds, that a glaſs ſphere, full of water, and held in the ſun, lighted the fire even in the coldeſt weather; which inconteſtably proves the effects of convex glaſſes.

Indeed, there is ſome difficulty in conceiving how they ſhould know ſuch glaſſes burnt, without knowing they magnified; which it is granted they did not, till towards the cloſe of the thirteenth century, when ſpectacles were thought of. For as to thoſe paſſages in Plautus, which ſeem to intimate the knowlege of ſpectacles, M. de la Hire obſerves, they do not prove any ſuch thing: and he ſolves this, by obſerving, that their *burning-glaſſes* being ſpheres, either ſolid, or full of water, their *foci* would be one fourth of their diameter diſtant from them: if then their diameter were ſuppoſed half a foot, which is the moſt we can allow, an object muſt be at an inch and a half's diſtance to perceive it magnified: thoſe at greater diſtances do not appear greater, but only more confuſed, through the glaſs than out of it. It is no wonder, therefore, the magnifying property of convex glaſſes was unknown, and their *burning* one known: it is more wonderful there ſhould be 300 years between the invention of ſpectacles and teleſcopes.

Every concave mirror, or *ſpeculum*, collects the rays diſperſed through its whole concavity, after reflexion, into a point or focus; and is therefore a *burning* mirror.

Hence, as the focus is there where the rays are the moſt cloſely contracted, if it be a ſegment of a large ſphere, its breadth muſt not ſubtend an arch above eighteen degrees: if it be a ſegment of a ſmaller ſphere, its breadth may be thirty degrees; which is verified by experiment.

As the ſurface of a mirror, which is a ſegment of a larger ſphere, receives more rays than another of a leſs, if the latitude of each ſubtend an arch of eighteen degrees; or even more or leſs, provided it be equal; the effects of the greater mirror will be greater than thoſe of the leſs.

And, as the *focus* is contained between the fourth and fifth parts of the diameter, mirrors that are ſegments of greater ſpheres *burn* at a greater diſtance than thoſe which are ſegments of a ſmaller.

Since, laſtly, the *burning* depends on the union of the rays, and the union of the rays on the concave ſpherical figure; it is no wonder, that even wooden mirrors, gilt, or thoſe prepared of alabaſter, &c. covered with gold; nay, even that thoſe made of paper, and covered with ſtraw, ſhould be found to *burn*.

Among the ancients, the *burning* mirrors of Archimedes and Proclus are eminent; by one of which, the Roman ſhips beſieging Syracuſe, under the command of Marcellus, according to the relations of Zonaras, Tzetzes, Galen, Euſtathius, Anthemius, &c. and by the other, the navy of Vitalian beſieging Byzantium, according to the ſame Zonaras, were burnt to aſhes.

Many have queſtioned the fact recorded by ſeveral hiſtorians concerning the ſurpriſing effects of Archimedes's *burning* mirrors; and they have principally urged the impoſſibility of producing ſuch effects by means of concave ſpecula, the focal diſtance of which muſt have been much too ſmall for the purpoſe. Des Cartes, particularly, diſcredited the ſtory, as fabulous, on this account; but Kircher made many experiments with a view of vindicating its credibility. Apprehending that the concave ſpecula of the ancients were ſections of a parabola, he began with combining ſeveral of this figure; but, failing of ſucceſs in this way, he tried the effect of a number of plane mirrors; and with five mirrors of the ſame ſize, placed in a frame, he contrived to throw the rays reflected from them to the ſame place, at the diſtance of more than a hundred feet; and by their means he produced ſuch a degree of heat, as led him to conclude, that, by increaſing their number, he could have ſet fire to inflammable ſubſtances at a greater diſtance. He likewiſe made a voyage to Syracuſe, in company with his pupil Schottus, in order to examine the place of the ſuppoſed tranſaction; and they were both of opinion, that the galleys of Marcellus could not have been more than thirty paces from Archimedes. M. Buffon, though ignorant of the particular teſtimonies of ancient writers, relative to the invention of Archimedes, and of the attempts of Kircher above mentioned, has more lately, by a ſimilar contrivance, ſufficiently evinced the practicability of the operation.

Dr. Wolfe, in the year 1768, after having given an account of ſome parabolic mirrors, conſtructed by M. Hoeſen of Dreſden, offers a conjecture, that thoſe of Archimedes might be of this kind, ſince it is not difficult to deſcribe a parabola, whoſe parameter is 2000 feet; and that rays reflected from ſuch a ſpeculum might be received by a lens, after having been brought to a focus, and tranſmitted parallel to any diſtance: but he was not apprized, that Kepler and Dechales had ſhewn, that no rays could be conveyed parallel to one another, except thoſe which proceeded from the ſame points in the ſun's diſk. Dutens du Miroir Ardent d'Archimede. Paris, 1755. Phil. Tranſ. vol. xlviii. p. 621, &c. Ibid. vol. lix. p. 8.

Among the moderns, the moſt remarkable *burning* mirrors, are thoſe of Magine, twenty inches in diameter; of Sepatala of Milan, which was near three feet and a half in diameter, and which burnt at the diſtance of fifteen feet; of Villette, and Tſchirnhauſen, and the new complex one of M. Buffon.

Villette, a French artiſt at Lyons, made a large mirror, which was bought by Tavernier, and preſented to the king of Perſia; a ſecond, bought by the king of Denmark; a third, preſented by the French king to the Royal Academy; a fourth has been in England, where it was publicly expoſed.—The effects hereof, as found by Dr. Harris and Dr. Deſaguliers, are, that a ſilver-ſixpence is melted in 7″ and ½; a king George's halfpenny in 16″, and runs with a hole in 34″. Tin melts in 3″, caſt iron in 16′, ſlate in 3″; a foſſile ſhell calcines in 7″; a piece of Pompey's pillar at Alexandria, vitrifies in the black part in 50″, in the white 54″; copper ore in 8′; bone calcines in 4″, and vitrifies in 33″. An emerald melts into a ſubſtance like a turquois ſtone; a diamond weighing four grains, loſes ⅞ of its weight; the *aſbeſtos* vitrifies; as all other bodies will do, if kept long enough in the *focus*; but when once vitrified, the mirror can go no further with them.—This mirror is forty-ſeven inches wide; and is ground to a ſphere of ſeventy-ſix inches *radius*; ſo that its *focus* is about thirty-eight inches from the *vertex*. Its ſubſtance is a compoſition of tin, copper, and tin-glaſs. Phil. Tranſ. vol. iv. p. 198.

M. Tſchirnhauſen's reflecting mirror deſerves next to be mentioned.—The following things are noted of it in the Acta Eruditorum, for 1687, p. 52. 1. Green wood takes fire inſtantaneouſly, ſo that a ſtrong wind cannot extinguiſh it. 2. Water boils immediately, and eggs in it are preſently edible. 3. A mixture of tin and lead, three inches thick, drops preſently, and iron or ſteel-plate becomes red-hot preſently, and a little after burns into holes. 4. Things not capable of melting, as ſtones, bricks, &c. become ſoon red-hot, like iron. 5. Slate becomes firſt white, then a black glaſs. 6. Tiles are converted into a yellow glaſs, and ſhells into a blackiſh yellow one. 7. A pumice-ſtone emitted from a volcano, melts into white glaſs; and, 8. A piece of crucible alſo vitrifies in eight minutes. 9. Bones are ſoon turned into an opake glaſs, and earth into a black one. It is made of copper, and its ſubſtance is not above double the thickneſs of the back of a knife: this was about 4½ French feet in diameter, and it burnt at the diſtance of twelve feet.

Every lens, whether convex, plano-convex, or convexo-convex, collects the ſun's rays, diſperſed over its convexity, into a point by refraction; and is therefore a *burning-glaſs*. The moſt conſiderable of this kind known, is that made by M. de Tſchirnhauſen: the diameters of his lenſes are three and four feet; the focus at the diſtance of twelve feet, and its diameter an inch and a half. To make the focus more vivid, the rays are collected a ſecond time by a ſecond lens parallel to the firſt; and placed in that place where the diameter of the cone of rays formed by the firſt lens, is equal to the diameter of the ſecond; ſo that it receives them all; and the focus from an inch and a half, is contracted into the ſpace of eight lines, and its force increaſed proportionably. It was purchaſed by the duke of Orleans, who preſented it to the French academy. Its weight was 160 pounds.

Its effects, among others, as related in the Acta Erudit. Lipſiæ, are, that it lights hard woods, even moiſtened with water, into a flame, inſtantly; that water, in a little veſſel, begins to boil preſently; all metals are melted; brick, pumice-ſtone, Delft wares, and the *aſbeſtos* ſtone, are turned into glaſs; ſulphur, pitch, &c. melted under water: the aſhes of vegetables, woods, and other matters, tranſmuted into glaſs; in a word, every thing applied to its focus, is either melted, turned into calx, or into ſmoke; and the colours of jewels, and all other bodies, metals alone excepted, are changed by it. He obſerves, that it ſucceeds beſt when the matter applied is laid on a hard charcoal well burnt.

Though the force of the ſolar rays be here found ſo ſtupendous, yet the rays of the full moon, collected by the ſame *burning-glaſs*, do not exhibit the leaſt increaſe of heat. Further, as the effects of a *burning* lens depend wholly on its convexity, it is no wonder that even thoſe prepared of ice produce fire, &c. A LENS of that kind is eaſily prepared, by putting a piece of ice into a ſcuttle, or hollow ſegment of a ſphere, and melting it over the fire, till it accommodate itſelf to the figure thereof.

Nor will thoſe ignorant of dioptrics be leſs ſurpriſed to ſee flame, and the effects thereof, produced by means of the refraction of light in a glaſs bubble with water.

Wolfius tells us, that an artiſt of Dreſden made *burning mirrors* of wood, bigger than thoſe of M. Tſchirnhauſen or Villette, which had effects, at leaſt equal to any of them.—Traberus teaches how to make *burning mirrors* of leaf gold, viz. by turning a concave, laying its inſide equally with pitch, and covering that with ſquare pieces of the gold, two or three fingers broad, faſtening them on, if need be, by fire. He adds, that very large mirrors may be made, of thirty, forty, or more concave pieces, artfully joined in a turned wooden diſh or ſcuttle; the effects of which will not be much leſs, than if the ſurface was continuous.—Zahnius adds further, that Newman, an engineer at Vienna, in 1699, made a mirror of paſteboard, covered within-ſide with ſtraw glued to it; by which all kinds of metals, &c. were readily melted.

Sir Iſaac Newton's *burning mirror* conſiſted of ſeven concave glaſſes, each of which was eleven inches and a half in diameter, and ſo diſpoſed as to have one common focus: ſix of them were placed round the ſeventh, and contiguous to it, in ſuch a manner as to form the ſegment of a ſphere, whoſe ſubtenſe is about thirty-four inches and a half; the focus is about twenty-two inches and a half diſtant, and about half an inch in diameter. This ſpeculum vitrified brick or tile inſtantaneouſly, and in about half a minute melted gold. M. Zeiher, not long ſince, made ſome improvement of this inſtrument; and formed panes of plain glaſs into the neceſſary degree of curvature, by heating them ſo hot on a diſh made of metal, that they would all aſſume the ſame form. M. Buffon has conſtructed furnaces for converting plain into concave mirrors; the mirrors are expoſed to a degree of heat ſufficient to ſoften the glaſs, in conſequence of which it conforms itſelf to the ſpherical figure of the mould on which it is placed. This method is ſubject to many difficulties and accidents; however, out of twenty-four mirrors treated thus, M. Buffon preſerved three; two of which are thirty-ſeven inches in diameter, and the other forty-ſix inches. The laſt was tin-foiled, and preſented to the French king; and is repreſented by the maker as the moſt powerful *burning* mirror in Europe; and yet the moon's light reflected from this concave ſpeculum, on a thermometer placed in the focus, produced no ſenſible dilatation of the included fluid. M. Buffon has alſo made attempts for conſtructing convex lenſes of great power, by fixing two of the above mentioned concave glaſſes together, and filling the cavity between them with water: one of his glaſſes broke in the trial; but others have ſince undertaken to conſtruct theſe water lenſes. He has likewiſe ſuggeſted another improvement in the conſtruction of *burning* glaſſes, conſiſting in a contrivance for diminiſhing the thickneſs of the middle or central part of the lens from three inches to one inch; whereby he propoſes to prevent the diminution of light occaſioned by its paſſing through the middle part of a lens of large diameter, and ſhort focus, which muſt be proportionably thick in that part. This new kind of lens is compoſed of three parts ground to the ſame radius, or of two circular zones, or bands, ſurrounding a central or middle part. He computes that the heat in the focus of a lens of this kind, three feet in diameter, will be about four times greater than that produced by any *burning* glaſs yet known.

But the moſt conſiderable improvement which M. Buffon has introduced into the optical apparatus is his machine, conſiſting of a number of mirrors; whereby he ſeems to have revived the ſecret of Archimedes, and to have vindicated the credit of hiſtory in this point. In the year 1747 he conſtructed a machine, with a hundred and forty plain mirrors, each about four inches long, and three broad; theſe are fixed at about a quarter of an inch diſtance from each other, upon a large wooden frame of about ſix foot ſquare. Each of them has three moveable ſcrews, which are ſo contrived, that the mirror can be inclined to any angle, and in any direction that meets the ſun; and by this means, the ſolar image of each mirror is made to coincide with all the reſt. The experiment was firſt tried with twenty-four mirrors, which readily ſet on fire a combuſtible matter, prepared of pitch and tow, and laid on a deal board, at the diſtance of ſixty-ſix French feet.

He then farther purſued the attempt, and put together a kind of polyhedron, conſiſting of 168 pieces of plane looking glaſs, each being ſix inches ſquare; and by means of this ſome boards of beech-wood were ſet on fire, at the diſtance of a hundred and fifty feet, in the month of March, and a ſilver plate was melted at the diſtance of ſixty feet. This machine, beſide other advantages, may be eaſily moved, ſo as to burn downwards or horizontally; and it burns either in its diſtant focus, or in any nearer interval, which our common *burning*-glaſſes cannot do, becauſe their focus is wholly fixed and determined. This machine, in the next ſtage of its improvement, contained three hundred and ſixty plain mirrors, each eight inches long, and ſix broad, mounted on a frame eight feet high, and ſeven feet broad. With twelve of theſe mirrors, light combuſtible matters were kindled at the diſtance of twenty feet; at the ſame diſtance, a large tin veſſel was melted with forty-five of them, and a thin piece of ſilver with a hundred and ſeventeen. When the whole machine was employed, all the metals and metallic minerals were melted at the diſtance of twenty-five, and even of forty feet. Wood was kindled in a clear ſky, at the diſtance of two hundred and ten feet. The focus, at the diſtance of fifty feet, is about ſeven inches broad; and at the diſtance of two hundred and forty feet, it becomes two feet in diameter. Mr. Buffon afterwards conſtructed a machine, which contained four hundred mirrors, each half a foot ſquare, with which he could melt lead and tin at the diſtance of a hundred and forty feet. Phil. Tranſ. vol. xliv. p. 493. 496. M. de Buffon Hiſtoire Naturelle, &c. Supplem. vol. i. Montucla, Hiſtoire des Mathematiques, vol. i. p. 246.

There is no ſolid ſubſtance that reſiſts the efficacy of modern *burning-glaſſes*. Meſſrs. Macquer and Baumé have ſucceeded in melting ſmall portions of PLATINA, by means of a concave glaſs, twenty-two inches in diameter, and of twenty-eight inches focus; though this metal is not fuſible by the ſtrongeſt fires that can be excited in furnaces, or ſuſtained by any chemical apparatus. Yet it was long ago obſerved by the Academicians del Cimento, that ſpirit of wine could not be fired by any *burning-glaſs* which they uſed; and notwithſtanding the great improvements which theſe optical inſtruments have ſince received, M. Nollet has not been able, by the moſt powerful *burning* mirrors, to ſet fire to any inflammable liquors whatever. See LENS, MIRROR, &c.

BURNING *of land*, called alſo *burn-beating*, and vulgarly *denſhiring*, from Devonſhire, a county in which it has been long practiſed, is a method of preparing and fertilizing lands barren, ſour, heathy, and ruſhy, for corn; by paring off the turf, and drying and burning it on the ground.—The ſame method alſo obtains for meadows and paſture-ground, moiſt, clayey, or ruſhy, to improve the hay.

BURNING, in *Law*. See ARSON, BRANDING, TREASON, &c.

BURNING *of metals*, *uſtio metallorum*, is either performed by fire, or by corroſive ſalts; which latter is alſo denominated CÆMENTATION.

The firſt preparation of moſt ores is by uſtion, or *burning*, whereby to diſpoſe them for fuſion. This is uſually performed by expoſing them, without addition, to a naked fire; ſometimes fixed alkalis and abſorbents are added, to hinder the avolation of the metalline particles. Some hold *burning* in the ſtone or glebe moſt advantageous; others *burning* in the meal. Phil. Tranſ. Nº 109.

The baſer metals, tin and lead, may be burnt like plants to aſhes. For gold and ſilver, the caſe is otherwiſe.

BURNING *mountains*. See VOLCANO, EARTHQUAKE, MOUNTAIN, &c.

The ancients deſcribe a meteor under the denomination of *burning buckler*, *clypeus ardens*. Plin. Hiſt. Nat. lib. ii. cap. 34. Mem. Acad. Inſcr. tom. vi. p. 95.

Travellers into Italy deſcribe a *burning* ſpot of ground at Firenzuola, in the Appennines, out of which a crackling flame continually ariſes, yet without any cleft for it to iſſue out at. Maffei ſuppoſes the ſteams which the place yields, to be a kind of native *phoſphorus ardens*, which take fire on their coming in contact with the air.

BURNING, among *Painters*.—Several of the painters COLOURS require *burning*, to fit them for uſe, as lamp-black, umber, ivory, &c.

The *burning*, or rather drying, of lamp-black, is performed by ſetting it over the fire in an iron ladle, or crucible, till no ſmoke ariſes from it. To *burn* umber, they put it in large lumps into a naked fire, where it is left till thoroughly red-hot. Ivory muſt be *burnt*, to make a black, in two crucibles, luted, covered with coals.

BURNING, in *Enamel Painting*. See ENAMELLING.

BURNING is alſo an operation in *Pharmacy*. Simples are frequently *burnt* in earthen-veſſels, either to reduce them to aſhes, as in the preparation of vegetable ſalts, or in order to dry them, that they may be more commodiouſly pulverized, as is practiſed in regard of hartſhorn, &c.

BURNING *phoſphorus*. See PHOSPHORUS.

BURNING *plant*, *Euphorbia*. See SPURGE.

BURNING *ſpring*, in *Natural Hiſtory*. See SPRING.

BURNING *zone*, in *Geography*. See TORRID *zone*.

BURNISHED *gold* or *ſilver*, denotes thoſe metals laid on any work or leaves, and afterwards paſſed over with a burniſher to heighten their luſtre.

BURNISHER, a round poliſhed piece of ſteel, ſerving to ſmooth and give a luſtre to metals.

Of theſe there are various kinds, of various figures; ſtrait, crooked, &c.—Half *burniſhers* are uſed to SOLDER ſilver, as well as to give a luſtre.

Burniſhers for gold and ſilver are commonly made of a dog's or wolf's tooth, ſet in the end of an iron or wooden handle. Of late, agates and pebbles have been introduced, which many prefer to the dog's tooth.

The *burniſhers* uſed by engravers in copper, uſually ſerve with one end to burniſh, and with the other to ſcrape.

BURNISHING, the act or art of ſmoothing, and poliſhing a metalline body, by briſkly rubbing it with a *burniſher*.

Bookbinders *burniſh* the edges of their books by rubbing them with a dog's tooth. Gold and ſilver are *burniſhed* with a wolf's tooth, a dog's tooth, or the blood ſtone, or by *tripoli*, a piece of white wood, emery, and the like.

Deer are ſaid to BURNISH *their heads*, when rubbing off a white downy ſkin from their horns againſt a tree, they thruſt them, as is ſaid, into a reddiſh earth, to give them a new colour and luſtre.

BURNT-*clay*. See MANURING.

BURNT-*grain*. See SMUT.

BURNT-*allum*. See ALLUM.

BURNT-*lead*. See LEAD.

BURNT, in ſpeaking of medicines, imports as much as imperfectly calcined. See CALCINATION.

Burnt bodies are generally dry and aſtringent. The other medicinal qualities belonging to bodies are frequently deſtroyed, at leaſt impaired, by the *burning*.

BURNT *planet*.—A planet is ſaid to be *burnt*, *combuſtus*, when it is in conjunction, or nearly ſo, with the ſun. Thus Saturn is ſaid to be *burnt*, when not above five degrees diſtant from the ſun, Jupiter when ſix, &c. Planets, in this ſituation, are ſuppoſed by aſtrologers to be much weakened or enfeebled in their influences.

BURNT *way*, *combuſta via*, among *Aſtrologers*, that part of the zodiac from the beginning of Libra to the middle of Scorpio; or, according to others, from the middle of Libra to the end of Scorpio, comprehending 45 degrees; a ſpace ſuppoſed very unfortunate, and in which the planets are much enfeebled in their virtues, eſpecially the moon. Vital. Lex. Math. p. 118.

BURNT *wine*. See WINE.

BURR-PUMP, or BILDGE-PUMP, a kind of PUMP ſo called, becauſe it holds much water.

BURR, the round knob of a horn next a deer's head.

BURRAS-*pipe*, an inſtrument uſed by goldſmiths, conſiſting of a copper box with a ſpout, having teeth like a ſaw; ſometimes alſo uſed by ſurgeons for the application of certain ſolid medicines by inſperſion.

BURREL-*fly*, in *Natural Hiſtory*. See WRINGLE-TAIL.

BURROCK, a ſmall wear or dam, were wheels are laid in a river for the taking of fiſh.

BURROUGH. See BOROUGH.

BURROUGH-*duck*, in *Zoology*, a common Engliſh name for the TADORNA.

BURROWS, holes in a WARREN, ſerving as a covert for rabbets, &c.

A coney's coming out of her *burrow*, is called *bolting*. To catch coneys, they ſometimes lay purſe-nets over the *burrows*, then put in a terrier cloſe muzzled, which making the creature bolt, ſhe is caught in the net.

BURROW, or BARROW. See BARROW.

BURSA, *Burſe*, originally ſignifies a purſe.

BURSAM, *revocatio per*, in the Norman *Laws*, is a right belonging to the next akin, to redeem or purchaſe back, within a year after ſale, a fee or tenement alienated by his kinſman, on paying the price it had been ſold at. Du-Cange.

BURSA is more particularly uſed, in *Middle Age Writers*, for a little college or hall in an univerſity, for the reſidence of ſtudents, called *burſales*, or *burſarii*.

BURSA, *Burſe*, or *Bourſe*, in the French univerſities, ſtill denotes a foundation for the maintenance of poor ſcholars in their ſtudies.

The nomination to *burſes* is in the hands of the patrons and founders thereof. The *burſes* of colleges are not benefices, but mere places aſſigned to certain countries and perſons. A *burſe* becomes vacant by the burſar's being promoted to a cure, as being incompatible. In the college of cardinal Maine at Paris, there are two ſorts of *burſes*, leſſer, for young ſcholars, who can only enjoy them ſix years, that is, as long as ſuffices for their riſing to the degree of maſter of arts; and greater, which may be held nine years, or till the ſtudents obtain the degree of doctors.

BURSA *paſtoris*. See SHEPHERD'S *Pouch*.

BURSA *paſtoris minor*. See DRABA.

BURSALIS *muſculus*, in *Anatomy*, a name given by Cowper and others to a muſcle of the thigh, called alſo *marſupialis* by the ſame authors. It is the *obturator internus* of Winſlow and Albinus, and is deſcribed by Veſalius under the name of *decimus tertius moventium*, and by Spigelius under that of *circumagentium tertius*, or *obturator internus*.

BURSAR, or BURSER, *burſarius*, is uſed in *Middle Age Writers* for a treaſurer, or caſh-keeper.

In this ſenſe, we meet with *burſars* of colleges. Conventual *burſars* were officers in monaſteries, who were to deliver up their account yearly on the day after Michaelmas.

The city of Bern is commanded by four bannerets, who are the heads of the militia of the whole canton, and two *burſars*, who are the treaſurers general, one for the German diſtrict, the other for the Roman or French.

The word is formed from the Latin *burſa*; whence alſo the Engliſh word *purſe*: and hence the like officer who in a college is called *burſar*, in a ſhip is called PURSER.

BURSARS, or BURSERS, in *Univerſities*, alſo denote thoſe who enjoy certain benefices left for defraying the expences of the education of young men of promiſing parts, and ſmall fortune. In Scotland, and at Paris, all exhibitioners are ſtill called *burſars*, or *bourſiers*. Actions brought for the effects of a college, are entered in the name of the principal and *burſars*. See BURSA.

BURSARIA, *Burſary*, in *Middle Age Writers*, denotes the place of receiving and paying money and rents by the burſars, or officers of account, in religious houſes. See BURSA and BURSAR.

BURSE, in *Matters of Commerce*. See EXCHANGE.

The firſt place of this kind to which the name *burſe* was given, Guicciardin aſſures us, was at Bruges; and it took its denomination from a hotel adjoining to it, built by a lord of the family *de la Bourſe*, whoſe arms, which are three purſes, are ſtill found on the crowning over the portal of the houſe. Catel's account is ſomewhat different, viz. that the merchants of Bruges bought a houſe or apartment to meet in, at which was the ſign of the purſe. From this city the name was afterwards transferred to the like places in others, as in Antwerp, Amſterdam, Berghen in Norway, and London.

BURSE *of merchants*, *Bourſe des marchands*, denotes a court or juriſdiction eſtabliſhed in ſeveral trading cities of France, for the taking cognizance, at the firſt inſtance, of all diſputes ariſing between merchants, bankers, negociants, and the like, and from which no appeals lie but to the parliament.

The *burſe* is a kind of conſular juriſdiction, the judges whereof are alſo denominated *priors* and *conſuls*.

The *burſe* of merchants at Tholouſe was eſtabliſhed by Henry II. in 1549, after the manner of the judges conſervators of the privileges of the fairs at Lyons. The chief officers are a prior and two conſuls, choſen yearly, and empowered to chooſe and aſſociate, to the number of ſixty, ſeveral merchants, to aſſiſt them in the deciſion of differences. Theſe are called judges *conſeillers de la retenuë*.

The *burſe* of Rouen, or, as it is commonly called, the convention of Rouen, is of ſome years later ſtanding than that of Tholouſe, having only been erected in 1566.

The lateſt of the conſular *burſes* is that of Marſeilles, eſtabliſhed by Louis XIV. in 1691; whoſe juriſdiction extends through ſeveral of the neighbouring dioceſes.

BURSERA, in the Linnæan *Syſtem of Botany*, a genus of the *hexandria monogynia* claſs. It has a three-leaved cup; the flower is compoſed of three petals, and has three valves, and contains one ſeed. Former botaniſts have called this the American turpentine-tree, and the American birch. See MASTIC-*tree*.

BURSTEN, a perſon ruptured, called by phyſicians *hernioſus*; in middle-age writers, *ponderoſus*. See HERNIA and RUPTURE.

BURTHEN. See BURDEN.

BURTON, in the *Sea Language*, a ſmall tackle, conſiſting of two ſingle blocks, capable of being made faſt any where at pleaſure, for hoiſting of ſmall things in or out, and which will purchaſe more than a ſingle tackle with two blocks. It is generally employed to tighten the ſhrouds of the top-maſts.

BURY, is ſometimes uſed to denote the hole or den of ſome animal under ground. See BURROW.

In which ſenſe we ſay, the *bury* of a mole, a tortoiſe, or the like. The *grillotalpa*, or male cricket, digs itſelf a *bury* with its fore-feet, which are made broad and ſtrong for that purpoſe. Naturaliſts ſpeak of a kind of urchins in the iſland of Maraguan, which have two entries to their *buries*, one towards the north, the other to the ſouth, which they open and ſhut alternately, as the wind happens to lie.

BURYING, the ſame with interment or BURIAL.

BUSELAPHUS, in *Zoology*, the name of an animal of the goat kind, called alſo *moſchelaphus*. It is of a ſort of middle ſhape between the ſtag and ox kind. Its head and its ears are long, its legs and feet ſmall, its tail about a foot long, and of the ſhape of that of a heifer; its upper part reddiſh and very naked, its lower covered with long hairs. The hair of its whole body is of a tawney or reddiſh yellow colour; its horns are black, ſmooth at the top, and rough every where elſe. It has two teats, and is an extremely tame and quiet animal, and naturally full of play. It is extremely ſwift in running, and in moſt reſpects, except in ſize, greatly reſembles the common ANTELOPE. Ray.

BUSH, a tuft or aſſemblage of boughs or branches.

BUSH-*lime*, among *Bird-Catchers*, denotes an arm or bough of a buſhy-tree, full of thick and long, yet ſmooth and ſtraight twigs, dawbed over with BIRD-LIME, and placed on ſome hedge where birds frequent, uſed eſpecially for the taking of pheaſants and fieldfares.

BUSH alſo denotes a coronated frame of wood hung out as a ſign at taverns. It takes the denomination from hence, that, anciently, ſigns where wine was ſold were *buſhes* chiefly of ivy, cypreſs, or the like plant, which keeps its verdure long. And hence the Engliſh proverb, "Good wine needs no *buſh*."

BUSH, *poiſon*. See SPURGE.

BUSHEL, a meaſure of capacity for things dry; as grains, pulſe, dry fruits, &c. containing four pecks, or eight gallons, or one eighth of a quarter.

Du-Cange derives the word from *buſſellus*, *buſtellus*, or *biſſellus*, a diminutive of *buz*, or *buza*, uſed in the corrupt Latin for the ſame thing: others derive it from *buſſulus*, an *urn*, wherein lots were caſt; which ſeems to be a corruption from *buxulus*.

Buſſellus appears to have been firſt uſed for a liquid meaſure of wine, equal to eight gallons. *Octo libræ faciunt galonem vini, & octo galones vini faciunt* buſſellum *London, quæ eſt octava pars quarterii.* The word was ſoon after transferred to the dry meaſure of corn of the ſame quantity—*Pondus octo librarum frumenti facit* buſſellum, *de quibus octo conſiſtit quarterium.*

By 12 Hen. VII. cap. 5. a *buſhel* is to contain eight gallons of wheat: the gallon eight pounds of wheat troy-weight; the pound twelve ounces troy-weight; the ounce twenty ſterlings; and the ſterling thirty-two grains, or corns of wheat, growing in the midſt of the ear.

This ſtandard *buſhel* is kept in the Exchequer; when being filled with common ſpring water, and the water meaſured before the houſe of commons in 1696, in a regular parallelopiped, it was found to contain 2145,6 ſolid inches; and the ſaid water being weighed, amounted to 1131 ounces and 14 penny weights troy. Greaves Orig. of Weights, p. 25.

Beſides the ſtandard or legal *buſhel*, we have ſeveral local *buſhels*, of different dimenſions in different places. At Abingdon and Andover, a *buſhel* contains nine gallons; at Appleby and Penrith, a *buſhel* of peaſe, rye, and wheat, contains 16 gallons; of barley, big, malt, mixt malt, and oats, 20 gallons. A *buſhel* contains at Carliſle, 24 gallons; at Cheſter, a *buſhel* of wheat, rye, &c. contains 32 gallons, and of oats 40; at Dorcheſter, a *buſhel* of malt and oats contains 10 gallons; at Falmouth, the *buſhel* of ſtricken coals is 16 gallons, of other things 20, and uſually 21 gallons; at Kingſton upon Thames, the *buſhel* contains eight and a half; at Newbury 9; at Wiccomb and Reading, eight and three fourths; at Stamford, 16 gallons. Houghton. Collect. tom. i. n. 46. p. 42.

At Paris, the *buſhel* is divided into two half *buſhels*; the half *buſhel* into two quarts; the quart into two half quarts; the half quart into two litrons; and the litron into two half litrons. By a ſentence of the provoſt of the merchants of Paris, the *buſhel* is to be eight inches two lines and an half high, and ten inches in diameter; the quart four inches nine lines high, and ſix inches nine lines wide; the half quart four inches three lines high, and five inches diameter; the litron three inches and an half high, and three inches ten lines in diameter.—Three *buſhels* make a minot, ſix a mine, twelve a ſeptier, and an hundred and forty-four a muid.

In other parts of France, the *buſhel* varies: fourteen one eighth *buſhels* of Amboiſe and Tours make the Paris ſeptier. Twenty *buſhels* of Avignon make three Paris ſeptiers. Twenty *buſhels* of Blois make one Paris ſeptier. Two *buſhels* of Bourdeaux make one Paris ſeptier. Thirty-two *buſhels* of Rochel make nineteen Paris ſeptiers. Oats are meaſured in a double proportion to other grains; ſo that twenty-four *buſhels* of oats make a ſeptier, and 248 a muid. The *buſhel* of oats is divided into four picotins, the picotin into two half quarts, or four litrons. For ſalt four *buſhels* make one minot, and ſix a ſeptier. For coals eight *buſhels* make one minot, ſixteen a mine, and 320 a muid. For lime, three *buſhels* make a minot, and forty-eight minots a muid. See Measure and Weight.

BUSKIN, *Cothurnus*, a kind of garment, ſomewhat in manner of a boot, covering the foot and mid-leg, and tied beneath the knee: very rich and fine, and uſed principally on the ſtage by the actors in tragedy.

The *buſkin* is ſaid to have been firſt introduced by Æſchylus: it was of a quadrangular form, and might be worn indifferently on either leg. Its ſole was made ſo thick, as, by means hereof, men of ordinary ſtature might be raiſed to the pitch and elevation of the heroes they perſonated: in which it was diſtinguiſhed from the ſock, worn in comedy; which was a low, popular ſhoe.

Dempſter obſerves, that the *buſkin* was not confined to actors only, but girls likewiſe uſed it to raiſe their height; and travellers and hunters to defend themſelves from the mire, &c.

As the *buſkin* was the diſtinguiſhing mark of tragedy on the ſtage, we find it in claſſic authors frequently uſed to ſignify *tragedy itſelf*.

BUSS, in *Navigation*, a ſhip with two maſts, uſed by the Engliſh and Dutch in the HERRING-FISHING.

The word is originally Flemiſh, *buis*, or *buys*, which ſignifies the ſame.

The herring-*buſs* is uſually about 60 tun, and furniſhed with two ſmall cabbins, one at the prow, and the other at the ſtern, the former of which is uſed as a kitchen. The officers on board it are the maſter or patron, his mate, and a boatſwain, who directs the fiſhermen, barrellers, &c. The only diet in a *buſs* is ſea-biſket, gruel, and the fiſh they catch.

Buss, *Buſſa*, is alſo the name of a large ſort of veſſel of war, in uſe in the middle age, ſpoke of by antiquaries and hiſtorians under the ſeveral denominations of *buſſa*, *buſcia*, *burcia*, *buza*, *bucca*, and *bucia*.

BUSSORES, by corruption from *Bazora* in Perſia, whence they were originally brought, a name given by ſome to that ſpecies of pigeon called the CARRIER.

BUST, or Busto, in *Sculpture*, denotes the figure, or portrait of a perſon *in relievo*, ſhewing only the head, ſhoulders, and ſtomach, the arms being lopped off; ordinarily placed on a pedeſtal, or conſole.

In ſpeaking of an antique, we ſay the head is marble, and the *buſt* porphyry, or bronze, that is, the ſtomach and ſhoulders. Felibien obſerves, that though in painting, one may ſay a figure appears in *buſto*, yet it is not properly called a *buſt*, that word being confined to things in *relievo*.

The *buſt* is the ſame with what the Latins called *herma*, from the Greek Hermes, Mercury, the image of that god being frequently repreſented in this manner among the Athenians.

Bust is alſo uſed, eſpecially by the Italians, for the trunk of an human body, from the neck to the hips.

Busta *Gallica*, was a place in ancient Rome, wherein the bones of the Gauls, who firſt took the city, and were ſlain by Camillus, were depoſited. It differed from

Busta *Gallorum*, a place on the Appennines, thus called by reaſon of many thouſands of Gauls killed there by Fabius.

BUSTARD, Otis, in *Zoology*, the name of a large bird. The *otis* is called *tarda* and *otardes* by ſeveral authors. See *Tab. of Birds*, N° 28.

In the Linnæan ſyſtem of zoology, the *otis* makes a diſtinct genus of birds of the order of the *gallinæ*; the diſtinguiſhing characters of which are, that the feet have only three toes each, and thoſe all placed before, and the head is not adorned with a creſt or any other ornament. It is of the ſize of the common turkey, its beak is like that of the common gallinaceous fowls; its head and neck are grey; its belly white, and its back variegated with tranſverſe ſtreaks of red and black: it has no hinder toe, by which, and by its ſize, it is eaſily diſtinguiſhed from all the reſt of the gallinaceous kind. The male is diſtinguiſhed from the female by being of a much larger ſize, and by a tuft of feathers about five inches long on each ſide the lower mandible. Beſides, the males have a pouch, whoſe entrance lies immediately under the tongue, which is capable of holding near ſeven quarts; this ſecures them againſt drought, in thoſe dry tracts where they commonly live, and is probably filled with water, to ſupply the hen when ſitting, or the young before they can fly. It feeds on herbs and grain, and earth worms, and eats very greedily the leaves of dandelion, and particularly on the ſeeds of hemlock, which ſeems a very ſtrange food. It is frequent in many parts of England, where there are large heaths and plains: they are very bad fliers, and very difficultly raiſe themſelves up from the ground; but they are extremely ſhy, and if they ſee a man at a very great diſtance, they immediately eſcape as faſt as they can. Their fleſh is eſteemed. The leſſer *buſtard*, or *otis tetrax*, of Linnæus is about the ſize of a pheaſant.

Bustard, *Thick-kneed*. See *Stone*-Curlew.

BUSTIARII, a kind of gladiators, among the ancient Romans, who fought about the buſtum, or pile, of a deceaſed perſon, in the ceremony of his obſequies.

The practice at firſt was, to ſacrifice captives on the tomb, or at the buſtum, of their warriors: inſtances of which we have in Homer, at the obſequies of Patroclus, and among the Greek tragedians. Their blood was ſuppoſed to appeaſe the infernal gods; and render them propitious to the manes of the deceaſed.

In after-ages, this cuſtom appeared too barbarous; and in lieu of theſe victims, they appointed gladiators to fight; whoſe blood, it was ſuppoſed, might have the ſame effect.—According to Valerius Maximus and Florus, Marcus and Decius, ſons of Brutus, were the firſt, at Rome, who honoured the funeral of their father with this kind of ſpectacle, in the year of Rome 489.—Some ſay, the Romans borrowed this cuſtom from the Hetrurians; and they from the Greeks.

BUSTUARIÆ *mœchæ*, a kind of public whores, who proſtituted their bodies among the *buſta* or tombs, which it ſeems were ordinarily places of rendezvous for affairs of this kind. Others ſuppoſe that theſe were women hired to attend a funeral, and lament the loſs of the deceaſed.

BUSTUM, in *Antiquity*, denotes a pyramid or pile of wood, whereon were anciently placed the bodies of the deceaſed, in order to be burnt.

The Romans borrowed the cuſtom of BURNING their dead from the Greeks. The deceaſed, crowned with flowers, and dreſſed in his richeſt habits, was laid on the *buſtum*. See Burning.

Some authors ſay, it was only called *buſtum*, after the burning, *quaſi bene uſtum*: before the burning it was more properly called *pyra*; during it, *rogus*; and afterwards, *buſtum*.

When the body was only burnt there, and buried elſewhere, the place was not properly called *buſtum*, but *uſtrina*, or *uſtrinum*.

Bustum, in the *Campus Martius*, was a ſtructure whereon the emperor Auguſtus firſt, and, after him, the bodies of his ſucceſſors were burnt.

It was built of white ſtone, ſurrounded with an iron paliſade, and planted within ſide with alder trees.

Bustum was alſo figuratively applied to denote any TOMB.

Whence thoſe phraſes, *facere buſtum*, *violare buſtum*, &c.

Bustum *of an altar*, was the hearth or place where the fire was kindled.

BUTCHER. Among the ancient Romans there were three kinds of eſtabliſhed *butchers*; viz. two colleges, or companies, compoſed each of a certain number of citizens, whoſe office was to furniſh the city with the neceſſary cattle, and to take care of preparing and vending their fleſh. One of theſe communities was at firſt confined

fined to the providing of hogs, whence they were called *ſuarii*; and the other were charged with cattle, eſpecially oxen; whence they were called *pecuarii*, or *boarii*. Under each of theſe was a ſubordinate claſs, whoſe office was to kill, prepare, &c. called *lanii*, and ſometimes *carnifices*.

Briſſonius, Modius, and others, mention a pleaſant way of ſelling meat, uſed for ſome ages among this people: the buyer was to ſhut his eyes, and the ſeller to hold up ſome of his fingers; if the buyer gueſſed aright, how many it was the other held up, he was to fix the price; if he miſtook, the ſeller was to fix it. This cuſtom was aboliſhed by Apronius, prefect of Rome; who in lieu thereof introduced the method of ſelling by weight.

Some derive the term *butcher* from *buccarius*, of *bucca*, *mouth*; others from βȣθυτης, *killer of cattle*.

The French call a place ſet apart either for the ſlaughter of cattle, or expoſing their fleſh to ſale, a *butchery*, *boucherie*. The Engliſh diſtinguiſh, calling the latter a *fleſh-ſhamble*, or *market*, the former a *ſlaughter-houſe*.—Nero built a noble edifice of this kind at Rome; on which occaſion was ſtruck that medal, whoſe reverſe is a building ſupported by columns, and entered by a perron of four ſteps; the legend, MAC. AVG. S. C. *Macellum Auguſti Senatuſconſulto*.

In London, the furniſhing the markets with *butchers* meat is cantoned into ſeveral offices. We have carcaſs-*butchers*, who kill the meat in great quantities, and ſell it out to another ſort called retail *butchers*, diſperſed in all out-parts, villages, and towns, near the city. There are, beſides, cow-jobbers, or ſaleſmen, who buy and ſell cattle, acting between the *butchers* and the breeders, or feeders. Something like this alſo obtains at Paris.

The company of *butchers* was not incorporated until the third year of king James I. when they were made a corporation by the name of maſter, wardens, and commonalty of the art and myſtery of *butchers*; yet the fraternity is ancient. Their arms are azure, two axes ſaltier wiſe argent, between three boars heads couped, attired or, a boars head gules, between two garbes vert.

There are ſome good laws made for the better regulation, and for preventing the abuſes committed by *butchers*. *Butchers*, ſelling ſwine's fleſh meaſled, or dead of the murrain, or that buy fleſh of Jews, and ſell the ſame to Chriſtians, for the firſt time ſhall be grievouſly amerced, the ſecond time ſuffer the pillory, the third time be impriſoned and fined, and the fourth time forſwear the town. 17 Edw. II. cap. 7. vid. 51 Hen. III.

Stat. 4. Hen. VII. cap. 3. no *butcher* ſhall ſlay beaſts within the wall of London, upon pain to forfeit for every ox 12*d*. and for every cow and other beaſt, 8*d*. and this law ſhall be obſerved in every city and town walled in England, and in the town of Cambridge; except Berwick and Carliſle.

Stat. 15 Car. II. cap. 8. § 2. no perſon uſing the trade of a *butcher*, ſhall ſell or expoſe to ſale, any fat oxen, ſteers, runts, kine, heifers, calves, ſheep, or lambs alive, on pain to forfeit double the value of the cattle.

Stat. 5 Anne, cap. 4. § 2. no perſon uſing the trade of a *butcher* ſhall ſell, or offer to ſell, within London and Weſtminſter, or within ten miles thereof, to any perſon uſing the trade of a *butcher*, any fat cattle or ſheep, alive or dead, upon pain to forfeit the value.

Stat. 7 Anne, cap. 6. the clauſe 5 Anne, cap. 34. § 32. ſhall not extend to the ſelling of calves, ſheep, or lambs, dead, by one *butcher* to another.

No *butcher* ſhall kill any calf, to ſell, being under five weeks old; nor uſe the craft and myſtery of a tanner.

BUTCHER-*bird*, in *Ornithology*, the Engliſh name of the *lanius*, the ſmalleſt of all the European birds of prey, yet very fierce and deſtructive. Its beak is all the way ſtraight, except juſt at the end, where it is ſlightly hooked, the upper mandible furniſhed with a ſharp proceſs, and its tail faſhioned like that of the magpye, the outer feathers being the ſhorteſt, the reſt gradually longer; for which reaſon ſome have called it the *pica*. The ancients called it the *tyrannus*, and in Engliſh we ſometimes alſo call it the *ſhrike*.

There are ſeveral ſpecies of the *lanius*: the principal are, 1. The common larger kind, called the MATTAGESS. 2. The ſmaller, called the FLUSHER. And, 3. The *lanius minor*, or grey little *butcher*-bird. See *Tab. of Birds*, N° 5. The *lanius minor cinereus*, or little grey *butcher*-bird, is the name of a very ſmall ſpecies of the *lanius*, common in Italy and elſewhere, and is a very great deſtroyer of the wrens, and other ſmall birds.

BUTCHER'S-*broom*, *Ruſcus*, in *Botany*, a genus of the *dioecia ſyngeneſia* claſs. Its characters are theſe: it hath male and female flowers in diſtinct plants; the male have erect ſpreading empalements, compoſed of ſix oval convex leaves, whoſe borders are reflexed; they have no petals, but an oval *nectarium* of the ſize of the empalement, which is erect and inflated, opening at the mouth; they have no ſtamina, but each has three ſpreading ſummits ſitting on the top of the *nectarium*, which are joined at their baſe. The female flowers have empalements, but no petals, and *nectariums* like the male; they have no ſtamina, but have an oblong, oval germen, hid within the *nectarium*, ſupporting a cylindrical ſtyle, crowned by an obtuſe ſtigma, ſtanding above the mouth of the *nectarium*; the germen afterward becomes a globular berry, with two or three cells, encloſing two globular ſeeds. There are eight ſpecies.

The root of *butcher's-broom* is one of the five aperient ones, and is celebrated by authors as a very powerful attenuant and reſolvent. It is good in all chronic caſes, and is frequently preſcribed in diet drinks, intended to open obſtructions of the *viſcera*, or to promote urine.

BUTEO. See BUZZARD.

BUTHYSIA, βȣθυσια, in *Antiquity*, a ſacrifice of the greateſt kind; ſuch were the hecatombs. See SACRIFICE and HECATOMB.

The Greeks frequently prefixed the particle βȣ, *bu*, to words, to denote things of extraordinary magnitude, as alluding to the bigneſs of oxen.

BUTIGA, is an inflammation of the whole face, otherwiſe called *gutta roſacea*.

BUTLER, or BOTILER, an officer whoſe chief charge is over the cellar and drinkables. See ARCH-*Butler*.

BUTLERS, *buticularii*, among the Normans, denote wine-taſters, appointed to examine liquors, and ſee that they be right and legal.

BUTLER *of France*, *buticularius Franciæ*, was one of the four great officers in the houſhold of the ancient kings of that country, who ſigned all the royal patents, or at leaſt was preſent at the diſpatch of them. His ſeat was among the princes, and he even diſputed the precedency of the conſtable of France. He had a right of preſiding at the chamber of accounts; and in the regiſters of that office of the year 1397, mention is made, that John de Bourbon, grand *butler* of France, was admitted there as firſt preſident. But the title is now aboliſhed, and, in lieu thereof, a new office of *grand echanſon*, or cup-bearer, erected.

BUTLER'S *ale*. See ALE.

BUTLER'S *ſtone*, a medicinal preparation, of which the ancient chemiſts relate wonders. See Boyle's Works, Abr vol. i. p. 50.

The inventor, from whom it takes its name, was a Scotchman, in great favour with king James I. and is ſaid to have done wonders with it, not only in the ſpeedy cure of the moſt dangerous diſtempers, but in the making of gold out of lead and quickſilver.

The preparation of this ſtone is given by Morley. Collect. Chym. Leyd. cap. 375.

BUTLERAGE and PRISAGE; theſe were originally the only cuſtom that was payable upon the importation of wines, and were taken and received by virtue of the regal prerogative, for the proper uſe of the crown: but for many years paſt, there having been granted by parliament, ſubſidies or aids to the kings of England, and theſe duties not repealed, but confirmed, they have been pleaſed to grant the ſame away to ſome noblemen, who, by virtue of ſuch grant or patent, are to enjoy the full benefit and advantage thereof, and may cauſe the ſame to be levied and collected in the ſame manner, as the kings themſelves might, and were formerly wont to do.

Butlerage is a duty of two ſhillings for every ton of wine imported by merchants ſtrangers; being a compoſition (in lieu of the priſage payable in kind by Engliſh only) in conſideration of the liberties and freedoms granted to them by king John, and king Edward I. by a charter called *Charta Mercatoria*. 31 Edw. I. cap. 1. & 2.—27 Edw. III. cap. 26.

BUTMENTS, in *Architecture*, thoſe ſupporters, or props, on or againſt which the feet of arches reſt.

The word comes from the French *bouter*, *to abut* or *terminate* on any thing; or rather from *buter*, *to prop*.

The name *butment* is alſo given to little places taken out of the yard, or the ground-plot of an houſe, for butteries, ſculleries, &c.

Butments of arches are the ſame with buttreſſes. They anſwer to what the Romans call *ſublices*, the French, *culees* and *butees*.

BUTMENTS, or ABUTMENTS of a BRIDGE, denote the two maſſives at the end of a bridge, whereby the two extreme arches are ſuſtained and joined with the ſhore on either ſide.

The *butments* of bridges next the banks ſhould be built more firm and ſolid, as ſerving to ſuſtain the whole ſeries of arches, and hinder them from ſpreading.

BUTOMUS, the *flowering ruſh*, in *Botany*. See RUSH.

BUTORIUS, in *Zoology*, a name by which ſome have called the *ardea ſtellaris*, or BITTERN.

BUTRO, in *Natural Hiſtory*, the name of a wild bull. See BISON.

BUTT, in our *Ancient Cuſtoms*, denotes a place erected for archers to ſhoot at, and in which a mark or white was fixed.

BUTT is uſed for a veſſel, or meaſure of wine, containing two hogſheads, or 126 gallons.—Otherwiſe called PIPE.

A *butt* of currans is from fifteen to twenty-two hundred weight.

BUTT, or **BUTT-*end***, in the *Sea Language*, denotes the end of any plank, which joins to another on the outſide of a ſhip, under water.

Hence, when a plank is looſe at one end, they call it *ſpringing a butt*; to prevent which, ſhips are uſually bolted at the *butt-heads*, that is, at the plank's end.

BUTTER, a fat, unctuous ſubſtance, prepared, or ſeparated from milk, by heating or churning it.

The word is formed from βȣτυρον, a compound of βȣς, *cow*, and τυρος, *cheeſe*; q. d. *cow's cheeſe*.—Some authors, out of regard to this etymon, affect to write the word *buttyr*, and *butyr*.

It was late ere the Greeks appear to have had any notion of *butter*. Homer, Theocritus, Euripides, and the other poets, make no mention of it; and yet are frequently ſpeaking of milk and cheeſe: and Ariſtotle, who has collected abundance of curioſities relating to the other two, is perfectly ſilent on this. Pliny tells us, that *butter* was a delicate diſh among the barbarous nations; and was that which diſtinguiſhed the rich from the poor. Hiſt. Nat. lib. xxviii. cap. 35.

The firſt time the word βȣτυρον occurs is in Hippocrates, in ſpeaking of the Scythians, from whom the Greeks appear to have firſt learnt the art of making it. In reality what reaſon can be given, why Herodotus ſhould deſcribe the Scythians proceſs of making *butter* with ſo much exactneſs, if the ſame had been in uſe among the Greeks. Herm. Melpom.

It muſt not be forgot, that the ancient Jews appear to have been acquainted with the method of preparing *butter*. Solomon, Iſaiah, and even Moſes, ſpeak of it. The laſt repreſents it as in uſe in Abraham's time, unleſs we ſhould ſuppoſe, with ſome modern writers, that by *butter* in theſe paſſages we are to underſtand CHEESE. See Prov. xxx. 33. Iſa. vii. 15.

The Romans uſed *butter* no otherwiſe than as a medicine, never as a food. Schookius obſerves, that it is owing to the induſtry of the Dutch, that there is any ſuch thing as *butter* in the Eaſt Indies: that in Spain, *butter* is only uſed medicinally, for ulcers; and adds, that the beſt opiate for making the teeth white, is the rubbing them with *butter*.

Cl. Alexandrinus obſerves, that the ancient Chriſtians of Egypt burnt *butter* in the lamps at their altars, inſtead of oil; and the Abyſſinians, according to Godignus, ſtill retain a practice much like it. Clemens finds a religious myſtery in it.—In the Roman churches, it was anciently allowed, during Chriſtmas-time, to uſe *butter* inſtead of oil; by reaſon of the great conſumption thereof, in other ways.

In the cathedral of Rouen there is a tower called the BUTTER *tower*, *tour du beurre*, becauſe George d'Amboiſe, archbiſhop of Rouen in 1500, finding the oil fail in his dioceſe during Lent, permitted the uſe of *butter*, on condition that each inhabitant ſhould pay ſix deniers for the liberty, with which ſum this tower was erected. There are other *butter* towers at Notre Dame, Bourges, &c.

Butter is made in the greateſt plenty from cows milk, but ſometimes alſo from goats, and the richeſt from ſheeps milk, as is obſerved by Pliny; though Galen ſeems to doubt it. Inſtances have alſo been known of *butter* made from women's milk, which is extolled by Hoffman as a ſovereign remedy againſt the *phthiſis*. Add, that the ancient Scythians, according to Hippocrates, made *butter* of mares milk; the method of preparing which is deſcribed by that author.

If cows feed on ſhort graſs, they will yield more *butter*, though leſs milk, than if they fed on long rank graſs. The milk of ſome cows, though fed on the ſame graſs, will not yield ſo much *butter* as that of others. In many caſes, the *butter* is found to retain the taſte of the plant on which the cows feed.

Writers on the dairy deſcribe the proceſs of making and ordering *butter*. The chief means whereby *butter* is produced, is a long continued agitation of milk, whereby its texture is broken. After the *butter* is come, as they call it, they take it out, waſh it, and beat it, to expreſs the milk. In Bengal, *butter* is eaſily made, by the ſlight turning of a ſtick in milk. Phil. Tranſ. Nº 337. p. 227.

In Barbary, *butter* is made by putting the milk or cream into a goat's ſkin, ſuſpended from one ſide of the tent to the other, and preſſing it to and fro in one uniform direction. This quickly occaſions the neceſſary ſeparation of the unctuous and wheyey parts. Shaw's Travels, p. 241.

If the milk be not well wrought out, the *butter* will not keep. When *butter* begins to decay and taſte amiſs, working it well anew, and waſhing it with water, will reſtore it.

In Bengal, to make *butter* paſs for freſh when old and rank, they melt it, and pour on it ſour curdly milk; ſome hours after which, they ſtrain it through a cloth for ſale.

BUTTER, *clarified*, and TALLOW, are ſaid to be ſpecifics againſt the *bloody* FLUX, and defluxions of the eyes and breaſt. The proceſs of *clarifying butter* is as follows.—Take new churned *butter*, without ſalt, melt it over a clear fire, and ſkim off the curdy part. Two ſpoonfuls of the clarified remainder are to be given twice or thrice within the day.

This oil of MILK, which is naturally diſtributed through all the ſubſtances of the milk, conſiſts of very ſmall particles, which are interpoſed betwixt the caſeous and the ſerous parts, among which it keeps itſelf ſuſpended, by a ſlight adheſion, but without being diſſolved. It is in the ſame ſtate in which oil is in emulſions; hence, the ſame whiteneſs in MILK and in EMULSIONS; and hence by reſt, the oily parts ſeparate from both theſe liquors to the ſurface, and form a cream. When *butter* is in the ſtate of cream, its proper oily parts are not yet ſufficiently united together to form a homogeneous maſs. They are ſtill half ſeparated by the interpoſition of a pretty large quantity of caſeous and ſerous particles. The *butter* is completely formed by preſſing out theſe heterogeneous parts, by means of continued percuſſion. It then becomes an uniform maſs.

The trade of *butter* is very conſiderable. It is chiefly made within forty miles round the city. Fifty thouſand firkins are ſaid to be ſent yearly from Cambridge and Suffolk alone; each firkin containing 56 pounds. Uttoxeter in Staffordſhire is a market famous for good *butter*, inſomuch that the London cheeſemongers have an eſtabliſhed factory here for *butter*. It is bought by the pot, of a long cylindrical form, weighing 14 pounds.

Divers abuſes are practiſed in the packing and ſalting of *butter*, to increaſe its bulk and weight, againſt which we have a ſtatute expreſs. 4 Car. II. cap. 26.

By 13 and 14 Car. II. cap. 26. no *butter* which is old or corrupt, ſhall be mixed or packed with that which is new and ſound.—Nor any *whey*-BUTTER be mixed or packed with *butter* made of cream.—But each ſort ſhall be packed ſeparately.—No *butter* ſhall be ſalted or ſaved with any great ſalt, but all with ſmall ſalt.

Butter, as a wholeſome aliment, ſhould be freſh, and free from rancidity, and not fried or burnt; otherwiſe the acid being diſengaged by age and fermentation, as well as by fire, it will diſorder digeſtion, render it difficult and painful, excite acrid, empyreumatic belchings, and introduce much acrimony into the blood.

Butter is an emollient, and has virtues approaching to thoſe of oil; having a peculiar power of reſiſting poiſon, and obtunding the acrimony thereof. By its ſuppling and relaxing the parts, Dr. Quincy thinks it has a tendency to ſtop in the capillaries and glands, and foul the *viſcera*; whence proceed blotches, and cutaneous diſeaſes. Some repreſent it as a diuretic, purgative, and promoter of expectoration.

BUTTER, *May*, BUTYRUM *Majale*, is a medicine in ſome repute among good women, for ſtrains, aches, and wounds. It is made of *butter* churned at that time, and expoſed to the ſun of the whole month, till, by repeated fuſions, it be brought to a whiteneſs. Helmont calls it *magiſtery of graſs*. Quincy affirms it is no better than plain lard.

Naturaliſts ſpeak of ſhowers and dews of *butter*. See DEW.

BUTTER-*milk*, the MILK which remains after the *butter* is come by churning.

Butter-milk is eſteemed an excellent food, in the ſpring eſpecially, and is particularly recommended in hectic fevers.

Some make curds of *butter-milk*, by pouring into it a quantity of new milk hot.

BUTTER-*bump*. See BITTERN.

BUTTER-*bur*, *Petaſitis*, in *Botany*, an officinal plant, both in figure and virtues reſembling *maſter*-WORT. Linnæus has comprehended this plant under the genus of *tuſſilago*, which belongs to the claſs of *ſyngeneſia polygamia ſuperflua*. Its characters are theſe: the flower is compoſed of ſeveral hermaphrodite florets, which are included in one common cylindrical empalement; they are tubulous, or funnel-ſhaped, of one petal, cut into five ſegments at the brim. They have each five ſmall hair like ſtamina, terminated by cylindrical ſummits, and a ſhort germen, crowned with down, ſupporting a ſlender ſtyle, crowned by a thick ſtigma; the germen afterward becomes an oblong, compreſſed ſeed, crowned with a hairy down. There are five ſpecies; the firſt of which is the common *butter-bur*, or peſtilent-wort, which grows naturally by the ſides of rivers and ditches in moſt parts of England. It is reputed an alexipharmic and detergent, and uſed in many compoſitions, eſpecially with the firſt of thoſe intentions. There is alſo a compound water denominated from it, though rejected in the laſt college diſpenſatory.

The root is the part principally uſed; and beſide theſe virtues, it has thoſe of an aperient and detergent. It is preſcribed in ſuppreſſions of the urine and *menſes*, and in coughs, aſthmas, and other diſeaſes of the breaſt.

Butter-*nut*, a fruit in New England, whoſe kernel yields a great quantity of ſweet oil.

Butter-*wort*, *Pinguicula*, in *Botany*, a genus of the *diandria monogynia* claſs. The corolla conſiſts of a ſingle ringent petal; the longer lip is ſtrait, obtuſe, trifid, and ſupine; the ſhorter lip is bifid, more obtuſe, and patent; the *nectarium* is corniculated, and produced from the baſe of the petal; the fruit is an oval capſule, compreſſed at top, and containing one cell, in which are ſeveral ſmall ſeeds of a cylindric figure.

This plant is found growing on bogs in many parts of England, and flowers in June; but is never cultivated in gardens.

Butter, *Butyrum*, is alſo uſed to expreſs ſeveral chemical ſubſtances—as, *butter* of ANTIMONY, of ARSENIC, of BEN, of BISMUTH, of CACAO, of FLAX, of SATURN, of TIN, of WAX, &c. on account of their form of conſiſtence reſembling that of *butter*.

Butter *of ſtone*, a kind of mineral drug found on the higheſt mountains and hardeſt rocks of Siberia, being drawn by the ſun's heat, in the way of tranſudation, from the dry ſubſtance of the ſtones themſelves, and adhering to the ſurface thereof like a ſort of calx, which, having received its full coction, is ſcraped off by the inhabitants under the name of *kamine maſla*. The Ruſſians aſcribe many virtues to it. It is much uſed for the dyſentery and venereal diſeaſes; but its operation is ſo violent, however corrected by other ingredients, that none but the Ruſſians dare uſe it.

Butter-*fiſh*, a ſmall fiſh common in Cornwal, ſhaped ſomewhat like an eel, and diſtinguiſhed by two rows of black ſpots along its back, and called GUNELLUS.

Butter-*fly*, in *Zoology*. See PAPILIO.

Butter-*fly fiſh*, the Engliſh name for the fiſh called by authors BLENNUS, or BLENNIUS.

It has its name of the *butter-fly fiſh* from a ſpot in the fin, which reſembles thoſe in the wings of ſome *butter-flies*.

Butter-*fly ſhell*. See VOLUTA.

Butter-*fly*, *Satyrion*, in *Botany*. See ORCHIS.

Butter-*jags*, flowers of the wild TREFOIL.

BUTTERY.—Officers in the king's *buttery*, are a gentleman, yeoman, and three grooms of the *buttery*. The *buttery* among us is uſually placed near the cellar, being commonly the room next the top of the cellar ſtairs.

BUTTING, *imbotare*, in *Middle Age Writers*, is uſed for turning of wine, or putting it into butts.

Butting-*pillar*. See PILLAR.

BUTTOCK *of a ſhip* is her full breadth right aſtern from the tuck upwards.—According as a ſhip is built, broad or narrow at the tranſom, ſhe is ſaid to have a *broad* or *narrow buttock*.

BUTTONS make an article in dreſs, whoſe form and uſe is too familiar to need a deſcription.—The matter whereof they are made is various; as metal, ſilk, mohair, &c.

Buttons, *metal*, are various; both with regard to the matter and manner of making: beſides thoſe caſt in moulds, much in the manner of other ſmall works (ſee FOUNDERY), there are now made great quantities with thin plates, or leaves of gold, ſilver, and braſs; eſpecially of the two laſt.—The invention of theſe *buttons* being very late, as not having been ſet on foot before the beginning of the eighteenth century; and their ſtructure very ingenious, though but of indifferent uſe; we ſhall here ſubjoin it.

Buttons, *manner of making plated*. The metal to be uſed being reduced into thin plates, or leaves, of the thickneſs intended (either by the goldſmith or braſier), is cut into little round pieces, of a diameter proportionable to the wooden mould they are made to cover: this cutting is performed with a ſharp punch, on a leaden block or table.—Each piece of metal thus cut, and taken off from the plate, is reduced to the form of a *button*, by beating it ſucceſſively in ſeveral ſpherical cavities, with a round piece of iron in form of a puncheon; ſtill beginning with the flatteſt cavity, and proceeding to the more ſpherical, till the plate has got all the relievo required; and the better to manage ſo thin a plate, they form ten or twelve to the cavities at once; and alſo boil the metal to make it more ductile.

The inſide thus formed, they give an impreſſion to the outſide, by working it with the ſame iron puncheon, in a kind of mould, like the minter's coins, engraven *en creux*, or indentedly; and faſtened to a block or bench. The cavity of this mould, wherein the impreſſion is to be made, is of a diameter and depth ſuitable to the ſort of *button* to be ſtruck in it; each kind requiring a particular mould. Between the puncheon and the plate is placed ſome lead, which contributes to the better taking off all the ſtrokes of the graving; the lead, by reaſon of its ſoftneſs, eaſily giving way to the parts that have relievo; and as eaſily inſinuating itſelf into the trace, or engraving of the dentures.

The plate thus prepared, makes the upper part or ſhell of the button. The lower part is formed of another plate, made after the ſame manner, but flatter, and without any impreſſion. To this laſt, is ſoldered a little eye made of wire of the ſame metal, for the *button* to be faſtened by.

The two plates are ſoldered together, with a wooden mould, covered with wax, or other cement, between; in order to render the *button* firm and ſolid: for the wax entering all the cavities formed by the relievo of the other ſide, ſuſtains it, prevents its flattening, and preſerves its boſſe or deſign. Ordinarily, indeed, they content themſelves to cover the naked mould with the ſhell; and in this caſe, for the faſtening, they paſs a thread or gut acroſs through the middle of the mould.

Buttons made of hair, or other foreign *buttons*, ſhall not be imported, on pain of forfeiture, &c. 13 and 14 Car. II. cap. 13.—4 W. and M. cap. 10. Alſo *buttons* are not to be made of cloth, ſtuff, or wood, under penalties. Stat. 4 and 5. W. and M.—10 W. III. cap. 2. 4 Geo. I. cap. 7.—7 Geo. I. St. 1. cap. 12.

Button, in *Botany*, denotes a flower or cluſter of leaves not yet expanded; and is much of the ſame import with BUD.

The term *button* is chiefly uſed in ſpeaking of vines and roſes; and is otherwiſe denominated *eye*, *ſprout*, *bud*, *burgeon*, &c.

Button, in *Building*, denotes a ſlight faſtening for a door or window, made to turn on a nail.

Button *of a lock*, denotes a round head ſerving to move the bolt.

Button, in *Chemiſtry*, ſignifies the metal which is collected, generally in a roundiſh maſs at the bottom of a crucible after fuſion, or which remains in the cupels after cupellation.

Button, in *Fencing*, ſignifies the end or tip of a foil, being made roundiſh, and uſually covered with leather, to prevent making contuſions in the body.

Button *of the reins of a* BRIDLE, in the *Manege*, is a ring of leather with the REINS put through it, running all along the length of the reins.

To put a horſe under the *button*, is when he is ſtopt, having no rider on his back, by the reins being laid on his neck, and the *button* lowered, ſo far as that the horſe's head is brought in by the reins, and fixed to the true poſture or carriage.

Button-*antennæ*, a name given by *Naturaliſts* to thoſe *antennæ* or horns, as they are called, of butterflies, which are ſlender and terminated at the top by a ſort of *button*, in form of an olive, or of part of one. The French naturaliſts, from Reaumur, call theſe *antennes a boutons*. See FEELERS.

Button-*ſtone*, in *Natural Hiſtory*, a kind of figured ſtone, ſo denominated from its reſembling the *button* of a garment.

The *button-ſtone* is called by *Naturaliſts porpites*. Some make it a ſpecies of ECHINITES.

Dr. Hook gives the figure of three ſorts of *button-ſtones*, which ſeem to have been nothing elſe but the filling up of three ſeveral ſorts of ſhells. They are all of them very hard flints, and have this in common, that they conſiſt of two bodies, which ſeem to have been the filling up of two holes or vents in the ſhell. Poſth. Works. p. 284.

Dr. Plot deſcribes a new ſpecies of *button-ſtone*, finely ſtriated from the top, after the manner of ſome hair buttons, on which account it may be denominated *porpites*, unleſs we ſhould rather take it for a new ſpecies of ECHINITES. Hiſt. Oxf. chap. v. § 178.

This name is alſo given to a peculiar ſpecies of ſlate found in the marquiſate of Bareith, in a mountain called Fichtelberg; which is extremely different from the common ſorts of ſlate, in that it runs with great eaſe into glaſs in five or ſix hours time, without the addition of any ſalt or other foreign ſubſtance, to promote its vitrification, as other ſtones require.

It contains in itſelf all the principles of glaſs, and really has mixed in its ſubſtance the things neceſſary to be added to promote the fuſion of other ſtony bodies.

The Swedes and Germans make *buttons* of the glaſs produced from it, which is very black and ſhining, and it has hence its name *button-ſtone*. They make ſeveral other things alſo of this glaſs, as the handles of knives, and the like, and ſend a large quantity of it unwrought in round cakes, as it cools from the fuſion, into Holland.

Button-*tree*, *Cephalanthus*, in *Botany*, a genus of the *tetrandria monogynia* claſs. The characters are theſe: it hath a number of ſmall flowers collected into a ſpherical head, and each particular flower hath a funnel-ſhaped empalement, divided into four parts at the top; the flower is funnel-ſhaped, of one petal, divided at the top into four parts, incloſing four ſtamina, which are inſerted in the petal. The germen is ſituated under the flower, which becomes a globular hairy capſule, incloſing one or two oblong, angular ſeeds; theſe are joined to an axis, and form a round head. There are two ſpecies.

Button-*tree of Jamaica*, *Conocarpus*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flowers are collected in a globular head, each ſtanding in a ſcaly empalement. At the bottom is ſituated a large, compreſſed germen, divided into five parts at the top. The flower has one petal, which is cut into five equal parts, and five ſlender ſtamina, which extend beyond the petal. The germen becomes a ſingle ſeed, incloſed in the ſcale of the fruit, which is ſhaped like the cone of the alder-tree. There are two ſpecies.

Button-*weed*. See Spermacoce.

BUTTRESS, a *butment*, or maſs of ſtone, or brick, ſerving to prop or ſupport the ſides of a building, wall, or the like, on the outſide; where it is either very high, or has any conſiderable load to ſuſtain on the other ſide, as a bank of earth, &c. See Arch, and Arc-boutant.

The theory and rules of *buttreſſes*, or props for eaſing walls, is ranked among the deſiderata of architecture. They are uſually placed leaning againſt the edifice they are to ſuſtain. We find them uſed againſt the angles of ſteeples, churches, and other buildings of ſtone; alſo along the walls of ſuch buildings as have great and heavy roofs, which would otherwiſe be ſubject to thruſt the wall out. They are alſo placed as ſupports againſt the feet of arches turned croſs great halls, in old palaces, &c. and are much uſed in fortification.

Buttress, **Buttrice**, or **Butteris**, likewiſe denotes a tool, uſed by farriers, to pierce the ſole of a horſe's foot, which is overgrown; to pare the hoof; to fit the ſhoe; and to cut off the ſkirts of the ſole, that overcaſt the ſhoe.

BUTYROUS, or **Butyraceous**, ſomething that partakes of the nature or qualities of butter.

BUVETTE, or **Beuvette**, in the *French Laws*, an eſtabliſhed place in every court, where the lawyers and counſellors may retire, warm themſelves, and take a glaſs of wine by way of refreſhment, at the king's charge.

There is one for each court of parliament, but theſe are only for perſons belonging to that body; there are others in the *palais* whither other perſons alſo reſort.

BUXBAUMIA, in *Botany*, a genus of the *cryptogamia moſſes*.

BUXTON *waters*. See Waters.

BUXUS, in *Botany*. See Box-*tree*.

BUYER, *Emptor*. See Buying and Emptor.

BUYING, the act of making a purchase, or of acquiring the property of a thing for a certain price.

Buying ſtands oppoſed to ſelling, and differs from borrowing or hiring, as in the former the property of the thing is alienated for perpetuity, which in the latter is not.

By the civil law, perſons are allowed to *buy* hope, *ſpem pretio emere*, that is, to purchaſe the event or expectation of any thing. E. gr. The fiſh or birds a perſon ſhall catch, or the money he ſhall win in gaming.

There are divers ſpecies of *buying* in uſe among traders; as *buying* on one's own account, oppoſed to *buying* on commiſſion; *buying* for ready money, which is when the purchaſer pays in actual ſpecie on the ſpot; *buying* on credit, or for a time certain, is when the payment is not to be preſently made, but, in lieu thereof, an obligation given by the buyer for payment at a time future; *buying* on delivery, is when the goods purchaſed are only to be delivered at a certain time future.

Buying *the refuſal*, is giving money for the right or liberty of purchaſing a thing at a fixed price, in a certain time to come; chiefly uſed in dealing for ſhares in ſtock. This is ſometimes alſo called by a cant name, *buying the bear*.

Buying *the ſmall-pox*, is an appellation given to a method of procuring that diſeaſe by an operation nearly akin to inoculation; frequent in South Wales, where it has obtained time out of mind.

It is performed either by rubbing ſome of the *pus* taken out of a puſtule of a variolous perſon on the ſkin, or by making a puncture in the ſkin with a pin dipped in ſuch *pus*. Phil. Tranſ. Nº 375. See Inoculation and Pox.

BUZ, in *Ichthyography*, the name of a fiſh more commonly known by that of albula, and caught in the German lakes.

BUZIDAN, in the *Materia Medica of the Ancients*, a name given by Avicenna, and others, to a wood produced in Africa, which had the ſame virtues with the radix behen, or white and red behen, or ben root. We are not acquainted with this medicine at this time, but it appears to have been of the colour of our red ſaunders; ſo that it could only ſerve to adulterate the red ben root; though they ſay, in general, that it was uſed to adulterate the ben when ſcarce.

BUZZARD, **Buteo**, in *Ornithology*, the name of a bird of prey, of the long-winged hawk kind; of which there are ſeveral ſpecies. 1. The bald *buzzard*, ſo called from the whiteneſs of his crown, ſometimes called *oſprey*. 2. The common *buzzard*, diſtinguiſhed from the former by the ſhortneſs of its wings, and its ſmaller ſize. 3. The honey *buzzard*, or apivorous *buzzard*, which feeds its young from the bee-hives. See Apivorus *Buteo*. 4. The subbuteo, the male of which has been uſually called the hen-harrier, the female the ring-tail; though by later obſervations males have been found of this ſpecies; and, 5. The moor *buzzard*, common in marſhy places, and called milvus æruginosus by authors.

The common *buzzard* is a bird of the long-winged hawk kind, of the ſize of a pheaſant, or ſmall pullet. It feeds on moles, field-mice, and other ſmall birds, and ſometimes will ſeize on rabbets. In want of better food, it will live on beetles, worms, and the like. Its eggs are white, more or leſs ſprinkled with irregular red ſpots. In age, or by ſome other accidents, the head and back in this ſpecies are ſometimes found grey.

The *moor buzzard* is a bird of the long-winged hawk kind, ſmaller than the common *buzzard*, and not ſo flat on the head. Its beak is large and crooked, covered with a greeniſh yellow ſkin near the top, and black in other places. Its mouth is bluiſh within; its head is of a whitiſh orange colour, variegated with black ſtreaks; its throat is of the ſame colour; and all the reſt of its body, as well back as belly, is of a duſky ruſt colour, only that in each wing there is a yellowiſh white ſpot; and the feathers at the root of the tail are yellowiſh. Its legs are long and ſlender, and of a yellowiſh colour. The inſide of its wing-feathers are whitiſh. It is common with us about heaths and marſhes.

BYAS is uſed by Petty for the central point ſuppoſed in the middle of each atom or corpuscle.

BY-LAWS, **Bye-laws**, or **Bi-laws**, private or peculiar orders, and regulations for the good government of a city, court, or other community, made by general conſent of the members thereof; being not repugnant to the general laws of the realm.

By ſtat. 9 Hen. VII. cap. 7. *bye-laws* made by corporations are to be approved by the lord-chancellor, or chief-juſtices, under penalty of 40*l*.

The word is formed from the Saxon *by*, *habitation*, *vill*, and *laxa*, q. d. *lex villæ*, or *town-law*.—They are alſo called *birlaws*, *byrlaws*, and *burlaws*, *bilager*, and *bellagines*. Such is the cuſtom in Kent of deciding controverſies among neighbours about boundaries, by the ſeneſchals, or bailiffs.

In Scotland, thoſe are called *laws of burlaw*, or *byrlaw*, which are made and determined by neighbours, elected by common conſent in burlaw-courts; wherein cognizance is taken of complaints betwixt neighbour and neighbour.—The men thus choſen as judges or arbitrators are called *burlaw-men*, or *byrlaw-men*.

BYRRHUS, in *Natural Hiſtory*, a genus of inſects of the order of *coleoptera*.

BYRSODEPSICON, from βυρσα, *ſkin*, and δεψεω, *I dreſs*, an epithet given to *ſumach*, denoting its uſe in dying of leather. See Sumach.

BYSSUS, or **Byssum**, a fine ſort of thready matter produced in India, Egypt, and about Elis in Achaia, of which the richeſt apparel was anciently made, eſpecially that wore by the prieſts both Jewiſh and Egyptian.

In reality, the ancients ſeem to have applied the name indifferently to any kind of matter that was ſpun and wove finer than wool: ſo that it is probable there were divers ſorts of *byſſus*. This is certain, that Ariſtotle gave the name *byſſus* to the hair or ſilken threads of the *pinna marina*; whether it were on account of its reſemblance to the *byſſus* of which cloths were made, or whether it were that this was the true *byſſus* itſelf. What countenances this latter opinion is, that the *byſſus* of the *pinna marina* may be ſpun, and conſequently there is little doubt but that in ages when ſilk was ſcarce, it might be uſed in the cloaths of great men. Add, that this *byſſus*, though groſly ſpun, appears much finer and more beautiful than wool, and comes not much ſhort of ſilk. Stockings and other ſuch manufactures are ſtill made of it, which would be more valuable if ſilk was leſs common.

mon. To ſpin this *byſſus*, they leave it ſome days in a cellar to moiſten and grow ſoft; after this they comb it, to get out the impurities, and, laſtly, ſpin it as they do ſilk.

Authors uſually diſtinguiſh two ſorts of *byſſus*, that of Elis, and that of Judea, which was the fineſt. Of this latter were the prieſtly ornaments made. Bonfrerius notes, that there muſt have been two ſorts of *byſſus*, one finer than the ordinary, by reaſon there are two Hebrew words uſed in Scripture to denote *byſſus*, one of which is always uſed in ſpeaking of the habit of the prieſts, and the other of that of the Levites. See Luke xvi. 19.

It is probable the *byſſus* of the ancients was a very fine ſort of cotton, or a mixture of linen and cotton. Forſter. De Byſſo Antiquorum.

Byssus, in *Botany*, a word uſed to expreſs a genus of moſſes, deſcribed by ſome of the ancients under the name of *alcyonium*, and belonging, in the Linnæan ſyſtem, to the claſs of *cryptogamia algæ*, the moſt imperfect of the whole claſs of vegetables. The characters of this genus are, that the moſſes of it are compoſed of ſimple and uniform parts, and always appear in form of excreſcences, either of a woolly or of a duſty matter. It ſeems properly a genus of vegetables of a middle kind, between the muſhrooms and the moſſes, but moſt approaching to the latter, in that the ſeveral ſpecies of it are of a longer duration, and want that fleſhy texture which diſtinguiſhes the *fungus* claſs, and in that they never produce heads, nor have any thing of the figure or texture of *fungi*. The *byſſi* differ from the CONFERVÆ, in that they do not grow in the water, and in their being compoſed of ſlenderer and ſhorter filaments. They have not yet been diſcovered to have either flower or ſeed, but appear always in form of threads, or of a light down, or fine powder, on the ſurfaces of many different bodies, but principally on ſuch as are liable to putrefaction. Micheli, in his Nova Genera Plantarum, p. 210. mentions the ſeeds of ſome of the *byſſi*; but later obſervers, and particularly the indefatigable Dillenius, were never able to obſerve them. This laſt author has deſcribed twenty ſpecies of theſe ſmall plants. See in the Philoſophical Tranſactions, vol. xlviii. part i. N° 54. an. 1753, an account, with obſervations, on this *genus* of plants, which in the order of nature comes between the moſſes and the *fungi*. This vegetable is found in England, as well as in many parts of Europe, covering the ground like a carpet.

BYTTNERIA, in *Botany*, a genus of the *pentandria monogynia* claſs; the corolla is compoſed of five petals; the capſule has five lobes, and is covered with prickles. There is only one ſpecies.

BYZANT. See Besant.

BYZANTINA *blatta*. See Blatta.

C.

C, The third letter, or ſecond conſonant of the alphabet, has two ſounds, one like *k*, as in the word *call*; and the other like *s*, as in *Cæſar*. It has the former ſound before *a*, *o*, *u*, or a conſonant; and the latter before *e*, *i*, and *y*. C is formed, according to Scaliger, from the ϰ of the Greeks, by retrenching the ſtem or upright line; though others derive it from the כ of the Hebrews, which has in effect the ſame form; allowing only for this, that the Hebrews, reading backwards, and the Latins, &c. forwards, each have turned the letter their own way. However, the C not being the ſame as to ſound with the Hebrew *caph*; and it being certain the Romans did not borrow their letters immediately from the Hebrews, or other Orientals, but from the Greeks; the derivation from the Greek ϰ is the more probable. Add, that F. Montfaucon, in his Palæographia, gives us ſome forms of the Greek ϰ, which come very near that of our C; this, for inſtance, C: and Suidas calls the C, the Roman kappa. The ſecond ſound of C reſembles that of the Greek Σ; and many inſtances occur of ancient inſcriptions, in which Σ has the ſame form with our C. Gruter, vol. i. p. 71. vol. iii. p. 1020.

All grammarians agree, that the Romans pronounced their Q like our C, and their C like our K. F. Mabillon adds, that Charles the Great was the firſt who wrote his name with a C; whereas all his predeceſſors of the ſame name wrote it with a K: and the ſame difference is obſerved in their coins.

C was alſo a numeral letter among the Romans, ſignifying an hundred: according to the verſe,

Non plus quam centum C litera fertur habere.

Some add, that a daſh over it, made it ſignify an hundred thouſand.

C is alſo an ABBREVIATURE.

In proper names, C. was uſed for Caius; as C. Cæſar, &c. Their lawyers uſed it ſingle for *Codice* or *Conſule*, and double, CC. for *Conſulibus*.

C was alſo uſed in their courts, as a letter of condemnation, and ſtood for *condemno*; in oppoſition to A, which ſignified *abſolvo*.

C, in *Muſic*, denotes the higheſt part in a *thorough* BASS; and when placed after the cliff, it intimates, that the muſic is in common time.

CAABA, a ſquare ſtone edifice in the temple of Mecca, ſuppoſed to have been built by Abraham and his ſon Iſhmael; being the part principally reverenced by the Mahometans, and to which they always direct themſelves in prayer. See KEBLA.

The word is Arabic, *caaba*, and *caabah*, a denomination which ſome will have given to this building, on account of its height, which ſurpaſſes that of the other buildings in Mecca; but others, with more probability, derive the name from the quadrangular form of this ſtructure.

CAAMINI, in *Botany*, a name given by the Spaniards and others to the fineſt ſort of the Paraguay tea. It is the leaves of a ſhrub which grows on the mountains of Maracaya, and is uſed in Chili and Peru as the tea is with us. The mountains, where the trees which produce this valuable leaf grow naturally, are far from the inhabited parts of Paraguay; but the people of the place know ſo well the value and uſe of it, that they conſtantly furniſh themſelves with great quantities of it from the ſpot. They uſed to go out on theſe expeditions many thouſands together, and their country was left to the inſults of their enemies in the mean time, and many of them periſhed with the fatigue.

To remedy theſe inconveniences, they have of late planted the trees about their habitations; but the leaves of theſe cultivated trees have not the fine flavour or the virtues of the wild ones. The king of Spain has permitted the Indians of Paraguay to bring to the town of Santfoy, twelve thouſand arobes of the leaves of this tree every year: but they are not able to procure ſo much of the wild leaves annually; about half the quantity is the utmoſt they bring of this; the other half is made up of the leaves of the trees in their own plantations, and this ſells at a lower price, and is called *pabos*. The arobe is about five and twenty pounds weight; the general price is four piaſtres for the arobe, and the money is always divided equally among the people of the colony.

CAA-APIA, in *Botany*, the name of a Braſilian plant, deſcribed by Marcgrave, Piſo, and others; the root of which ſo much reſembles the ipecacuanha in its virtues, that ſome have erroneouſly called it by the ſame name. It is an aſtringent and emetic, as the ipecacuanha, but it poſſeſſes both theſe qualities in a much weaker degree, and is therefore neceſſarily given in a much larger doſe, a dram being the quantity commonly given at once. The Braſilians bruiſe the whole plant, and expreſs the juice, which they take internally, and alſo apply it externally to wounds made by poiſoned arrows, and by the bites of ſerpents. Some have ſuppoſed the root of this plant to be the white ipecacuanha; but this is an error, that being little different from the grey. Mem. Acad. Par. an. 1700. p. 134. hiſt. 69. Geoffroy.

CAAPIBA, in *Botany*, the name given by Plumier to a genus of plants, called afterwards by Linnæus CISSAMPELOS.

CAB, or KAB, denotes a Hebrew meaſure of capacity, equal to the ſixth part of the ſeah, or an eighteenth of the EPHA. Arbuthnot's Tab. Anc. Coins, &c. n. 14. and 15.

The *cab* of wine contained two Engliſh pints; the *cab* of corn, $2\frac{5}{8}$ pints corn meaſure.

We alſo find mention of the *cab* as a dry meaſure, in Grecian and Roman writers: ſome make it equal to the Grecian CHOENIX, and aſſert it to be the quantity of what a labourer eats per day, as aſſigned by Cato.

CABAL, a name given to a ſort of drink made of dried raiſins. The manner in which the Portugueſe make *cabal* is this; they take out the ſtones of about twenty pounds of raiſins, and then bruiſing the raiſins a little, they put them into a barrel of white wine, in the month of January or February, and let them ſtand till about Eaſter. It is then very clear and rich, luſcious and palatable to the taſte. It is recommended to ſtop coughs, and give ſtrength to the ſtomach. It is worth while to try the experiment with the ſame proportion of raiſins to the ſame quantity of our Engliſh cyder, which would probably prove a fine drink. Phil. Tranſ. Nº 157.

CABALA *vein*, in *Natural Hiſtory*, a name given by our Suſſex miners to one kind of the iron ore commonly wrought in that country. It is a ſtony ore, of a browniſh colour, with a bluſh of red, which is more or leſs conſpicuous in different parts of the ſame maſſes. It is uſually found in thin ſtrata, lying not far from the ſurface, and is not very rich in iron, but it runs very readily in the fire.

CABALATAR, in *Natural Hiſtory*, a name given by ſome of the chemical writers to nitre, called alſo *cerberus chemicus*, and *ſal infernalis*.

CABALISTE, in *Commerce*, a term uſed at Thouloufe, and in the whole province of Languedoc; which ſignifies a merchant who does not trade in his own name, but is concerned in the trade of another merchant in chief. See ANONYMOUS *partnerſhip*.

CABALLEROS, in *Commerce*; wools of *caballeros*, or *cavalleros*, are Spaniſh wools, of which there is a conſiderable trade at Bayonne in France.

CABALLI, among *Myſtic Philoſophers*, denote the ſhades, or aſtral bodies of men who died any ſudden or violent death, before the expiration of their predeſtinated term of life.

The *caballi*, called alſo *cabales* and *cobales*, are ſuppoſed to wander as goblins or ghoſts over the face of the earth, till their deſtined term is accompliſhed; being doomed to live out the time as ſpirits, which they ought to have ſpent in the fleſh.

CABALLINA, *Aloe*, is a denomination given to the coarſeſt and rankeſt kind of ALOES, as being little uſed unleſs for purging horſes. Hiſt. Acad. Scienc. an. 1708. p. 66.

CABALLINUM, *Sulphur*, denotes common brimſtone, or SULPHUR.

CABALLINE, CABALLINUS, from the Greek καϐαλλος, *a horſe*, ſomething relating to, or partaking of, the nature and qualities of a horſe.

CABBAGES, in *Gardening*; for the characters, ſee BRASSICA. The common ſorts of *cabbages* are largely cultivated about London. The common white, red, flat, and long-ſided ones, are chiefly for winter uſe. The ſeeds of theſe ſorts muſt therefore be ſown in the end of March, and beginning of April, in beds of good freſh earth; and in May, when the young plants will have about eight leaves a-piece, they are to be pricked out into ſhady borders, about three inches ſquare, and, about the beginning of June, they muſt be tranſplanted to the places where they are to remain: and this is commonly between cauliflowers or artichokes, at about two feet and a half diſtance in the rows. They muſt be watered at times, and the earth muſt be hoed up about their roots, and kept clear from weeds.

Theſe *cabbages* will be fit for uſe ſoon after Michaelmas, and will continue till the end of February, if not deſtroyed by bad weather; to prevent which, the gardeners about London pull up their *cabbages* in November, and trench the ground in ridges, laying their *cabbages* againſt the ridges, as cloſe as poſſible on one ſide, burying their ſtems in the ground; and in this manner they let them remain till after Chriſtmas, when they cut them for market.

The Germans make great uſe of a preparation of *cabbages*, which they call *ſour krout*, and CROUTE.

The Ruſſian *cabbage* is ſmall, and not much cultivated now. It is to be raiſed as the others, but may be planted nearer, as not ſo large. It is fit for uſe in July.

The early and ſugar-loaf *cabbages* are ſown for ſummer uſe, and are commonly called Michaelmas *cabbages*. The ſeaſon for ſowing theſe is the end of July or beginning of Auguſt, in an open ſpot of ground. The plants are pricked out at three inches diſtance, when they have eight leaves. It is common to ſow ſpinach in the ſame beds with theſe, hoeing it up from about their ſtalks in ſpring; in May and June theſe begin to turn their leaves for cabbaging, and may be brought to it much ſooner than naturally they would, by tying them about the top with an ozier band.

The Savoy *cabbages* are for winter uſe, and are to be ſown about the middle of April; they are to be treated as the common *cabbage*, and planted out at two feet and a half diſtance, in an open place.

The *bore-cole* may be cultivated in the ſame manner, but muſt be planted only at one foot diſtance; theſe are not fit to cut till the froſts have nipped them. See BROCCOLI, and CAULIFLOWER.

The method of getting good *cabbage*-ſeed is this: chooſe out ſome fair plants about the end of November, pull them up, and hang them up three days, with the root upward, in a ſhady place; then plant them under a warm hedge, burying the whole ſtalk and half the *cabbage* in the earth; cover them with ſtraw or peaſe haum, if the winter be ſevere, and in ſpring they will ſhoot out many branches. When theſe begin to pod, the ends of the upper ones ſhould be cut off, to give ſtrength to the other pods. The ſeed muſt be preſerved from the birds, by fixing ſome lime twigs about the plants, where the catching one or two will intimidate the reſt. When ripe, it muſt be threſhed out, and kept for uſe. Miller.

The culture of *cabbages* as food for cattle, makes a very conſiderable branch of modern huſbandry. Thoſe in common uſe for this purpoſe are the great Scotch *cabbage*, the turnep *cabbage*, and, on account of its peculiar hardineſs and duration, the turnep-rooted *cabbage*. By proper management, a ſucceſſion of different *cabbage* crops may be obtained through the winter. *Cabbages* afford a wholeſome and nutritive food for cattle, ſheep, horſes and hogs: and if they are cultivated on good ground, well manured, and horſe-hoed after the method of Mr. Tull, they produce very large crops, from 30 to 60 tons on an acre. An Iriſh acre (which is in proportion to the Engliſh as 196 to 121) was planted with *cabbages* by Mr. Baker in July, at the diſtance of two feet from each other, in the middle of ridges five feet aſunder, and hoed in Mr. Tull's method, and produced by December 52,038 lb. weight of *cabbages*, each weighing at an average about 7 lb. 6 oz. The ſame quantity of ground planted with turnep *cabbages*, and treated in the ſame manner, yielded in the whole 57,761 lb. each *cabbage* weighing at an average 8 lb. 2 oz. Bore-cole planted in the ſame manner, and on the ſame ſpace of ground, yielded 40,096 lb. each plant at an average weighing 5 lb. 10 oz. Mr. Baker, by ſubſequent trials, found, that larger crops might be obtained by planting his *cabbages* on four feet ridges, and eighteen inches diſtant in the rows; and the ſmaller kinds at the diſtance only of one foot.

CABBAGE-*ſhrub*, *Anjou*, or *Colewort*, a plant which has been for ſome time cultivated in France, and lately introduced into England. It is an excellent vegetable for the kitchen, good food for cattle, and greatly increaſes the milk of cows. The dry ſtalk of this plant ſerves for fewel. It will grow in any ſoil that is well dunged. The ſeeds are ſown in June; and the plants are to be well watered and kept free from weeds, and tranſplanted into the common field where they are to remain till November. The Marquis de Turbilly, in a letter to Mr. Mills, has given particular directions for the management of them. See COLEWORT.

CABBAGE, *Dog's*, *Theligonum*, in *Botany*, a genus of the *monoecia polyandria* claſs. Its characters are theſe: it has male and female flowers on the ſame plant; the male flowers have a turbinated empalement of one leaf, cut into two ſegments which turn backward. It has no petal, but ſeveral erect ſtamina of the length of the empalement, terminated by ſingle ſummits. The female flowers have a ſmall bifid empalement of one leaf, which is permanent. It has no petals, but has a globular germen, ſupporting a ſhort ſtyle, crowned by an obtuſe ſtigma. The germen afterward becomes a thick globular capſule with one cell, incloſing one globular ſeed. We have but one ſpecies, which grows naturally in the ſouth of France, in Italy, and Tartary; and is the *cynocrambe*, or *dog's cabbage* of Dioſcorides.

CABBAGE, *Turnep*, is the *Braſſica cauleſcente orbiculari carnoſo foliis ſeſſilibus* of Linnæus. It is ſo called, becauſe the ſtalk forms an orbicular bunch near the root, but a little above the ground. This plant has been long known in England as an object of curioſity in botanic gardens, or as an eſculent herb; but the firſt perſon who introduced it into uſe as an article of huſbandry was Mr. Baker, not twenty years ago. It has ſince been cultivated by many others, and found to be an excellent fodder for cattle in ſcarce winters, though not ſo hardy as the ſpecies of *cabbage* deſcribed in the next article.

CABBAGE, *Turnep-rooted*, or *Engliſh ſea-cabbage*, is comprehended in the fifth ſpecies of *braſſica*; denominated by Linnæus *braſſica radice caulescente tereti carnoſa*. Its root is larger than that of the common turnep, and runs into ſeveral ramifications, which are thicker than a man's thumb at their inſertion; in taſte and conſiſtence it reſembles the kernel of the cocoa-nut, being much firmer, more oily, and leſs ſucculent than the common turnep. From the root ariſes a ſtalk, ſmooth, round, and branched into ſeveral arms. The leaves near the root are like thoſe of the ſea-*cabbage*, roundiſh and jagged: but thoſe which riſe from the ſtalks are oblong, narrow, and ſinuated. The flowers are large and yellow, of a deeper colour than thoſe of the common kind of *cabbage*: to theſe ſucceed narrow cods about an inch long. This plant has been long cultivated in the more northern parts of Europe; but it was firſt introduced into England, as an article of agriculture, by Mr. Reynolds, not quite ten years ago. It is a very valuable acquiſition on account of its hardineſs and duration through the whole year; as it may be eaſily raiſed on ground not rich and without manure, and as the produce it affords is very conſiderable, and its quality wholeſome and nutritive.

CABBAGE-*bark tree of Jamaica*, in *Botany*, is a ſpecies of the GEOFFRÆA of Linnæus. The wood of this tree is uſed in building, but it is chiefly valued for its bark, which is adminiſtered in different forms, viz. in decoctions, ſyrup, powder, and extract, as an anthelmintic medicine. From this medical property it is alſo called the *worm-bark* tree. The decoction made by boiling an ounce of the bark in a quart of water, is moſtly uſed in Jamaica; and it ſeldom fails to perform every thing that can be expected from an anthelmintic medicine, by deſtroying worms in the inteſtines, and bringing them away in great quantities. This bark is externally of a grey colour, and internally black and furrowed; its taſte, when freſh, is mucilaginous and ſweet, and its ſmell, which it retains in the decoction, diſagreeable. Dr. Wright of Jamaica recommends it as a very valuable remedy. See his deſcription of the tree, with a drawing, and of the method of preparing and adminiſtering the bark in the Phil. Tranſ. vol. lxvii. pt. ii. art. 28.

CABBAGE-*tree*. See PALM-*tree*.

CABBAGING, among *Gardeners*, is ſometimes uſed to denote the knitting or gathering of certain pot-herbs into round bunched heads.

In which ſenſe the word amounts to the ſame with what Evelyn calls *poming*, *pommer*; q. d. appling, or growing applewiſe. Others call it ſimply heading or bunching.

To make lettuce *cabbage*, they tranſplant it, taking care, during the great heats, to water it; otherwiſe, inſtead of poming, it runs to ſeed. To promote the *cabbaging* of cabbage, thoſe who live on the ſea-coaſt, put ſea-weed, with a little nitre, under their roots.

Cabbage plants of the early kind begin to turn in their leaves for *cabbaging* in May. The Batterſea ſort *cabbage* apace when they once begin, and as ſoon grow hard and burſt open; but the ſugar-loaf kind is longer before it comes, and is as ſlow in its *cabbaging*.

CABBALA, a myſterious kind of ſcience, delivered by revelation to the ancient Jews, and tranſmitted by oral tradition to thoſe of our times; ſerving for interpretation of the books both of nature, and ſcripture.

The word is alſo written *Cabala*, *Caballa*, *Kabbala*, *Kabala*, *Cabaliſtica*, *Ars Cabala*, and *Gaballa*. It is originally Hebrew, קבלה, *kabbalah*; and properly ſignifies *reception*; formed from the verb קבל, *kibel*, *to receive by tradition*, *or from father to ſon*, eſpecially in the Chaldee and Rabbinical Hebrew.

Cabbala, then, primarily denotes any ſentiment, opinion, uſage, or explication of Scripture tranſmitted from father to ſon. In this ſenſe, the word *cabbala* is not only applied to the whole art; but alſo to each operation performed according to the rules of that art. Thus it is, R. Jac. Ben Aſcher, ſurnamed Baal-Hatturim, is ſaid to have compiled moſt of the *cabbalas* invented on the books of Moſes before his time.

As to the origin of the *cabbala*: the Jews believe, that God gave to Moſes on mount Sinai, not only the law, but alſo the explication of that law; and that Moſes, after his coming down, retiring to his tent, rehearſed to Aaron both the one and the other. When he had done, Aaron ſtanding on the right hand, his ſons, Eleazar and Ithamar, were introduced to a ſecond rehearſal: this being over, the ſeventy elders that compoſed the ſanhedrim were admitted; and laſtly, the people, as many as pleaſed: to all of whom, Moſes again repeated both the law and explanation, as he received them from God. So that Aaron heard it four times, his ſons thrice, the elders twice, and the people once. Now, of the two things which Moſes taught them, the laws, and the explanation, only the firſt were committed to writing; which is what we have in Exodus, Leviticus, and Numbers: as to the ſecond, or the explication of thoſe laws, they were contented to impreſs it well in their memory, to teach it their children; they, to theirs, &c. Hence, the firſt part they call ſimply the law, or the written law; the ſecond, the oral law, or *cabbala*. Such is the original notion of the *cabbala*.

Among theſe explications of the law, which, in reality, are little elſe but the ſeveral interpretations and deciſions of the Rabbins on the laws of Moſes, ſome are myſtical; conſiſting of odd abſtruſe ſignifications given to a word, or even to the letters whereof it is compoſed: whence, by different combinations, they draw meanings from Scripture, very different from thoſe it ſeems naturally to import. The art of interpreting Scripture after this manner, is called more particularly *cabbala*: and it is in this laſt ſenſe the word is more ordinarily uſed among us.

This *cabbala*, called alſo *artificial cabbala* (to diſtinguiſh it from the firſt kind, or ſimple tradition), is divided into three ſorts. The firſt, called *gematria*, conſiſts in taking letters as figures, or arithmetical numbers, and explaining each word by the arithmetical value of the letters whereof it is compoſed; which is done various ways. The ſecond is called *notaricon*; and conſiſts either in taking each letter of a word for an entire diction, or in making one entire diction out of the initial letters of many. The third kind, called *themurah*, q d. *changing*, conſiſts in changing and tranſpoſing the letters of a word; which is done various ways.

This is by ſome called the acroamatic philoſophy of Moſes, by way of contradiſtinction from the exoteric or popular doctrine. See Acroamatic.

The generality of Jews prefer the *cabbala* to the Scripture; comparing the former to the ſparkling luſtre of a precious ſtone, and the latter to the fainter glimmering of a candle.

The *cabbala* only differs from *maſorah*, as the latter denotes the ſcience of reading the Scripture, the former of interpreting it. Both are ſuppoſed to have been handed down from generation to generation by oral tradition only, till at length the readings were fixed by the vowels and accents, as the interpretations were by the *maſorah* and *gemara*. Prideaux Conn. p. i. lib. v. p. 506.

The firſt author who delivered any thing of the *cabbala*, was Joachaides, or Simon ſon of Joachai, who publiſhed that famous cabbaliſtical work entitled Zohar. Some ſay, he lived about the time of the deſtruction of Jeruſalem by Titus; others, only in the tenth century. Baſnage, Hiſt. of the Jews.

Dr. Burnet examines into the merits of the ſeveral parts of the *cabbala*, which he finds to be without rational foundation, and not conducing to any real knowledge. But he conjectures, that the moſt ancient *cabbala*, before it was confounded and defiled with fables, might contain ſomething of the original of things, and their gradations; particularly, that, before the creation, all things had their being in God; that from him they flowed as emanations; that they will all flow back again into him, when they are deſtroyed; and that there will ſucceed other emanations and regenerations, and other deſtructions and abſorptions to all eternity, as they had been from all eternity; that nothing is produced out of nothing; and that the things produced never return to nothing, but always have their ſubſiſtence in God. Burn. Archæol. lib. i. cap. 7. Phil. Tranſ. Nº 201. p. 800.

The *cabbala* hitherto ſpoken of, may be called *ſpeculative cabbala*; in oppoſition to the following, which may be called *practical cabbala*.

Cabbala is alſo applied to the uſe, or rather abuſe, which viſionaries and enthuſiaſts make of Scripture, for diſcovering futurity, by the ſtudy and conſideration of the combination of certain words, letters, and numbers, in the Sacred Writings. All the words, terms, magic figures, numbers, letters, charms, &c. uſed in the Jewiſh magic, as alſo in the hermetical ſcience, are compriſed under this ſpecies of *cabbala*. But it is only the Chriſtians that call it by this name, on account of the reſemblance this art bears to the explications of the Jewiſh *cabbala*: for the Jews never uſe the word *cabbala* in any ſuch ſenſe, but ever with the utmoſt reſpect and veneration. It is not, however, the magic of the Jews alone which we call *cabbala*, but the word is alſo uſed for any kind of magic.

CABBALIC *art*, *Ars caballica*, is uſed by ſome writers for *ars palæſtrica*, or the art of wreſtling.

CABBALISTIC *art*. See Cabbala, and Cabbalists.

D. Franc. Berlendi, a Theatin of Venice (under the fictitious name of C. Berardo Schinflini), has publiſhed a *Caballomachia*, or Refutation of the *Cabbaliſtic* Art.

CABBALISTS, a ſect among the Jews, who follow and practiſe the *cabbala*, or interpret Scripture according to the rules of the literal *cabbala*, above laid down.

The Jews are divided into two general ſects; the Karaites, who refuſe to receive either tradition, or the Talmud, or any thing but the pure text of Scripture: and the Rabbiniſts or Talmudiſts, who, beſide this, receive the traditions of the ancients, and follow the Talmud.

Theſe latter are again divided into two other ſects; pure Rabbiniſts, who explain the Scripture in its natural ſenſe, by grammar, hiſtory, and tradition; and *Cabbaliſts*, who, to diſcover hidden myſtical ſenſes, which they ſuppoſe God to have couched therein, make uſe of the *cabbala*, and the myſtical rules and methods above mentioned.

There are viſionaries among the Jews, who believe that Jeſus Chriſt wrought his miracles by virtue of the myſteries of the *cabbala*. Some learned men are of opinion, that Pythagoras and Plato learned the *cabbaliſtic* art of the Jews in Egypt; and fancy they ſee evident footſteps thereof in their philoſophy: others, on the contrary, ſay, it was the philoſophy of Pythagoras and Plato, that firſt furniſhed the Jews with their *cabbala*. Be this as it will, it is certain, that in the firſt ages of the church, moſt of the heretics gave into the vain notions of the *cabbala*: particularly the Gnoſtics, Valentinians, and Baſilidians. Hence aroſe the αϐραξας, and the multitude of taliſmans, wherewith the cabinets of the virtuoſi were ſtocked.

See a particular account of the *cabbaliſtic* art, as practiſed not only by Jews, but by Heathens and Chriſtians, in Baſnage's Hiſt. of the Jews, book iii. chap. 10—28.

CABBIN. See Cabin.

CABEBI, a name given by ſome authors to the ſcales of iron. Rulandus.

CABECA, or Cabesse, in *Commerce*; the Portugueſe who carry on the trade of ſilks in the Eaſt Indies, diſtinguiſh them by the names of *cabeça*, and *bariga*; that is to ſay, head and belly. The *cabeça* ſilks are the fineſt; the *bariga* being from fifteen to twenty *per cent.* inferior to them. The Indian workmen endeavour to mix them together; for which reaſon the more experienced European merchants, who carry on that trade, take care to open the bales, and to examine the ſkains.

CABIDOS. See Cavidos.

CABILIAU, in *Zoology*, a name by which ſome authors have called the common cod-*fiſh*, the *morhua* and *aſellus major* of other writers.

CABIN, or **Cabbin**, is ſometimes uſed for the huts or cottages of ſavages, and other poor people.

The habitations of the Indians in Virginia are *cabins*, about nine or ten feet high, which are made after this manner: they fix poles into the ground, and bring the tops of them one within another, and ſo tie them together; the outſide of theſe poles they line with bark, to defend them from the injuries of the weather, but they leave a hole in the top, right in the middle of the *cabin*, for the ſmoke to go out; round the inſide of their *cabins* they have banks of earth caſt up, which ſerve inſtead of ſtools and beds. Phil. Tranſ. N° 126.

Cabins, or **Cabbins**, in a ſhip, are ſmall cells, or apartments for the officers of the ſhip to lie in; very narrow, and in form of armories or preſſes; uſed in ſeveral parts of the ſhip, particularly on the quarter-deck, and on each ſide of the ſteerage. The bed-places erected for ſailors at the ſhip's ſide, in merchant-men, are likewiſe called *cabins*. The word comes from the French *cabane*, Spaniſh *cabana*, or Italian *capanna*, *a little ſtraw hut*; and that from the Greek καπανη, *a ſtall* or *manger*.

CABINET, or **Cabbinet**, the moſt retired place in the fineſt apartment of a building; ſet apart for writing, ſtudying, or preſerving any thing very precious.

A complete apartment conſiſts of an hall, ante-chamber, chamber, and *cabinet*; with a gallery on one ſide.

Cabinet is ſometimes particularly uſed for a place at the end of a GALLERY, wherein are preſerved the paintings of the beſt maſters, conveniently ranged, and accompanied with buſts, and figures of marble and bronze, with other curioſities.

In this ſenſe, *cabinet* amounts to the ſame with what is called by Vitruvius, *pinacotheca*. Sometimes there are ſeveral pieces or rooms deſtined for this uſe, which are all together called *cabinet*, or GALLERY.

Cabinet alſo denotes a kind of bufet or cheſt of drawers, partly for the preſervation of things of value, and partly as a decoration of a chamber, gallery, or other apartment.

In the repoſitory of the Royal Society is a Chineſe *cabinet*, filled with the inſtruments and ſimples uſed by the ſurgeons of that country. The moſt remarkable are thoſe which are contrived for ſcratching, picking, and tickling the ears, in which the Chineſe take great pleaſure. Phil. Tranſ. N° 246. p. 390, ſeq.

Cabinet, in *Gardening*, is a little inſulated building in manner of a ſummer-houſe, built in ſome agreeable form, and open on all ſides; ſerving as a place of retirement, and to take the freſh air under cover.

According to Miller, a *cabinet* is a kind of ſaloon, placed at the end or in the middle of a long ARBOUR.

It differs from an arbour, which is long, in form of a gallery, and arched over head; whereas the *cabinet* is either ſquare, circular, or in cants, making a kind of ſaloon.

Cabinet is alſo uſed in ſpeaking of the more ſelect and ſecret councils of a prince or adminiſtration.

Thus we ſay, the ſecrets, the intrigues of the *cabinet*.

To avoid the inconveniences of a numerous council, the policy of Italy, and practice of France, have introduced *cabinet* councils; a remedy worſe than the diſeaſe.

King Charles I. is charged with firſt eſtabliſhing this uſage in England. Beſides his privy council, that prince erected a kind of *cabinet* council, or junto, under the denomination of a council of ſtate; compoſed of archbiſhop Laud, the earl of Strafford, and lord Collington, with the ſecretaries of ſtate.

Yet ſome pretend to find the ſubſtance of a *cabinet* council of much greater antiquity, and even allowed by parliament, who anciently ſettled a quorum of perſons moſt confided in, without whoſe preſence no arduous matter was to be determined; giving them power to act without conſulting the reſt of the council. As long ſince as the 28th of Henry III. a charter paſſed in affirmance of the ancient rights of the kingdom; which provided, that four great men, choſen by common conſent, who were to be conſervators of the kingdom, among other things, ſhould ſee to the diſpoſing of monies given by parliament, and appropriated to particular uſes; and parliaments were to be ſummoned as they ſhould adviſe. But even of theſe four, any two made a quorum; and generally the chief juſtice of England, and chancellor, were of the number of the conſervators. Matth. Par. 28 Hen. III.

In the firſt of Henry VI. the parliament provides, that the quorum for the privy council be ſix, or four at leaſt; and that in all weighty conſiderations, the dukes of Bedford and Glouceſter, the king's uncles, ſhould be preſent; which ſeems to be erecting a *cabinet* by law.

CABIRI, in *Antiquity*, certain deities worſhipped more eſpecially by the Samothracians, and in the iſle of Imbros, and ſome other parts of Greece.

The *Cabiri*, according to Sanchoniathon, were alſo adored by the Phœnicians. Diodorus Siculus aſcribes to them the invention of fire, and the art of working iron. Whence it is, that on a medal of Gordian, and another of Furia Sabina Tranquillina, both ſtruck at Carrhæ, where the *Cabiri* were worſhipped, we find the figure of a *Cabirus* on a column, holding a hammer in his right hand. For the ſame reaſon, Herodotus obſerves, they were repreſented like Vulcan. Diod. Sic. lib. v. Herod. lib. iii.

The word *cabir*, conſidered as of Hebrew or Phœnician origin, denotes *great* and *powerful*; and ſome have ſuppoſed that the deities worſhipped under this appellation were Ceres, Proſerpine, Pluto, and Mercury: whilſt others have comprehended under it all the principal heathen deities: though it is diſputed who, and how many, the *Cabiri* were, whether they be of Phœnician, Samothracian, or Egyptian origin; and whether the ſons of Vulcan or of Jupiter?

Cabiri is alſo uſed to denote the *Gabri*, or Perſian FIRE-*worſhippers*. Hyde de Rel. Perſarum, cap. 29. See GABRES.

CABIRIA, Καϐειρια, religious feaſts held by the ancient Greeks of Lemnos and Thebes, in honour of the gods *Cabiri*.

Theſe feaſts were very ancient, and prior even to the time of Jupiter; who is ſaid to have reſtored them: they were held by night. Children above a certain age were here conſecrated; which conſecration was ſuppoſed to be a preſervative againſt all dangers of the ſea, &c.

The ceremony of conſecration, called θρονωσις, or θρονισμος, q. d. *enthronizing*, conſiſted in placing the initiated youth on a throne, the prieſts dancing round him: the badge of the initiated was a girdle or ſcarf.

When a perſon had committed any murder, the *cabiria* gave him an aſylum.—Meurſius is very particular in the proof of each of theſe points.

CABLE, a thick, long, three-ſtrand rope, ordinarily of hemp, ſerving to hold ſhips firm at anchor, and to tow veſſels in large rivers. In Europe, the *cables* are commonly made of hemp; in Africa, of long ſtraw or ruſhes called *baſs*; and in Aſia, of a peculiar kind of Indian graſs.

The word *cable* comes from the Hebrew word *chebel*, *cord*. Du-Cange derives it from the Arabic, *habl*, *cord*, or *habala*, *vincire*: Menage, from *capulum*, or *cabulum*; and that from the Greek καμηλος, or the Latin *camelus*.

The term *cable* is ſometimes alſo applied to the cordage uſed to raiſe maſſy loads, by means of cranes, wheels, and other like engines: though, in ſtrictneſs, *cable* is not to be applied to ropes of leſs than three inches circumference. Every *cable*, of whatever thickneſs it be, is compoſed of three ſtrands; each ſtrand of three twiſts; and each twiſt of a certain number of caburns, or threads of rope-yarn, more or leſs, as the *cable* is to be thicker or ſmaller.

To make a *cable*: after forming the ſtrands, they uſe ſtaves; which they firſt paſs between the ſtrands, that they may turn the better, and be intertwiſted the more regularly together. And to prevent any entangling, a weight is hung at the end of each ſtrand. The *cable*, being properly twiſted, neither too much, ſo as to become ſtiff, nor too little, ſo as to be weakened, is untwiſted again three or four turns, that the reſt may the better retain its ſtate. The uſual allowance for the diminution of length by twiſting, is one third of the whole; ſo that for a *cable* of 120 fathoms, the rope-yarn muſt be 180 fathoms long.

The number of threads which each kind of *cable* is to be compoſed of, is always proportioned to its length and thickneſs; and it is by this number of threads, that its weight and value are aſcertained. Suppoſing, then, the lengths to be equal, the number of threads and the weights will be as the areas of their baſes, or, which comes to the ſame, as the ſquares of their circumferences. Having, then, the weight and number of threads of any one *cable*, we may eaſily calculate the following table:

Circumference.	Threads.	Weight.
3 Inches	48	192 Pounds
4	77	308
5	121	484
6	174	696
7	238	952
8	311	1244
9	393	1572
10	485	1940
11	598	2392
12	699	2796
13	821	3284
14	952	3808
15	1093	4372
16	1244	4976
17	1404	5616
18	1574	6296
19	1754	7016
20	1943	7772

Every merchant-veſſel, how ſmall ſoever, has three *cables*; viz. the main or maſter-*cable*, which is that of the chief anchor, called the ſheet-*cable*; and the two *bowers*, beſt and ſmall. The ordinary length of the great *cable*, is 120 fathoms or braces.

A long *cable* is not ſo apt to break as a ſhort one, becauſe it draws more horizontally on the anchor than the other; and a ſhip will ride more ſmoothly as well as more ſafely with a long *cable*, becauſe ſhe will not be ſo liable to plunge deep in the water with her fore-part.

By ſtat. 21 Hen. VIII. c. 12. ſect. 2. no perſon dwelling within five miles of the town of Bridport, in the county of Dorſet, ſhall ſell out of the market, holden within the ſaid town, any hemp which ſhall grow within the ſaid five miles, upon pain of forfeiture of the hemp.

Sect. 3. No perſon other than ſuch as ſhall dwell within the ſaid town, ſhall make out of the ſaid town, any *cables*, halſers, ropes, traces, halters, or other tackle made of hemp, within five miles of the ſaid town; upon pain of forfeiture of the ſaid *cables*, &c.

Sect. 4. Twenty pounds weight ſhall be accounted the ſtone.

Sect. 5. Every perſon dwelling within the ſaid diſtance, may make *cables* and other tackle for their own uſe. This act to endure to the next parliament. Continued indefinitely by 3 Car. I. c. 4.—16 Car. I. c. 4.

Stat. 35 Eliz. c. 8. ſect. 3. If any perſon ſhall make *cables* of any old or overworn ſtuff, which ſhall contain above ſeven inches in compaſs; every perſon ſo offending, ſhall forfeit four times the value: and if any perſon ſhall tar any halſers or other cordage made within this realm, of ſuch old and overworn ſtuff, being of leſſer aſſiſe, and not containing in compaſs ſeven inches; and by retail put to ſale the ſame being ſo tarred; every perſon ſo offending, ſhall forfeit treble the value, &c.

Sect. 4. Every perſon who ſhall offend againſt this act, ſhall be impriſoned during her majeſty's pleaſure.

Stat. 6 Ann. c. 29. ſect. 13. Foreign cordage or *cable*-yarn imported, upon exportation ſhall have no allowance or drawback of duties.

CABLE, *ſtream*, a halſer, or rope, ſmaller than the *bowers*, uſed to moor a ſhip in a river or haven.

The ſeamen ſay, the *cable is well laid*, when it is well wrought, or made.

Serve the cable, or *plat the cable*, i. e. bind it about with ropes, clouts, &c. to keep it from galling in the hawſe.

To *ſplice a cable*, is to make two pieces faſt together, by working the ſeveral ſtrands of the rope one into another.

To *coil the cable*, is to roll it up round in a ring; of which, the ſeveral rolls one upon another are called *cable-tire*.

Pay more cable, *pay cheap the cable*, *veer more cable*; that is, let it more out from the ſhip, that the boat which carries the anchor may the more eaſily drop it into the ſea.

Heave in the cable; that is, draw it into the ſhip by winding it about the capſtane or windleſs.

When two *cables* are ſpliced together, it is called a *ſhot of a cable*.

Bit the cable. See BITS.

CABLE, or **CABLE'S-LENGTH**, is alſo uſed for a meaſure of 120 fathoms, being the uſual length of the *cable*.

CABLED, in *Heraldry*, is applied to a croſs formed of the two ends of a ſhip's cable: ſometimes alſo to a croſs covered over with rounds of rope; more properly called a croſs corded.

CABLING, in *Architecture*, the figure of a ſtaff, or reed, either plain or carved, in reſemblance of a rope, or a ruſh, wherewith a third part of the flutings of a column are ſometimes filled up; hence called *cabled flutings*.

There are alſo *cablings* in relievo without fluting, eſpecially on certain pilaſters, as in the church of Sapienza at Rome. See FLUTES.

CABLISH, *Cablicia*, in the *Foreſt Law*, denotes bruſh, or browſe wood; though Spelman takes it more properly to ſignify trees, or branches, thrown down by the wind; from the French *chablis* or *bois chablis*, which denotes the ſame.

CABOCHED, **CABOSHED**, or **CABOSSED**, in *Heraldry*, is where the head of a beaſt is cut off behind the ears, by a ſection parallel to the face; or by a perpendicular ſection: in contradiſtinction to couped; which is done by a horizontal line; beſides that it is farther from the ears than *caboſſing*.

The word is formed from the obſolete French *caboche*, from *caput*, *head*.

CABOCLES, a name given in the Weſt Indies by the Portugueſe to thoſe produced between Americans and Negroes.

CABOTE, in *Zoology*, the name of a fiſh of the cuculus kind, more uſually known among authors by the name of the CORAX.

CABRUSI, in the *Writings of the Ancients*, a word frequently uſed to expreſs Cyprian, or coming from the iſland of Cyprus. The ancient Greeks had almoſt all their vitriols and vitriolic minerals from this iſland; they therefore ſometimes called theſe *cabruſi*, without any addition. It is very probable that our word copperas, the common name of green vitriol, is a falſe pronunciation of this word *cabruſi*.

CABUIA, a Weſt Indian ſpecies of hemp, produced in the province of Panama, from a plant ſomewhat like the *chardon* or *iris*; when ripe, they lay it to ſteep in water, and after drying it again, beat it with wooden mallets till nothing but the hemp remains, which they afterwards ſpin, and make thread and ropes of it; the former of which is ſo hard and tough, that with it they ſaw iron, by fitting it on a box, and laying a little fine ſand over the metal as the work proceeds.

CABURE, in *Zoology*, the name of a ſmall Braſilian bird of the owl-kind; very beautiful, and very eaſily tamed. It is of a brown colour, variegated with white, and is feathered down to the toes. The Braſilians keep it tame for its diverting tricks; it will play with people like a monkey, and is perfectly harmleſs.

CABUREIBA, in *Botany*, a name by which ſome authors have called the tree which affords the black Peruvian balſam of the ſhops.

CABURNS, in *Sea-language*, denotes ſmall lines made of ſpun yarn, wherewith to bind cables, ſeize tackles, and the like.

CACABOGA, in *Zoology*, the name of an American ſpecies of ſerpent, by ſome accounted the ſame with the TAREIBOIA, or black water-ſnake of that part of the world; but by others deſcribed as yellow in colour, living about houſes, and doing great miſchief among poultry, though not fatal to mankind in its bite.

CACAGOGA, in *Ancient Medicinal Writings*, a word uſed for certain ointments intended for rubbing on the fundament to procure ſtools. The moſt common of theſe was made of alum mixed with honey, and boiled till the whole was of a tawny colour. This anointed on the fundament, procured a great many ſtools, but not without ſome pain.

CACALIA, in *Botany*. See *Foreign* COLT'S-FOOT.

CACAO, in *Botany*, *Theobroma* of Linnæus, the chocolate-nut tree; a genus of the *polyadelphia pentandria* claſs. Its characters are theſe: the flower hath five petals, which are irregularly indented; and hath five erect ſtamina. In the centre is placed the oval germen, which afterward becomes an oblong pod ending in a point, which is divided into five cells, filled with oval, compreſſed, fleſhy ſeeds. We have but one ſpecies of this plant, which is a native of America, and is found in great plenty in ſeveral places between the tropics; but particularly at Carracca, and Carthagena, on the river Amazon, in the iſthmus of Darien, at Honduras, Guatimala, and Nicaragua. At all theſe places it grows naturally without culture; but is cultivated in many of the iſlands poſſeſſed by the French and Spaniards; and was formerly planted in ſome of the iſlands which are in poſſeſſion of the Engliſh.

The native Mexicans call the *cacoo-tree*, *cucuhua guahuitl*; and the Spaniards, *cacaotal*. It reſembles our cherry-tree; but is ſo very delicate, and the ſoil it grows in ſo hot, that to guard it from the ſun, they always plant it in the ſhade of another tree, called mother of *cacao*.

It is very proper to obſerve, that the chocolate-nut will not retain its vegetative faculty long after they are taken from the trees; ſo that there is no poſſibility of tranſporting them to any great diſtance for planting: nor ſhould they be kept long out of the ground in the natural places of their growth. In order therefore to cultivate this plant for curioſity in Europe, it will be neceſſary to have the nuts planted in boxes of earth, in the countries where they grow, ſoon after they are ripe. Theſe plants muſt be frequently but gently watered, and protected from the ſun and the cold, according to the latitudes they paſs through; and when arrived, muſt be carefully preſerved in a bark ſtove.

The fruit is incloſed in a kind of pod, of the ſize and figure of a cucumber; except that it begins and ends in a point. Within the pod, which is half a finger thick, is formed a plexus of white fibres, very ſucculent, a little acid, and good to appeaſe thirſt. In the middle of theſe fibres are contained ten, ſometimes twelve, and ſometimes more, as far as forty ſeeds, of a violet colour, and dry as acorns. Each ſeed, which is covered with a little bark or rind, when ſtripped thereof, ſeparates into five or ſix unequal pieces, in the middle whereof is a kernel having a tender bud, very difficult to preſerve.

Of this ſeed, with the addition of vanilla, and ſome other ingredients, the Spaniards, and, after their example, the reſt of Europe, prepare a kind of conſerve, or cake; which, diluted in hot water, makes that delicious, wholeſome drink, called CHOCOLATE.

It is likewiſe made into a ſweet-meat; and there is an oil extracted from it, to which they give the name of butter. That oil is as ſweet as oil of almonds, and is made after the ſame manner. It is an extraordinary remedy for the cure of burns and ſcalds. Some of the Creolian ladies uſe it as a paint, to render their complexion freſh, and their ſkins ſmooth.

In ſome parts of America, the *cacao* ſeeds are uſed by the Indians as money: twelve or fourteen are eſteemed equivalent to a Spaniſh real, or ſix pence three farthings ſterling.

There are two kinds of *cacaos*: the moſt common, which is likewiſe the beſt, is of a dark colour, bordering on red, and round: the other is called *patlaxe*, which is white, larger, thicker, and flatter; its quality is deſiccative. Some druggiſts, however, ſell four kinds; viz. the great and little *caracca*, and the great and little *cacao* of the iſlands: theſe, however, may be probably reduced to the two kinds above mentioned; it being only the greatneſs and ſmallneſs that multiplies the name and kinds.

They were procured in great plenty from one of the iſlands called King George's Iſlands, by Commodore Byron, in his late voyage through the South ſeas, and found to be an excellent antiſcorbutic. Many, he obſerves, whoſe limbs were become as black as ink, who could not move without the aſſiſtance of two men, and who, beſides total debility, ſuffered excruciating pain, were in a few days, by eating theſe nuts, although at ſea, ſo far recovered as to do their duty, and could go even aloft as well as they did before the diſtemper ſeiſed them. Hawkeſworth's Voyages, vol. i. chap. x. p. 114.

Cacao is one of the moſt oily fruits which nature produces; and has this ſingular advantage, that it never grows rank, how old ſoever it be, as all other fruits do which have any analogy with this: ſuch as walnuts, almonds, kernels of pine-apples, piſtacho-nuts, olives, &c. The *cacao*-nuts are eſteemed by the Mexicans as anodyne; and uſed, eaten raw, to aſſuage pains of the bowels.

CACAOTETE, in *Natural Hiſtory*, the name by which the Braſilians call the BELEMNITES, which is very common there as well as with us.

CACATORY *fever*, a denomination given by Sylvius to an intermittent fever, accompanied with a ſevere looſeneſs, and ſometimes gripes.

CACAVATE, in *Botany*, a name given by ſome authors to the COCOA-*tree*; which is alſo ſometimes called *cacavera*.

CACAVIA, in *Botany*, a name given by the Greek authors and ſome of the others to the LOTUS or nettle-tree. It obtained this name from the reſemblance of its fruit when ripe, to the HALICACCABUM or winter-cherry.

CACCALIA, in *Botany*, a name given by ſome of the old Greek writers to the *halicaccabum* or *alkekengi*, the winter-cherry; a kind of nightſhade or plant allied to that family, but diſtinguiſhed from all the others by the fruit being covered with a membranaceous bag.

CACCABON, in *Botany*, a name given by ſome authors to the *water*-LILY or *nymphæa*.

CACEDONIUS *tartarum*, is peccant matter in the human body, generated from ſeparations by the ſecretive faculty, which are not immediately ſucceeded by the operation of the expulſive faculty.

CACHALOT, in *Ichthyology*, a cetaceous fiſh, with teeth in the lower jaws only; claſſed by Linnæus under the *phyſeter*. The blunt-headed *cachalot* is one of the ſpecies that yields the *ſpermaceti*: there are beſides the round-headed and the high-finned *cachalots*. See PHYSETER.

CACHEF, or CACHEEF, in the *Turkiſh Affairs*, the governor of a city, town, or even province in Egypt.

The title *cachef* is alſo given to the captains or commanders of little flying armies, intended to keep the Arabs in obedience.

Egypt is divided by the Turks into thirty-nine *cacheſtecks*, or governments.

CACHEXY, in *Medicine*, an ill ſtate or diſpoſition of body; wherein the nutrition is depraved throughout the whole habit; accompanied with a ſwelling, or bloating of the fleſhy parts; a flaccid ſtate of the body, eaſily perceived externally, and ariſing from a viſcoſity of the juices, and a remiſſion of the tonic motions of the parts.

The word is formed from κακος, *ill*, and ἑξις, *habit* or *diſpoſition*.

The *cachexy* is diſtinguiſhed from the anaſarca by the fleſh hanging flaccid and pendulous, and being ſoft in it; whereas in the anaſarca it is often ſo diſtended and hard, that the ſkin ſhines, and looks as if it would burſt. The anaſarca alſo uſually forms œdematous tumors in many parts of the body, but the *cachexy* never does this. It differs from the aſcites in that this diſeaſe only affects the lower parts of the body, but the *cachexy* the whole; but it differs only from the chloroſis as genus from ſpecies. Phyſicians diſtinguiſh the *cachexy* into ſimple and compound: the firſt is, when it is combined with no other diſeaſe; in the other, it is frequently compounded with the ſcurvy.

CACHEXY, *ſigns of the*. There is no diſeaſe more readily known than this, as none has ſuch obvious and diſtinctive ſymptoms. The face, hands, feet, and legs, are always bloated, and ſwelled beyond their natural dimenſions; the natural heat of the body decreaſes, and there is an evident and actual ſenſation of cold in the parts. This is attended with an univerſal languor, and anxiety of mind, and a painful weakneſs in going up ſtairs, or walking up hill: the appetite is very uncertain, and loathings of food are very frequent: after food, there are all the ſymptoms of a bad digeſtion, as tenſions and oppreſſions about the ſtomach, and flatulencies. The bowels are in a very uncertain ſtate, ſometimes remaining coſtive for a long while; and at others, throwing off the food undigeſted, in the manner of a lientery: the patients have always a great propenſity to ſleep, but they are not refreſhed by it. The urine is but ſmall in quantity, and is ſometimes crude and reddiſh; ſometimes limpid, but always has a livid appearance. The pulſe is languid and weak; and the blood, if it happens to be ſeen by any accident, is pale and thin, and abounds in ſeroſities. The patients always complain alſo of a ſhortneſs of the breath, and a difficulty of breathing, eſpecially after the body has been at any time in motion. Heats and fluſhings come on at times, and the head is always diſturbed; always torpid and inclined to ſleep, and ſometimes vertiginous and violently painful; and œdematous tumours appear in the feet, when the patient is ſtanding up, but diſappear again when he lies down.

There is always alſo a ſenſe of weight and preſſure in the abdomen; ſometimes in the right hypochondrium, ſometimes in the left; and often deeply inward under the navel; ſometimes the whole abdomen is inflated and hard, and ſometimes it is only partially ſo; hardneſſes and inequalities being ſenſible to the touch in it.

It moſt frequently attacks perſons of a phlegmatic habit, and is more common among women than men, as well on account of their ſofter texture, as of the frequent diſorders the irregularity of their menſtrual diſcharges throws them into. Women oftener, however, are brought into it through a defect of the menſes, than by the exceſs of that diſcharge.

Cauſes of it. Among theſe are to be reckoned, the living in wet and damp rooms; the leading an idle and ſedentary life; and the feeding on viſcous things, and drinking great quantities of water. On the contrary, the abuſe of ſpirituous liquors will alſo occaſion it; and the taking aſtringent medicines at the times when the blood is in violent emotions, as in hæmorrhages, and in acute fevers: the ſtriking in of cutaneous humours will alſo ſometimes occaſion it; and very often the omiſſion or ſuppreſſion of habitual diſcharges of blood, by whatever paſſages. Great loſs of blood is vulgarly ſuppoſed to be one of the principal agents in bringing on this diſeaſe, but improperly; for when this ſucceeds ſuch diſcharges, it is rather owing to their being long continued, than violent, and to the improper diet of the patient afterwards, which prevents a proper ſupply of blood again, than from the actual loſs of it. Improper treatment of the gout, and the abuſe of volatile ſalts in high fevers, are alſo too often the cauſes of this diſeaſe.

According to Boerhaave, *cachexies* may ariſe either from a vitiated ſtate of the nutritious juice, from ſome diſorder of the veſſels that are to receive it, or from a defect in the faculty that ſhould apply it. The juices, he obſerves, may be depraved, either from the quality of the food; as if it be farinaceous, leguminous, fat, fibrous, ſharp, aqueous, or viſcous; from the want of motion; from the organs being vitiated by too much weakneſs, or too much ſtrength: and theſe, again, may be occaſioned by immoderate ſecretions, and evacuations of any kind, the ſchirrhoſity of ſome of the viſcera, or the retention of ſomething that ſhould be ſecreted: and hence, a diminution of the ſolids, or a repletion of the liquids with things that cannot paſs; whence ariſe two notable ill effects of this evil, viz. a leucophlegmatia, and an anaſarcous dropſy. According to the various colour, quantity, tenacity, acrimony, and fluidity of the nutritious liquor, ariſe alſo various diſorders, as the effects of the *cachexia*; v. g. paleneſs, yellowneſs, lividneſs, greenneſs, blackneſs, or redneſs of the ſkin; heavineſs, windineſs, palpitation of the heart and arteries increaſed with the leaſt motion, crude thin urine, ſpontaneous watery ſweats; and, at length, a leucophlegmatia and dropſy. For the veſſels that receive the nutritious juice, there cannot well be aſſigned any univerſal fault; unleſs their too great laxity, and the diſorders accruing from them, may be admitted as ſuch. Laſtly, nutrition is impeded and perverted, by a defect in the faculty that ſhould apply it; as when the circulating force is either too languid or too violent.

Prognoſtics. When this diſeaſe is plenary, and the whole craſis of the humours is depraved by it, it is very difficult of cure: it is in general more eaſily cured in young people than in older; and in theſe laſt, it uſually degenerates into a dropſy, and hectic; and when driven back, it often produces a ſuffocative catarrh. When the diſeaſe is not plenary, or in its full ſtate, but rather may be called a *cachectic* diſpoſition than a *cachexy*, as is frequently the caſe with young people; particularly with girls, on account of the ſuppreſſions of the menſes; then it is in general eaſily cured, unleſs the bad regimen of the patient for ſome time before has rendered it more than uſually obſtinate and violent; in general, the ſooner it is undertaken, the more eaſily it is cured.

The chloroſis of young girls, which ſeems to be of a middle nature, between a cachectic diſpoſition, and a confirmed *cachexy*, is a chronic caſe, and ſeldom admits of a ſudden cure, unleſs there be a remarkable change of life in the patient, as by marriage. This chloroſis is in itſelf rather troubleſome than dangerous, as it gives an univerſal languor both of body and mind, a bad colour, palpitations of the heart, and other painful ſymptoms; but it ſometimes degenerates into a *cachexy*, or a hectic.

Method of cure. The general method muſt be by correction of the vitiated humours; a reſeration of the viſcera; an evacuation of the humors, when thus prepared for it; and, finally, a reſtitution of the due tone to the ſolids.

For the firſt fortnight, the patient ſhould be treated with reſolvents and digeſtives: ſuch as the *tartarum vitriolatum*, and abſorbents ſated with acids; as crab's eyes with lemon juice; and with aperient decoctions of the woods of guaiacum and ſaſſafras; as the roots of pimpernel, and the like; and either during this time, or afterwards, evacuants are to be given; ſuch as ſena, jalap, and dwarf-elder. When the improper treatment of a fever has been the occaſion of the malady, the mild alexipharmics are to be given at times; and when an obſtruction of the menſes is in the caſe, the time they are to be expected is to be carefully regarded, and emmenagogues and baths for the feet, are to be ordered at thoſe periods. When obſtructions of the hæmorrhoidal diſcharges are in the caſe, then, after the firſt fortnight, leeches ſhould be applied to the hæmorrhoidal veins; and if the diſeaſe has ariſen from long continued hæmorrhages, then analeptics are to be truſted to, with very gentle correctives, for fear of exciting new commotions in the blood; and in theſe caſes, bleeding in the arm is ſometimes found neceſſary.

It is of the utmoſt conſequence in this caſe, that a proper diet be obſerved; all coarſe and heavy foods are to be avoided, as alſo all acid and ſalt things; and much water is as carefully to be guarded againſt, as an exceſſive uſe of ſpirituous liquors. Finally, when the diſeaſe is cured, its return is to be guarded againſt, by taking proper purgatives once a month. To this purpoſe, Stahl greatly recommends a mixture of gum ammoniacum, galbanum and myrrh, and ſmall quantities of calomel, with the purges. It is too common a practice to give boldly the forcing medicines, as they are called, to young women in *cachectic* complaints; ſuch as myrrh, ſaffron, ſavin, and the like; but this very often throws them into an *aſcites*, or other diſorders, worſe than the firſt.

Cachexy, *uterine*, a term uſed by Hoffman for the *fluor albus*.

CACHLEX, in *Natural Hiſtory*, a name uſed by ſome authors for the ſmall pebbles found on the ſea and river ſhores, which being heated red-hot, and quenched in whey, are ſaid to give an aſtringent virtue.

CACHORRODOMATO, in *Zoology*, the name by which the Portugueſe, in America, call the taiibi; a creature in many reſpects reſembling the opossum, and ſuſpected to be the male of that creature.

CACHRYS, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe: it hath an umbellated flower, the involucrum compoſed of many narrow ſpear-ſhaped leaves, with five ſpear-ſhaped erect petals. It hath five ſingle ſtamina. The turbinated germen is ſituated under the receptacle; the empalement afterward becomes a large, oval, blunt fruit, dividing in two parts, each having one large fungous ſeed. There are five ſpecies.

The ſeed of *cachrys*, though not uſed in the preſent pharmacy, was recommended by the ancients for its heating and drying qualities; and therefore judged a proper ingredient in ſmegmas. It alſo made a good plaſter for the head in defluxions upon the eyes, provided it is taken off at the end of three days; and taken with pepper and wine, it was ſaid to be good for the epilepſy. James.

Cachrys, or Canchrys, among *Ancient Botaniſts*, denoted a ſcaly tuft, growing like a catkin on certain trees; as the oak, beech, pine, and the like; or, according to others, an unſeaſonable kind of germen or bud, appearing either in the ſpring, or autumn; and which, after the winter is over, ſpreads or ſhoots into branches. The word is ſometimes alſo uſed for the ſeed of roſemary, or even the plant itſelf; ſometimes for barley roaſted in a furnace, to render it more eaſy to grind into flour.

CACHU, Cachou, or Catechu. See Catechu.

CACHUNDE, the name of a medicine, highly celebrated among the Chineſe and Indians, and made of ſeveral aromatic ingredients, the perfumes, medicinal earth, and precious ſtones: they make the whole into a ſtiff paſte, and form out of it ſeveral figures according to their fancy, which are dryed for uſe: theſe are principally uſed in the Eaſt Indies, but are ſometimes brought over to Portugal. In China, the principal perſons uſually carry a ſmall piece in their mouths, which is a continued cordial, and gives their breath a very ſweet ſmell. It is a highly valuable medicine alſo, in all nervous complaints; and is eſteemed a prolonger of life, and a provocative to venery, the two great intentions of moſt of the medicines in uſe in the Eaſt.

CACHYMIA, in *Metallurgy*, a term uſed by Paracelſus for an imperfect metalline ore, as he expreſſes it, an immature metalline body, which is neither a ſaline ſubſtance nor a metal.

The *cachymiæ* may be divided into ſulphureous, as marcaſite; mercurial, as arſenic or orpiment; and ſaline, as all talcs.

CACOCHYMIA, a vicious ſtate of the vital humours, eſpecially of the maſs of blood; ariſing either from a diſorder of the ſecretions, or excretions, or from external contagion.

The word is compounded of *κακος*, *ill*, and *χυμος*, *juice*.

Gorræus gives this name to the abundance, or exceſs of any ill humour; whether it be bile, *pituita*, or any other; provided there be only one that thus offends in quantity; and *plethora* he calls the abundance or exceſs, or all the humours together.

CACODES, in the *Ancient Writers of Medicine*, a name given to ſeveral kinds of matter diſcharged from the human body, which had an ill ſmell. The offenſive matter voided ſometimes by vomit, has this name, as alſo that evacuated by ſtool, and the diſcharge of foul ulcers.

CACOETHES, or Cacoethia. See Malignant.

CACOPHONIA, in *Grammar* and *Rhetoric*, the meeting of two letters, or ſyllables, which yield an uncouth, and diſagreeable ſound.

The word is compounded of *κακος*, *evil*, and *φωνη*, *voice*.

Cacophonia, in *Medicine*, denotes a vice or depravation of the voice, or ſpeech; of which there are two ſpecies, *aphonia*, and *dyſphonia*.

CACTONITES, in *Natural Hiſtory*, a name given by ſome old writers, to a beautiful pale red ſtone, ſuppoſed to be the ſame with our pale *cornelian*.

CACTUS, in *Botany*. See *Melon* Thistle.

CACULE, in the *Materia Medica*, a name given by Avicenna, Serapio, and all the other Arabian writers, to the *cardamom* ſeeds. They diſtinguiſh two kinds of this fruit, a larger, and a ſmaller. The larger is the grain of paradiſe, and the ſmaller the common cardamom ſeed of theſe times. They alſo called the cardamoms, in general, by the name *heil*, and diſtinguiſhed the ſmall kind, now principally in uſe, by the word *bilbanc*, which after-writers corrupted into *hilbave* and *hilbua*, or *helbua*.

CADARI, or Kadari, a ſect of Mahometans, who aſſert free-will, attribute the actions of men to men alone, not to any ſecret power determining the will; and deny all abſolute decrees, and predeſtination.

The author of this ſect was Mabed ben Kaled Al Gihoni, who ſuffered martyrdom for it.

The word comes from the Arabic, קדר, *cadara*, *power*. Ben Aun calls the *Cadarians*, the Magi, or Manichees of the Muſſulmen.

CADE, a cag, caſk, or barrel; uſed in the book of rates for a determinate number of ſome ſorts of fiſh.—Thus a *cade* of herrings is a veſſel containing the quantity of five hundred herrings, and of ſprats one thouſand.

Anciently the *cade* of herrings appears to have contained ſix hundred fiſh, reckoning ſix ſcore to the hundred.

Cade-*lamb*, a young lamb weaned, and brought up by hand, in a houſe; called in the North, *pet-lamb*.

Cade-*oil*, in the *Materia Medica*, a name given to an oil much in uſe in ſome parts of France and Germany. The phyſicians call it *oleum cadæ*, or *oleum de cada*. This is ſuppoſed by ſome to be the *piſſelæum* of the ancients, but improperly; it is made of the fruit of the *oxycedrus*, which is called by the people of theſe places, *cada*.

Cade-*worm*, in *Natural Hiſtory*, a name given by authors to the *phryganium*, a common worm, found in ditches, and uſed as a bait for fiſh. The fly produced from this worm has a long body, four brown wings, and a forked tail, and is found in the month of Auguſt very frequent on waters.

CADENCE, in *Muſic*, denotes a kind of cloſe, or reſt, either at the end of a ſong, or ſome of its parts, into which it is divided as into members, or periods.

The word ſeems a metaphor, drawn from the dancing-ſchool, where it properly ſignifies a pauſe, or fall, from motion to reſt. A *cadence* is properly when the parts fall, and terminate on a chord, or note, the ear ſeeming naturally to expect it. Regularly it is to be made on the final or dominant, though ſometimes alſo on the mediant, or middle chord of a mode.

Cadences in ſinging anſwer nearly to points, or ſtops, in diſcourſe. They are reſts contrived to favour the weakneſs of the performers, as well as the hearers, of a muſical compoſition. Men are not able to ſuſtain their attention, or their voice, beyond the ſpace of two meaſures; even in this ſhort interval we perceive the ſong to fall, and tend rapidly to a pauſe, or reſt: the notes which introduce theſe pauſes, are called *cadences*, in the proper conducting and expreſſing of which a great part of the muſician's ſkill depends. The chief *cadence* or cloſe is the key itſelf, in which the baſs muſt always conclude; the next in dignity is the fifth above, and the next to that the third. Or if the baſs be ſharp, the fourth or ſecond above the key.

In modulation, *cadences* are made on ſeveral keys, though ſtill with ſome relation to the principal one: the harmony muſt always return to the key appropriated to the piece, and often terminate there by middle as well as final *cadences*.

Cadences uſually occur in every two meaſures, and always in the note which begins the meaſure they happen in. It requires a nice taſte to diſtinguiſh the tonic note on which the *cadences* eſſentially fall; becauſe they uſually ſeem to fall on another note preſented in the ſong. It is by the natural progreſſion of the fundamental baſs that we are enabled to make the diſcovery. As often as this baſs falls a fifth, or riſes a fourth, there is a *cadence*. In reality, this diſpoſition imitates a cloſe ſo well, that when we come to the firſt ſound of this *cadence*, we find ourſelves as it were forced to fall on the other, ſo that it requires an extraordinary effort of the voice to ſuſtain itſelf on the firſt, or only to fall a third. Hence it is that the firſt ſound which makes its fifth of the tonic, is called its dominant, being in reality the top, or higheſt part of the harmonical ſyſtem, and that fartheſt from the fundamental ſound: thus *ſol* is the dominant of *ut*; and *re*, of *ſol*. In making a *cadence*, the baſs muſt always fall a fifth, or riſe a fourth.

CADENCE, among the French *Muſicians*, is uſed to ſignify a *trillo*, or *ſhake*, but improperly, according to Broſſard. In effect, the *cadence* is properly the tranſition from the note on which the ſhake is made, to a note which is a tone lower, or a ſemi-tone major higher, in the treble parts. See CADENZA *Sfuggita*.

CADENCE, in the *Ancient Muſic*, denotes a ſeries or ſucceſſion of muſical notes, in certain intervals, which ſtrike the ear agreeably; and eſpecially at the cloſe of a ſong, couplet, or ſtanza. In which ſenſe, *cadence* amounts to much the ſame with *rhythmus*.

CADENCE, in *Oratory* and *Poetry*, denotes the running of verſe, or proſe; otherwiſe called the numbers, and by the ancients ῥυθμος. See RHYTHM.

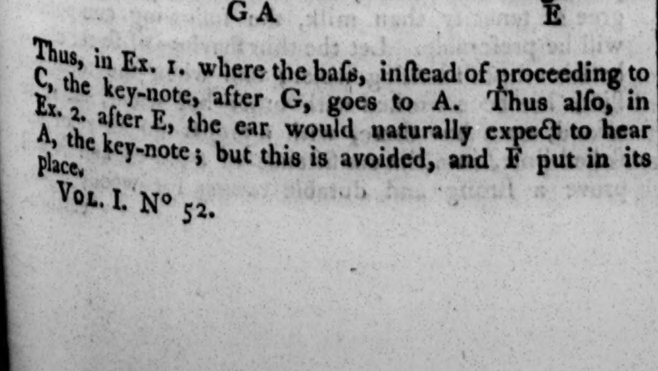
CADENCE, in the *Modern Dancing*, is when the ſeveral ſteps and motions follow, or correſpond to, the notes or meaſures of the muſic.

CADENCE, in the *Manege*, denotes an equal meaſure, or proportion, obſerved by a horſe in all his motions, when he is thoroughly managed, and works juſtly either at the gallop, *terra à terra*, or the airs.

A horſe's working in *cadence* imports, that his times or motions are uniform, and that one does not take in more ground than another.

CADENCY, in *Heraldry*, the ſtate, or quality, of a CADET. Niſbet has an eſſay on the additional figures and marks of *cadency*. See DIMINUTION.

CADENZA *Sfuggita*, in the *Italian Muſic*, is uſed when a part inſtead of aſcending or deſcending the proper interval, to form a *cadence*, proceeds by ſome other interval. For inſtance, when the baſs, inſtead of riſing a fourth, or falling a fifth, aſcends only by a tone, or ſemi-tone major.



Thus, in Ex. 1. where the baſs, inſtead of proceeding to C, the key-note, after G, goes to A. Thus alſo, in Ex. 2. after E, the ear would naturally expect to hear A, the key-note; but this is avoided, and F put in its place.

CADETS, the younger brothers of a family: a term naturalized in our language from the French.

At Paris, among the citizens, the *cadets* have an equal portion with the eldeſt: in other places, the eldeſt has all. According to the cuſtom of Spain, one of the *cadets*, in great families, takes the mother's name.

CADET alſo denotes a young gentleman ſoldier, who, to attain to ſome knowlege in the art of war, and in expectation of preferment, chooſes to carry arms as a private man in a company of foot.

Cadet differs from volunteer, as the former takes pay, though only that of a private man, whereas the latter ſerves without pay.

Formerly there were allowed only two *cadets* in each company. In 1682, the king of France eſtabliſhed companies of *cadets*, wherein the young gentry were trained up to war, and taught the arts and exerciſes belonging thereto, as riding, fencing, mathematics, &c.

CADGE, a round frame of wood, on which falconers carry their hawks when they expoſe them to ſale.

CADI, among the Turks and Saracens, denotes an ordinary judge, who decides in all civil controverſies within the diſtrict of a town, or city, though ſubject to appeals to ſuperior judges.

The word is Arabic קדי or קאדי, q. d. *judge*, formed of קדי, *to judge*. D'Herbelot writes it *cadhi*.

The term *cadi*, uſed abſolutely, denotes the judge of a ſmaller town or village; thoſe of cities being called *mollas*, or *moulas*, ſometimes *mouli-cadis*, or *great cadis*.

We find numerous complaints of the avarice, extortion, and iniquity of the Turkiſh *cadies*; all juſtice is here venal; the people bribe the *cadies*; the *cadies* bribe the *moulas*; the *moulas* the *cadileſchers*, and the *cadileſchers* the *mufti*.

It is uſually vain to appeal from the ſentences of the *cadi*; ſince the affair is never heard anew, but judgment is paſſed on the caſe, as ſtated by the *cadi*. The *cadies*, nevertheleſs, are often caſhiered, and puniſhed for notorious injuſtice with the *baſtonado* and mulcts; but the law forbids them to be put to death. Conſtantinople has had *cadies* ever ſince the year 1390, when Bajazet I. obliged John Palæologus, emperor of the Greeks, to receive *cadies* into the city, to judge all controverſies happening between the Greeks and the Turks ſettled there.

In ſome countries of Africa, the *cadies* are alſo judges of religious matters. Among the Moors, *cadi* is the denomination of their higher order of prieſts, or doctors, anſwering to the rabbins among the Jews.

CADIANG, in *Botany*, a kind of lentiles in Batavia, and the adjacent country, which makes a conſiderable part of the food of the common people. Dr. Hawkeſworth's Account of the Voyages to the South Seas, vol. iii. p. 733.

CADILESCHER, or CADI-LESKER, a capital officer of juſtice among the Turks, anſwering to a chief-juſtice among us.

The word comes from the Arabic *kadi*, *judge*, the particle *al*, and *aſchar*, *army*; as being at their firſt inſtitution chiefly judges of the ſoldiery; of whoſe cauſes they have ſtill the ſole cognizance. D'Herbelot writes the name *cadhi-leſker*, or *cadhi-aſker*.

It is ſaid that this authority was originally confined to the ſoldiery; but that at preſent it extends itſelf to the determination of all kinds of law-ſuits; yet nevertheleſs ſubject to appeals.

There are but three *cadileſchers* in all the Grand Seignior's territories: the firſt, is that of Europe; the ſecond, of Natolia; and the third reſides at Grand Cairo. This laſt is the moſt conſiderable. They have their ſeats in the divan next to the grand viſir.

The *cadileſchers* have much the ſame authority in the provinces, that the *muftis* have at Conſtantinople: they even frequently riſe to be *muftis*: their chief ſtudy is the Alcoran, which is the code of their civil, as well as canon law. Appeals are ſometimes brought to them from the ſentences of the *cadies* in civil affairs; and they have the ſuperintendence of all other officers of juſtice within the empire. They nominate the *cadies*, and *moula-cadies*; but theſe laſt only with the conſent of the Grand Seignior. On any grievous complaint againſt the *cadies*, they condemn and depoſe them. Tournef. Voyage Lev. tom. ii. let. 14. Pocock. Egypt. p. 170.

CADITES, an appellation given by Plott to a kind of figured ſtone, reſembling a *cadus*, or barrel.

The *cadites* ſwells in the middle, and goes tapering to both ends, being divided lengthwiſe, with ſuch equidiſtant lineaments, as are uſually made by the ſtaves of a barrel, but without hoops, nor yet hollow.

CADIZADELITES, a ſect among the Muſſulmen, reſembling the ancient ſtoics, who avoid all feaſting and diverſion, and affect an uncommon gravity in all they do or ſay. Thoſe of them who inhabit the frontiers of Hungary, &c. agree in many things with the Chriſtians, and drink wine, even in the faſt of the Ramazan.

They read the Sclavonic tranſlation of the Bible, as well as the Alcoran. Mahomet, according to them, is the Holy Ghoſt, which deſcended on the apoſtles at the feaſt of Pentecoſt.

CADLOCK, in *Botany*. See MUSTARD.

CADMEAN *Letters*, the ancient Greek, or Ionic characters, ſuch as they were firſt brought by Cadmus from Phœnicia; whence Herodotus alſo calls them, *Phœnician letters*.

According to ſome writers, Cadmus was not the inventor, nor even importer of the Greek letters, but only the modeller and reformer thereof; and it was hence they acquired the appellation *Cadmean*, or *Phœnician letters*; whereas before that time they had been called *Pelaſgian letters*.

CADMIA, in *Pharmacy*, a name which has been variouſly applied; but it uſually denotes a mineral ſubſtance, whereof there are two kinds, *natural* and *artificial*.

The *natural cadmia*, again, is of two ſorts; the one containing arſenic, and called *cadmia foſſilis*, or COBALT; the other containing zinc, called calamine, or *lapis* CALAMINARIS.

The *artificial cadmia*, called *cadmia fornacum*, is prepared from ores containing zinc, when ſmelted in furnaces: of this there are five kinds; the firſt called *botryitis*, as being in form of a bunch of grapes; the ſecond, *oſtracitis*, as reſembling a ſea-ſhell; the third, *placitis*, becauſe reſembling a cruſt; the fourth, *capnitis*, *duſty*; and the fifth, *calamitis*: this laſt hangs round certain iron rods, wherewith the matter of the copper is ſtirred in the furnace, which being ſhaken off, bears the figure of a quill, called in Latin *calamus*.

The *cadmia botryitis* is found in the middle of the furnace; the *oſtracitis* at the bottom; the *placitis* at the top; and the *capnitis* at the mouth of the furnace.

This *cadmia* is deſiccative and deterſive: it is generally uſed in ſtinking ulcers; which by means hereof are brought to cicatrize. The *botryitis*, and *placitis*, are alſo good in diſeaſes of the eyes. See TUTTY.

CADMIA is alſo uſed by Pliny for copper-ore, or the ſtone of which copper is made. And hence the ſeveral appellations, *cadmia foſſilis*, *cadmia fornacum*, *cadmia metallico*, *cadmia atramentoſa*, and *cadmia pro cæruleo*. Hiſt. Nat. lib. xxxiv. cap. 10. cum Hard. Not.

CADMITES, in *Natural Hiſtory*, a kind of gem, nearly reſembling the OSTRACITIS; from which it only differs in that the latter is ſometimes girt with blue ſpots.

In ſome MSS. for *cadmites*, we read *calamites*.

CADRITES, a kind of religious among the Mahometans; whoſe founder was Abdul Cadri, a great philoſopher and lawyer; whence they take their name, *Cadrites*.

They live in common, and in a kind of monaſteries; which, however, they are allowed to quit, if they requeſt it, and to marry; on condition of their wearing black buttons on their garments, to diſtinguiſh them from the reſt of the people.

In their monaſteries, they paſs the greateſt part of every Friday night in running round, holding each other's hand, and crying inceſſantly, *hhai*, *living*, one of the names of God: one of their number plays all the time on a flute, to animate them in this extravagant dance.

CADUCEATOR, in *Antiquity*, a denomination given to heralds or meſſengers of peace. See CADUCEUS.

CADUCEUS, or CADUCEUM, Mercury's rod, or ſceptre; a wand entwiſted with two ſerpents, worne by that deity as the enſign of his quality and office.

The poets attribute wondrous virtues to the *caduceus*; as that of throwing people into a ſleep, raiſing the dead, &c. It was alſo uſed by the ancients as a ſymbol of peace and concord: the Romans ſent the Carthaginians a javelin, and a *caduceus*, offering them their choice, whether of war or peace.

Among that people, thoſe who denounced war were called *feciales*, and thoſe who went to demand peace, *caduceatores*; becauſe they bore a *caduceus* in their hand.

The *caduceus* found on medals, is a common ſymbol, ſignifying good conduct, peace, and proſperity. The rod expreſſes power, the two ſerpents prudence, and the two wings diligence.

Wedelius has given a diſſertation expreſly on *caduceated* medals.

CADUCEUS is alſo a name given to a kind of ſtaff covered with velvet, and decorated with *fleurs de lys*, which the French heralds of arms bear in their hands on ſolemn occaſions. That borne by the king at arms has a golden *fluer de lys* at the end; and is by ſome called ſceptre.

CADUCUS *morbus*, in *Medicine*. See EPILEPSY.

CADUS, an ancient liquid meaſure of capacity, containing ten, ſometimes twelve *congii*; and ſixty, or, according to others, ſeventy-two *ſextaries*.

The *cadus* is the ſame with what is otherwiſe denominated *metretes*, and *cerameon*, &c. See AMPHORA.

CÆCÆ *Glandulæ*. See GLANDS.

CÆCILIA, in *Zoology*, the name of a genus of ſerpents. See SLOW-*worm*.

CÆCILIA, in *Ichthyography*, a name uſed by ſome authors for the fiſh more uſually known by the name of the ACUS.

CÆCILIANA, in *Botany*, a name uſed by Pliny and ſome other authors for the *tutſan*, or *androſæmum*. Ger. Emac. Ind. 2.

CÆCUM, in *Anatomy*. See COECUM.

CÆLATURA, or COELATURA, the art of ENGRAVING on metals, ſtones, woods, or the like, with inſtruments of ſteel, diamond, &c. See SCULPTURE.

CÆLESTIANS, the followers of Cæleſtius, a monk, who flouriſhed under the empire of Arcadius, about the year 405, and taught much the ſame doctrines as Pelagius. See PELAGIANS.

CÆMENT, in a general ſenſe, any compoſition of a glutinous, or tenacious nature, proper to bind, unite, or keep things in coheſion.

The word is alſo written *cement*, and even *ciment*. It is formed from the Latin *cæmentum*, of *cædo*, *I beat*.—Though M. Felibien obſerves, what the ancient architects called *cæmentum*, was a very different thing from our *cæment*. The name *cæment*, with them, ſignified a kind of maſonry, or manner of laying the ſtones, and even the quality of the ſtones; as when the walls were built of rude, unequal ſtones. In reality, the ſtones were cut for ſuch work, but not ſquared nor uniform: ſo that *cæmenta* ſtood oppoſed to *quadrati lapides*.

CÆMENT is particularly uſed, in *Architecture*, for a ſtrong binding ſort of mortar, uſed to bind, or unite bricks or ſtones together, for ſome kinds of mouldings; or to make a block of bricks, for the carving of ſcrolls, capitals, &c.

It is of two ſorts: the *hot cæment*, which is the moſt common, is made of reſin, bees-wax, brick-duſt, and chalk, boiled together. The bricks to be *cæmented* are heated, and rubbed one upon another, with *cæment* between.

The *cold cæment* is leſs uſed; it is made of Cheſhire cheeſe, milk, quick-lime, and whites of eggs.

Mortar, ſolder, glue, &c. are *cæments*. The BITUMEN brought from the Levant is ſaid to have been the *cæment* uſed in the walls of Babylon.

Equal quantities of powdered glaſs, ſea-ſalt, and iron filings, mixed with loam, make a very hard and durable *cæment*.

Mr. Boyle informs us, that the beſt method to cloſe and repair pipes of ſubterraneous aquæducts is with tobacco-pipe clay pulverized, and mixed with a large quantity of pulverized flocks, and carefully beat up with linſeed oil into a ſtiff paſte. See MORTAR and TARRAS.

CÆMENT is alſo uſed among *Goldſmiths*, *Engravers*, *Jewellers*, &c. for a compoſition of fine brick-duſt, well ſifted, reſin, and bees-wax; in uſe among thoſe artificers to keep the metals to be engraven, or wrought on, firm to the block, &c. as alſo to fill up what is to be chiſſelled.

The receiver of an air-pump may be faſtened to a metalline plate by means of a *cæment* of bees-wax and turpentine, made with equal parts, for the winter; and three parts of the former, to two of the latter, for the ſummer. We have various receipts for making *cæments* to mend broken china or glaſſes: one of the fineſt, and at the ſame time ſtrongeſt, *cæments* for this purpoſe, is the juice of garlick, ſtamped in a ſtone mortar; this, if applied with care, will leave little or no mark. Another *cæment* for broken glaſſes, china, or earthen-ware, may be prepared by beating the white of an egg very clear, and mixing it with fine powdered quick-lime; or iſinglaſs, powdered chalk, and a little lime, may be mixed together, and diſſolved in fair water; with which the glaſſes, &c. are to be *cæmented*, and then ſet in the ſhade to dry.

Drying oil with white lead is alſo frequently uſed for this purpoſe; but where the veſſels are not expoſed to heat or moiſture, iſinglaſs glue, with a ſmall quantity of tripoli, or chalk, is better.

Some have recommended a *cæment* made by tempering quicklime with the curd of milk, till it become of a proper conſiſtence for uſe; but as cheeſe has a greater degree of tenacity than milk, the following compoſition will be preferable. Let the thin ſhavings of ſweet cheeſe be ſtirred with boiling water; and when the tenacious ſlime has been worked with other hot water, let it be mixed, on a hot ſtone, with a proper quantity of unſlaked lime, into the conſiſtence of a paſte; and it will prove a ſtrong and durable *cæment* for wood, ſtone, earthen-ware, and glaſs; and it has this advantage, that when it is thoroughly dry, it will receive no injury from water.

A *cæment* may be prepared for chemical glaſſes that will bear the fire, by mixing equal quantities of wheat flour, fine powdered Venice glaſs, pulverized chalk, with half the quantity of fine brick-duſt, and a little ſcraped lint, in the whites of eggs: this mixture is to be ſpread upon a linen cloth, and applied to the cracks of the glaſſes, and ſhould be well dried before they are put into the fire.

Old varniſh will likewiſe anſwer the ſame purpoſe. A very uſeful *cæment* for joining alabaſter, marble, porphyry, and other ſtones, may be prepared in the following manner. Melt two pounds of bees-wax, and one pound of reſin; add a pound and a half of the ſame kind of matter pulverized, as the body to be *cæmented* is compoſed of, and ſtir them well together; let the maſs be kneaded in water, and heated when applied to the heated parts of the body to be *cæmented*. The colour of this maſs may be adapted to that of the body on which it is employed, by varying the proportion of the powdered matter added to the maſs of bees-wax and reſin.

The beſt *cæment* for electrical purpoſes is made with two parts of reſin, two of bees-wax, and one of the powder of red ochre. Theſe ingredients are melted, and mixed together in any veſſel over the fire, and afterwards kept for uſe. This adheres well, is leſs brittle than reſin, and inſulates as well.

For the manner of preparing a *cæment* to bind together the various embeliſhments of grottos, ſee **Grotto**. See alſo **Glue**, **Putty**, and **Solder**.

Cæment, in *Chemiſtry*, is a general name, comprehending all paſtes or powders, which, by means of fire, and proper crucibles, are capable of producing changes in any body. See **Brass**, **Steel**, and **Porcelain**.

It is particularly uſed to denote a compound maſs, or ſaline powder, uſed for the purifying of gold, and conſuming the improper metals mixed therewith.

The principal *cæment* uſed for this purpoſe is compoſed of four parts of bricks powdered and ſifted, of one part of green vitriol calcined, till it becomes red, and of one part of common, or ſea-ſalt. A paſte is made of this mixture, by moiſtening it with water or urine. This is called *royal cæment*, from its uſe in purifying gold, the king of metals; and becauſe gold, previous to the diſcovery of platina, was the only metal capable of reſiſting it. Some writers on this ſubject recommend a mixture of nitre in ſubſtance, with an equal weight of calcined green vitriol, and twice its weight of powdered bricks.

Cæment *for gilding fiſh*. See **Gilding** *of fiſh*.

Cæment, or *ziment copper*, is copper precipitated from vitriolic waters by iron. The name is derived, it is ſaid, from a vitriolic water in Hungary, called *ziment*.

Cæment-*pots*, in *Aſſaying*, are veſſels made for the *cementation* of metals.

Theſe pots are cylindrical veſſels, made of potters clay, with tiles adapted to them, and may be conveniently turned by the potters. The ſize of theſe veſſels muſt be proportioned to the quantity of *cæment* to be put in them. It is not prudent, however, to make them of more than eight or ten inches broad, becauſe when they are larger the fire acts but difficultly and unequally upon them, eſpecially on that part of the matter near their center.

It is to be obſerved, in the making theſe veſſels alſo, that all kinds of clay contract and take up a ſmaller ſpace in the drying and baking; the purer clay will contract one tenth part of their diameter, but the more ſand or other dry powder there is in the mixture, the leſs it contracts. If a veſſel, therefore, of any determinate ſize is to be made of clay without admixture, it muſt be made one tenth larger than the expected ſize; if of clay with theſe admixtures, experience alone can ſhew what muſt be the exceſs in ſize, when moiſt. Cramer.

CÆMENTATION, a manner of purifying gold from other metals, by means of *cæment*. Or, as it is defined by Stahl, a method of corroding metals in a dry form by the fumes of dry ſalts.

It is performed thus: thin plates, or laminæ, are ſtratified in a crucible with the royal cæment; the crucible is covered up, luted with a mixture of clay and ſand, and encompaſſed with fire for twenty-four hours, till being thus calcined, the ſalts have imbibed and conſumed the impurities of the gold.

The crucible is then left to cool, and the gold is to be carefully ſeparated from the cæment, and boiled at different times in a large quantity of pure water. It is often neceſſary, for the effectual purification of the gold, to repeat the proceſs. This method, which has obtained the name of *concentrated parting*, ſays Dr. Lewis, is incommodious, either for purifying gold, or aſcertaining its purity, and is therefore now little uſed. Its principal uſe is for extracting ſilver or baſe metals from the ſurface of gold, and thus giving ſuperficial purity and high colour to alloyed or pale gold. Lewis's Comm. Phil. p. 155. See **Depart**, **Gold**, **Refining**, and **Silver**.

CÆRITES, or **Cæritum** *tabulæ*, in *Antiquity*, denote the cenſors tables, wherein were entered the names of ſuch perſons as, for ſome miſdemeanor, were to loſe their right of ſuffrage in elections at Rome.

The origin of the appellation aroſe hence; that during the captivity of Rome under the Gauls, the *Cærites*, or inhabitants of Cære, a city in Etruria, preſerved their ſacred books, and other matters belonging to the worſhip of the Gods, in gratitude for which, the Romans dignified the *Cærites* with the appellation of Roman citizens, but without admitting them into any part of the adminiſtration.

CÆRULEUS, in *Zoology*, a name given by authors to a bird of the thruſh or blackbird kind, and ſomewhat reſembling that ſpecies of blackbird commonly called the ſolitary ſparrow.

Cæruleus is alſo a name given by Solinus to the great Indian worm deſcribed, by Pliny and others, as inhabiting the Ganges. It is probable that all the accounts we have of this monſtrous animal are only falſe deſcriptions of the crocodile.

CÆSALPINIA, in *Botany*, *Braziletto*, a genus of the *decandria monogynia* claſs, deriving its name from Cæſalpin, the famous botaniſt and phyſician to pope Clement VIII. The characters are theſe: the flower hath five petals, which are ſituated like thoſe of the butterfly-flowers; it hath ten declining ſtamina, which are diſtinct; it hath an oblong germen; the empalement afterward becomes an oblong compreſſed pod with one cell, encloſing three or four compreſſed ſeeds. There are two ſpecies.

The firſt ſort is the tree which affords the braziletto wood, which is ſo much uſed in dying. It grows naturally in the warmeſt parts of America, from whence the wood is imported for the dyers; and the demand for it has been ſo great, that there are no large trees left in any of the Britiſh colonies; the biggeſt ſcarcely exceeding eight inches in diameter, and fifteen feet in height. It hath very ſlender branches, which are armed with recurved thorns.

Theſe plants are propagated by ſeeds, which ſhould be ſown in ſmall pots filled with light rich earth early in the ſpring, and plunged into a hot-bed of tanner's bark. Being tender, they ſhould always be kept in the bark-ſtove, and have a moderate ſhare of heat in the winter; and being placed among other tender exotics of the ſame country, will afford an agreeable variety.

CÆSAR, among the Romans, was a long time uſed for the heir intended, or preſumptive, of the empire; as *king of the Romans* is now uſed for that of the German empire.

The *Cæſars* were a kind of adjuncts or aſſociates of the empire, *participes imperii*. They wore the imperial mantle, purple, and diadem, and walked with other marks of the ſovereign dignity: they were created like the emperors, by putting on the purple robe.

The dignity of *Cæſar* remained the ſecond of the empire, till Alexius Comnenus made Nicephorus Meliſſenus *Cæſar* by contract, and it being neceſſary to confer ſome higher dignity on his own brother Iſaacius, he created him Sebaſtocrator, with the precedency over Meliſſenus, ordering that in all acclamations, &c. Iſaacius Sebaſtocrator ſhould be named the ſecond, and Meliſſenus *Cæſar* the third.

The title took its riſe from the cognomen, or ſurname of the firſt emperor, C. Julius *Cæſar*, which by a decree of the ſenate all the ſucceeding emperors were to bear. Under his ſucceſſor, the appellation Auguſtus being appropriated to the emperors, in compliment to that prince, the title *Cæſar* was given to the ſecond perſon in the empire, though it ſtill continued alſo to be given to the firſt: and hence the difference between *Cæſar* uſed ſimply, and *Cæſar* with the addition of Imperator Auguſtus. Authors are divided as to the origin of the word *Cæſar*, the cognomen of the Gens Julia. The more common opinion is, that the word *Cæſar* comes *à cæſo matris utero*; becauſe his mother's womb was cut open to give him birth.

Some pretend that the laurel crown on medals is never given to *Cæſars*, but only to *Auguſti*; which is overthrown by a medallion of Maximus; not to mention another medal of the lower empire, wherein Criſpus *Cæſar* is crowned with laurel.

Card. Noris obſerves, that the years of the *Cæſars* were frequently marked on their medals; of which we have inſtances in the medals of Conſtantine, Chlorus, and divers others, whoſe years are expreſſed on their coins, though they were never more than *Cæſars*.

CÆSARIAN *ſection*, in *Midwifery*, the operation of extracting the *fœtus* from the mother, whether living or dead, by an inciſion through the *abdomen* into the *uterus*. Thoſe brought into the world in this manner, are called *Cæſares*, and *Cæſones*, *à cæſo matris utero*; as were C. Julius Cæſar, Scipio Africanus, Manlius, and our Edward VI. See Delivery.

Many have exclaimed againſt the cruelty of this operation; and certainly it is too terrible to be uſed on any but the moſt emergent occaſions: but there ſeem three caſes in which it is juſtifiable, nay abſolutely neceſſary. The firſt is, when the mother is dead, either in labour, or by ſome other accident, and the child is perceived to be alive. The ſecond is, when the mother is living, and the *fœtus* dead, and incapable of being extracted by the common paſſages by any help of the midwife. And the laſt, when the mother and child are both living, and there is found an utter impoſſibility of delivery any other way. In all theſe caſes the *Cæſarian* practice is juſtifiable to ſave life, that muſt otherwiſe be inevitably loſt.

In the firſt caſe, the operation muſt be performed immediately after the death of the mother, otherwiſe it is to no purpoſe, for the child can live but a very little time afterwards in the body. The ſurgeon is, in this caſe, to make a crucial inciſion, as in the common diſſections; or a longitudinal one on one ſide, without regard to the courſe of the fibres or veſſels: and if the *fœtus* ſhould have fallen into the cavity of the *abdomen*, through a rupture of the *uterus*, it ſhould then be taken out; or if it be yet in the womb, or in the Fallopian tube, theſe parts muſt be carefully opened, and the child being taken out, muſt have Hungary water, or the like, held at ſome ſmall diſtance from its noſe to revive it, and the navel-ſtring be tied up as uſual. The *fœtus* is not always preſerved, or found alive after this operation; but as there is often a probability of it, it is certainly better to open an hundred dead women in vain, than to loſe the life of one infant.

In the ſecond caſe, when a dead *fœtus* is contained in the cavity of the *abdomen*, in the Fallopian tube, or in a kind of hernia or ſacculus without the *abdomen*, of all which caſes there are inſtances recorded; or when from the particular ſtructure of the parts, as is ſometimes the caſe in crooked women, and others; and when, as in many inſtances, there is no poſſibility of the extraction of the infant, even by inciſion of it, there is no way but the opening the *abdomen*, and, if neceſſary, the *uterus* of the mother, and taking out the *fœtus*; and this is often the means of preſerving the mother, and when in parallel caſes the child is alſo alive, there have been not a few inſtances of both being preſerved.

The *Cæſarian ſection* is recommended by ſeveral authors, and Mr. Helvetius communicated to the Academy of Sciences at Paris, a well-atteſted hiſtory of a woman recovering after the operation had been performed upon her by a midwife. Vid. Hiſt. de l'Acad. des Scienc. 1731.

We have alſo an account of this operation ſucceſsfully performed by a midwife in Ireland. See Med. Eſſ. Edinb. vol. v. art. 37.

There is likewiſe an account of the *Cæſarian* operation ſucceſsfully performed by a butcher on a woman in Ireland. Vid. Phil. Tranſ. N° 461. ſect. 17.

Cyprianus, profeſſor at Franeker, gives an extraordinary caſe of the *Cæſarian* operation, whereby a *fœtus*, which had been dead twenty-one months, was drawn out of the *tuba uteri*, yet the mother preſerved. M. Jobert, phyſician at Chateau Thierri, relates the hiſtory of a woman in the neighbourhood of that place, who was twice delivered of children by the *Cæſarian* operation; the firſt time in 1682, the ſecond time eleven months after, and recovered from both.

See an account of two caſes in which this operation was performed in London, both of which proved fatal to the mothers, with remarks on the hiſtory of the operation, in the Medical Obſerv. and Inq. vol. iv. p. 261. 272. and vol. v. p. 217.—See alſo inquiries relative to this operation, by Monſ. Simon, in the firſt volume of the Memoirs of the Academy of Surgery at Paris.

CÆSARIANS, or Cæsarienses, in *Antiquity*, were miniſters or officials of the procurator *Cæſaris*, to whom belonged the keeping the fiſcal accounts, and taking poſſeſſion of effects devolving or eſcheating to the emperor. Theſe were alſo called *catholiciani*. From the appellation *Cæſarianus* ſome deduce the modern word ſergeant. See Sergeant.

CÆSARIS, *Emplaſtrum*, among *Phyſicians*, a name given to a plaſter compoſed of aſtringents, to prevent abortion.

CÆSIAS, in *Meteorology*, denotes the north-eaſt wind; called, in the Mediterranean, *vento Græco*, or *Greco levante*.

CÆSTUS, a large leathern gantlet, loaded with lead, uſed in the combats, or exerciſes, of the ancient athletæ. It was called *cæſtus*, *à cædendo*, from *cædo*, *to ſtrike*, or *beat*.

Calepine ſays it was a kind of a club with leaden balls hanging from it, ſuſpended by leathern thongs: but he was miſtaken, it being only a leathern thong ſtudded with nails of lead or iron; part of it was twiſted round the hand and arm, to prevent their being broken or diſlocated. See Cestus.

CÆSURA, in the *Ancient Poetry*, is when, in the ſcanning of a verſe, a word is divided, ſo that one part ſeems cut off, and goes to a different foot from the reſt; e. gr.

Menti | ri no | li: nun | quam men | dacia proſunt.

Where the ſyllables *ri*, *li*, *quam*, and *men* are *cæſures*.

Or, it denotes a certain and agreeable diviſion of the words, between the feet of a verſe; whereby the laſt ſyllable of a word becomes the firſt of a foot: as in

Arma virumque cano, *Trojæ qui primus ab oris.*

Where the ſyllables *no* and *jæ* are *cæſures*.

Cæsure, in the *Modern Poetry*, denotes a reſt or pauſe towards the middle of a long Alexandrine verſe; by which the voice and pronunciation are aided, and the verſe as it were divided into two hemiſtichs.

CÆTERIS *paribus*, a Latin term, in frequent uſe among mathematical, and phyſical writers.

The words literally ſignify, *other things being equal*; which expreſſes pretty nearly their meaning as a term. Thus, we ſay, the heavier the bullet, *cæteris paribus*, the greater the range; i. e. by how much the bullet is heavier, if the length and diameter of the piece, and the quantity and ſtrength of the powder, be the ſame, by ſo much will the utmoſt range or diſtance of a piece of ordnance be greater.

Thus alſo, in a phyſical way, we ſay, the velocity and quantity of blood circulating in a given time, through any ſection of an artery, will, *cæteris paribus*, be according to its diameter, and nearneſs to, or diſtance from the heart.

CAFFA, in *Commerce*, cotton cloths painted with ſeveral colours, and of divers deſigns; they are manufactured in the Eaſt Indies, and ſold at Bengal. The length and breadth are not the ſame in all pieces.

CAFFACA, in *Natural Hiſtory*, a name given by the Turks and Tartars to a peculiar kind of earth, of a grey colour, having a light caſt of green in it. It is very ſoft and unctuous, and ſomething reſembles our fullers earth; but is more aſtringent, and adheres very firmly to the tongue: theſe people bathe very frequently, and they uſe this earth on thoſe occaſions.

CAFFILA, a company of merchants or travellers, or both together, who join company, in order to go with more ſecurity through the dominions of the Great Mogul; and through other countries on the continent of the Eaſt Indies. There are alſo ſuch *caffilas*, which croſs ſome parts of the deſerts of Africa, particularly what is called the ſea of ſand, which lies between Morocco, and the kingdoms of Tombut and Gago. This is a journey of four hundred leagues, and takes up two months in going, and as many in coming back; the *caffila* travelling only by night, becauſe of the exceſſive heat of the country. The chief merchandize they bring back conſiſts in gold-duſt.

The *caffila* is properly what is called caravan in the dominions of the Grand Signior, and in other parts of the Eaſt. See Caravan.

On the coaſt of Guzerat, or Cambaya, it ſignifies a ſmall fleet of merchant-ſhips.

CAFRES, according to Ludolf, an opprobrious appellation given by the Arabs to all thoſe who do not profeſs the Mahometan religion. It comes from the Arabic word *cafir*, which ſignifies *infidel*, or *unbeliever*.

CAGADO *de agoa*, in *Zoology*, a name by which the Portugueſe in America call a ſpecies of tortoiſe common there, and uſually known among authors by its Braſilian name JURURA.

Cagado *de terra*, in *Zoology*, the name by which the Portugueſe in America call a remarkable ſpecies of tortoiſe, called by the Braſilians JABOTI. See Testudo.

CAGANUS, or Cacanus, an appellation anciently given by the Huns to their kings.

The word appears alſo to have been formerly applied to the princes of Muſcovy, now called CZAR.

From the ſame alſo, probably, the Tartar title CHAM, or *can*, had its origin.

CAGAO, in *Natural Hiſtory*, the Indian name for a large bird which inhabits the mountains, and feeds on the piſtachia nuts, and many other fruits, all which it ſwallows whole: it is very voracious, and its food paſſes off very quickly; the piſtachias only looſe their rind in its ſtomach, and the almonds their pulpy covering; the kernel and the ſtone being voided whole: it is of the ſize of a common hen, but has a longer neck.

CAGASTRUM is uſed by Paracelſus to denote a morbific *ſemen*, not connate or hereditary, but acceſſional, owing to corruption.

In which ſenſe the word ſtands oppoſed to *iliaſtrum*. The pleuriſy, plague, fever, &c. are ranked by that author in the number of *cagaſtric* diſeaſes.

CAGE, an incloſure made with wire, wicker, or other matter, interwoven latticewiſe, for the detention of wild beaſts or birds.

The word is French, *cage*, formed from the Italian *gaggia*, of the Latin *cavea*, which ſignifies the ſame: *a caveis theatralibus in quibus includebantur feræ*.

Beaſts were uſually brought to Rome ſhut up in oaken or beechen *cages*, artfully formed, and covered or ſhaded with boughs, that the creatures, deceived with the appearance of a wood, might fancy themſelves in their foreſt. The fiercer ſort were pent in iron *cages*, leſt wooden priſons ſhould be broke through.

In ſome priſons there are iron *cages* for the cloſer confinement of criminals.

The French laws diſtinguiſh two ſorts of *bird-cages*, viz. high, or ſinging *cages*, and low, or *dumb-cages*; thoſe who expoſe birds to ſale are obliged to put the hens in the latter, and the cocks in the former, that perſons may not be impoſed on, by buying a hen for a cock.

CAGES, *caveæ*, denote alſo places in the ancient amphitheatres, wherein wild beaſts were kept, ready to be let out for ſport. The *caveæ* were a ſort of iron *cages* different from dens, which were under ground and dark; whereas the *caveæ* being airy and light, the beaſts ruſhed out of them with more alacrity and fierceneſs than if they had been pent under ground.

CAGE, in *Carpentry*, ſignifies an outer-work of timber, encloſing another within it.

In this ſenſe we ſay, the *cage* of a wind-mill.

The *cage* of a ſtair-caſe denotes the wooden ſides, or walls, which encloſe it.

CAGGAW, in *Botany*, a name given, by the people of Guinea, to a plant which they boil in water, and uſe the decoction to waſh the mouth with, as a cure for the tooth-ach. The leaves of this are ſmooth and ſhining, like thoſe of the laurel, but they are thin, and bend like thoſe of the bay. Phil. Tranſ. N° 232.

CAGIT, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands, to a ſpecies of parrot, very common in their woods: it is of a middling ſize, and is all over of a fine green colour.

CAGUI, in *Zoology*, the name of a kind of Braſilian monkey, called alſo *pougi*, of which there are two ſpecies, the one larger, the other ſmaller. The large kind is of a grey colour, with a mixture of black, and its hairs are longer than thoſe of the ſmall ſpecies; its face is round, and it has ſomething of the look of a lion; its ears are ſmall, round, black, and naked; its eyes are alſo black, as is its mouth, and its forehead is covered with a mixture of grey and black hairs; its tail is above a foot long, and is covered with hairs of a tawney colour.

The leſſer *cagui* is a ſmall and tender animal, but has the ſame lion-like face with the larger. Its body is not above ſix fingers breadth long; its tail about ten fingers; its head is ſmall, ſcarce ſo large as a ſmall apple; its noſe is ſmall and elate; its eyes very tender, its mouth little, and its teeth extremely ſharp; its ears are round, and ſurrounded with white hairs in a very beautiful order; its hair is all of a reddiſh tawney toward the body, and toward the ends of a mixture of white and brown; and its tail is variegated with circular rings of white and brown; its voice is extremely ſhrill; it is naturally an extremely lively and nimble creature, but cannot bear the leaſt cold. Ray.

CAHLLO, in *Ichthyology*, a name given by ſome authors to the fiſh uſually called the LUPUS *marinus*, or wolf-fiſh.

CAIA, in the *Turkiſh Military Orders*, an officer ſerving in the poſt of a deputy or ſteward, and acting for the body of the janizaries.

CAIANI, in *Eccleſiaſtical Antiquity*, a ſort of heretics, thus denominated from one Caianus of Alexandria, their leader, otherwiſe denominated APHTHARTODOCETÆ.

The ſame name is ſometimes alſo given to the ſect of Cainians or Cainites.

CAIC, CAIQUE, CAICA, in *Sea-language*, is uſed to denote the ſkiff, or ſloop, belonging to a galley.

The Coſſacs give the ſame name, *caic*, to a ſmall kind of bark uſed in the navigation of the Black ſea. It is equipped with forty or fifty men, all ſoldiers: their employment is a kind of piracy. The Turks have alſo a ſort of *caics*, which ſome render by *biremes*.

CAJEPUT, an oil brought from the Eaſt Indies. The ſmell of the oil of *cajeput* reſembles that of cardamoms; hence Dr. Trew judges the plant from which it is obtained to be the *elegans meligettæ ſpecies*, deſcribed by Sobelius, or the *granis paradyſi ſive meligettæ affinis fructus.* Four or five drops of this oil of *cajeput*, in a proper liquor, is recommended as an excellent nervous medicine, and as of great efficacy in the cardialgia.

CAIMACAN, or CAIMACAM, a dignity in the Ottoman empire, anſwering to that of lieutenant, or vicar, among us.

The word is compoſed of the two Arabic words, *Caim machum*, q. d. *he who holds the place, or diſcharges the function of another.*

There are uſually two *caimacans*: one reſides at Conſtantinople, who is the governor thereof: the other attends the grand vizir, in quality of his lieutenant. Sometimes there are three *caimacans*; one conſtantly attending the grand ſignior, another the grand vizir, and a third conſtantly at Conſtantinople, who examines affairs of policy, and regulates them in great meaſure. The *caimacan* that attends the vizir, only officiates when at a diſtance from the grand ſignior; his function ceaſing, when the vizir is with the ſultan. The *caimacan* of the vizir is his ſecretary of ſtate, and the firſt miniſter of his council.

CAINITES, or CAINIANS, a ſect of ancient Gnoſtics, that ſprung up towards the cloſe of the ſecond century, and paid extraordinary honours to thoſe perſons repreſented in Scripture as the worſt of mankind; ſo called from Cain, whom they eſteemed their patriarch, and the chief object of their veneration. They held, that Cain and Eſau, Lot, and thoſe of Sodom, were born of a moſt eminent celeſtial virtue; that Abel, on the contrary, was born of a virtue much leſs eminent: to Cain, and others of the ſame order, who, according to them, had a mighty knowlege of all things, they aſſociated Judas, whom they held in ſo much eſteem, that they had a book among them called the goſpel of Judas. S. Epiphanius relates, and at the ſame time refutes, their errors.

CAINITO, in *Botany*, the name given by Plumier to the *ſtar*-APPLE.

CAINS, in the iſland of Candia, denote Greeks revolted, and retired to the Venetians, either at Suda, or Spina longa; who, in time of war, burn, pillage, and commit all manner of cruelties on their ancient brethren under the Turks.

When a *cain* or falſe brother is taken, there is no mercy for him; they either impale him, or put him to the ganche.

CAJOU, CASHEW, or CASSU. See ANACARDIUM.

CAIRINA, in *Zoology*, a name by which ſome authors have called the Muſcovy duck.

CAISSON, in the *Military Art*, is ſometimes uſed for a cheſt; and in particular for a BOMB-CHEST.

The *caiſſon* is conſidered as a ſuperficial MINE, or *fourneau*. See MINE.

CAISSON is alſo a covered waggon to carry bread, or ammunition.

CAISSON is alſo uſed for a kind of cheſt uſed in laying the foundations of the piers of bridges. See BRIDGE.

CAITAIA, in *Zoology*, the name of an American monkey, remarkable for its ſweet ſmell; it has indeed ſomewhat of a ſcent of muſk about it; its hair is long, and of a whitiſh yellow colour; its head is round; its forehead depreſſed, and very ſmall; its noſe ſmall and flatted, and its tail arched. It is eaſily tamed and kept about houſes, but is very clamorous and quarrelſome.

CAKE, a finer ſort of BREAD, denominated from its flat, round figure.

We meet with divers compoſitions under the name of *cakes*; as *ſeed-cakes*, made of flour, butter, cream, ſugar, coriander and caraway ſeeds, mace, and other ſpices and perfumes baked in the oven; *plum-cake*, made much after the ſame manner, only with fewer ſeeds, and the addition of currants; *pan-cakes*, made of a mixture of flour, eggs, &c. fried; *cheeſe-cakes*, made of cream, eggs, and flour, with or without cheeſe-curd, butter, almonds, &c. *oat-cakes*, made of fine oaten flour, mixed with yeſt, and ſometimes without, rolled thin, and laid on an iron or ſtone to bake over a ſlow fire; *ſugar-cakes*, made of fine ſugar beaten and ſearced with the fineſt flour, adding butter, roſe-water, and ſpices; *roſe-cakes*, *placentæ roſaceæ*, are leaves of roſes dried and preſſed into a maſs, ſold in the ſhops for epithems. See EPITHEM.

CAKE-*wax*, a denomination ſometimes given to the white or virgin-WAX.

CAKE-*ſoap*, ſtands diſtinguiſhed from ſoft-ſoap, and ball-ſoap. See SOAP.

CALABA, in *Botany*, the name given by Plumier to a genus of plants afterwards called by Linnæus CARYOPHYLLUM.

CALABASH, in *Botany*. See MELOPEPO.

CALABASH-*tree*, *Creſcentia*, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Its characters are theſe: the flower hath one petal which is irregular, having a curved gibbous tube; it hath an empalement of one leaf, cut into two obtuſe ſegments, which are concave. It hath four ſtamina, two of which are the length of the petal, the other are ſhorter; with an oval germen, which afterward becomes an oval or bottle-ſhaped fruit with a hard ſhell, encloſing many flat, heart-ſhaped ſeeds. There are two ſpecies, the firſt of which grows naturally in Jamaica, and in all the Leeward iſlands; it has a thick trunk, covered with a whitiſh bark, which riſes from twenty to thirty feet high, and at the top divides into many branches, forming a large regular head.

From the lower part of the tube of the flower, ariſes a long ſlender foot-ſtalk, ſupporting an oval germen, which afterward turns to a large fruit of different forms and ſize, ſometimes with a contracted neck like a bottle, and ſo large, that when the pulp and ſeeds are cleaned out, the ſhells will contain three pints or two quarts. Theſe fruits are covered with a thin ſkin of greeniſh yellow when ripe, which is peeled off; and under it is a large ligneous ſhell, encloſing a yellowiſh ſoft pulp, of a tart unſavoury flavour, ſurrounded with a great number of ſeeds. See BAOBAB.

Theſe fruits are ſeldom eaten, but the ſhell is converted to many uſeful purpoſes when dried; and ſerves to make cups, ladles, and many other articles of houſehold furniture; for caſes to put divers kinds of goods in, as pitch, roſin, or the like.

The word is Spaniſh, *calabaça*, which ſignifies the ſame. The Indians alſo, both of the North and South ſea, put the pearls they have fiſhed in *calabaſhes*, and the negroes on the coaſt of Africa do the ſame by their gold-duſt.

The ſmaller *calabaſhes* are alſo frequently uſed by theſe people as a meaſure, by which they ſell theſe precious commodities to the Europeans.

CALABRINI, in *Botany*, a name by which ſome authors call the rough SPLEENWORT, or *lonchitis aſpera*. Ger. Emac. Ind.

CALADE, in the *Manege*, a deſcent or ſlope in a riding-ground, by which to bring a horſe to bend his haunches, and form his ſtop, with the aids of the calves of the legs, bridle, and caveſon, ſeaſonably given.

The *calade* is alſo called, by the French, *baſſe*. They ſay, to ride or gallop down the *calade*.

CALAE, CALAEM, or CALAEMUM, denotes a ſpecies of Indian tin, which by force of fire is tranſmutable into ceruſs, like that made of our lead.

Alchemiſts alſo pretend, that it may be converted by cementation into ſilver; and allege it as an argument in behalf of a poſſibility of tranſmutation of other metals into gold.

CALAINUS, in *Natural Hiſtory*, a name given to the ſubſtance otherwiſe called CALLIMUS.

CALAMANCO, in *Commerce*, a woollen ſtuff manufactured in Brabant and in Flanders, particularly at Antwerp, Liſle, Tournay, Turcoin, Roubaix, and Lannoy. There are alſo a great many made in England.

It is commonly woven wholly of wool; there are ſome, however, wherein the warp is mixed with ſilk, and others with goat's hair. There are *calamancos* of all colours, and diverſly wrought. Some are quite plain, others have broad ſtripes adorned with flowers; ſome with plain broad ſtripes; ſome with narrow ſtripes; and others watered. This is alſo no inconſiderable branch of the woollen manufacture in England, both for home wear and exportation.

CALAMARIÆ, in *Botany*, an order of plants in the Fragmenta Methodi Naturalis of Linnæus. See CULM.

CALAMBA, or CALAMBAC, in *Commerce*, a kind of wood brought from China, uſually ſold under the denomination of *lignum* ALOES, or AGALLOCHUM.

Sir Phil. Vernatti makes *calambac* and *lignum aloes* ſynonymous. Others ſeem to diſtinguiſh, reſtraining *calamba* wood to the beſt ſort of aloes wood, growing chiefly in Malacca, and Sumatra; and much uſed in India for making of beads and crucifixes. Phil. Tranſ. Nº 43. p. 863.

CALAMIFEROUS, a denomination given by ſome to thoſe otherwiſe called CULMIFEROUS plants.

CALAMINARIS *lapis*, CALAMINE-*ſtone*, a kind of foſſile of ſome uſe in medicine, but of more in foundery; being uſed to make copper yellow, i. e. to convert it into braſs. It is either of a browniſh colour, as that of Germany, and England; or reddiſh, as that about Liege, and in ſome parts of France, which is accounted the beſt, becauſe turning yellow by calcination. It is dug out of mines, uſually in ſmall pieces; having always eyes, ſometimes veins, of lead in it; though it be not always found in lead-mines. We have mines of *calamine* at Wrington in Somerſetſhire, and elſewhere. It is generally dug in barren rocky ground; its courſes running, uſually at ſix o'clock, as they call it, i. e. from eaſt to weſt; ſometimes at nine, and ſometimes at twelve; or perpendicular, which is accounted the beſt.

Dr. Lawſon was the firſt who publicly proved *calamine* to be the ore of ZINK.

Calamine-ſtone is a ſpecies of *foſſile* CADMIA; ſome even take it for the true CADMIA of Galen and the ancients, to which it is certain it bears a near reſemblance: when burnt, its fume gathers and grows on the ſides of the chimney.

When dug, it is waſhed, or buddled, as they call it, in a running water, which carries off the impure and earthy parts; leaving the lead, *calamine*, and ſparry parts, at bottom; they then put it in a ſieve, and ſhaking it well in water, the lead mixed with it ſinks to the bottom, the ſparry parts get to the top, and the *calamine* lies in the middle: thus prepared, they bake it in an oven or reverberatory furnace four or five hours; the flame being ſo contrived, as to paſs over, and ſo to heat and bake the *calamine*; ſtirring and turning it all the while with iron rakes. Or, it may be roaſted or calcined by ſetting fire to a conical pile, compoſed of horizontal layers of *calamine* and of charcoal placed alternately one upon the other, and of a lower ſtratum conſiſting of large pieces of wood; in which lower ſtratum are four horizontal channels, through which the air maintaining the fire paſſes to the centre, and it thence ariſes through a chimney or perpendicular empty ſpace, left for that purpoſe, along the axis of the conical pile. The length of time and degree of heat for this operation, are different according to the qualities of the mineral. This done, they beat it to powder, and ſiſt it; picking out of it what ſtones they find. And thus it is fit for uſe.

For the manner of applying *calamine* in the preparation of braſs, ſee BRASS.

Beſides the two natural *calamines*, this and cobalt, there are two artificial ones: the beſt is that called *pompholyx*, the other *tutty*.

Calamine is of ſome medicinal virtue; being aſtringent, deſiccative, and deterſive; and is much uſed for taking off films from the eyes of horſes, &c.

CALAMINT, in *Botany*, an officinal plant, whoſe leaves are reputed warm, aperient, and diaphoretic, and enter ſeveral alexipharmic compoſitions. It is enumerated by Miller, among the ſpecies of *meliſſa*, or baum. For its general characters therefore, ſee BAUM.

There are three ſorts of *calamint* in uſe, viz. the *ſylveſtris*; the *vulgaris*, or *montana*; and *paluſtris*, or *aquatica*; of which the firſt ought to be the officinal ſort, though the ſcarcity of it among us uſually brings the ſecond to market in its ſtead; the third is taken into the college diſpenſatory, but rarely uſed. In the college diſpenſatory, we find a compound powder denominated from *calamint*. See Phil. Tranſ. vol. xlix. pt. ii. p. 838.

CALAMISTRUM, in *Natural Hiſtory*, a name by which Linnæus and ſome authors have called a ſmall plant, known among us by the name of *pepper-graſs*, from its having graſſy leaves, and round globules at their inſertions, reſembling pepper-corns. Mr. Vaillant has more properly named it PILULARIA.

CALAMITA, or CALAMITIS, is uſed to denote the MAGNET or loadſtone.

CALAMITA *alba*, in *Natural Hiſtory*, the name of an earth dug in Spain and Italy, of a hard texture, a white colour, and ſtyptic taſte; they pretend that this attracts fleſh in the ſame manner as the magnet does iron, and thence call it MAGNES *carneus*.

CALAMITA *ſtorax*. See STORAX.

CALAMITES, in *Natural Hiſtory*, a name given by ſome to the oſteocolla, which when in ſmall pieces, ſometimes pretty exactly reſembles the barrel of a quill; others have called ſome of the foſſile coralloides by this name, there being frequently in them the reſemblance of ſeveral quills cemented together in ſtone.

CALAMITIS is uſed for a ſpecies of artificial *cadmia*, found adhering to the ſticks, ladles, and other utenſils wherewith they ſtir the copper when in fuſion in the furnace. It is denominated *calamitis*, from the Latin *calamus*, *a reed*, on account of its reſemblance to the figure of a reed cloven in the middle.

CALAMUS, in *Botany*, a genus of the *hexandria monogynia* claſs of plants: the calyx conſiſts of ſix leaves; it has no corolla; and the fruit is a ſingle-ſeeded berry.

CALAMUS is commonly uſed to denote the ſame with *arundo*, a reed, ruſh, cane, or flag.

CALAMUS, in the *Paſtoral*, denotes a ſimple kind of pipe, or fiſtula, the muſical inſtrument of the ſhepherds and herdſmen; uſually made either of an oaten ſtalk, or a reed.

CALAMUS *aromaticus*, in *Pharmacy*, a ſpicy, bitteriſh root, produced by a peculiar kind of water-plant, growing in the Levant, and even in ſeveral parts of England. See ACORUS.

The beſt is that which is greyiſh without, and reddiſh within; its pulp white, and taſte ſomewhat bitter; but its leaves, as well as roots, ſweet-ſcented.

The agreeable flavour and peculiar taſte of the root, are owing to an eſſential oil. Neumann.

CALAMUS *indicus petrifactus*, in the *Natural Hiſtory of the Ancients*, a name given to a ſubſtance found often in the foſſile kingdom, uſually of about three inches long, half an inch broad, and one third of an inch thick, and covered all over its ſurface with large round figures, in form of radiated ſtars within. This very much reſembled in external appearance the root of our common *calamus aromaticus* of the ſhops turned into ſtone, and ſeems to have been vulgarly ſuppoſed to be that ſubſtance petrified. The more accurate among the earlier writers, however, have by no means countenanced ſo wild a conjecture; and Theophraſtus, though he records the ſubſtance under that name, as it had no other in his time, yet joins it to the corals which, he ſays, grow in the ſea, and are vegetables; and adds, that thoſe, and this ſubſtance, are properly the ſubjects of another treatiſe, not of a hiſtory of ſtones. See *Tab. of Foſſils, Claſs* 7.

This author's placing it among the CORALS is perfectly right, ſince the ſpecimens of it now found are plainly no other than corals of the ſtellated kinds, which have been long buried in the earth.

CALAMUS *odoratus*, in the *Materia Medica*, the name of a reed of the Eaſt Indies, of a very ſweet ſmell. Our CALAMUS *aromaticus*, which is the root of a water-plant, is a very different ſubſtance.

CALAMUS *ſcriptorius*, properly denotes a reed, or ruſh to write with, anſwering the uſe of the ancient ſtylus and modern pen.

The ancient Egyptian *calamus* was a ſort of *arundo aquatica* growing plentifully about Memphis, and on the banks of the Nile; whence it was alſo called *calamus Memphiticus, Niloticus*, &c.

CALAMUS *ſcriptorius*, in *Anatomy*, is a dilatation of the fourth ventricle of the BRAIN; ſo called from its figure, which reſembles that of a quill.

CALAMUS *aucupatorius*, or *calamus ſtructus*, among *Fowlers*, ſignifies a *bird*-CALL.

CALAMUS alſo denotes a ſort of meaſure otherwiſe called CANNA, CANE, or reed.

CALANDRE, in *Natural Hiſtory*, a name given by the French writers to an inſect that does vaſt miſchief in granaries. It is properly of the ſcarab claſs.

The female lays a conſiderable number of eggs, and the increaſe of theſe creatures would be very great, but nature has ſo ordered it, that while in the egg ſtate, and even while in that of the worm, they are ſubject to be eaten by mites; theſe little vermin are always very plentiful in granaries, and they deſtroy the far greater number of theſe larger animals.

CALANGAY, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a ſpecies of parrot very common there; it is all over white, and has a creſt of white feathers on its head; it is of the ſize of a pigeon, and is eaſily kept tame, and learnt to talk. It is called alſo in ſome of the Philippines *catatua* and *abacay*.

CALASH, or CALESH, a ſmall light kind of chariot, or chair, with very low wheels, uſed chiefly for taking the air in parks and gardens.

The word is French, *caleche*, which Menage derives from the Latin *carrus, carri, carriſcus, carriſca, carreſca, caleſca, caleche*.

The *calaſh* is for the moſt part richly decorated, and open on all ſides, for the conveniency of the air, and proſpect; or at moſt incloſed with light mantlets of waxed cloth, to be opened and ſhut at pleaſure.

In the Philoſophical Tranſactions, we have a deſcription of a new ſort of *calaſh*, going on two wheels, not hung on traces, yet eaſier than the common coaches; having this further advantage, that whereas a common coach will overturn if one wheel goes on a ſurface a foot and a half higher than that of the other, this will admit of a difference of three feet and one third, without danger of overturning. Add, that it would turn over and over, that is, after being turned ſo as that the ſpokes are parallel to the horizon, and one wheel flat over the head of him that rides in it, and the other flat under him, it will turn once more, by which the wheels are placed in *ſtatu quo*, without any diſorder to the horſe, or rider. N°. 172. p. 1028.

CALASIRIS, or CALASSIS, in *Antiquity*, a linen tunic worn by the Phœnician, Ægyptian, Roman, and other prieſts. We alſo find mention of the *calaſiris* as worn by the ſoldiers, and by women. In which laſt ſenſe it ſeems to have been a knot in the women's gown, whereby it was drawn about the neck.

CALATHIANA *viola*, in *Botany*, a name given by many writers to a ſpecies of GENTIAN, called alſo by others *pneumonanthe*.

CALATHUS, in *Antiquity*, a kind of hand-baſket made of light wood, or ruſhes; uſed by the women ſometimes to gather flowers, but chiefly, after the example of Minerva, to put their work in.

The figure of the *calathus*, as repreſented on ancient monuments, is narrow at the bottom, and widening upwards, like that of a top. Pliny compares it to that of a lily. Hiſt. Nat. lib. xxi. cap. 5.

The *calathus* or work-baſket of Minerva, is no leſs celebrated among the poets, than her diſtaff.

CALATHUS is alſo uſed to denote a drinking-cup. Pliny ſeems likewiſe to uſe it for the CALYX of a flower. Hiſt. Nat. lib. xxv. cap. 7.

CALATOR, in *Antiquity*, a cryer, or officer appointed to publiſh ſomething aloud, or call the people together.

The word is formed from καλεω, *voco, I call*. Such miniſters the pontifices had, whom they uſed to ſend before them when they went to ſacrifice on *feriæ* or holidays, to advertiſe the people to leave off work.

The magiſtrates alſo uſed *calatores*, to call the people to the COMITIA, both *curiata* and *centuriata*. The officers in the army alſo had *calatores*; as had likewiſe many private families, to invite their gueſts to entertainments.

CALATRAVA, a military order, inſtituted in 1158, by Sancho III. king of Caſtile, on the following occaſion. The Moors going to attack the little city *Calatrava*, and the Templars, who held it, ſurrendering it up to the king, on a ſuſpicion of their inability to defend it; Diego Velaſquez, a Ciſtercian monk, but a man of quality, perſuaded Raimond abbot of Fitero, a monaſtery of Ciſtercians, to beg *Calatrava* of the king. He obtained it; and Raimond and Diego put themſelves in it; being followed by a great number of people who joined them out of zeal, for the defence of *Calatrava*. The Moors abandoning the enterprize, many of thoſe, who came to the defence of the city, entered the order of the Ciſtercians; and that under a habit more fit for military than monaſtic exerciſes. Accordingly, they began to make excurſions on the Moors; and this was the riſe of the order of *Calatrava*.

The firſt grand maſter was Garcias; under whoſe government the order was approved by Alexander III. in 1164, and confirmed by Innocent III. in 1198. In 1489, Ferdinand and Iſabella, with the conſent of pope Innocent VIII. reunited the grand maſterſhip of *Calatrava* to the Spaniſh crown: ſo that the kings of Spain are now become perpetual adminiſtrators thereof.

The knights bear a croſs gules, fleury with green, &c. Their rule and habit was originally that of the Ciſtercians, but their dreſs was a little ſhortened, on account of their exerciſes: and in proceſs of time they were permitted a ſecular habit.

Alphonſus IX. having recovered Alcantara from the Moors, in the year 1212, committed the cuſtody and defence thereof, firſt to the knights of *Calatrava*; and, two years afterwards, to the knights of the Pear-tree, another military order inſtituted in 1170, by Gomez Fernand, and approved by pope Alexander III. under the rule of St. Benedict: upon which they changed their name, and took the denomination of knights of Alcantara.

CALAUDRA, in *Zoology*, the name of a bird of the lark-kind, and of the ſhape of the common lark, but conſiderably larger. This bird is either the ſame with the common Engliſh bunting, called by authors *emberiza alba*, or very like it.

CALAURITIS, in the *Materia Medica of the Ancients*, a name given to a ſort of litharge. We find the litharge made in the ſame operation will be of different colours, according to the degree of heat it receives; and we have accordingly dignified it with the founding names of litharge of gold, and litharge of ſilver: the Greeks went yet farther, and added to theſe a third kind, which they called litharge of lead, or *molybditis*. All theſe ſorts of litharge were brought in great abundance from Calauros, a ſmall iſland near Crete, to the Greeks, for their uſe in medicine.

CALCADIS, in the *Materia Medica*, a name given by the Arabians to white vitriol, or to ſome white vitriolic mineral.

CALCAGIUM, in *Middle Age Writers*, a tax or contribution paid by the neighbouring inhabitants towards the making or repairing a common cauſeway.

CALCANEUM, or Calcaneus, in *Anatomy*, the ſame as calx, os calcis, calcar, or the heel-bone.

It lies under the *aſtragalus*, to which it is articulated by *ginglimus*; behind it is a large protuberance, which makes the heel, and into which the *tendo Achillis* is inſerted.

CALCANTHUM, in *Mineralogy*. See Vitriol.

CALCAR, in *Anatomy*, the ſame with calcaneum.

Calcar, in *Glaſs-making*, is the name of a ſmall oven, or reverberatory furnace, in which the firſt calcination of ſand and ſalt of pot-aſhes is made, for the turning them into what they call frit.

CALCAREOUS, ſomething that partakes of the nature and qualities of calx, or lime.

We ſay, a *calcareous* earth, *calcareous* ſtone.

Liſter ſpeaks much of a *calcareous* nitre.

Several authors attribute the heat of *thermæ*, or hot ſprings, to the admixture of a *calcareous* earth or ſtone with the water.

Calcareous earths and ſtones, properly ſo called, have been found by experiment to conſiſt of the following component parts; viz. quick-lime, or pure *calcareous* earth; fixed air, which, when extricated from them, is permanently elaſtic; and water. But if the term is more generally applied according to common uſe, the earths and ſtones calcined for making quick-lime, are intermixed with various other ſubſtances, ſuch as ſand, or vitrifiable earth, clay, and metallic calces. Theſe earths acquire cauſticity, and loſe a great part of their weight by calcination, and by diſſolution in acids, in conſequence of the diſcharge of a conſiderable quantity of fixed air. See Air *fixed*, Phosphorus, and *Quick*-Lime.

CALCAREUS *lapis*, the ſtone of which lime is made.

The *lapis calcareus* is found unfit for the making of glaſs, by reaſon of the acid ſalt it abounds with.

CALCEARIUM, or Calciarium, in *Antiquity*, a donative, or largeſs beſtowed on the Roman ſoldiers for buying ſhoes.

In the monaſteries, *calcearium* denoted the daily ſervice of cleaning the ſhoes of the religious.

CALCEDONIANS, a denomination given by Copt writers to the Melchites, on account of their adherence to the council of Calcedon. See Cophti, Monophysites, &c.

CALCEDONY, *Lapis* Calcedonius, one of the loweſt-prized among precious ſtones; diverſified with various colours, partly tranſparent, and partly opake.

Salmaſius derives the word, by corruption, from *carchedonius*; taking the modern *calcedony* to be the ſame with the *lapis carchedonius* of the ancients.

The *calcedony*, or *calcidony*, nearly reſembles the common agate, and is reputed a ſpecies thereof: its colour is a miſty grey, clouded with blue, yellow, or purple. It is ſuppoſed to be the white agate of the ancients; though we ſometimes find pieces of it blackiſh.

It is very fit for the graver; and much uſed, either to engrave arms, &c. upon, as being harder and preferable to cryſtal, if good; or to paint them on the backſide. In ſome parts, vaſes, cups, religious beads, &c. are made thereof. The cleareſt and beſt is that with a pale caſt of blue.

The Italians make it into beads, and both they and the Germans call theſe *caſſidonies*; but they are not determinate in the uſe of the word, but call beads of ſeveral of the agates by the ſame name.

Many chimerical virtues are attributed to this ſtone; but its true medicinal virtues ſeem to conſiſt in its abſorbent quality, when reduced to a fine powder, and exhibited like other earthy and abſorbent powders. But becauſe apothecaries have other ſubſtances of the ſame virtues, and, at the ſame time, far more eaſily prepared, it is rarely preſcribed by the moderns.

Neri ſhews how to make artificial *calcedonies* of the colour of agate, and oriental jaſpers.

Calcedonius is alſo a term uſed by the jewellers for a defect in ſome precious ſtones; when, in turning them, they find white ſpots, or ſtains, like thoſe of the *calcedony*.

This defect is frequent in granates and rubies. The lapidaries uſually remedy it by hollowing the bottom of the ſtone.

CALCENA, a term uſed by ſome medicinal writers to denote a morbid tartareous humour in the body.

CALCEOLUS, in *Botany*. See Lady's *ſlipper*.

CALCHACCA, in *Botany*, a name by which ſome authors have called the tree whoſe bark is the *caſſia lignea*, uſed in medicine.

CALCHOCRUM, in *Botany*, a name by which ſome authors call the *fumaria* or *fumitory*.

CALCHOPHONOS *lapis*, among the *Ancients*, a name given to a ſtone of a black colour and conſiderable hardneſs, which when cut into thin plates, and ſtruck againſt by any other hard body, gave a ſound like that of braſs: it ſeems to have been one of the hard black marbles.

CALCIFRAGA, in *Botany*, a name given by ſome authors to ſamphire.

The ancients alſo gave the appellation *calcifraga* to the ſea-fennel, though on a different account, becauſe of its ſprouting up in the middle of ſtones.

CALCIFRAGUS, *ſtone-breaking*, an appellation given by ſome to the *ſcolopendrium*; by others to pimpernel, on account of their lithontriptic quality.

CALCINATION, the act of reducing any matter into a calx, or very ſubtile white powder, by fire, whereby it is deprived of its volatile and inflammable principles; ſometimes alſo called *chemical pulverization*.

Calcining differs from mere burning, as the latter leaves the bodies of a black colour, the former of a white one. If white wine, tartar, or the white cryſtals of ſuch tartar, are burnt without being truly *calcined*, the *caput mortuum* will be black. But if the *calcination* be continued till the tartar is perfectly reduced to aſhes, and kept long enough in a ſtrong fire, the remaining calx will be white. And ſo we ſee, that not only other vegetable ſubſtances, but even white woods, as the hazel, will yield a black charcoal, and afterwards whitiſh aſhes. Thus alſo animal ſubſtances, naturally white, as bones and egg-ſhells, grow black upon being burnt, and white again when perfectly *calcined*.

Hence the rule *aduſta nigra, peruſta alba*; which yet does not hold ſo univerſally, but that Mr. Boyle finds ſeveral exceptions to it. Lead *calcined* by a ſtrong fire turns to minium; which is of a red colour.

Calcination alſo differs from mere combuſtion, or burning, in that the former requires the preſence and aſſiſtance of the air, whereas the latter may be done without it. Thus a coal kept in a veſſel exactly cloſed, will not be *calcined* though kept ever ſo long in a ſtrong fire; but when taken out in the open air, readily falls to pure white aſhes, without the help of any new *calcination*.

By *calcination*, the parts of bodies are not only much broken, but rarified and rendered ſpecifically lighter. Thus the gravity of crude lead compared to water, is above eleven to one; of *calcined* lead, only as nine to one. And the like holds of other metals: yet in ſome bodies *calcination* ſometimes increaſes the abſolute gravity, while it diminiſhes the ſpecific. Thus four ounces of regulus of antimony, by being kept in fuſion an hour and a half, will gain two drams and a half, notwithſtanding all that it has loſt by evaporation; the reaſon of which ſeems difficult to aſſign.

The increaſe of weight in minium, which is prepared from *calcined* lead, is ſaid to amount to one fourth the weight of the lead; and the lead recovered from the minium, to be one twentieth leſs than the original weight of the metal: and the quantity of lead recoverable, is leſs in proportion to the vehemence and continuance of the *calcination*.

The increaſe of weight, which the imperfect or calcinable metals acquire by *calcination*, has been long known to the chemiſts, though, before the modern diſcoveries with reſpect to fixed air, they had not been able to aſſign any probable cauſe of it. Dr. Pemberton, in his Chemical Lectures, obſerved, that the air, by acting on the inflammable ſubſtance either in metals or other bodies, expels it from them, and unites itſelf (in part at leaſt) to the remains of the body; and to this he aſcribed the additional weight acquired by their calces; that portion of air which loſes its elaſticity, and ſeems to be conſumed by burning bodies, being abſorbed by them in the proceſs of *calcination*. It had not eſcaped the notice of the ingenious Dr. Hales, that the calces of metals contain air of ſome kind or other, and that this air contributes to their additional weight. Many facts have ſince been alleged in proof of this obſervation. Dr. Prieſtley found, that no weight is either gained or loſt by the *calcination* of tin in a cloſe glaſs veſſel; and in an experiment for revivifying the calx of lead, he perceived a conſiderable generation of air; and he afterwards expelled a quantity of air, by heating a ſmall phial filled with red lead, about four or five times the bulk of the lead, together with a ſmall quantity of water; whence he concluded, that the water and air together muſt be the cauſe of the addition of weight in the calx: and this, he apprehends, is, in ſome inſtances, owing to a nitrous acid attracted from the common air in which metallic ſubſtances are calcined. M. Lavoiſier had about the ſame time made a ſimilar diſcovery, and he explains the whole proceſs of *calcination* by means of the combination of fixed air with metals converted into calces. He obſerved, that metals cannot be calcined in veſſels that are either cloſely ſtopped or exhauſted of air; that the facility of *calcination* depends on the extent of ſurface in the metal, that is expoſed to the air; that the efferveſcence which takes place, when the metallic ſubſtance paſſes from the ſtate of a calx to that of a metal, is no more than the ſeparation of an elaſtic fluid which before exiſted under a fixed form, and at this inſtant recovers its elaſticity; and that whenever a metal paſſes from its metallic ſtate to that of a calx, there is an abſorption of the ſame fluid, and that the *calcination* is nearly proportionable to this abſorption. Dr. Prieſtley had obſerved, that a diminution in the volume of air was produced by the *calcination* of metals; and M. Lavoiſier adds, that this diminution is nearly anſwerable to the augmentation of weight in the metal. He concludes, however, from ſome ſubſequent experiments, that the air which may be obtained from all metallic calces, is not fixed but common air, in a ſtate rather more pure than that which we uſually breathe; and that the fixed air, which is produced from reductions in the common method, does not proceed from the calx, but from the charcoal employed in the proceſs: whereas Dr. Prieſtley found, that ſeveral of the metallic calces yielded fixed air by heat only, as we have already obſerved, without any addition of charcoal. See Pemberton's Courſe of Chemiſtry, p. 245. Prieſtley's Exp. and Obſ. on Air, vol. ii. p. 194, &c. Lavoiſier's Eſſays Phyſical and Chemical, vol. i. pt. ii. chap. 5, 6, 7, and Appendix.

CALCINATION, in a more extenſive ſenſe, includes alſo the ſolution of metalline bodies by corroſive matters.

In this ſenſe, *calcination* is divided into *actual*, and *potential*.

CALCINATION, *actual*, is that effected by actual fire, of wood, coals, or other fewel, raiſed to a certain heat, according to the nature of the ſubſtance to be calcined.

Actual *calcination* is ſubdivided into *incineration*, and *reverberation*. To this head alſo belongs the *extinction* of things ignited.

CALCINATION, *potential*, is that procured by potential fire; viz. by ſalts, ſulphurs, and other drugs, which have, as it were, the force of fire; as ſtrong waters, corroſive ſpirits, &c.

Gold is calcined by a reverberatory fire, with mercury, and *ſal ammoniac*; ſilver with common ſalt, and alcali ſalt; copper with ſalt, and ſulphur; iron with *ſal ammoniac*, and vinegar; tin with antimony, lead, and ſulphur; mercury with *aqua fortis*: this laſt, alſo, as well as moſt other minerals, calcines with fire alone, without any other ingredient.

CALCINATION, *potential*, *philoſophical*, or *chemical*, comprehends AMALGAMATION, PRECIPITATION, EVAPORATION, FUMIGATION, and CÆMENTATION; and DETONATION by nitre is alſo reduced by Libavius to this ſpecies of *calcination*.

CALCINATION *by dry corroſion*, is that effected without moiſture, by the application of dry corroſive ſalts; to which head belongs CÆMENTATION.

CALCINATION *by vaporous corroſion*, is when metalline bodies being reduced to thin plates, are expoſed to the action of an acrimonious fume or vapour.

There are divers ways of performing this; ſometimes the plates are ſuſpended over *aqua fortis*; ſometimes over vinegar, or the recrements of preſſed grapes; ſometimes, eſpecially the nobler metals, over melted lead or quickſilver, &c.

CALCINATION, *humid*, is either by vapour, or immerſion. Iron is calcined to a ſubtile crocus, by a vaporous corroſion over ſtrong *aqua fortis*. Lead is calcined to cerus over vinegar, copper over the recrements of grapes.

CALCINATION, *humid*, *by immerſion*, is when the body is dipt into the corroſive fluid, and is either performed by amalgamation or precipitation.

CALCINATION, *reverberatory*, properly denotes the ſolution or reduction of a body into a CALX or impalpable powder; ſometimes alſo denominated ALCOHOL.

CALCINATION *of gold and ſilver by electricity*, was effected by Mr. Canton, who by the heat of electrical exploſions, produced numberleſs beautiful globules of tranſparent glaſs, and alſo others tinged with all the varieties of colour from thoſe metals. He made it alſo probable that the *black duſt* diſcharged from the braſs chain, and other pieces of metal in ſuch experiments, is the calx or glaſs of the metal reduced to ſmaller particles than the laws of optics require to produce colour. Hiſt. of Electr. edit. 1775. vol. ii. p. 292.

CALCINATUM, a CALX or body which has undergone CALCINATION.

CALCINATUM *majus*, is uſed by alchemiſts for any thing rendered ſweet by chemical art, which of its own nature was not ſo; as *mercurius dulcis*, or *ſaccharum ſaturni*.

CALCINATUM *minus*, denotes a thing which is naturally ſweet, as ſugar, manna, &c.

CALCIS *Os*. See OS *Calcis*.

CALCITRAPA, in *Botany*. See CENTAURY.

CALCITRAPOIDES, in *Botany*, thorny knap-weed. See CENTAURY.

CALCULARII, in *Antiquity*, a ſort of jugglers who practiſed ſlight of hand. Their art conſiſted in laying ſeveral calculi, or counters on the table, then covering them with cups, and ſhifting and changing them with dexterity, like what is practiſed by our jugglers.

CALCULARY *of a pear*, a congeries of little ſtony knots diſperſed through the whole parenchyma of the fruit.

The *calculary* is no vital, or eſſential part of the fruit; the ſeveral knots whereof it conſiſts being only ſo many concretions or precipitations out of the ſap, as we ſee in urines, wines, and other liquors.

CALCULATION, the act of computing ſeveral ſums, by adding, ſubtracting, multiplying, or dividing. See ARITHMETIC.

An error in *calculation* is never protected, or ſecured, by any ſentence, decree, &c. In ſtating accounts, there is always underſtood, *ſalvo errore calculi*.

The word *calculus* is uſed in this ſenſe, in alluſion to the practice of the ancients, who uſed *calculi*, or little ſtones, in making computations, in taking ſuffrages, and in keeping accounts, &c. as we now uſe counters, figures, &c.

A merchant or trader is ſaid to have been miſtaken in his *calculation* or accounts, when he has happened to take falſe meaſures, and has not ſucceeded in his undertakings ſo well as he expected.

CALCULATION is more particularly uſed to ſignify the computations in aſtronomy and geometry, for making tables of logarithms, ephemerides, finding the times of eclipſes, &c.

CALCULATION *of clock and watch-work*. See CLOCK and WATCH-WORK.

CALCULATOR, a machine contrived and conſtructed by Mr. Ferguſon, in the ſhape of an orrery, for exhibiting the motions of the earth and moon, and reſolving a variety of aſtronomical problems. See the conſtruction, figure, and uſe of this machine, in Ferguſon's Aſtronomy, 4to. p. 265, &c.

CALCULATORES, in *Antiquity*, accomptants who reckoned their ſums by *calculi*. There were ſeveral ſervants under this denomination in great families. Children alſo at ſchool were taught to practiſe the ſame.

In the ancient canons, we find a ſort of diviners, or enchanters, cenſured under the denomination of *calculatores*.

CALCULUS primarily denotes a little ſtone, pebble, or counter, anciently uſed in making computations, taking of ſuffrages, playing at tables, and the like.

Hence the phraſe *ponere calculos*, to denote a ſeries of reaſons, and a multitude of others alluding to the uſe of theſe *calculi* in accounts. Computiſts were by the lawyers called *calculones*, when they were either ſlaves, or newly freed men; thoſe of a better condition were denominated *calculatores*, or *numerarii*: ordinarily there was one of theſe maſters in each family of diſtinction; the title of whoſe office was *a calculis*, or *a rationibus*.

The Roman judges anciently gave their opinions by *calculi*, which were white for abſolution, and black for condemnation.

Hence *calculus albus*, in ancient writers, denotes a favourable vote, either in behalf of a perſon to be abſolved and acquitted of a charge, or elected to ſome dignity or poſt; as *calculus niger* did the contrary.

This uſage is ſaid to have been borrowed from the Thracians, who marked their happy or proſperous days by white, and their unhappy, by black pebbles put each night into an urn. Hence alſo the phraſes, *ſignare*, *notare aliquid albo*, *nigrove lapillo ſeu calculo*.

Beſides the diverſity of colour, there were ſome alſo which had figures or characters painted or graven on them; as thoſe which were in uſe in taking the ſuffrages both in the ſenate, and at aſſemblies of the people.

The letters marked upon theſe *calculi* were U. R. for *uti rogas*, and A. for *antiquo*; the firſt of which expreſſed an approbation of the law, the latter a rejection of it.

Afterwards the judges, who ſat in capital cauſes, uſed *calculi* marked with the letter A. for *abſolvo*, C. for *condemno*, and N. L. for *non liquet*; ſignifying a more full information was required.

We may alſo mention another ſpecies of *calculi* uſed at the public games, whereby the rank and order in which the athletæ were to fight was determined. If for inſtance they were twenty, then twenty of theſe pieces were caſt into an urn; each ten were marked with numbers from one to ten, and the law was, that each of thoſe who drew, ſhould fight him who had drawn the ſame number.

Theſe were called *calculi athletici*.

Calculus is alſo uſed in *Ancient Grammatic Writers* for a kind of weight equal to two grains of *cicer*. Some make it equivalent to the *ſiliqua*, which is equal to three grains of barley. Two *calculi* made the *ceratium*.

Calculus *differentialis* is a method of differencing quantities, or of finding an infinitely ſmall quantity, which, being taken infinite times, ſhall be equal to a given quantity: or, it is the arithmetic of the infinitely ſmall differences of variable quantities.

The foundation of this *calculus* is an infinitely ſmall quantity, or an infiniteſimal, which is a portion of a quantity incomparable to that quantity, or that is leſs than any aſſignable one, and therefore accounted as nothing; the error accruing by omitting it being leſs than any aſſignable one. Hence two quantities, only differing by an infiniteſimal, are reputed equal.

Thus, in *Aſtronomy*, the diameter of the earth is an infiniteſimal, in reſpect of the diſtance of the fixed ſtars; and the ſame holds in abſtract quantities. The term infiniteſimal, therefore, is merely reſpective, and involves a relation to another quantity; and does not denote any real ens, or being.

Now infiniteſimals are called *differentials*, or differential quantities, when they are conſidered as the differences of two quantities. Sir Iſaac Newton calls them *moments*; conſidering them as the momentary increments of quantities; v. g. of a line generated by the flux of a point; or of a ſurface by the flux of a line. The *differential calculus*, therefore, and the doctrine of FLUXIONS, are the ſame thing, under different names; the former given by M. Leibnitz, and the latter by Sir Iſaac Newton: each of whom lay claim to the diſcovery.

There is, indeed, a difference in the manner of expreſſing the quantities reſulting from the different views wherein the two authors conſider the infiniteſimals; the one as moments, the other as differences: Leibnitz, and moſt foreigners, expreſs the differentials of quantities by the ſame letters as variable ones, only prefixing the letter d: thus the differential of x is called dx; and that of y, dy: now dx is a poſitive quantity, if x continually increaſe; negative, if it decreaſe.

The Engliſh, with Sir Iſaac Newton, inſtead of dx, write $\dot{x}$ (with a dot over it); for dy, $\dot{y}$, &c. which foreigners object againſt, on account of that confuſion of points, which they imagine ariſes, when differentials are again differenced; beſides, that the printers are more apt to overlook a point than a letter. Stable quantities being always expreſſed by the firſt letters of the alphabet $da = o$, $db = o$, $dc = o$; wherefore $d\,(x+y-a) = dx+dy$, and $d\,(x-y+a)\ dx-dy$. So that the differencing of quantities is eaſily performed, by the addition or ſubtraction of their compounds.

To difference quantities that multiply each other; the rule is, firſt, multiply the differential of one factor into the other factor, the ſum of the two factors is the differential ſought: thus, the quantities being xy, the differential will be $xdy+ydx$, i. e. $d\,(xy) = xdy+ydx$. Secondly, if there be three quantities mutually multiplying each other, the factum of the two muſt then be multiplied into the differential of the third: thus, ſuppoſe vxy, let $vx=t$, then $vxy=ty$; conſequently $d\,(vxy) = tdy+ydt$: but $dt = vdx+xdv$. Theſe values, therefore, being ſubſtituted in the antecedent differential, $tdy+ydt$, the reſult is, $d\,(vxy) = vxdy+vydx+xydv$. Hence it is eaſy to apprehend how to proceed, where the quantities are more than three.

If one variable quantity increaſe, while the other y decreaſes, it is evident $ydx-xdy$ will be the differential of xy.

To difference quantities that mutually divide each other; the rule is, firſt, multiply the differential of the diviſor into the dividend; and, on the contrary, the differential of the dividend into the diviſor; ſubtract the laſt product from the firſt, and divide the remainder by the ſquare of the diviſor; the quotient is the differential of the quantities mutually dividing each other. See FLUXIONS.

Calculus *exponentialis*, is a method of differencing exponential quantities, or of finding and ſumming up the differentials or moments of exponential quantities; or at leaſt bringing them to geometrical conſtructions.

By exponential quantity, is here underſtood a power, whoſe exponent is variable; v. g. $x^x\ a^x.\ x^y.$ where the exponent x does not denote the ſame in all the points of a curve, but in ſome ſtands for 2, in others for 3, in others for 5, &c.

To difference an exponential quantity: there is nothing required but to reduce the exponential qualities to logarithmic ones; which done, the differencing is managed as in logarithmic quantities.—Thus, ſuppoſe the differential of the exponential quality x^y required, let

$$\underline{x^y = z}$$

Then will $\underline{ylx = lz}$

$$\underline{lxdy + \frac{ydx}{x} = \frac{dz}{z}}$$

$$zlxdy + \frac{zydx}{x} = dz$$

That is, $x^y\,lxdy + x^{y-1}\,dx = dz$. Bernouilli Opera, tom. i. See EXPONENTIAL.

Calculus *integralis*, or *ſummatorius*, is a method of integrating, or ſumming up moments, or differential quantities; i. e. from a differential quantity given, to find the quantity from whoſe differencing the given differential reſults.

The *integral calculus*, therefore, is the inverſe of the differential one: whence the Engliſh, who uſually call the differential method, *fluxions*, give this *calculus*, which aſcends from the fluxions, to the flowing or variable quantities: or, as foreigners expreſs it, from the differences to the ſums; by the name of the *inverſe method of* FLUXIONS.

Hence, the integration is known to be juſtly performed, if the quantity found, according to the rules of the *differential calculus*, being differenced, produce that propoſed to be ſummed.

Suppoſe $\int$ the ſign of the ſum, or integral quantity; then $\int ydx$ will denote the ſum, or integral of the differential ydx.

To integrate, or ſum up a differential quantity. It is demonſtrated, firſt, that $\int dx = x$: ſecondly, $\int (dx+dy) = x+y$: thirdly, $\int (xdy+ydx) = xy$: fourthly, $\int (mx^{m-1}\,dx = xm$: fifthly, $\int (n:m)\,x^{\frac{n-m}{m}}\,dx = x^{\frac{n}{m}}$: ſixthly, $\int (ydx-xdy) : y^2 = x:y$. Of theſe, the fourth and fifth caſes are the moſt frequent; wherein the differential quantity is integrated, by adding a variable unity to the exponent, and dividing the ſum by the new exponent multiplied into the differential of the root; v. g. the fourth caſe, by $m-(1+1)\,dx$, i. e. by mdx.

If the differential quality to be integrated, doth not come under any of theſe formulas, it muſt either be reduced to an integral finite, or an infinite ſeries, each of whoſe terms may be ſummed.

It may be here obſerved, that, as in the analyſis of finites, any quantity may be raiſed to any degree of power; but *vice verſa*, the root cannot be extracted out of any number required: ſo in the analyſis of infinites, any variable or flowing quantity may be differenced; but, *vice verſa*, any differential cannot be integrated. And as, in the analyſis of finites, we are not yet arrived at a method of extracting the roots of all equations; ſo neither has the *integral calculus* arrived at its perfection: and as in the former we are obliged to have recourſe to approximation; ſo in the latter we have recourſe to infinite SERIES, where we cannot attain to a perfect integration.

Calculus *literalis*, or *literal* **Calculus**, is the ſame with ſpecious arithmetic, or algebra, ſo called, from its uſing the letters of the alphabet: in contradiſtinction to numeral arithmetic, which uſes figures.

In the literal *calculus*, given quantities are expreſſed by the firſt letters, $a\,b\,c\,d$; and quantities ſought by the laſt $z\,y\,x$, &c. Equal quantities are denoted by the ſame letters.

Calculus, in *Medicine*, the diſeaſe of the ſtone in the bladder, or kidneys.

The term is Latin, and ſignifies a *little pebble*.

The *calculus* in the bladder is called *lithiaſis*; and in the kidneys, *nephritis*. See STONE.

Calculus *Minervæ*, among the *Ancient Lawyers*, denoted the deciſion of a cauſe, wherein the judges were equally divided. The expreſſion is taken from the hiſtory of Oreſtes, repreſented by Æſchylus and Euripides; at whoſe trial, before the Areopagites for the murder of his mother, the votes being equally divided for and againſt him, Minerva interpoſed, and gave the caſting vote, or *calculus*, in his behalf.

M. Cramer, profeſſor at Marpurg, has a diſcourſe expreſs, De Calculo Minervæ; wherein he maintains, that all the effect an entire equality of voices can have, is to leave the cauſe *in ſtatu quo*.

Calculus *tiburtinus*, a ſort of figured ſtone, formed in great plenty about the cataracts of the Anio, and other rivers in Italy; of a white colour, and in ſhape oblong, round, or echinated. They are a ſpecies of the *ſtiriæ lapideæ*, and generated like them; and ſo like ſugar-plums in the whole, that it is a common jeſt at Rome to deceive the unexperienced by ſerving them up at deſerts.

CALDA, or **Caldum**, in the *Ancient Diet*, denotes hot water, uſed much among the Romans, anciently, as a drink, partly for pleaſure, and partly for health.

The word is formed from *calidus*, *hot*; *aqua* being underſtood; *calda*, q. d. *calida aqua*.

Lipſius, Caſtalio, Mercurialis, Baccius, and Freinſhemius, have treated largely *de potu caldæ*, or *caldi*. Act. Erud. Lipſ. 1721.

CALDARIA *Judiciaria*, the method of trial, or PURGATION by boiling water. See ORDEAL.

CALDARIUM, in the *Ancient Baths*, denoted a brazen veſſel or ciſtern, placed in the hypocauſtum, full of hot water, to be drawn thence into the *piſcina* or BATH, to give it the neceſſary degree of heat.

In this ſenſe, the *caldarium* ſtood contradiſtinguiſhed from the *tepidarium* and *frigidarium*.

CALDARIUM alſo denoted the ſtove, or ſudatory, being a cloſe vaulted room, wherein by hot dry fumes, without water, people were brought to a profuſe ſweat.

In which ſenſe, *caldarium* was the ſame with what was otherwiſe denominated *vaporarium*, *ſudatorium*, and *laconium*; in the Greek baths, *hypocauſtum*, ὑποκαυϛον.

CALDARIUM *æs*, denotes POT-*Metal*.

CALDRON, a large kitchen utenſil, commonly made of copper; having a moveable iron handle, whereby to hang it on the chimney-hook.

The word is formed from the French *chaudron*, or rather the Latin *caldarium*.

CALDRONS, *boiling in*, *caldariis decoquere*, is a capital puniſhment ſpoken of in the middle age writers, decreed to divers ſorts of criminals, but chiefly to debaſers of the coin.

One of the torments inflicted on the ancient Chriſtian martyrs, was boiling in caldrons of water, oil, &c.

CALE, or KALE. in *Botany*, a ſpecies of the BRASSICA, or *cabbage*. See BORECOLE and COLEWORT.

CALE, *ſea*. See CRAMBE.

CALEA, in *Botany*, a genus of the *ſyngeneſia polygamia æqualis* claſs of plants; the receptacle of which is covered with a hairy down, and the calyx imbricated.

CALEDONIANS, in *Antiquity*, the ancient inhabitants of that part of Britain which lies northward beyond Graham's Dyke, or the wall of Antoninus Pius, afterwards called Picts by the Romans and Provincials. The term *Caledonii* became, in proceſs of time, ſo common among the Roman writers, that they applied it generally to all Britain, and all the foreſts of Britain.

Camden derives the name from the plural *kaledion*, of the Britiſh word *kaled*, *hard*; whence *Caledonii*, denoting a people *hardy*, *uncivilized*, and *ruſtick*. Buchanan derives it from the old Scottiſh word *calden*, *hazel-tree*.

CALEFACIENTIA, in *Medicine*. The *calefacientia* of the Latins are the ſame with the θερμαντικα of the Greeks; and denote no more than what we commonly call warming medicines. That the natures and qualities of the ſeveral medicines coming under this denomination may be the more thoroughly underſtood, it is neceſſary to obſerve, that there may be heat without any external appearance of fire, and that it diſcovers itſelf by numberleſs effects; but in no inſtance more conſpicuouſly than by the dilatation of the air in the thermometer. Boerhaave's Chemiſtry, vol. i.

The means then by which warmth is generated in bodies, are the very ſame with thoſe by which apparent fire is produced. Where there is a heat, there is alſo a proportionable and correſpondent motion and agitation of the parts of the body ſaid to be hot; and, *vice verſa*, where there is an agitation of the parts of a body, there is a proportionable heat and warmth.

CALEFACTION, a ſchool term for the action of fire in heating a body; or the impulſe which the particles of a hot body impreſs on other bodies around.

The word is particularly uſed in pharmacy; where *calefaction* is diſtinguiſhed from coction: the firſt being applied, where the thing is only heated, without boiling.

CALENDAR, KALENDARIUM, CALENDARIUM, or KALENDAR, a diſtribution of time, accommodated to the uſes of life; or a table, or ALMANAC, containing the order of days, weeks, months, FEASTS, &c. happening throughout the YEAR. See TIME, MONTH, YEAR, &c.

It is called *calendar* from the word *calendæ*, anciently wrote in large characters at the head of each month. See CALENDS.

The days in *calendars* were originally divided into octoades, or eights, but afterwards, in imitation of the Jews, into hebdomades, or ſeven; which cuſtom, Scaliger obſerves, was not introduced among the Romans till after the time of Theodoſius.

There are divers *calendars*, according to the different forms of the year, and diſtributions of time, eſtabliſhed in different countries. Hence the Roman, the Jewiſh, the Perſian, the Julian, the Gregorian, &c. *calendars*.

The ancient Roman *calendar* is given by Ricciolus, Struvius, Danet, and others; by which we ſee the order and number of the Roman holy-days, and work-days.

The three Chriſtian *calendars* are given by Wolfius in his Elements of Chronology.

The Jewiſh *calendar* was fixed by rabbi Hillel, about the year 360, from which time the days of their year may be reduced to thoſe of the Julian *calendar*.

CALENDAR, *the Roman*, owed its origin to Romulus; but it has undergone various reformations ſince his time. That legiſlator diſtributed time into ſeveral periods, for the uſe of the people under his command: but as he was much better verſed in matters of war than of aſtronomy, he only divided the year into ten months, making it begin in the ſpring, on the firſt of March: imagining the ſun made his courſe through all the ſeaſons in three hundred and four days.

Romulus's *calendar* was reformed by Numa, who added two months more, January and February; placing them before March: ſo that his year conſiſted of three hundred fifty-five days, and began on the firſt of January. He choſe, however, in imitation of the Greeks, to make an intercalation of forty-five days, which he divided into two parts; intercalating a month of twenty-two days at the end of each two years; and at the end of each two years more, another month of twenty-three days; which month, thus interpoſed, he called *Marcedonius*, or the intercalary February.

But theſe intercalations being ill obſerved by the pontiffs, to whom Numa committed the care of them, occaſioned great diſorders in the conſtitution of the year; which Cæſar, as ſovereign pontiff, endeavoured to remedy: to this end, he made choice of Soſigenes, a celebrated aſtronomer of thoſe times; who found, that the diſpenſation of time in the *calendar* could never be ſettled on any ſure footing, without having regard to the annual courſe of the ſun. Accordingly, as the ſun's yearly courſe is performed in three hundred ſixty-five days ſix hours, he reduced the year to the ſame number of days: the years of this correction of the *calendar* was a year of confuſion; they being obliged, in order to ſwallow up the ſixty-five days that had been imprudently added, and which occaſioned the confuſion, to add two months beſides the *Marcedonius*, which chanced to fall out that year; ſo that this year conſiſted of fifteen months, or four hundred forty-five days. This reformation was made in the year of Rome 708, forty-two or forty-three years before Chriſt.
